Finance.—Revenue, ordinary (est. 1940), 741,100,000 florins; expenditure, ordinary (est. 1940), 746,500,000 florins; public debt (May 1940), 3,600,000,000 florins; notes in circulation (April 1940), 1,123,000,000; gold reserve (April 1940), 1,195,000,000 florins; exchange rate: (average 1938) 8.89 florins=£1 sterling; (July 31, 1939) 8.82 florins=£1 sterling; (average, April 1940) 6.66 florins=£1 sterling—approximately $4.03½, U.S.

Trade and Communication.—Trade (merchandise): imports (1938), 1,414,768,000 florins; (1939) 1,517,000,000 florins; exports (1938), 1,039,156,000 florins; (1939) 966,000,000 florins. Communication and transport, 1938: roads, suitable for motor traffic, 16,000 mi.; railways, open to traffic, 2,016 mi.; rivers and canals, navigable, 4,817 mi.; airways, distance flown, 6,629,000 mi.; shipping (June 30), 2,855,400 gross tons; launched (July 1938–June 1939), 246,400 gross tons; entered with cargoes, 27,606,524 net tons; cleared with cargoes, 23,151,428 net tons. Motor vehicles licensed (Aug. 1, 1938): cars, 94,000; buses, 4,088; trucks, 50,988; cycles, 55,140; wireless (June 30, 1939): registered receiving sets, 839,542; connections with radio-distributing systems, 368,710.

Agriculture, Manufactures, Mineral Production.—In metric tons (1939 actual figures): wheat, 416,523; rye, 603,532; barley, 146,041; oats, 449,241; pulse, 185,891; sugar beet, 1,716,052; flax, 152,487; cotton goods (1938), 136,565,000 guilders; machinery (1938), 99,821,000 guilders; coal, 12,861; salt, 199,800; iron ore (1938), 276,600; zinc, 20,500. (*See* also CURAÇAO; DUTCH EAST INDIES; NETHERLANDS COLONIAL EMPIRE; SURINAM.)

(H. F. D. B.)

Netherlands Colonial Empire.

Total area, excluding mother country, 789,700 sq.mi. (approx.); total pop. (est. Dec. 31, 1940), 70,154,000. The table lists the colonial possessions of the Netherlands, together with statistics appropriate to each.

History.—Although Japan did not specifically include the Netherlands East Indies in its war declarations of Dec. 7, 1941, the Dutch government in exile at London immediately declared war on the Japanese empire, "in view of Japan's aggression against two powers with whom the Netherlands maintain particularly close relations." The navy and air forces of the Netherlands East Indies took an aggressive part in the early stages of the Pacific war, and by the end of the year claimed the sinking of an average of one Japanese ship for each day of hostilities. (*See* WORLD WAR II.)

War found the Netherlands East Indies prepared. Since 1939 many developments of local industries had taken place and included the installation of an aluminum plant, a large hydroelectric plant, a scrap-iron plant and a rolling mill. The ship-repairing yards at Surabaya and Batavia, for both naval and merchant shipping, were improved and enlarged, and it was proposed to establish various new industries. Assembly plants for aircraft and factories for the local production of cement, glass and aluminum ware had been erected. In Semarang, Java, a shipbuilding company was formed under the auspices of Droogdok Maatschappij

Netherlands Colonial Empire

Territory and Area, sq. miles (approx.)		Population est. Dec. 31, 1938 (000's omitted)	Capital	Status	Governors
ASIA					
NETHERLANDS INDIES, including Java and Madura, Sumatra, Celebes, Borneo (D.), New Guinea (D.), Timor (D.), etc.	735,300	69,880 (est. Dec. 31, 1940)	Batavia	colony	*Governor-General:* Jonkheer Dr. A. W. L. Tjarda van Starkenborgh-Stachouwer.

CURAÇAO	403	101	Willemstad	colony	*Governor:* G. J. J. Wouters.
SURINAM (Dutch Guiana)	54,000	173	Paramaribo	colony	*Governor:* Dr. J. C. Kielstra.

Tandjong Priok. Four slipways for 10,000-ton vessels were to be provided. (*See* also JAVA; SUMATRA.)

On Sept. 20, 1941, the Volksraad (people's council) had adopted the budget for 1942, amounting to 800,000,000 guilders, of which 530,400,000 guilders were to be for defense purposes. The population had contributed to the Spitfire fund up to Oct. 1 nearly 12,000,000 guilders, with which 86 fighters, 29 bombers, 3 night Beau fighters and 3 motor torpedo boats were bought. Up to early November the Netherlands East Indies contributed 4,000,000 guilders to the Van Galen fund for the purchase of a new destroyer as a birthday gift to Queen Wilhelmina, and undertook to raise 5,000,000 guilders of the 6,500,000 guilders necessary to pay for the destroyer.

Compulsory service of the native population was decreed during 1941, and affected some 600,000 natives annually. Naval units in the Netherlands East Indies were considerably strengthened. Anticipating the war, in July the Netherlands East Indies took action against Japan by suspending foreign exchange transactions, extending the system of special licences for all exports to Japan to include the Japanese empire, Manchoukuo, occupied China and French Indo-China, and prohibiting bank payments or deposits on behalf of Japanese nationals with special permits.

(H. F. D. B.; X.)

Neutrality. **Neutrality in Transition.**—Neutrality, in the technical sense of the position of states remaining aloof from war, underwent many changes and presented new problems during 1941. A number of states lost their neutrality by being invaded and forced to fight in defense of their national independence. Yugoslavia (*q.v.*) resisted the attempt of Germany to force it into collaboration with the axis and was overrun and conquered. Russia, having been technically neutral in spite of the pact of August 1939, was attacked by Germany on June 22 and entered the ranks of the belligerents. Finland (*q.v.*), having regained its status as a neutral in 1940, declared war on Russia on June 27 and became once more a belligerent. Bulgaria and Egypt continued technically neutral in spite of collaboration, the one with Germany and the other with Great Britain. Iraq and Persia continued neutral notwithstanding the occupation of their respective countries by British armies. Following the declaration of war upon them by Great Britain, Hungary, Rumania and Finland lost their status of formal neutrality.

Position of the United States.—The United States, without formally abandoning its status as a neutral toward Germany and Italy, continued and extended its policy of giving aid to the states resisting the axis powers. The legal justification given by the government for acts technically in violation of the obligations of neutrality was the necessity of self-defense against an international outlaw. This attitude was affirmed on numerous occasions, notably in addresses by the president on May 27, before the governing board of the Pan American union, and on October 27, navy and total defense day; and in an address by Secretary Hull on April 24 before the American Society of International Law. Germany, by openly repudiating the most fundamental rights of neutral states, could no longer claim the benefit of the observance of neutral duties by the other members of the community; and it was for them to decide upon the measures of defense to be taken against the menace to their own peace and safety. In an address at Havana on March 27, 1941, Attorney-General Jackson put forth the additional justification of the violation by Germany of the Kellogg-Briand pact.

With this justification of self defense, the United States broke freely with the traditional rules of neutrality. Statements announcing the necessity of "defense measures" were accompanied by denunciations of the German government which, taken apart from their justification, would have been in violation of the rule that a neutral government must not give expression to opinions unfavourable to either belligerent. The Roosevelt-Churchill statement on August 14 of "peace terms," known as the "Atlantic Charter," was thus a technically unneutral document, in that it was accompanied by a pledge from the United States to one belligerent to bring about the defeat of the other. Following the outbreak of war between the United States and Japan, President Roosevelt, in an address of Dec. 9, linked the other axis powers so closely to Japan as to eliminate the last vestiges of even formal neutrality.

The Lend-Lease Act.—The outstanding departure of the United States from the technical rules of neutrality, however, was the passage by congress on March 11 of the Lend-Lease act, by which the government itself contributed directly to the resources of one of the belligerents against the other. For, while under international law neutral citizens may sell arms to a belligerent and make loans, a neutral government must avoid strictly any such transactions. It was also a violation of neutral obligation for the United States to permit the repair of British warships in the ports of the United States, as well as to allow them to remain in port more than twenty-four hours.

Seizure of Belligerent Merchant Ships.—On March 30 the United States seized a number of merchant ships belonging to Germany and Italy and to countries occupied by Germany. The seizure in itself could be legally justified on the ground of the prevention of sabotage. An act of congress, approved June 6, authorized the acquisition by the United States of title to or the use of domestic or foreign merchant vessels for urgent needs of commerce and national defense. To the extent to which vessels thus owned by the United States were used to send materials to Great Britain there was a departure from technical neutrality.

Occupation of Iceland and Surinam.—On July 7 American naval forces occupied Iceland, the legal basis of the occupation being an agreement with the Danish minister in Washington, whose act could not in strict law be said to be the act of the government of Denmark under German occupation. Here again, self defense was regarded as overruling technical rules of neutrality. On Nov. 23, acting with the consent of the *de jure* government of Holland in London, and in accordance with the provisions of the act of Havana of 1940, the U.S. occupied Surinam (Dutch Guiana) ostensibly for the protection of the bauxite mines. (*See* also GREENLAND.)

Resistance to Submarine Attacks.—Beginning with the case of the "Robin Moor" on May 21, a number of vessels flying the American flag were sunk by German submarines in open violation of the laws of war, no notice of visit and search being given and no adequate provision made for the safety of the passengers and crew. The state department, after protesting the sinking of the "Robin Moor," subsequently proposed liquidation of the case by the payment by Germany of an indemnity for the destruction of the vessel. Following the sinking of the "Sessa," President Roosevelt announced Sept. 11 that American warships had been ordered to attack enemy submarines at sight. The legal ground for this order is the right of the neutral state to defend itself against acts of piracy, in accordance with the terms of the Washington treaty of 1922. In spite of the attack by a German submarine upon the United States destroyer, "Kearny," and the sinking of the destroyer "Reuben James," both the United States and Germany refrained from considering the hostilities as technical "war."

On October 17 the house of representatives voted to repeal sec. 6 of the Neutrality act of 1939, by which it was forbidden to arm American merchant ships. On Nov. 7 the senate amended the house bill by repealing, in addition to sec. 6, secs. 2 and 3 by which American vessels were forbidden to carry passengers or materials to the belligerents or to proceed into or through waters designated as combat areas. These amendments were voted by the house on Nov. 13, and the repeal bill became law on Nov. 17. Inasmuch as the provisions of the Neutrality act were in excess of the obligations of international law, the repeal measure did not of itself alter the neutral status of the United States. The carriage of contraband to a belligerent port is not of itself a violation of international law; it merely subjects the vessel engaged in the traffic to the penalty of capture and confiscation, after proper visit and search. To attack such vessels without warning and without making provision for the safety of the passengers and crew would be an act of piracy on the part of Germany and justify the most extreme measures of self defense.

Inter-American Neutrality.—The Inter-American Neutrality committee continued in session at Rio de Janeiro, its most important recommendation, made at the request of the Havana meeting of foreign ministers in July, 1940, being one in favour of the extension of territorial waters to a distance of 12 miles. A dissenting opinion to this proposal was entered by one of the members on the ground that it involved established fishing rights belonging to other nations and that as a neutrality measure it was in derogation of the wider "security zone" already approved.

On June 21 the government of Uruguay proposed that the American republics should adopt a policy of not treating as a belligerent any American country which in defense of its own rights should find itself in a state of war with nations of other continents. The proposal was based upon the principle of continental solidarity, that any act susceptible of affecting adversely the rights of any one of the American countries should be regarded as an offense against all of them. On July 1 the United States replied, supporting the initiative of the Uruguayan government and restating the policy of the United States, in accordance with which the security of each of the American republics is regarded as dependent upon the security of all and aid is to be given to countries resisting the forces of aggression (department of state *Bulletin*, July 5). Upon the outbreak of war between the United States and Japan, Argentina and other American countries declared that, in accordance with the principle of continental solidarity, they would not treat the United States as a belligerent. (*See* also INTERNATIONAL LAW; LEAGUE OF NATIONS; PROPAGANDA.)

(C. G. FK.)

Nevada. The smallest of the U.S. mountain states, Nevada was admitted to the union Oct. 31, 1864. It has two popular names, the "sagebrush state" and the "Silver state." Total area, 110,540 sq.mi.; pop. (1940) 110,247. Of the population, 39·3% were urban; 93,431 were native white, 10,599 were foreign-born white, 664 were Negro and 5,553 were of other races. Capital, Carson City (2,478); other cities are: Reno (21,317); Las Vegas (8,422); Sparks (5,318); Ely (4,140); Elko (4,094); Winnemucca (2,485); and Fallon (1,911).

History.—The 40th session of the state legislature was held early in 1941 and accomplished little of importance. Adherence to the previous policies of freedom from all so-called nuisance

taxes and a continuance of the sound business principles that had given Nevada a balanced budget and large treasury surplus were noted. A driver's licence law was approved.

Political activity was not noticeable. The appointment by Governor Carville of a director of the state council of defense resulted in Nevada's having an efficient operating council months in advance of U.S. entry into the war. The council was financed by an emergency appropriation of $10,000 passed by the legislature.

The principal state officials were: governor, E. P. Carville; lieutenant governor, Maurice J. Sullivan; secretary of state, Malcolm McEashin; attorney general, Gray Mashburn; state treasurer, Dan W. Franks; state controller, Henry C. Schmidt; superintendent of public instruction, Mildred Bray; U.S. senators, Pat McCarran and Berkeley L. Bunker. Chief justice of the state supreme court was Edward A. Ducker.

Education.—In 1940–41 there were 240 elementary schools, with a total enrolment of 14,853 pupils, staffed by 669 teachers. In 1941 there were 40 high schools, with a total enrolment of 5,911 pupils, staffed by 259 teachers. In 1941 the total school enrolment was 21,695; and $2,894,156.40 was spent for education. The University of Nevada during 1940–41 had a total net enrolment of 1,382 and 121 members on the faculty.

Public Welfare, Charities, Correction.—The amount spent for public assistance for the fiscal year ending June 30, 1941, was $27,000; for social security and old-age assistance, $771,975.36. On Jan. 1, 1942, the state prison had 244 inmates; total expenditures for the year ending June 30, 1941, were $98,471.82; the State Industrial home had 40 inmates, expenditures, $20,343.25; the State Hospital for Mental Diseases had 359 patients, expenditures, $106,748.36; the orphans' home had 53 inmates, expenditures, $39,201.62.

Communication.—On Jan. 1, 1942 there were 5,521 mi. of roads in the state-designated highway system, 2,780 mi. of oil or paved surface roads and 3,067 mi. of improved roads. During 1941, 215 mi. of road were constructed and surfaced. Expenditures were $4,508,973.58 for the fiscal year ending June 30, 1941. On Jan. 1, 1942, there were 418.40 mi. of short-line railroads and 1,475.40 mi. of trackage on the three transcontinental railroads in the state. On Jan. 1, 1942, there were six standard airports and 26 secondary airports in Nevada.

Banking and Finance.—On Jan. 1, 1942, there were six state banks with deposits, as of Sept. 24, 1941, of $4,005,636.56. On Jan. 1, 1942, there were seven national banks, one of which, the First National Bank of Nevada, had 10 branches throughout the state. These banks had total deposits, as of June 30, 1941, of $41,153,000, and total resources of $44,712,000. On Jan. 1, 1942, there were three savings and loan associations with resources of $305,575.75.

State receipts for the fiscal year 1940–41 were $9,647,112.52; disbursements, $9,684,065.23. The state gross and net debt was as follows, June 30, 1941: state investment, $3,488,652.18; bonded debt, $542,000; net investment, $2,946,652.18.

Agriculture.—The total value of agricultural production in 1940 was $12,132,935, and the total acreage harvested was 451,688.

The cash income from crops and livestock was $15,334,158. During 1941, livestock and agriculture enjoyed a good season with plentiful rains and no droughts.

Table I.—*Leading Agricultural Products of Nevada, 1940 and 1929-38 Average*

Crop and unit of production	1940	Average 1929-38
Corn, bu.	120,000	50,000
Oats, bu.	280,000	115,000
Wheat (all), bu.	483,000	382,000
Barley, bu.	540,000	260,000
Hay (all), tons	534,000	485,000
Potatoes, bu.	391,000	384,000
Pears, bu.	3,000	4,000
Peaches, bu.	5,000	5,000
Grapes, tons	110	94

Manufacturing.—The total value of manufactures, according to the 1939 U.S. biennial census, was $20,581,713. The average number of employees in manufacturing was 1,093, and the total wages paid $1,642,397. The number of manufacturing establishments in Nevada in 1941 was 105, and the leading manufactures were iron and steel products, automobile parts, printing products, lumber products, brick and clay products.

Mineral Production.—The total value of gold, silver, copper, lead and zinc production in 1940 was $37,089,777; production of miscellaneous minerals, as of 1938, was $3,501,801. The production of all the strategic metals was greatly increased in 1941; tungsten, mercury, manganese, vanadium and antimony showed a substantial increase, and the same activity was noted in the nonmetallic field. Nevada produced a large tonnage of magnesite and brucite. The state ranked first in the United States in the production of turquoise. (E. C. D. M.)

Table II.—*Principal Mineral Products of Nevada, 1940 and 1939*

Mineral	Value, 1940	Value, 1939
Gold	$13,437,655	$12,653,130
Silver	3,080,060	2,929,068
Copper	17,730,604	13,852,176
Lead	749,000	398,184
Zinc	1,490,958	647,712

Nevinson, Henry Woodd (1856–1941), British foreign correspondent and author, was born in Leicester and attended Shrewsbury school and Christ Church, Oxford. He began his career as a war correspondent in an era when reporters generally were eyewitnesses at battles, and he covered nearly every major conflict from the Graeco-Turkish War of 1879 to World War I. He escaped capture on several occasions and was wounded during the Dardanelles campaign of World War I. He also covered a number of postwar parleys for the *Manchester Guardian*. Among his works are *A Modern Slavery* and *The Dawn in Russia* (1906), *The New Spirit in India* (1908), *The Dardanelles Campaign* (1918), *Between the Wars* (1936) and *Films of Time* (1938). Nevinson died in Chipping-Campden, Gloucestershire, Nov. 9.

Newbery Medal: *see* AMERICAN LIBRARY ASSOCIATION.

New Brunswick. One of the four provinces which united to form the dominion of Canada (*q.v.*) in 1867; area 27,985 sq.mi.; population, 1941, 453,377, of whom 97% were native-born and 36% were urban. Capital, Fredericton (9,905). Other cities are St. John (50,084) and Moncton (22,411). The lieutenant governor in 1941 was W. G. Clark and the premier was J. B. McNair.

Education.—The enrolment in 1941 in the public schools was 96,953; in private schools, 2,958. The number of teachers was 2,767. The state university in Fredericton had an enrolment of 404 students, with 24 instructors. Mount Allison university in Sackville had 425 students and 54 instructors.

Communication.—Surfaced highways had a mileage of 7,772 in 1941; earth highways, 4,278. The cost in 1940 was $8,304,588. The railroad mileage was 1,873 in 1941; the number of telephones, 33,872.

Finance.—Government receipts for the fiscal year 1939–40 were $12,459,611; expenditure, $11,921,467; gross debt $103,568,573; net debt $92,263,340.

Agriculture.—Acreage under cultivation in 1941 was 908,000; the value of agricultural products was $32,076,000, with a cash income of $26,632,000.

Table I.—*Leading Agricultural Products of New Brunswick, 1941 and 1940*

Crop	1941	1940
Oats, bu.	6,507,000	6,671,000
Potatoes, cwt.	6,896,000	5,039,000
Turnips, cwt.	3,340,000	2,772,000
Hay and clover, tons	944,000	931,000

Manufacturing.—The total estimated value of manufactures in 1939 was $66,058,151; the number of wage earners was 14,501; wages paid, $13,659,162.

Table II.—*Principal Industries of New Brunswick, 1938 and 1937*

Industry	Value of products	
	1938	1937
Pulp and paper	$14,297,334	$20,195,064
Sawmills	5,414,051	7,585,133
Coffee, tea and spices	3,464,593	3,580,214
Fish packing	2,557,617	3,115,280

Newfoundland and Labrador. Area: Newfoundland 42,000 sq.mi.; Labrador 110,000 sq.mi.; total 152,000 sq.mi.; pop. (est. Dec. 31, 1938): Newfoundland, 290,660; Labrador, 4,780. Chief town (capital, pop. 1941): St. John's (39,886). Governor: Sir Humphrey Walwyn; language: English; religion (1935 census):

Roman Catholic, 93,925; Church of England, 92,732; United Church, 76,100; Salvation Army, 18,054.

History.—During 1941 Newfoundland, proportionately to its population, made a larger contribution in manpower to the Allied war effort than did any other part of the empire. It continued to be administered by the commission of government, on which H. A. Winter succeeded his brother, J. A. Winter, who had been appointed chief clerk and registrar of the supreme court, and P. D. H. Dunn succeeded J. H. Garvin.

Newfoundland relinquished its annual grant-in-aid from the imperial government, imposed extra taxation and inaugurated a war-savings campaign; the budget for 1940–41 for the first time in many years showed a surplus, with revenue at $16,200,000 and expenditure at $15,500,000—a result to which increased imports, employment on the U.S. and Canadian bases and remittances from those working overseas as lumbermen and in the armed forces contributed. Economic conditions also improved, as was exemplified by the opening in March of a new $4,000,000 sulphite plant built for the Bowater paper mills for an annual output of 30,000 tons. Of the budget surplus, $500,000 went to provide a Newfoundland fighter squadron for imperial use, and $2,300,000 of the estimated 1941–42 surplus of $2,600,000 was earmarked as an interest-free loan to Britain.

The granting of the lease of a naval base to the U.S. met with some opposition, but this was at once allayed by a letter from Prime Minister Churchill stressing the advantages to be gained by such U.S. aid, and the base at Quidividi lake was constructed. Other effects of the war were the emigration of numbers of young men to Canada for R.A.F. training under the empire scheme, and the revocation of the exequatur of the Vichy French consul at St. John's. (L. H. D.)

Education.—In 1940: schools, 1,898; scholars on rolls, 66,508; average attendance, 70.2%.

Banking and Finance.—Revenue, ordinary: 1940–41 (actual), $16,187,505; 1941–42 (est.), $17,463,295; expenditure: 1940–41 (actual), $15,490,974; 1941–42 (est.) $14,865,475, including $1,232,267 for special reconstruction work; public debt (June 30, 1939), sterling £20,382,869; notes in circulation (June 30, 1939), $24,023; exchange rate same as Canadian dollar.

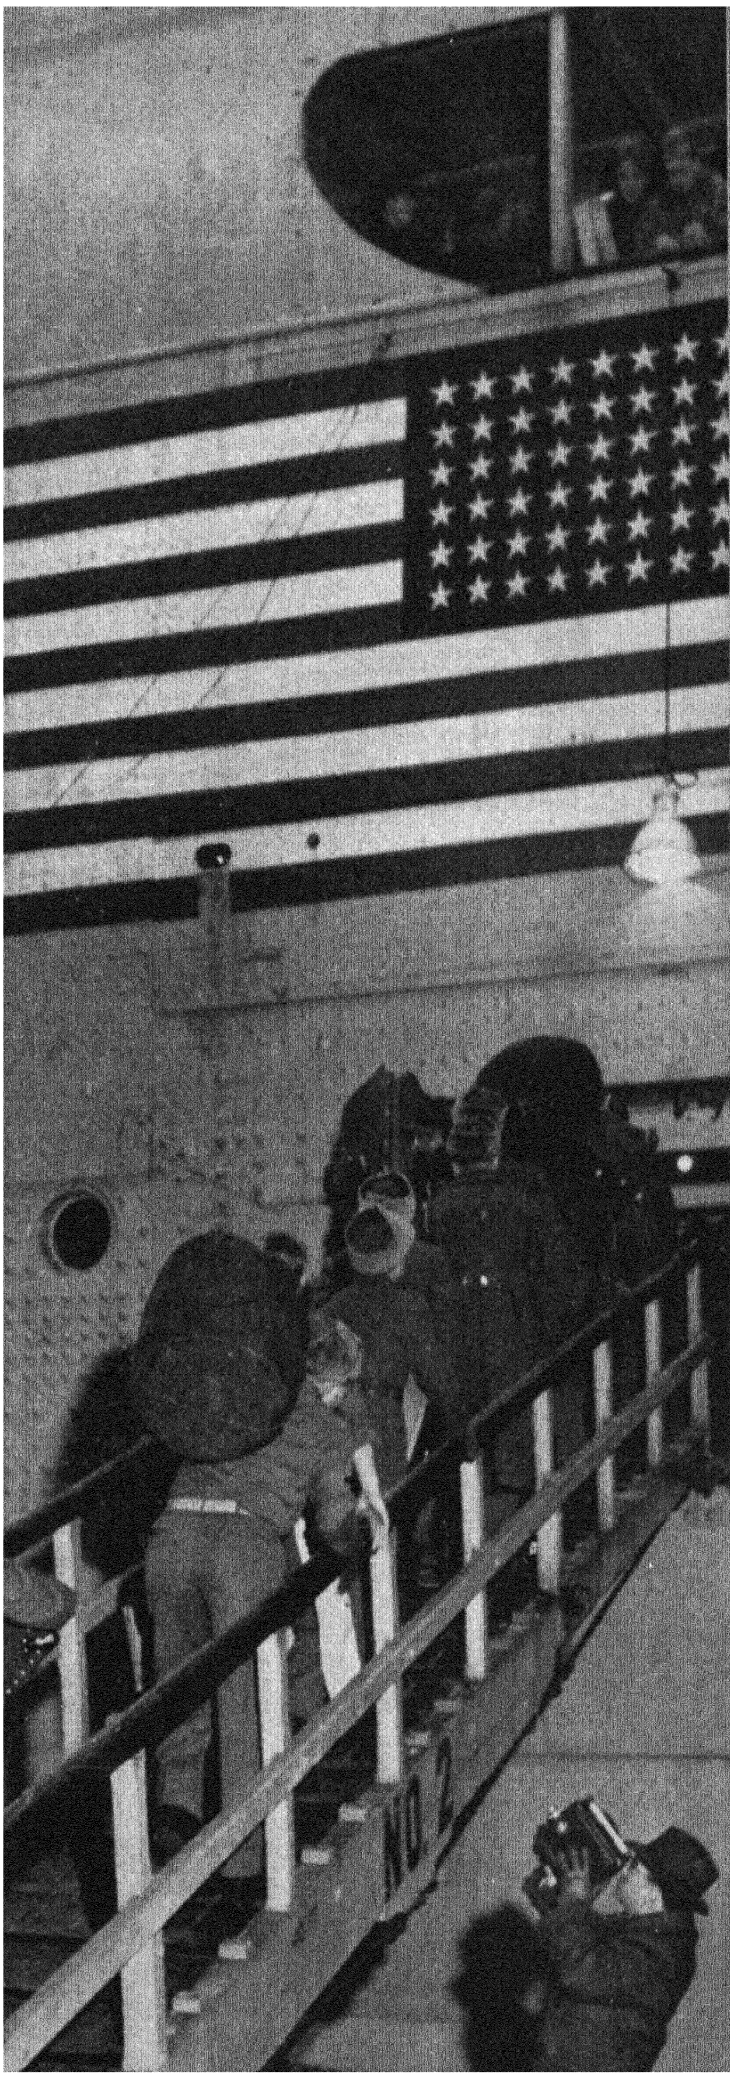
Trade and Communication.—Overseas trade 1939–40 (merchandise): imports, $28,421,897; exports, $32,827,323. Communications (Dec. 31, 1938): roads, main, 1,150 mi.; secondary and local, 6,000 mi.; railways, open to traffic, 747 mi.; motor vehicles licensed (1940): cars, 4,429; trucks and buses, 1,340; cycles, 154; telephones (1940), 10,588.

Mineral Production and Fisheries.—Fisheries (1940): cod (inshore, deep sea and Labrador), 87,549 metric tons; seal, $205,030; salmon (export), 3,750,336 lb.; lobster (export), 2,477,289 lb.; fish oils (export), 1,826,377 lb. In metric tons (1938): wood pulp, 242,000; iron ore (metal content), 887,000; lead ore (metal content), 24,300; silver, 44.0; gold, 754 kg.

New Guinea: *see* DUTCH EAST INDIES; MANDATES; PACIFIC ISLANDS, MANDATED.

New Hampshire. One of the New England group of states and one of the original states of the United States, popularly known as the "Granite state." Total area, 9,304 sq.mi.; pop. (1940), 491,524. Of this population, 283,225 or 57.6% were urban. In 1930 there were 464,350 whites, of whom 381,690 were native born and 82,660 foreign born. Capital, Concord (27,171). Other cities are Manchester (77,685), Nashua (32,927), Berlin (19,084), Dover (14,990) and Portsmouth (14,821).

History.—The general court met in its 163rd session from Jan. 1 to June 13, 1941. Important legislation included an act setting up a state council of defense, with advisory and local committees; an antisabotage act; a law for regulating the sale and handling



THE FIRST CONTINGENT of U.S. troops bound for duty at the leased base in Newfoundland sailed from New York city Jan. 15, 1941. They were the first U.S. soldiers to leave for service on foreign soil. The flag on the ship's side is correctly displayed, in accordance with the U.S. Maritime Commission's ruling that flags painted on the starboard side of ships should have their stripes flowing back, as if flying in the wind

of explosives; an act establishing a state guard regiment for local military defense in the absence of the federalized national guard; a capital budget act carrying an appropriation of $216,000 for new construction and permanent improvements to state buildings; and an act abolishing the 2% capital stock tax on domestic insurance firms. The state constitutional convention which had met in 1938 was reconvened Sept. 23, 1941, to consider reduction of membership in the house of representatives, which stood at the high figure of 423. A proposal was adopted designed to effect a reduction of approximately 60 seats, which was to be submitted to the voters at the state election of 1942.

State officers in 1941 were: governor, Robert O. Blood (elected in Nov. 1940); secretary of state, Enoch D. Fuller; state treasurer, F. Gordon Kimball; adjutant general, Charles F. Bowen; attorney general, Frank R. Kenison (all Republican). U.S. senators from New Hampshire were H. Styles Bridges and Charles W. Tobey (both Republican).

Education.—There were, in 1938, 1,810 public elementary schools, with an enrolment of 50,173 pupils and 2,120 teachers. There were 89 public high schools, with 20,304 pupils and 837 teachers. Total state expenditures for public education, in the year ending June 30, 1939, $8,547,642. Private schools had an enrolment of 28,136 pupils, of whom at least 20,000 were in elementary parochial schools in 1938.

The University of New Hampshire, at Durham, had an enrolment of 2,013 at its regular session (1939) with a teaching staff of 153. The New Hampshire State Normal school at Keene had 338 students enrolled, and a staff of 33, while the Normal school at Plymouth had 193 students and a staff of 29.

Public Welfare, Charities, Correction.—The burden on the state for direct relief decreased steadily after April 1940. There were 26,973 persons on direct relief in March 1941; the cost of direct relief in the same month, $217,222. Employees in 1938 under the old-age insurance plan, 144,916, with taxable wages of $100,033,000. Unemployment compensation benefit payments in 1939 amounted to $1,553,000, with a total of 357 claims. Public assistance under federal works program in June 1940 was $1,458,000. On Jan. 1, 1938, there were 262 persons in prisons and reformatories in New Hampshire. The 1941 appropriation for the state prison at Concord was $126,540; and for the Industrial School for Committed Minors, at Manchester, $91,600.

Communication.—Rural highways and urban extensions amounted in 1938 to 3,584 mi. Disbursements in 1939 for highways, including federal-aid funds, $8,815,000. In 1938 there were 1,013 mi. of steam railroads in the state.

Banking and Finance.—As of Dec. 30, 1939, there were in New Hampshire 52 national banks, with deposits of $74,032,000 and resources of $88,853,000; and 55 other than national banks, with deposits of $209,675,000 and resources of $235,333,000. Forty-three savings banks and eight savings departments of trust companies reported deposits of $207,095,202 as of June 30, 1941, representing an increase over June 30, 1940, of $1,515,722. There were in 1941, 26 building and loan associations with resources of $13,112,451.59, an increase of $568,884 over the preceding year.

Cash receipts of the state treasury department for the fiscal year ending June 30, 1940, $39,575,339.71; cash disbursements, $39,111,037.32; cash balance, $1,244,916.50. Gross fixed bond and note debt, June 29, 1940, $10,292,000; total net bonded debt and temporary loans, $10,627,438.97.

Agriculture.—The total value of farm products sold, traded or used by farm households, 1939, was $22,939,158, as compared with $28,583,645 for 1929. Total acreage crop-land harvested (1939), 371,611. Income (1939) from livestock and livestock products, $15,148,055. Farm products used by farm households, $3,579,343. Estimated payments to New Hampshire in 1940 under the Agricultural conservation program, $417,514. New Hampshire agriculture faced serious difficulties in 1941, owing to prolonged drought and a shortage of farm labour, occasioned in part by the demands of defense industries.

Table I.—*Leading Agricultural Products of New Hampshire, 1941 and 1940*

Product	1941	1940
Corn (grain and silage), bu.	615,000	600,000
Oats, bu.	259,000	280,000
Potatoes, bu.	1,472,000	1,634,000
Apples, bu.	764,000	925,000
Hay (tame and wild), tons	371,000	435,000
Maple sugar, lb.	26,000	72,000
Maple syrup, gal.	58,000	83,000
Milk, lb.	353,720,000	355,200,000

Manufacturing.—Total estimated value of manufactures (1939), $237,396,015. Salaried personnel, 4,593; salaries, $10,483,983. Wage earners, 55,781; wages paid, $52,735,240.

Table II.—*Principal Industries of New Hampshire, 1939*

Industry	Value	Industry	Value
Boot and shoe cut stock and findings	$12,709,283	Paper and paperboard mills	$16,293,358
Cotton broad woven goods	20,267,109	Woollen and worsted	25,881,985
Footwear (except rubber)	63,464,629	Paper and allied products	17,095,136
		Machinery	8,150,154

Table III.—*Principal Mineral Products of New Hampshire, 1939 and 1938*

Mineral	Value, 1939	Value, 1938	Mineral	Value, 1939	Value, 1938
Clay products	$321,751	$278,206	Sand and gravel	$219,296	$243,040
Feldspar	161,968	135,760	Stone	437,342	444,537
Mica	5,330	(unavailable)			

Mineral Production.—The total value of minerals produced in 1939 was $1,187,339. In 1940, under the direction of the State Planning and Development commission, a mineral resources survey was made, the results of which were published by the commission. Mica production declined during the decade 1931–41, because of low prices and foreign competition.

(W. E. Ss.)

New Hebrides: *see* PACIFIC ISLANDS, BRITISH; FRENCH COLONIAL EMPIRE.

New Jersey. One of the original states of the United States; known as the "Garden state." Area, 7,836 sq.mi.; pop. (1940) 4,160,165; capital, Trenton (124,697). Other cities include Newark (429,760); Jersey City (301,173); Paterson (139,656); Camden (117,536) and Elizabeth (109,912).

History.—While only legislative and local offices were filled in 1941, New Jersey's "off year" was not without notable political developments. Conspicuous was the break between Governor Charles Edison, formerly secretary of the navy in President Roosevelt's cabinet, and Mayor Frank Hague of Jersey City, the Democratic state leader and vice-chairman of the Democratic National committee. Mayor Hague had supported Edison in the 1940 election. The governor had been in office less than a month when he asserted his independence of the Hague organization. He made appointments and decided on policies without consulting the party leader.

The evident coolness culminated in a break in midsummer when Governor Edison appeared before the Republican legislature in joint session and urged the adoption of the railroad tax bills. This legislation provided for a new method of assessing and taxing railroad property. It had been bitterly opposed by Mayor Hague in a series of newspaper advertisements, and was the climax of a ten-year court fight by the roads to change taxing methods theretofore in vogue. Mayor Hague contended the legislation favoured the railroads unduly, and that Jersey City would be deprived of millions of dollars in revenue.

Governor Edison acted upon the recommendations of a fact-finding committee which he appointed to resolve the long-standing controversy. The governor contended the proposed system was equitable and that in prosperous years the state would reap larger returns than ever. The new laws did not end the litigation. Attorney General David T. Wilentz, supporting Mayor Hague, attacked the constitutionality of the laws in the court of chancery. The state treasurer, William Albright, was authorized by the legislature to engage outside counsel to defend its action. Meantime, Mayor Hague announced his intention to turn the party leadership over to Governor Edison.

Prior to this development, Governor Edison had come out for a constitutional convention to overhaul New Jersey's charter adopted in 1844. Reorganization of the state courts was also proposed by the governor, who advocated two-year instead of one-year terms for assemblymen; four-year instead of three-year terms for senators, and a four-year term instead of a three-year term for the governor. He also urged extension of executive authority, with respect to appointments and vetoes.

Insisting that he was not seeking personal aggrandizement, Governor Edison stipulated that the constitutional changes not become effective until his administration had terminated. The Republican legislature refused to accede. Thereafter Edison began a campaign to elect a Democratic assembly and to gain senate seats. He appeared in almost every county. The Hague organization remained aloof from the state fight, concentrating on the pro-

duction of a huge "protest vote" in Hudson county against the railroad laws. The Hague candidates were elected overwhelmingly, and the Republicans retained control of the legislature by increased majorities in both houses. The 1942 house stood Republican by 43 to 17, the senate, Republican by 17 to 4.

Apart from the accord on the railroad issue, the year was one of conflict between the governor and the legislature. The dispute had its origin in the refusal of the senate to confirm some of Edison's key appointees, including William L. Dill as state highway commissioner and General Richard Williams, a retired marine, as superintendent of state police. E. Donald Sterner, a Republican, continued in the former office. General Williams was subsequently named as Edison's secretary for defense, a position for which senate confirmation was not necessary. Major Charles Schoeffel, a state police veteran, later was named superintendent.

On Dec. 22 the legislature revived a law enacted in 1918. It gave the governor wide powers to call upon the resources and personnel of the state in a war emergency. Under it the governor formed a war cabinet to expedite civilian defense measures and to extend the work of the State defense council. As another defense measure, a state guard consisting of approximately 2,000 was equipped to replace the national guard.

Education.—There were 785,195 pupils enrolled in the elementary and secondary schools of New Jersey in 1939–40; teachers, numbering 28,640, were paid an average salary of $2,100. In 1938, pupils enrolled in private and parochial schools, except kindergartens, numbered 127,266. The 30 institutions of higher education in the state had a total enrolment of 19,706. State expenditures for elementary and secondary schools in 1939–40 were $111,736,671.

Public Welfare, Charities, Correction.—In June 1940 there were 48,138 persons receiving relief in New Jersey, as compared with 61,900 in June 1939. Federal grants to New Jersey for public assistance in 1939–40 totalled $8,229,896, divided as follows: old age, $3,832,457; dependent children, $1,547,192; blind, $99,311; unemployment compensation and state employment services, $2,723,936. There were 3,457 prisoners in state and federal prisons and reformatories in New Jersey in 1938.

Communication.—On Jan. 1, 1939 there were 1,235 mi. of primary-system rural state highways in New Jersey—all surfaced—and 1,593 mi. of rural roads and urban extensions. Disbursements on state highways, including federal-aid funds, were $48,330,000 in 1939. There were 2,132 mi. of steam railways in the state in 1938. In 1937 there were 698,782 telephones.

Finance.—The net value of real and personal property, subject to taxation in 1940 was $5,489,669,439, a decrease from 1939 of $129,134,237. These ratables were made up as follows: real estate, exclusive of second-class railroad property, $4,652,595,551; second-class railroad property, $177,594,315; personal property, exclusive of bank stock, $727,316,142. The average tax rate for 1940 was $4.718 per $100 of valuation. Real estate and personal property specifically exempted from taxation in 1940 amounted to $1,103,937,844, comprising mainly schools, churches, cemeteries, public and charitable properties.

Agriculture.—Farm income for 1940 was $105,870,000, an increase of $5,278,000 over 1939. The number of farms totalled 25,835, with a land area of 4,814,070 acres. New Jersey farms were valued at $227,805,686, according to the United States census bureau. Total farm population in New Jersey in 1940 was 146,459.

Table I.—*Leading Agricultural Products of New Jersey, 1941 and 1940*

Crop	1941	1940
Wheat, bu.	1,232,000	1,316,000
Corn, bu.	7,869,000	7,371,000
Oats, bu.	1,485,000	1,419,000
Barley, bu.	196,000	196,000
Potatoes, bu.	9,790,000	10,150,000
Apples, bu.	3,150,000	3,926,000
Tame hay, tons	340,000	367,000

Manufacturing.—New Jersey was among the leading states in the production of war matériel in 1941. As of Nov. 1941, armament contracts of all descriptions aggregated $1,937,305,000. The per capita defense expenditure amounted to $465.67, largest in the U.S.A. Employment in manufacturing plants increased in 1941 by 27.8%; weekly pay rolls rose 46.3%. Average weekly earnings for full-time and part-time employees rose from $28.86 in 1940 to $35.72 in 1941. Average hourly earnings were 83.6 cents, and average hours worked a week totalled 42.9.

Mineral Production.—The total value of minerals produced in New Jersey in 1939 was $30,271,293, as compared with $24,408,545 in 1938.

Table II.—*Principal Mineral Products of New Jersey, 1939 and 1938*

Mineral	Value, 1939	Value, 1938
Zinc	$11,507,318	$10,891,683
Clay	6,726,041	5,210,105
Sand and gravel	3,301,055	2,519,575
Stone	3,036,516	2,678,766

(W. R. Ck.)

Newlon, Jesse Homer (1882–1941), U.S. educator, was born July 16 in Salem, Ind. He received his LL.D. degree from the University of Denver (Colo.) in 1922. While superintendent of the Denver public schools, 1920–27, Newlon instituted curriculum changes which became the basis for educational revisions throughout the United States. He preached academic freedom, stressed the need for changing social ideas in education and advocated the participation of educators in government. He was president of the National Education association, 1924–25, and in 1925 was awarded the Butler medal from Columbia university. He was director of the Lincoln Experimental School of Teachers college at Columbia university, 1927–37, and in 1938 became director of the college's division of the foundations of education. He was the author of *Education Administration as Social Policy* (1934) and *Education for Democracy in Our Time* (1939). He died at New Hope, Pa., Sept. 1.

New Mexico. Fourth largest state in the southwestern United States, popularly known as the "Sunshine state"; admitted to the union in 1912. Total area, 121,666 sq.mi.; pop. (1940) 531,818 (25.6% increase since 1930), divided among rural, 355,417; urban, 176,401 (33.2%); native white, 477,065; Negro, 4,672; foreign born, 15,247. Capital, Santa Fe (20,325). Other cities include Albuquerque (35,449); Roswell (13,482); Hobbs (10,619); Clovis (10,065).

History.—The administration, legislature and congressional representation were Democratic in 1941. The chief officers of the state in 1941, elected for two years, were: governor, John E. Miles; lieutenant governor, Ceferino Quintana; secretary of state, (Mrs.) Jessie M. Gonzales; auditor, E. D. Trujillo; treasurer, Rex French; attorney general, Edward P. Chase; superintendent of public instruction (Mrs.) Grace J. Corrigan; commissioner of public lands, H. R. Rodgers. U.S. senators were Carl A. Hatch and Dennis Chavez.

Legislation of 1941 provided for airport zoning regulation, prohibition of liquor sales near army posts, permissive municipal slum clearance, the teaching of Spanish in the 5th to 8th grades under certain conditions, a public service commission, a board of examiners in the basic sciences for practising the healing art and a state guard. The State Merit System commission and Legislative Reference bureau were abolished. A special appropriation of $750,000 was made for national defense to be expended by the state finance board.

Education.—For the school year 1939–1940, 907 rural schools, with 62,669 pupils and 1,900 teachers, cost $4,447,061.60; 236 municipal schools, with 69,920 pupils and 1,898 teachers, cost $5,995,034.59. The University of New Mexico had a faculty of 118, a student enrolment of 1,505; New Mexico Highlands (formerly Normal) university, 37 and 338; State Teacher's college, 51 and 199; Eastern New Mexico college, 36 and 458.

Public Welfare, Charities, Correction.—For the fiscal year ending June 30, 1941, the WPA spent $11,044,573.76 for labour and material, and NYA spent $354,520.82. During the calendar year 1941, $778,750 was paid out for unemployment benefits; in old-age assistance, approximately 4,870 beneficiaries received about $17.02 per month, total $989,437.23; approximately 5,872 dependent children received about $9.16 per month, total $652,372.98; approximately 225 needy blind received about $18.62, total $50,110.17; and $147,157.25 was expended for general assistance.

The penitentiary appropriation was $130,480 for 667 inmates (Sept. 1, 1941), including 76 on the prison farm; Insane Asylum, $227,280, 913 inmates; School for Mental Defectives, $47,480, average daily population 79.58 (1940); Industrial school, $39,000, 119 inmates (Nov. 1941); Girls' Welfare home, $62,000, 100 inmates (Nov. 1941).

Communication.—New Mexico had an estimated 61,500 mi. of roads in 1941; 9,276 mi. constituted the state highway system. For the fiscal year ending June 30, 1941, the state highway department expended $8,702,367.45. Steam railway companies operated 2,812 mi. of main track (1940). There were 45 airports, and approximately 1,302 mi. of airways operated by three scheduled air carriers in 1941. There were about 41,000 telephones.

Banking and Finance.—On June 30, 1941, there were 22 national banks with deposits of $51,583,000; loans, $20,916,000; investments, $16,470,000; and 19 state banks with deposits of $14,767,000; loans, $6,542,000; investments, $3,250,000. Total resources of 12 building and loan associations in 1940 were $4,166,208.38 and of 7 federal savings and loan associations, $2,448,889.90. Total of all state receipts for the fiscal year end-

ing June 30, 1941, were $28,923,630.91; expenditures, $30,018,531.93. The gross and net debt were respectively $24,331,500 and $24,009,569.79.

Agriculture.—The total value of agricultural production in 1941 was estimated at $38,626,000; acreage harvested, 1,548,300. Unusual rainfall caused an estimated loss of $1,299,180, principally in the Pecos valley.

Table I.—*Leading Agricultural Products of New Mexico, 1941 and 1940*

Crop	1941	1940
Grain sorghums, bu.	8,348,000	3,150,000
Wheat, bu.	2,735,000	1,720,000
Corn, bu.	3,315,000	2,376,000
Beans, bags	1,078,000	656,000
Cotton, bales	115,000	123,000

Manufacturing.—Manufactured products were valued at $25,123,641 in 1939; an average of 3,250 employees received $2,912,993 in wages.

Table II.—*Principal Industries of New Mexico, 1939 and 1937*

Industry	Value of products	
	1939	1937
Petroleum refining	$3,538,753	$3,431,417
Lumber and timber	2,757,424	4,945,151
Bakery products	1,756,121	1,666,226
Newspapers	1,456,759	1,211,859
Nonalcoholic beverages	1,208,823	870,213
Cottonseed oil, etc.	1,164,676	1,436,751

Mineral Production.—As in preceding years, copper was New Mexico's chief mineral in 1941. The total value of minerals produced in 1939 was $69,921,765.

Table III.—*Principal Mineral Products of New Mexico, 1941 and 1940*

Mineral	Value, 1941 (preliminary)	Value, 1940
Copper	$16,745,508	$15,785,648
Zinc	5,752,516	3,819,438
Silver	996,619	1,001,130
Gold	996,415	1,258,005
Lead	511,280	382,200

(F. D. R.)

New South Wales. A state of the Australian commonwealth, lying in the southeast and occupying 309,432 sq.mi.; pop. (est. Dec. 31, 1940) 2,789,000. Chief cities (pop. est. Dec. 31, 1939): Sydney, capital (1,302,890); Newcastle (117,050). The state governor is Capt. the Rt. Hon. Lord Wakehurst.

History.—The elections for the state legislature were held in May and resulted in a crushing defeat of the United Australia party-Country party government which had held office since 1932. There was little difference between the programs of the defeated Premier Mair and the leader of the official labour party, McKell. Each side pledged itself to support the federal government in the prosecution of the war and each outlined plans for extensive public works and improved social services. A feature of the election was the failure of the left wing N.S.W. labour group to win a seat. The final figures gave McKell's party 54 seats; U.A.P. 15; C.P. 12 and Independents 9. Before the election, parliament had passed the National Emergency bill which gave the government wide powers to protect civilians in time of emergency by means of forced evacuation, compulsory billeting, blackouts, etc. A bill had also been passed in March reducing the unemployment and social services tax by 6*d.* a week on incomes of less than £6 a week and by 10% on incomes above £6. This concession operated from April 1 and was estimated to cost £1,000,000 a year.

Important among the many wartime developments within the state was the recommendation of the transport emergency committee that a bridge should be constructed across the Hawkesbury river at a cost of £1,300,000 and that the Cootamundra-Junee section of the southern railway line should be duplicated at a cost of £1,100,000. In case of interruption of coastal shipping these projects would enable essential transport services to be maintained. The war cabinet approved the proposals and by October the state government was able to report that work was proceeding satisfactorily.

Education.—In 1939: public schools, 3,285; teachers, 13,047; scholars on roll, 363,134; average attendance, 294,628; expenditure by state £A4,960,000.

Finance.—In 1940–41: revenue £A60,750,000; expenditure, £A61,610,000; debt outstanding (June 30, 1941), £A368,975,000.

Communications.—Roads (March 30, 1937), 46,108 mi. fit for motor traffic. Railways, government (March 1941), 6,141 mi. Tramways (June 1940), 172 mi. Motor vehicles licensed (March 31, 1941): cars, 206,876; commercial vehicles, 84,724; cycles, 21,148; buses, 878; taxicabs, 1,358. Wireless receiving set licences (June 1941), 1,293,266. Telephones (June 1940): exchanges, 2,016; instruments connected, 268,216.

Agriculture, Manufacturing and Mineral Production.—Production in 1940–41: wheat, 24,441,000 bu.; butter, 112,000,000 lb.; grease wool, 550,000,000 lb.; maize, 2,833,000 bu.; coal (1939), 11,196,000 tons; gold (1939), 87,189 fine oz. Industry and labour: average number of employees in factories (March 1941), 262,000; employment (June 1941), 95.5%.

(W. D. Ma.)

Newspapers and Magazines. War news was the "lead story" in nearly every newspaper almost every day in 1941. But, although interest in the engrossing war story, combined with the stimulation of radio news bulletins, greatly increased popular buying and reading of newspapers, the war story brought American newspapers more serious financial problems, rather than the greater prosperity that might be expected to accompany increased sales.

An increase of about 2% in circulation over the all-time record of 46,579,892 newspapers sold each day in 1940 was indicated by a preliminary cross-section survey of about two-thirds of the daily newspapers made by *Editor and Publisher* during Dec. 1941. While morning newspapers increased their sales about 2.79% and evening newspapers about 1.26%, Sunday newspaper sales went up 4.29%. On the other side of the ledger, in addition to the increased expense of gathering news from distant parts of the world by cable and radio, publishers faced rising costs of materials, increasing wages, shorter work week, added complex taxes and confusing priorities on metals, rubber and machinery that more than offset any gains in sales. With advertising, both local and national, continuing to decline, newspaper owners faced 1942 with even greater misgivings than during any year since 1918. The one bright spot in the financial picture was that, in spite of the scarcity of other types of paper, no shortage of newsprint paper had appeared by the end of the year, and the current price of $50 a ton seemed assured until April 1942. Early in the year a definite trend toward five-day newspapers was reported among smaller dailies to meet the increased costs imposed by wage-hour regulations.

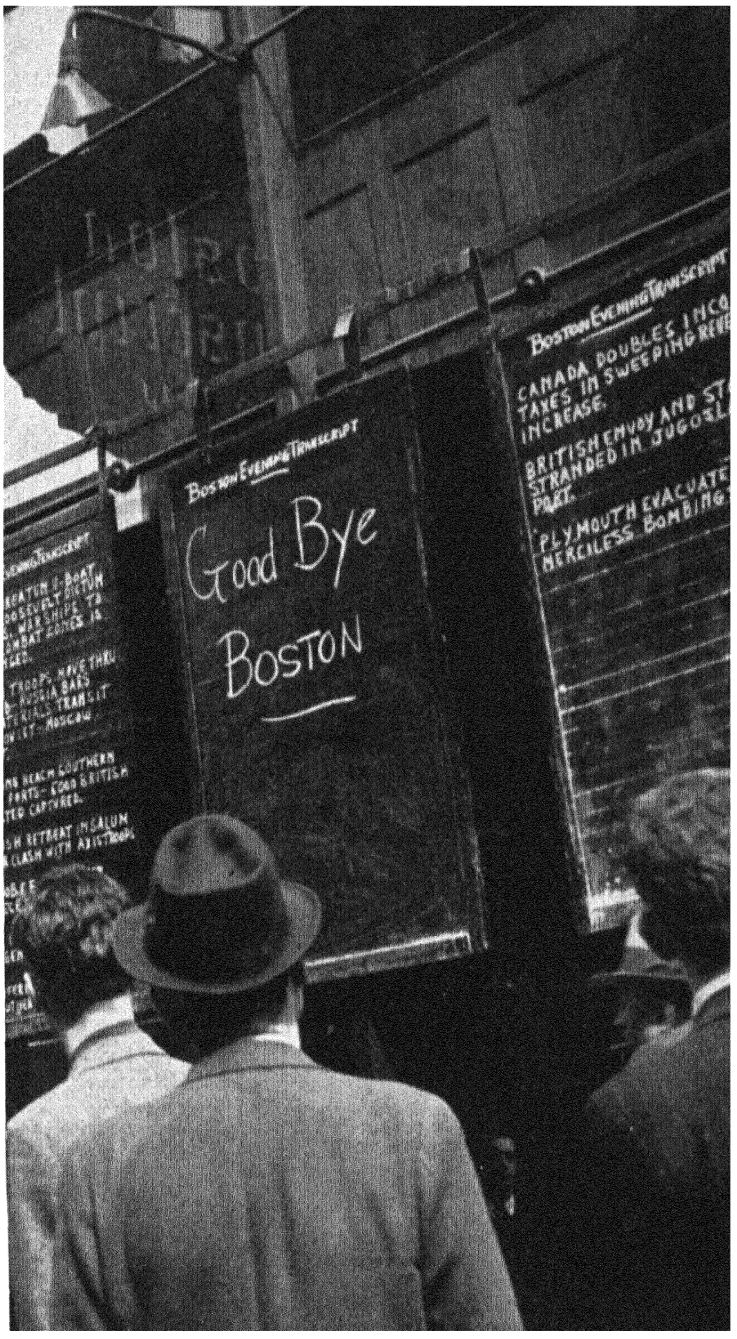
By August, the selective service draft had taken 1,613 news and advertising men, and the number of staff losses to war service increased sharply as the year continued. Before the nation declared war, more than 1,000 dailies had enrolled in a plan, originated by the *Philadelphia Bulletin*, to use some 500,000 newsboys as salesmen of defense stamps. Earlier disagreement with the foreign policy of President Roosevelt ended with the declaration of war, and there were no exceptions to the united newspaper support of the war effort; even the *Chicago Tribune*, prominent in the America First group, reversed the policy on Dec. 8. Much discussion of censorship, voluntary or otherwise, was heard early in the year, especially in connection with British warships in American ports for repairs, and the declaration of war brought the wartime regulation of news that was expected. On Dec. 16, Byron Price, executive news editor of the Associated Press, was appointed director of censorship, and complete war power of censorship over all communications was enacted by congress the next day. In spite of the tenseness of public opinion during the impending war emergency and the many possible occasions for disagreement between the press and governmental authorities, the year was notable for the almost complete absence of the criticism of the press by governmental officials and public

leaders that had been much in the air for nearly a decade. Part of this was undoubtedly due to the great attention directed by newspaper men, singly and in groups, to the problem of giving the public a more truthful picture of foreign events, with adequate background and interpretation, less coloured by rumour and propaganda, than was the case in 1914–18. Meanwhile, one of the most active foreign propaganda services in the United States had been eliminated in March by the arrest and deportation of Dr. Manfred Zapp and Guenther Tonn, of the nazi Transocean News service agency operating in New York. In retaliation, the nazis arrested and deported Richard G. Hottelet, of the United Press, and Jay Allen, of the North American Newspaper alliance.

Ten Biggest Stories of 1941.—The extent to which war news overshadowed all other kinds of news was evidenced in the lists of "Ten Biggest Stories of 1941" compiled by the Associated Press, the United Press and the International News service. All three agreed on no. 1 on the list, and two agreed on the first three. Only two nonwar items appeared in the three lists. The United Press list was: (1) the attack on Pearl Harbor and America's entrance in the war; (2) destruction of the legend that the Germans are invincible on land, as shown by the Russian successes after the nazi drive to the gates of Moscow; (3) the "all aid short of war" program of the United States, including the lend-lease bill, repeal of the neutrality act and defense production, with attendant strikes and labour trouble; (4) Rudolf Hess's flight to Scotland; (5) the meeting at sea between President Roosevelt and Prime Minister Churchill to draft the Atlantic charter; (6) U.S. occupation of Iceland and the loss of U.S. warships that were attempting to keep the sea lanes open to that outpost; (7) the battle of Libya; (8) the battle of Crete, involving the first use of air-borne troops and climaxing the nazi invasion of the Balkans; (9) the "V" for victory campaign and the rising tide of unrest in occupied Europe; and (10) the Hood-Bismarck battle. To this list, the Associated Press added: (7) six dreadnaughts sunk; (9) army acts in defense strikes; and (10) Brooklyn wins a pennant. I.N.S. added: (10) strike of captive coal miners, holding up national defense production.

Strikes.—Partly because of the war situation, fewer strike tieups in newspapers occurred than in recent years. Most unusual was the "strike," or trade boycott, in October of seven major New York city newspapers by the Newsdealers Federal Labor union, local 22,371, which numbered less than 1,000 of the 14,000 newsdealers in the city. Guild strikes suspended for a time the *Chester* (Pa.) *Times*, the *Birmingham* (Ala.) *Post*, the *Aliquippa* (Pa.) *Gazette*, and threatened the New York Jewish language newspaper, *The Day*. Printers' strikes suspended three newspapers in Champaign-Urbana, Ill. The American Newspaper Guild in October held an election coloured with charges of communism against the old administration of Donal M. Sullivan, president, Milton Kaufman, vice-president, and Victor Pasche, secretary-treasurer, and elected a new group headed by Milton M. Murray, of Detroit, Mich., and Sam Eubanks, of Oakland, Calif.

Miscellaneous.—A new victory for freedom of the press was seen in the decision of the supreme court of the United States on Dec. 8, reversing the decision in 1940 of the supreme court of California on the contempt of court charges against the *Los Angeles Times*. This followed a similar decision on June 10 in which the Missouri supreme court reversed a lower court and freed the *St. Louis Post-Dispatch* of like charges of contempt of court resulting from cartoons and editorials concerning a local criminal case. Much interest centred in the hearings of the federal communications commission on the problem of "newspaper-owned or controlled radio stations," during which it was announced that newspapers controlled 249 of the 838 broadcasting stations in the United States. Meanwhile, the *New York Times* started the broadcasting of news bulletins over WMCA in November. The second annual National Newspaper week, Oct. 1–8, fostered by the Newspaper association managers, was an important event, in which hundreds of dailies and weeklies participated and during which millions of readers inspected their newspaper plants. The American Newspaper Publishers association started a precedent by offering a prize of $1,000 for an essay on newspaper public service by a school of journalism student; as a preliminary, a prize of $500 was awarded to Phil Davis, cartoonist, for a medal design. Among the noteworthy anniversaries celebrated during 1941 were: the 90th birthday of the *New York Times* on Sept. 18; the 100th birthday of the *New York Herald-Tribune* on April 10, dated from Horace Greeley's founding of the *Tribune;* the 41st anniversary of the present Associated Press on Sept. 30. Plans were made for a $100,000 fund to restore St. Paul's Protestant Episcopal church, Eastchester, Mount Vernon, N.Y., as a national shrine to commemorate the Bill of Rights and the famous John Peter Zenger libel case which



THE BOSTON *EVENING TRANSCRIPT* wrote farewell on its news bulletin boards April 30, 1941, when it suspended publication after 111 years

resulted from an election in front of the church in 1733. The Associated Press in January announced the organization of a subsidiary Press Association, Inc., to handle radio news to non-members, various foreign services and other by-products, and placed the activity in charge of William J. McCambridge and Oliver Gramling of the A.P. organization. On Aug. 1 the A.P. purchased Wide World Photos, picture service of the *New York Times*. Great gains were made in wire transmission of photographs, and in July the first radiophotos were received from the U.S.S.R. Invention of a "blackout camera" utilizing infra-red light was announced by George Luxton, chief photographer of the *Minneapolis Star-Journal* in March.

The most notable newcomer in the newspaper world was the *Chicago Sun*, founded by Marshall Field, with Silliman Evans as publisher, printed in the plant of the *Chicago Daily News*, which appeared in the streets on Dec. 4 as a two-cent contestant of the morning monoply held by the *Chicago Tribune*. On April 30 the 111-year-old *Boston Transcript* ended publication; on Nov. 25 the 151-year-old *Bridgeport Times-Star* suspended; the *Philadelphia Evening Public Ledger*, published by Robert Cresswell, closed a day or two after the end of the year; the *Kansas City Journal* was sold on Oct. 22 by the Henry L. Doherty estate to Harry Newman. Harry Chandler retired as president of the *Los Angeles Times* on Feb. 25 and was succeeded by his eldest son, Norman; Edwin S. Friendly, general manager of the *New York Sun*, retired on April 25 from nine years' service as chairman of the bureau of advertising of the American Newspaper Publishers' association, and was succeeded by Frank E. Tripp of the Gannett newspapers; James G. Stahlman, publisher of the *Nashville Banner*, reporting as lieutenant commander under Secretary of Navy Frank Knox, publisher of the *Chicago Daily News*, was just one of the prominent newspaper men who went into military service.

Magazines.—Because of the continued decline in national advertising, 1941 was a quiet year in the magazine world. The picture magazine *Life*, selling over 3,200,000 copies, and the news magazine *Time*, approaching 850,000, both published by the same owners, continued to forge ahead in circulation. Other picture magazines, with the exception of *Look*, showed something of a decline in popularity. Among the weekly magazines, the *Saturday Evening Post*, selling 3,300,000 copies, *Collier's Weekly* selling 2,900,000, and *Liberty*, selling 2,300,000, more than held their own but exhibited more noticeably the new development of weekly war news articles transmitted by cable or radio from their travelling correspondents abroad, including W. B. Courtney and Quentin Reynolds for *Collier's* and Charles Codman and Leigh White for the *Post*. Among the monthlies, *American Magazine*, selling 2,200,000 and *Cosmopolitan*, exceeding 1,800,000, held their leadership, while the *Reader's Digest* and the *National Geographic Magazine* continued to be staples in popularity. Among trade journals, business papers and small specialized periodicals, the year proved to be a more profitable one, especially for those publications related to trade associations. Because of difficult business conditions, few new publications were launched; however, there were several notable new ones: publication of the *American Boy*, combined with the *Youth's Companion*, both of which had been discontinued, was revived in September by James A. Humberstone of Detroit, Mich.; in July Marshall Field, owner of New York's *PM*, launched a new week-end newspaper magazine supplement, entitled *Parade*, which by fall had been purchased by 13 large newspapers and attained 1,500,000 circulation. Two former *PM* writers, Richard O. Boyer and Marion Bachrach, started in Chicago in November a new national weekly review called *U.S. Week;* McGraw-Hill Publishing company of New York in September launched a picture and news magazine in Spanish and Portuguese, *En Guardia*, for distribution in Latin and South America; *Time* magazine published several aeroplane editions, printed in Spanish on thin paper, for aero distribution in South America. Throughout 1941, closer attention to significant news events was the greatest feature in the magazine world. (G. M. Hy.)

Great Britain.—The newspaper and periodical industry of Great Britain, with its prewar income of £53,000,000 and some 80,000 direct employees on the newspaper side alone, is one of the largest in the country. Loss and dislocation of business, most serious as it certainly was, was only one of its troubles in 1941; and this was met by organization and mutual self-help, as when papers at Coventry, Plymouth and Southampton were, after their various "blitzes," printed by rival houses in Birmingham, Exeter and Bournemouth respectively, while in London the great nationals appeared next morning in spite of destruction of plant and material and the failure of every sort of power. Other difficulties faced included rising costs, serious paper shortage and the somewhat harassing conditions imposed from time to time by a ministry of information which seemed often to underestimate the value of journalistic experience and technique in the realm of propaganda—though among journalists themselves it was generally agreed that the service departments and not the ministry were usually responsible for the unnecessarily cautious and irritating decisions forbidding publication of innocuous news.

On the whole, official action in respect to the industry was slight; it was specially excluded from the board of trade's concentration of industry scheme, and only once—in the case of the *Daily Worker*, export of which had been prohibited in May 1940—did the home secretary exercise his power of suppression. This was in January, when he ruled that its stock contents were calculated to foment opposition to the successful prosecution of the war, and the ban extended to its mimeographed offshoot, the *Week;* in spite of numerous attempts in and out of parliament to effect its cancellation after Great Britain's alliance with the U.S.S.R. it remained in force in 1941.

The press's most complicated problem, the provision of raw material, was, within the limits imposed by its scarcity, successfully met by the Newsprint Supply company, an organization representing the whole press of Great Britain formed early in 1940 to pool all available supplies for the benefit of all national, provincial and Scottish papers. Its activities, coupled with the regulation of price instituted by the government paper controller, prevented undue hardship and kept prices steady; but the reduction in size of all publications, and the narrowing of columns in many, adversely affected advertisement revenue returns and led to an all-round increase of rates and higher charges in the case of many papers and most magazines. The drop in national advertising was to some extent met by that on government account, as is shown by the fact that during the year June 1940–May 1941 the expense incurred under this head by the home office and ministry of labour alone amounted to nearly £120,000. The following figures giving the profits of a number of concerns as shown in the 1941 balance sheets compared with those (in brackets) for 1940 testify to the general prosperity of the industry: Allied, £937,689 (£870,222); Associated, £469,542 (£401,018); Daily Mirror, £188,545 (£300,509); Illustrated London News and Sketch, £16,336 (£24,369); Illustrated Newspapers, £16,021 (£86,492); Sunday Pictorial Newspapers, £208,709 (£203,643); the Amalgamated Press profit at £593,555 showed an increase of approximately £90,000.

The acute shortage of paper had small effect on the total number of papers published, but whereas in Sept. 1939 the newspapers' weekly consumption of newsprint was 11,100 tons, by the early months of 1941 it had been reduced to 3,200 tons. The percentage reduction becomes more marked if the periodical publications are taken into account, for by suppression or suspension and amalgamation they were able to effect additional economies; all made drastic cuts in the number of pages and many adopted the popular "pocket-size" format. The prohibition of the "on sale or return" system was rescinded in February, but the ban on new issues remained, and was lifted only in favour of organizations of a national character mostly from enemy-occupied countries, a few service and home guard publications (among which were the fortnightly bulletins issued only to officers of the newly formed army bureau of current affairs), and a sprinkling of trade and professional journals of wartime importance, like

the *Power Farmer*, a 6*d*. monthly published by the Power User's association. The useful pamphlet reprints of collections of war articles by some papers—notably the *Times* and *Sunday Times*—should also be mentioned.

Toward the end of the year the Press association, after consultations with the chancellor of the exchequer and the minister of information, sold half its interest in Reuters Ltd. to the Newspaper Proprietors' association, thereby giving the London press, which had hitherto not been directly represented on the board, a power equal to that of the provincial press—formerly its sole controllers. A trust consisting of eight leading proprietors (four London, four provincial) was set up under a chairman appointed by the lord chief justice, to ensure the independence and integrity of the agency and the reliability and equable dissemination of its news service and to prevent the possibility of Reuters falling into the hands of any group or faction. The trust is irrevocable for 21 years, and can thereafter be amended or dissolved only with the consent of the lord chief justice. (*See* ADVERTISING; PRINTING.) (L. H. D.)

New York.

One of the original 13 states of the union, popularly known as the "Empire state," New York covers an area of 49,576 sq.mi., of which 1,647 sq.mi. are water. With a population of 13,479,142 (federal census, 1940) it retained its place as the most populous of the states. It had in that year a white foreign-born pop. of 2,853,530, which included 316,800 born in Germany and 584,075 born in Italy. The capital is Albany, with a pop. of 130,577. Among the other cities are New York, with a population of 7,454,995, or about twice as many as any other city in the U.S.; Buffalo (575,901); Rochester (324,975); Syracuse (205,967); Yonkers (142,598); Utica (100,518); Binghamton (78,309); Troy (70,304).

History.—During 1941 the legislature created a division of commerce as an executive department to take over the work of the state planning council and the publicity bureau. It is headed by a commissioner of commerce, appointed by the governor and confirmed by the senate, who is directed to promote the development of business and to compile periodically a census of business and industry within the state and to make recommendations for the removal of any burdens imposed on business by law or otherwise. In order to discourage the circulation of scurrilous campaign documents, a law was passed forbidding the circulation of any political circulars unless they bear the name and address of the printer or of the person or organization responsible for them. The emergency income tax of 1% was not renewed, thus saving the taxpayers $21,000,000 a year. An appropriation of $247,000 was voted to the committee investigating the cost of the public schools and the extent of subversive activities in them. The appointment of boards to inquire into labour disputes was authorized, and the mortgage moratorium was continued for another year. Persons voluntarily leaving their jobs were barred from unemployment insurance benefits; the creation of a state defense council was authorized; an appropriation of $600,000 for vocational education was voted; and several bills intended to bar communists and other radicals from subversive activities were killed.

Four constitutional amendments were submitted to the voters in the November election. One lengthened the term of state senators from two to four years. Previous amendments had lengthened the term of the governor to four years and the term of the members of the assembly to two years without changing the term of the senators which had always been twice as long as that of the members of the assembly. The amendment was defeated. The voters, however, approved an amendment permitting the use for highway and parkway improvement of the proceeds of an issue of $60,000,000 in bonds originally authorized for the elimination of grade crossings over railroads. They also approved a proposal for building 20 mi. of ski trails on Whiteface mountain in the Adirondack forest reserve and another amendment validating future amendments even though certain technical regulations had been disregarded.

Education.—There were in the state, in 1941, 9,488 public schools with a total registration of 2,174,955 pupils instructed by 80,553 teachers. The elementary schools numbered 8,615 with 1,469,913 pupils, and there were 973 high schools with 705,042 pupils. The state supported eleven normal schools and teachers' colleges with 10,349 students and 578 teachers. There were also 86 colleges and universities. The public schools are under the supervision of the board of regents of the University of the State of New York, the head of which is the superintendent of public instruction.

Public Welfare, Charities, Correction.—An average of 400,866 persons a month received public assistance of some kind during the fiscal year 1940–41 at a cost of $162,423,945 for the year. Included in this number were 120,598 receiving $37,819,405 for old-age relief; 34,553 dependent children for whose support $19,150,904 was paid; and 2,864 blind persons receiving $904,068. There were 14 institutions under the supervision of the department of correction with a population of 18,093. On June 30, 1941 there were 2,526 inmates in Sing Sing prison, 1,673 in Auburn prison and 1,534 in the Great Meadow prison. The cost of maintaining these institutions for the year was $10,004,823.12 or $553.10 per capita. The average number of WPA workers each month during 1941 was 131,041, or 14.9% fewer than in 1940, and their earnings were $108,803,000, a reduction of 14.1%.

Communication.—There were in the state 71,034 mi. of town and county roads and 14,043 mi. of state highways, a total of 85,077 mi. Of the town and county roads 45,144 mi. were improved, and 12,751 mi. of the state roads were also improved. The appropriations for the state highways for the fiscal year 1940–41 were $33,604,674, of which $8,299,635 was received from the federal government. The counties spent $15,513,390.64 and the towns $17,561,553.37. On Jan. 1, 1941, there were 2,926,900 telephones in use. On the same date there were 7,731.49 mi. of main-line railroads in operation.

Banking and Finance.—On June 30, 1941, there were in the state 1,273 financial institutions incorporated under the banking laws or under the supervision of the banking department. Included in this number were 162 state banks, 160 trust companies, 15 industrial banks, 7 private banks and 134 mutual savings banks. The total deposits in all these institutions were $19,101,128,106. The total capital was $670,759,510, and the total resources were $22,798,589,807. Included in the institutions reporting to the banking department were 198 savings and loan associations with resources of $266,590,527, of which $236,240,731 was due to shareholders. In addition to the banks under state control there were, on Nov. 5, 1941, 425 national banks with capital of $275,500,000, deposits of $8,476,568,000 and assets of $9,394,871,000. The total receipts of the state government for the fiscal year ending June 30, 1941, were $428,108,405.28 and the expenditures were $391,047,794.31, leaving an operating surplus of $37,060,610.97. After wiping out accumulated deficits there was a net surplus of $7,029,256.67. The state had a gross bonded debt of $676,157,000. The sinking fund contained $146,696,980.48, which leaves a net debt of $529,460,019.42.

Agriculture.—There were in the state 153,238 farms with a total acreage of 17,170,337 (U.S. census, 1940). The value of the products sold on the farms reporting for 1939 was $273,175,053, of which $167,052,240 consisted of livestock and livestock products, $73,885,420 crops and $2,479,536 forest products.

Table I.—*Leading Agricultural Products of New York, 1941 and 1940*

Crop	1941	1940
Corn, bu.	26,169,000	21,452,000
Oats, bu.	24,166,000	29,960,000
Barley, bu.	2,664,000	3,790,000
Tame hay, tons	4,189,000	5,681,000
Tobacco, lb.	2,100,000	1,750,000
Potatoes, bu.	2,766,000	2,845,700
Apples, bu.	16,120,000	12,936,000
Grapes, tons	56,800,000	75,800,000

Manufacturing.—In 1939 there were 34,506 manufacturing establishments, employing 957,844 persons, paying $1,163,785,198 in wages and producing goods valued at $7,134,400,147.

Table II.—*Principal Industries of New York, 1939 and 1937*

Industry	Value of products	
	1939	1937
Boots and shoes	$104,144,500	$125,819,448
Bread and bakery products	204,500,887	243,386,287
All clothing	917,562,506	842,556,856
Steel products	107,884,816	157,800,733
Printing, including all periodicals	426,760,806	576,731,209

Mineral Production.—The total value of the minerals produced in 1939 was $78,383,851.

Table III.—*Principal Mineral Products of New York, 1939 and 1938*

Mineral	Value, 1939	Value, 1938
Cement	$ 9,866,102	$ 7,893,270
Coke	24,526,646	23,520,138
Ferroalloys	18,388,766	7,699,520
Petroleum	10,650,000	9,550,000
Pig iron	45,275,716	25,450,764
Salt	5,855,422	5,467,077
Sand and gravel	7,050,104	6,493,099
Stone	10,111,032	10,527,452

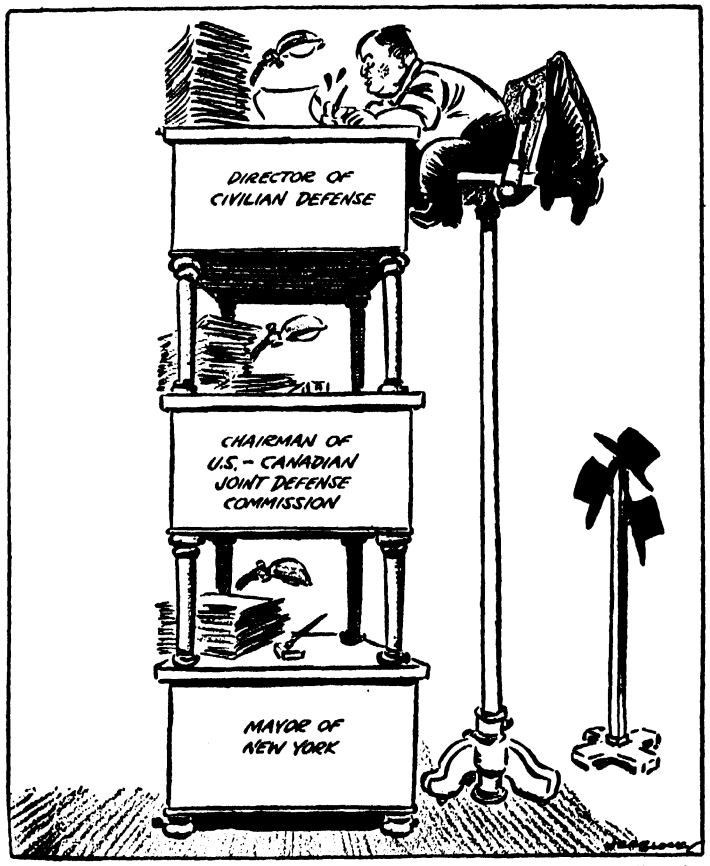
(G. W. Do.)

New York City.

Fiorello H. La Guardia was re-elected mayor of New York city Nov. 4, 1941 for a third term of four years, the only mayor in the history of the city to be chosen for three terms in succession. He was nominated by the American Labor party of which he is a member and endorsed by the Republican, the Fusion and the United City parties. President Roosevelt also urged the voters to support him. As the American Labor party polled a vote twice as large as La Guardia's majority, it claimed credit for his election. The Democratic candidate was William O'Dwyer, district attorney of Brooklyn, who had succeeded in convicting the members of a gang engaged in murder and had in other respects made a good record. The controller and the president of the city council, supported by the parties which backed the mayor, were re-elected, and enough other members of the board of estimate in sympathy with the policies of the mayor were successful in giving him a majority in that important policy-making body. The Democrats elected two of the five borough presidents, the other three being men who would work with the mayor.

A city council was chosen by the proportional representation system with one councilman from each borough for every 75,000 votes polled and another if there was a remainder of 50,000 votes. The rise in population resulted in an increase in the size of the council from 21 to 26 members, with a gain of two from Brooklyn and one each from Manhattan, Queens and the Bronx. The Democrats elected 17 of the councilmen, the Republicans 2, the American Labor party 3, the Fusionists 2 and the Independents and Communists 2 each. As 378,393 blank or invalid ballots were cast, it was evident that the voters found it difficult to understand the system of voting.

More remarkable than the re-election of Mayor La Guardia for a third term was the election of Francis S. Hogan as district attorney of New York county. Hogan, the first assistant under District Attorney Dewey, obtained the evidence on which a Tammany district leader was convicted and sent to prison. Dewey was not a candidate for re-election and public sentiment demanded that his successor should be a man who would continue the work which he had begun. The force of this sentiment was recognized by the leaders of Tammany Hall, and in August they announced their intention to support Hogan. He was endorsed by the parties supporting the mayor's candidacy and was unanimously elected.



"LA GUARDIA AT WORK" as viewed by Herblock of NEA Service after the New York mayor was appointed director of U.S. civilian defense in 1941

A revolutionary change in the organization of the county governments within the city was authorized by the adoption of an amendment to the city charter abolishing the offices of sheriff, register, register of wills and registrar in the five counties and providing that there should be one sheriff and one register for the whole city appointed by the mayor from a civil service eligible list. An estimated saving of $500,000 a year was expected to result from the change.

In October the city council reduced the tax of 2% on goods bought within the city and 3% on goods bought outside for use within the city to a uniform rate of 1%. The abandonment of the elevated railroad lines in Manhattan was extended to Brooklyn by the removal of the elevated structure from Fulton street. Buses were substituted for trolley cars on the street. The City Housing authority demolished 785 old buildings to make way for a $20,000,000 housing development in the neighbourhood of Fort Greene park in Brooklyn with accommodations for 3,535 families. The Brooklyn Public library, begun in 1912, on which work was suspended in 1919, was completed at a cost of $5,000,000. (*See* also MUNICIPAL GOVERNMENT.) (G. W. Do.)

New York University.

This institution at New York, N.Y., although maintaining first place among U.S. institutions in point of student enrolment, with 43,671 men and women, sustained a loss of some 10% in 1941, partly because of the call to military service but more largely because of employment in defense industries. Fifty-nine members of the faculty were relieved of academic duty to join the U.S. armed or civilian forces engaged in defense activity.

Some 2,000 special students received training in short engineering courses, government-sponsored, thus augmenting the supply of defense industry technicians. In all other divisions the program of instruction stressed defense activity in various forms. The Washington Square College of Arts and Science introduced four-year courses combining liberal arts with such vocational specialties as X-ray technology, motion picture technique and actuarial mathematics.

The 100th anniversary of the college of medicine was celebrated in 1941. Plant improvements included an addition to the Sage electrical engineering laboratory at University Heights and provision of a new chancellor's house at 5 Washington square. Gifts received by the university exceeded $664,000. The operating budget for the year was $8,667,353.71. Book collections exceeded 600,000 volumes. The faculty numbered 2,249. The year's award of degrees and certificates totalled 4,750. (H. W. CH.)

New Zealand, Dominion of.

A British dominion, consisting of a group of islands lying in the south Pacific between 34° 25′ and 47° 17′ S., and between 166° 26′ and 178° 36′ E. Area: Dominion proper, 103,415 sq.mi.; other islands, 519 sq.mi.; pop.: Dominion proper (est. March 31, 1940), 1,640,901 (Maoris 90,980); Cook and other Pacific islands (census 1936), 16,350. Chief cities (pop. est. April 1, 1939): Auckland (221,500); Wellington (cap. 157,900); Christchurch (135,400); Dunedin (82,800). Language: English. Religion: Christian (1936 figures, excluding Maoris: Church of England 600,786; Presbyterian 367,855; Roman Catholic 195,261; Methodist 121,012). Ruler: King George VI; governor gen-

eral, Air Marshal Sir Cyril Newall, O.M.

History.—During 1941 New Zealand's military forces were involved in the costly campaigns in Greece and Crete and in consequence the dominion became increasingly conscious of the gravity of the issues at stake. The prime minister, Peter Fraser, visited the New Zealand forces in the middle east on his way to Britain and the United States. While in London he attended sessions of the war cabinet and expressed himself well satisfied with the existing media of imperial co-operation.

New Zealand's first echelon completed its training in Egypt. The second was diverted to England when Italy entered the war, later proceeding to Egypt after taking part in the Dover Command's anti-invasion vigil. The third echelon went direct to Egypt. In the fighting of early 1941 in the western desert New Zealanders took part in patrol operations. They were again in action in this area during the second Libyan campaign which began Nov. 18. In the Greek campaign, New Zealanders, with Australians and British troops, fought one of the greatest rearguard actions in history. Prime Minister Fraser announced that the government was fully consulted and fully accepted its share of responsibility for the decision to send troops to Greece. In Crete the Allied troops were placed under the command of New Zealand's commanding officer, Major General Bernard C. Freyberg. When the German air invasion began, New Zealand troops, including the Maori battalion, fought superbly without air support. After the evacuation, Brigadier L. M. Inglis was sent to London to report on the lessons of the campaign. The award of the Victoria Cross to three members of the Canterbury regiment, 2nd New Zealand expeditionary force, was announced in October.

New Zealanders of the R.A.F. and R.N.Z.A.F. won many decorations for valour. Sergeant J. A. Ward, the dominion's first V.C. of the war, was reported missing in September. The New Zealand navy was given the title "royal."

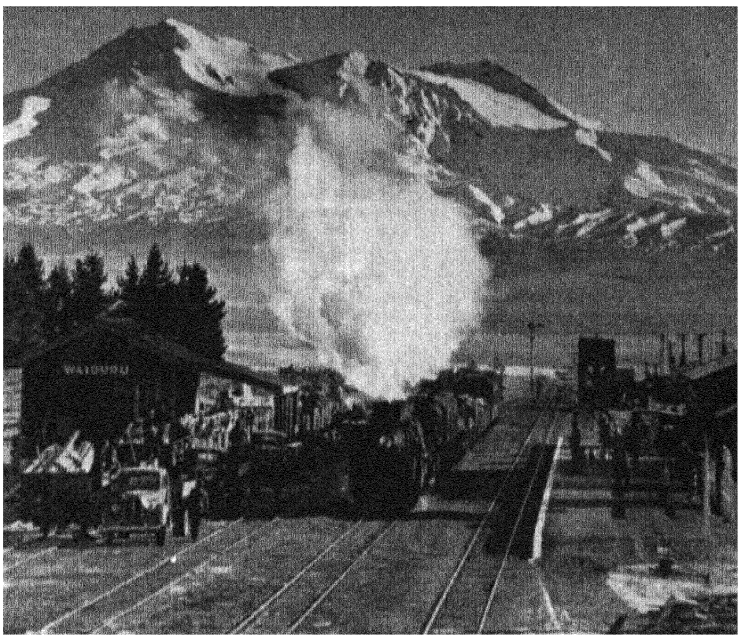
In March the prime minister referred to the desirability of direct diplomatic relations with the United States. F. Langstone, minister of lands and J. G. Coates visited the United States on a war mission. Arrangements for opening a legation at Washington were made. An agreement with Australia provided for a permanent consultative committee, consisting of the two countries' ministers of supply and other ministers as required, to meet at regular intervals in both countries. R. Semple, minister of national service, on his return from Australia, said that so far as allocation of war supplies produced in Australia was concerned, New Zealand would be treated on the same basis as any one state of Australia.

On Dec. 7 New Zealand declared war on Finland, Hungary and Rumania and on Dec. 9 on Japan.

At the end of 1940 a committee appointed by the Economic Stabilization conference made a series of recommendations intended (1) to stabilize prices, wages and cost, so that the burden of war should be evenly distributed; and (2) to increase production and efficiency. Oversea borrowing, it recommended, should be reduced to the minimum. Increased primary production should be fostered by making farm labour conditions more attractive.

In internal politics there was no truce in spite of the war. The "National" party, although represented in the war cabinet by A. Hamilton and J. G. Coates, replaced the former as its leader by S. G. Holland, a move resented by the government (Labour) party. Dr. D. G. McMillan and W. Lee Martin left the Labour cabinet owing to ill-health and were succeeded by A. H. Nordmeyer and J. G. Barclay. In October it was announced that the general election due in November would be postponed for a year.

In his budget statement in July, W. Nash proposed no increase of taxation and said the government's objective was "to maintain the standard of living at the highest level possible after we have



IN THE REMOTE TOWN of Walouru, at the base of Mt. Ruapehu, New Zealanders worked 20 hours a day in 1941 to complete a military training camp

contributed supplies and done all that can be done to help win the present conflict." Reviewing the war expenses account to July 31, Adam Hamilton said that New Zealand seemed determined to conduct the war without domestic sacrifices. He hoped it would be possible to continue social benefits and still not go short so far as war needs were concerned. Total receipts of the account from Sept. 1939 were: from loans £24,612,237 (£8,176,988 borrowed overseas, balance in New Zealand); from taxation £24,517,550, with other receipts amounting to £3,400,000. Total expenditure £47,000,000, but more than £5,000,000 was amortization of debt.

Education.—(Dec. 1939) state elementary schools, 2,230; scholars 245,786; secondary 197; scholars 55,300. University of New Zealand had six constituent colleges, including two agricultural colleges at Lincoln and Palmerston North, grouped together as the New Zealand school of agriculture. Number of students: 5,979.

Finance.—Revenue, consolidated fund, year to March 31, 1941, £40,438,000; expenditure £38,712,000; public debt (March 31, 1940) £322,907,536; note circulation May 26, 1941, £21,782,022; reserve (in Reserve bank) May 26, 1941, gold £2,802,000, sterling £21,240,184. Net oversea funds, April 28, 1941, £NZ.32,188,454. Exchange rate: £NZ.125=£100 sterling (£1=approx. $4.03½ U.S.). Deposits in post office and trustee savings banks (March 31, 1941) £77,715,381; depositors, 1,250,000.

Trade and Communication.—Oversea trade: exports for year ending June 30, 1941, £65,766,000 (compared with £65,859,000 in 1940); imports for year ending June 30, 1941, £46,185,000 (compared with £46,070,000 in 1940). Communications and transport: total length of roads 53,086 mi., including main highways 12,465 mi.; railways 3,400 mi.; passenger journeys, year to March 31, 1941, 26,276,923 (compared with 24,454,014); goods traffic 8,426,182 tons (compared with 7,673,950). Shipping (1939) entered 2,974,833 tons net, cleared 3,032,981 tons net; commercial air transport (year to March 31, 1941), miles flown: internal services 1,029,588, overseas 459,608. Motor vehicles licensed (March 1941): cars, taxis 221,187; trucks 48,477; buses 747; motorcycles 18,276; wireless receiving set licences 341,481; number of telephone subscribers 165,151.

Agriculture.—(1939–40) Acreages: wheat, for threshing, 257,532, total, 269,779; oats, for threshing, 49,751, total, 268,541; barley, for threshing, 25,262, total, 31,728; maize, for threshing, 7,962, total, 14,352; linseed, 1,216; peas, for threshing, 21,323; potatoes, 20,033; onions, 839; peren-

MEMBERS of New Zealand's Women's War Service auxiliary on parade in Auckland in the spring of 1941

nial rye grass, 43,895; western wolths and Italian rye grass, 6,843; cocksfoot, 10,255; tobacco, 1,828. Yields, total and per acre; wheat, 8,010,089 bu. (31.10); oats, 2,081,106 bu. (41.83); barley, 915,805 bu. (36.25); maize, 404,179 bu. (50.76); linseed, 8,788 cwt. (7.23); peas, 563,159 bu. (26.41); potatoes, 141,105 tons (7.04); onions, 8,025 tons (9.56); perennial rye grass, 13,399,456 lb. (305); western wolths and Italian rye grass, 2,597,831 lb. (380); cocksfoot, 1,063,394 lb. (104); tobacco, 1,555,631 lb. (851).

Livestock in dominion, 1940: horses, 271,581; cattle, 4,533,032 (including 1,850,071 dairy cows in milk and dry); pigs, 714,001 (including 92,759 breeding sows); sheep, 31,062,875 (including 19,727,657 breeding ewes).

Manufacturing.—Factory production (1939–40): number of establishments, 6,342; total number of employees, 108,722; salaries and wages paid, £24,460,549; value of products, £129,061,826; value of land, buildings, machinery and plant, £80,573,475. (A. J. Hp.)

Nicaragua. A Central American republic lying between Honduras and Costa Rica and reaching from the Caribbean sea on the east to the Pacific ocean on the west. Area, 49,000 sq.mi.; pop. (est. 1941) 1,172,324; language: Spanish; capital: Managua, pop. 70,000; president: General Anastasio Somoza.

History.—During 1941, domestic happenings in Nicaragua were dwarfed by world developments. Pres. Somoza's government followed a policy of close collaboration in hemisphere defense. It co-operated with U.S. bans on extra-hemispheric export of strategic materials, supported the black list of axis business firms, refused to prohibit showing of anti-dictatorship films and invited the United States to establish air and naval bases on Nicaragua's coasts.

In September Nicaragua severed consular relations with Germany. The axis attack upon the United States in December was promptly answered by Nicaraguan declaration of war against the principal axis powers and by steps to put the country on a war basis.

Economically, the year was marked by continued accelerated increases in gold mining, and by efforts to stimulate agriculture and industry through crop loans, financing of agricultural exports, and long-term industrial loans. Commercial development of wild rubber and expansion of chicle production were especially emphasized. Meanwhile, shortage of fuels and other needed commodities, owing to war conditions, and an undue dependence upon the foreign-dominated gold-mining industry, whose chief return to the country is in wages, rendered the immediate outlook for solid economic prosperity uncertain.

Education.—In 1937–38, there were 796 primary schools, with 53,184 students and 8 secondary schools, with 849 pupils. The Central university (established in Sept. 1941) is at Managua.

Defense.—Nicaragua had a standing army of around 3,000 in 1941, with reserves of 10,000. Compulsory military service for males from 18 to 35 was introduced in 1941. The small air force included 20 planes. Nicaraguan aviators were being trained in the United States.

Finance.—The monetary unit is the córdoba, tied to the U.S. dollar at 20 cents. The original 1940–41 budget was balanced at 25,503,219 córdobas, a 20% increase, after a 1940–41 surplus of more than 2,000,000 córdobas. In May 1941, supplementary appropriations approximating 5,000,000 córdobas were made; these were primarily to cover earlier government salary increases ranging up to 30%, and to provide an additional flat 10%. The national debt (1941) was $4,402,354, including $1,884,167 of otherwise unexpended U.S. Export-Import bank credits of $4,500,000.

Trade and Resources.—In 1940, exports were $9,494,142, a 17.4% increase, with gold (60.6%), coffee (22.1%) and bananas (4.7%) the principal commodities. In 1941 gold exports increased 26% over 1940, exceeding $7,000,000 in value. Virtually all Nicaraguan exports are to the United States (1940: 94.2%). Coffee, the leading agricultural export, is under a quota, with a 1941–42 allotment of 216,450 bags to the United States (1940 export: 244,905 bags). Imports (textiles, machinery and foodstuffs) were $7,052,486, a 10.8% increase, and came largely from the United States (84.0%), Great Britain (3.0%), Peru (2.7%) and Japan (2.3%).

Communication.—There is good external communication by sea and by Pan American Airways. Internal facilities are, however, inadequate, with 227 mi. of public railway and 1,882 mi. of main highway in 1941. The latter was being extended, however, especially through United States credits for completion of the Inter-American highway. (L. W. Be.)

Nickel. Although specific data were lacking, general information indicated that new high world records were made in world production of nickel in 1939, 1940 and 1941, as compared with former record of 114,400 metric tons in 1937. World consumption was estimated at 250,000,000 lb. in 1939 and 290,000,000 in 1940.

Nickel production in the United States is confined to a few hundred tons annually as a by-product in the refining of copper, and considering the nature and value of the metal, there is a comparatively small amount recovered as secondary metal (5,150 short tons in 1940); this means that each year practically the whole of the consumption demand must be supplied by new imports, most of which come from Canada. Imports are growing constantly, the gross weight of nickel products imported having averaged 9,073,000 lb. monthly in 1937, 10,781,000 lb. in 1939, 15,375,000 lb. in 1940 and 20,872,000 lb. in the first eight months of 1941. Corresponding figures for exports were 636,000 lb. in 1937, 1,581,000 lb. in 1939, 1,820,000 lb. in 1940 and 1,178,000 lb. in the first eight months of 1941. In spite of the fact that net imports were more than 40% greater in 1941 than in 1940, the supply was insufficient to balance consumption demands, and it was necessary to impose a mandatory priority basis on the distribution and use of nickel, effective March 7, 1941. This limits the use of the metal to products essential in the defense program, and for the duration of the war, or until greater supplies of nickel can be made available, all nonessential uses will be cut to a minimum.

The only indicator available on the trend of operations in Canada, aside from the rising imports, was an increase of 17% in the net operating profit of the International Nickel Co. in the first half of 1941 as compared with the first half of 1940; in view of generally rising costs for labour, materials, etc., while the price of nickel remains unchanged, this probably indicated an even greater increase in output. (G. A. Ro.)

Nimitz, Chester William (1885–), U.S. naval officer, was born Feb. 24 in Fredericksburg, Tex., and was graduated from Annapolis in 1905. An experienced submarine officer, he commanded a submarine flotilla in 1912 and during World War I he was chief of staff to the commander of the Atlantic fleet's submarine force. He was assistant chief of the bureau of navigation, 1935–38, and became chief of the bureau in 1939. He was promoted to rear admiral, June 23, 1938 and was commander of Battleship Division 1 of the Battle Force, 1938–39. On Dec. 17, 1941 the navy high command was overhauled after the surprise attack on Hawaii, and Admiral Nimitz was made commander-in-chief of the Pacific fleet, with the rank of admiral. He assumed his post at Pearl Harbor on Dec. 31.

Nitrogen, Chemical. The combined nitrogen supply of the world comes chiefly from three sources: nitrogen of mineral origin comes from the sodium nitrate deposits of Chile, and from the widely scattered by-product coke industry, which recovers the small percentage of nitrogen in the coal treated, and markets it as ammonium sulphate; the third source is the nitrogen of the air, which by several different processes may be combined to form nitrates and ammonia. In 1905 the world supply was entirely from the mineral sources, in the ratio of two-thirds from Chilean nitrate and one-third from coal. The air fixation industry began in 1906, and by 1914 the ratios were 54% from Chilean nitrate, 36% from coal and 10% from air. The heavy demand for nitrates incident to World War I gave the air industry an opportunity to expand at a rapid rate, and this was accompanied by a corresponding expansion in by-product coking, with the result that in 1918 the ratios had changed to 42% from Chilean nitrate, 35% from coal and 23% from air.

During the postwar period, expansion of air processes was rapid and cut proportionately into the markets for mineral nitrogen, giving ratios of 23% from Chilean nitrate, 21% from coal and 56% from air in 1929. The depression years cut heavily into the markets for mineral nitrogen, but had little effect on the progress of the air processes, so that while the mineral sources made a good recovery they were not able to come back to their former predominant place; in 1937, the latest year for which data are available, the ratios stood at 8% from Chilean nitrate, 17% from coal and 75% from air.

There were no data on which to base an estimate of the 1941 status, but it seemed probable that the trend of affairs would follow much the same pattern during World War II as it did during World War I; that is, there would likely be a rapid expansion of output in all three branches of the combined nitrogen industry, but with the air processes well in the lead; in fact, much of this anticipated expansion was already under way. Expansion of the demand for coke was expected to keep coal in second place as a source of nitrogen. With the war over, there would have to be another readjustment of production levels to bring them back to a normal basis, and in the redistribution of world markets it seemed probable that the air branch of the industry would again be able to absorb a share that would make even lower ratios than ever before for the producers of mineral nitrogen. (G. A. Ro.)

NLRB: *see* NATIONAL LABOR RELATIONS BOARD.

Noel, Carlos Martin (1886–1941), Argentine statesman and writer, was born Oct. 30 in Buenos Aires. He was twice mayor of Buenos Aires and also served as minister and later ambassador to Chile. In 1930 and again in 1933 he was exiled for his activities in the Civic Union Radical party. In 1936 he was elected to the chamber of deputies and served as president of the chamber in 1936–37 and 1937–38. His private library was one of the most famous in Argentina. Noel wrote works on economics and the theatre and a novel on Don Juan. He died Jan. 3 at Pocos de Caldas, Brazil.

North Borneo: *see* BORNEO.

North Carolina. A south Atlantic coast state, popularly known as the "Old North state" or the "Tar Heel state," North Carolina is one of the original 13 states of the union; area 52,712 sq.mi.; pop. (1940), 3,571,623, of which 974,175 (27·3%) were urban, 2,597,448 (72·7%) rural and 1,005,501 (28·2%) nonwhite. Capital, Raleigh (46,897); Charlotte, the largest city (100,899); Winston-Salem (79,815); Durham (60,195); Greensboro (59,319); Asheville (51,310).

History.—In North Carolina the year 1941 was characterized by activity in national defense and war, by the inauguration of J. Melville Broughton as governor Jan. 9, and by the regular biennial session of the state legislature, Jan. 8–March 15, which was unusually harmonious, brief, liberal and amenable to the new governor's leadership. Expanding business activity permitted the legislature to increase appropriations to the biennial record total of $166,500,000, to levy no new taxes and to exempt foods for the home table from the 3% sales tax. The legislature contributed notably to educational development by doubling the support of vocational education, appropriating more liberally for public schools and higher institutions, increasing the salaries and security of public school teachers, adding a 12th grade to the public school curriculum and adopting a retirement system for teachers and state employees. State aid of $100,000 a year was extended to public libraries. A 12th congressional district was created and representation in the U.S. senate and house of representatives was reapportioned. The legislature created the motor vehicle department and reorganized the utilities commission, the state highway and public works commission, the unemployment compensation commission, the department of conservation and development and the revenue department, vesting appointive power in the governor.

Important state officers in 1941 were: J. Melville Broughton, governor; R. L. Harris, lieutenant governor; Thad Eure, secretary of state; George Ross Pou, auditor; C. M. Johnson, treasurer; Clyde A. Erwin, superintendent of public instruction; Harry McMullan, attorney general; W. P. Stacy, chief justice.

Education.—North Carolina maintains separate public schools for whites, Negroes and Indians, with a minimum eight months' term and compulsory attendance from 7 to 13 years, inclusive. In 1939–40, there were 3,858 public elementary schools with 18,579 teachers and 703,597 pupils and 975 public high schools with 6,859 teachers and 205,213 pupils, operated at a cost of $30,811,279, about four-fifths of which was contributed by the state government. The state maintained three branches of the consolidated University of North Carolina at Chapel Hill, Raleigh and Greensboro, with 778 teachers and 14,045 students in 1940–41. It also maintained seven teachers' colleges with the following teaching staff and enrolment for 1940–41: East Carolina Teachers college at Greenville, 91 and 1,248; Western Carolina Teachers college at Cullowhee, 50 and 642; Appalachian State Teachers college at Boone, 54 and 968; Pembroke State College for Indians, 12 and 130; Elizabeth City State Teachers college (for Negroes), 26 and 465; Winston-Salem Teachers college (for Negroes), 22 and 601; Fayetteville State Teachers college (for Negroes), 29 and 693. There were 41 private colleges for whites and Negroes.

Public Welfare, Charities, Correction.—In Oct. 1941 public grants amounting to $393,626 were made to 38,727 persons for old-age assistance, $165,019 to 9,934 families for aid to dependent children, $31,169 to 2,084 blind persons, and $27,960 for general relief (by the county governments). The average monthly volume of unemployment compensation benefits was $266,195 in 1939 and $382,114 in the first half of 1940. On Dec. 9, 1941 WPA employment in the state was 24,228. The state maintained eight charitable institutions with 9,752 inmates in Oct. 1941; five correctional institutions with 853 inmates; and state highway prison camps with 9,048 prisoners.

Communication.—In 1941 the state highway and public works commission maintained 11,298 mi. of state highways, of which 9,583 mi. were hard-surfaced, and 47,642 mi. of county roads, of which 1,824 mi. were hard-surfaced. There were 4,596 mi. of railroads, 495 mi. of city bus routes, 6,223 mi. of passenger bus routes and 6,753 mi. of freight vehicle routes. There were in operation across the state one east-west and two north-south airways.

Banking and Finance.—On June 30, 1941, there were 44 national banks with deposits of $138,803,000, loans of $55,355,000 and investments of $28,412,000; and there were 184 state banks with deposits of $454,714,000, loans of $162,189,000 and investments of $141,909,000. In 1940 there were 160 building and loan associations with total assets of $90,680,929.81. In 1940–41 state receipts were $155,534,983; disbursements, $146,847,207. On June 30, 1941, the state gross bonded and net debts were $141,536,500 and $122,768,025, respectively. The assessed value of property was $2,394,236,806 in 1940.

Table I.—*Leading Agricultural Products of North Carolina, 1941 and 1940*

Crop	1941	1940
Tobacco, lb.	465,235,000	524,185,000
Cotton, bales	556,000	739,000
Corn, bu.	52,006,000	47,600,000
Tame hay, tons	1,071,000	1,026,000
Peanuts, lb.	284,400,000	366,800,000
Wheat, bu.	7,110,000	6,645,000
Sweet potatoes, bu.	6,880,000	7,178,000
Irish potatoes, bu.	6,636,000	8,720,000
Oats, bu.	6,300,000	5,875,000
Soybeans, bu.	1,710,000	1,020,000
Lespedeza seed, lb.	28,500,000	23,400,000
Peaches, bu.	2,760,000	1,344,000
Apples, bu.	1,365,000	962,000
Pecans, lb.	1,400,000	993,000

Table II.—*Principal Industries of North Carolina, 1939 and 1937*

Industry	Value of products	
	1939	1937
Textile products	$540,741,388	$496,420,367
Cigarettes	532,439,765	536,915,093
Food products	69,205,628	51,058,740
Furniture and finished lumber products	62,775,741	56,200,035

Table III.—*Principal Mineral Products of North Carolina, 1940 and 1939*

Mineral	Value, 1940	Value, 1939
Stone	$4,850,277	$6,979,426
Clay products	...	4,761,867
Sand and gravel	1,430,457	1,101,369
Feldspar	426,784	397,631
Mica	301,481	253,721
Talc and pyrophyllite	298,382	283,780

Agriculture.—The total value of agricultural production harvested from an acreage of 6,399,400 was approximately $300,000,000 in 1941. The cash income of North Carolina farmers in 1940 was $168,301,000 from crops, $36,684,000 from livestock and $14,876,000 from government payments. The value of the lands and buildings on the 278,276 farms, 44% of which were operated by tenants, was $736,708,125. Despite severe spring drought and excessive summer rains, 1941 was a better than average crop year. (*See* Table I on page 487.)

Manufacturing.—In 1939 manufacturing establishments numbering 3,225 employed 270,210 wage earners at wages of $199,289,501 and made products valued at $1,421,329,578. (*See* Table II on page 487.)

Mineral Production.—The mineral production for North Carolina in 1940 was valued at approximately $20,000,000. (*See* Table III on page 487.)

BIBLIOGRAPHY.—*Public Laws of N.C.*, 1941; U.S. Census; *Minerals Yearbook. Review of 1940;* reports of state agencies. (A. R. N.)

North Dakota. A west north central state of the United States, popularly known as the "Flickertail state." Area, 70,054 sq.mi.; pop. (1940) 641,935. The rural population was 510,012; urban, 131,923. Capital, Bismarck (15,496). The chief cities are Fargo (32,580); Grand Forks (20,228); and Minot (16,577).

History.—On the boundary line between North Dakota and Canada, in the region known as Turtle mountains, a park of 3,000 acres called the International Peace garden was established in 1941 to commemorate the long-continued peace between Canada and the United States. The chief officers of the state in 1941 were as follows: governor, John Moses; lieutenant governor, Oscar W. Hagen; secretary of state, Herman Thorson; state auditor, Berta E. Baker; state treasurer, Carl Anderson; attorney general, Alvin C. Strutz; commissioner of insurance, Oscar E. Erickson; commissioner of agriculture and labour, Math Dahl.

Education.—Elementary schools in 1940 numbered 3,996; enrolment 105,734; teaching staff 6,143. Secondary schools numbered 181; enrolment 33,895; teaching staff 1,218. Institutions of higher learning are the state university and school of mines, the agricultural college, three state teachers colleges, two normal schools, a school of forestry and a school of science. The total enrolment in these institutions in 1941 was 6,600, and their teaching staffs numbered 445.

Public Welfare, Correction.—The WPA during the fiscal year ending June 30, 1941, expended $7,254,375 of federal funds and employed an average of 10,534 persons per week. The number of correctional institutions in 1941 was five. The average number of inmates was 2,645; the cost of maintenance was $1,031,835.

Communication.—Mileage of state highways on Jan. 1, 1941, was 7,342; of rural highways on Jan. 1, 1937, 110,053. State expenditures of the highway department for the year ending June 30, 1940, were $4,677,361. The total railway mileage in the state in 1941 was 5,269.92.

Banking and Finance.—In 1941 there were 115 state banks and one trust company, with resources of $35,637,947.34 and deposits of $19,931,722.00. There were 23 savings and loan associations with resources of $12,466,382. For the year ending June 30, 1941, state receipts were $41,970,988.01, and expenditures were $31,759,278.36. The bonded indebtedness of the state was $21,643,000. New state capitol building indebtedness was $270,000.

Agriculture.—The total farm acreage harvested in 1941 was 13,773,109. The cash income from crops and livestock was $341,352,977, and the benefit payments amounted to $22,224,000. Value of livestock (1941) was $118,413,697. The average rainfall (23.23 inches—6.35 inches above normal and the highest on record) made 1941 a good crop year and had an excellent effect on pastures and ranges.

Table I.—*Leading Agricultural Products of North Dakota, 1941 and 1940*

	1941	1940
Wheat, bu.	111,960,000	69,972,000
Durum, bu.	34,238,000	27,082,000
Corn, bu.	24,670,000	24,480,000
Oats, bu.	58,575,000	33,432,000
Barley, bu.	43,675,000	28,064,000
Rye, bu.	13,516,000	9,776,000
Flax, bu.	4,576,000	3,888,000
Potatoes, bu.	14,155,000	18,920,000

Manufacturing.—The total value of manufactures in 1939 was $43,767,082, and the total employment was 3,435. The principal industries and the value of their products were creamery butter, $12,894,964; flour and grain mill products, $5,303,788; publishing and printing, $2,255,874.

Mineral Production.—For the year ending July 1, 1941, the production of lignite coal was 2,347,258 tons, valued at $2,714,872. The total value of mineral production in 1939 was $2,689,627; in 1938 it was $2,653,473.

Table II.—*Principal Mineral Products of North Dakota, 1939 and 1938*

Mineral	Value, 1939	Value, 1938
Coal	$2,425,000	$2,380,000
Sand and gravel	128,279	151,824
Natural gas	29,000	27,000

(O. G. L.)

Northern Ireland: *see* IRELAND, NORTHERN.

Northern Rhodesia: *see* RHODESIA.

Northern Territory OF AUSTRALIA. Area 523,620 sq.mi.; pop. (June 30, 1940): aboriginals, full-blooded, 13,901; half-caste, 902; white (est. Dec. 31, 1940), 8,852.

Darwin is a key strategic point in the defenses of the commonwealth. During 1941 the garrison was considerably strengthened and important works in connection with both sea and land defenses were carried out.

Finance.—Revenue (1940–41), actual, £A157,042; from Central Australia railway (1940–41), £A243,702; from North Australia railway (1940–41), £A181,414. Expenditure, ordinary appropriation (1940–41), £A462,172.

Communication.—Work on the construction of the 625 mi. of strategic road from Alice Springs to Birdum was completed early in 1941, and the federal cabinet then decided on plans for a connecting road to Mount Isa in western Queensland. A survey was made and an all-weather highway was under construction, the junction being at Tennant's Creek.

Agriculture, etc.—Production in 1939–40: Pastoral industry, £A587,821; gold, £A233,789; wolfram, £A47,836; pearl shell, £A15,998. Railways, government (Dec. 31, 1939), 508 mi. (W. D. MA.)

Northwestern University. An institution of higher learning at Evanston and Chicago, Ill. The university comprises the following divisions: the college of liberal arts, the graduate school and the schools of engineering, music, education, speech, commerce and journalism, all located in Evanston (suburb of Chicago) on a campus bordering Lake Michigan; the medical, law and dental schools and the evening departments of the university, all on Chicago's near north side, on a campus six blocks from the loop business district. The enrolment of the university for the first semester of 1941–42 consisted of 6,137 full-time students, of whom 4,971 were registered on the Evanston campus; and 9,033 part-time and evening students, most of whom were registered on the Chicago campus. The 1941 summer session had an enrolment of 4,855 students. The faculty of the university, including demonstrators and assistants, totalled 1,380.

The total of gifts for the fiscal year ending Aug. 31, 1941 amounted to approximately $2,072,000, including a bequest from Mrs. Emma H. Morrison of $1,500,000.

During 1941 construction was completed on two new buildings on the Evanston campus—Lutkin Memorial hall, an auditorium for the school of music, and the $5,000,000 Technological institute building. On the Chicago campus the 20-story Wesley Memorial hospital was completed.

The Naval Midshipmen's school on the Chicago campus graduated during the year 2,136 men, who were commissioned as ensigns in the U.S. naval reserve. On the Evanston campus the naval R.O.T.C. maintained an enrolment of 300 men, civilian pilot training was given to 150 students, and approximately 800 men were enrolled in technological defense courses.

Northwest Territories. The Northwest Territories of Canada comprise the territories formerly known as Rupert's land and the Northwestern territory, except such portions thereof as form the provinces of Manitoba, Saskatchewan and Alberta and the Yukon territory, together with all British territories and possessions in North America and all islands adjacent thereto, not included within any province, except Newfoundland and its dependencies. The Northwest Territories are governed by a commissioner, deputy commissioner and five councillors appointed by the governor general in council. Area, 1,309,682 sq.mi.; pop. (1941 census) 10,661. Seat of government, Ottawa.

Trade and Communication.—The main activities are the fur trade and the mining industry. Furs to the value of approximately $1,325,000 are exported annually. Natives and half-breeds living the life of natives enjoy free hunting and trapping rights, and an area of 609,877 sq.mi. has been set

aside as native game preserves. Only those white men who qualify under the residence regulation are able to purchase hunting and trapping licences. Fur trading is controlled by regulation and only those who have established permanent posts are able to engage in the fur trade.

Two well organized transportation companies maintain regular boat service for both passengers and freight. Regular and frequent commercial air service connects Edmonton, Alberta, with the Mackenzie district and carries mail. The eastern arctic is served by a yearly supply ship from Montreal and smaller boats operating from Churchill. Strategically placed government radio stations, supplemented by sets operated by trading companies, maintain wireless communication with centres of population in the provinces.

Mineral Production.—Mining in 1941 was confined mainly to the Yellowknife area, where the output of gold on a commercial basis commenced with the pouring of the first gold brick at the Con property of the Consolidated Mining and Smelting Company of Canada, Ltd., on the west side of Yellowknife bay, in Sept. 1938. By 1941 four other properties had come into production, namely, Negus Mines, Ltd., Slave Lake Gold Mines, Ltd., Thompson Lundmark Gold Mines, Ltd., and Rycon Mines, Ltd. The total value of gold produced in 1938–41 from these five properties exceeded $7,000,000. The largest producer has been the Con mine, which by 1941 had contributed more than $4,100,000. From the Negus mine more than $2,000,000 had been produced. The Ptarmigan Mines, Ltd. was installing a mill in 1941 and expected to go into production early in 1942. It was also reported that the Eldorado Gold Mines, Ltd. would resume, in the spring of 1942, mining of their valuable and extensive radium-bearing ore deposit at Great Bear lake, which was discontinued in 1940 after several years of successful production. (R. A. G.)

Norway. A country of northern Europe. Bounded N. by the Arctic ocean, E. by Finland and Sweden, S. and W. by the North sea. Area 124,556 sq.mi.; pop. (est. 1939) 2,921,000. Capital, Oslo (253,124). Other principal cities, with 1930 populations, are Bergen (98,303); Trondhjem (54,458); and Stavanger (46,780). Religion, Lutheran Christian. Ruler in 1941: King Haakon VII (*q.v.*). Prime Minister: Johan Nygaardsvold (in exile in London). Norway was occupied by Germany in 1940, and was administered in 1941 through Reichscommissar Josef Terboven.

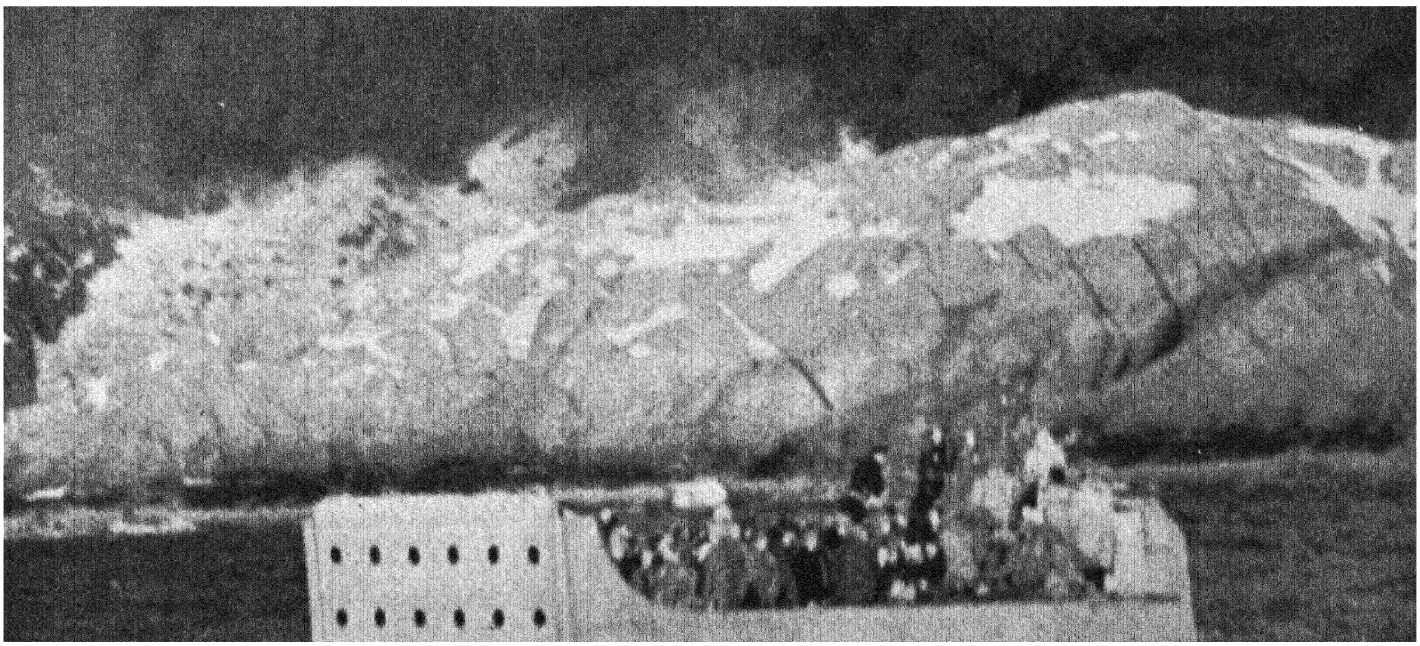
History.—Norway was at war in 1941—internally by sabotage and other forms of civil resistance, elsewhere by well planned action under the royal government in London. Early in August the German authorities declared "a state of siege" in Norway, and in the weeks that followed they made thousands of arrests and executed unknown numbers of opponents of the nazi regime. Radios were ordered surrendered; blankets, heavy clothing, knapsacks, skis, skiboots and large quantities of food were requisitioned. Demands for items such as apples, potatoes and fish were so heavy that a shortage of fish was foreseen for the first time in Norwegian history. Reichscommissar Terboven issued also a statement saying that "persons who display laziness, carelessness or stubbornness, and who do not perform worthy labour, shall not participate in the distribution of necessities and luxuries of life in the same degree as those who co-operate whole-heartedly."

Seemingly reliable figures indicated that by July 1, 1941 the Germans had already taken from Norway 1,277 tons of coffee, 133 tons of eggs, 5,819 tons of butter and margarine, 5,108 tons of milk and 1,166 tons of cheese. The food requirements of some 300,000 soldiers and large numbers of wounded sent into the country from Germany indicated that the "non-co-operating" portion of the population would have to eat meagrely. By March 1 the Bank of Norway had paid to the occupying authorities 1,600,000,000 kr., and continued to pay at the rate of 150,000,000 kr. per month. Fines laid upon recalcitrant communities increased the financial burden. In other ways, too, the yoke was heavy—no hunting licences were issued except upon recommendation of the Nasjonal Samling (the nazi Quisling party). Workers were prohibited from changing jobs without permission.

Opposition grew. Clashes between populace and authorities increased, and executions and arrests fanned the flames. Forty-three labour and professional organizations joined in one common protest. In Dec. 1940 the supreme court had resigned in protest against arbitrary changes, and the lawyers of the country supported the court's position. The clergy came out in a strong statement against the brutality of the regime, and some 98% of the ministers consistently opposed nazi decrees. When R.A.F. bombers appeared, the people cheered and sang "Tipperary" instead of running to shelters. Informers along the coast were able to get word to the British about such German ship movements as the sailing of the "Bismarck". It appeared that perhaps 99% of the people continued to reject the "new order" in 1941, though at the end of the year a new attempt was being made to force the schools to teach totalitarian doctrines at least one half hour each week. That requirement seemed mild indeed, compared with others, and was an indication both of frustration and opposition met by the nazis and of their strenuous efforts to get some sort of co-operation.

The British kept the nationalistic hope alive by the daring Commando raids, especially those on the Lofoten islands (March 4 and Dec. 26). At other points too, such as Vaagsoey and Maaloey, these quick-acting raiders destroyed German matériel and captured nazi and Quisling soldiers and sympathizers. The Germans imposed punishment by fines and imprisonments, but hundreds of Norwegians joined the Commandos, went to England and prepared to return on similar expeditions. In Canada an air force

IN A RAID on Norway's Lofoten islands, carried out with armoured "invasion barges" March 4, 1941, the British blew up oil tanks and withdrew with 215 German prisoners and 323 Norwegians



of young Norwegians, many of whom had escaped in small boats via the fjords of Norway and across to England, was in training.

Most important of all in the larger struggle was the activity of the Norwegian merchant fleet, one of the world's largest (4,835,000 gross tons in 1939), some 80% of which had eluded Hitler's grasp. The modern tankers were of great help in carrying to England more than 50% of her gasoline and oil. This fleet took to England also about one-third of her foodstuffs and munitions. About 2,000 of the 30,000 Norwegian sailors had died in action by the end of 1941; 234 Norwegian ships had been sunk since 1939, but 830 were left. United under the control of the Norwegian shipping and trade mission, this fleet was the largest single group of merchant ships afloat.

Within Norway itself trade was down 50 to 65%, and the cost of living (with Jan.–June 1914 as the base of 100) had risen without interruption from 159 in 1939 to 251 in Sept. 1941.

Diplomatically the Norwegian government-in-exile threw her whole weight with Britain and the United States. Therefore, on Dec. 7, this government broke off relations with Finland, and on Dec. 9 broke with Japan.

Education.—In 1937–38 there were 357,793 students and 10,521 teachers in the elementary schools; 31,127 students and 1,809 teachers in the middle schools and gymnasia, and 16,033 students in continuation schools. The 11 universities had a combined enrolment of 4,998. The Norwegian state in 1937–38 spent on higher education 7,105,000 kr.; universities also received 2,055,000 kr. from other sources. The total state budget for educational purposes in 1939–40 was 65,364,000 kr. Local districts provided more than half the funds for elementary education.

Defense.—The budget for 1939–40 was 54,762,000 kr.; Jan.–June 1941 (by govt. in London), 21,385,543 kr.

Army. Under the law in force in 1940, compulsory service began at age 20, extended for 12 years in the regular army and 12 years in the "Landvaern." About 30,000 men became liable annually, and served a training period of 84 days. In 1935 permanent personnel included 1,135 officers, 765 noncommissioned officers and men.

Navy. The navy on Jan. 1, 1941 had two coast-defense ships, 16 torpedo boats and 6 submarines. By the end of 1941 it was claimed this strength had been increased, largely by the use of some of the over-age U.S. destroyers.

Finance.—The monetary unit is the krone (23.4 U.S. cents in 1939). Budgetary income and expenses for 1937–38 balanced at 572,135,000 kr.; the proposed budget of 1939–40 was 595,627,000 kr. The government in London planned expenditures of 142,827,636 kr. in the first six months of 1941. The state debt Dec. 31, 1938 was 1,430,395,000 kr.

On Dec. 31, 1938 the Norges bank had capital of 35,000,000 kr. and deposits of 130,643,000 kr.; 711 private and savings banks had deposits of 2,928,000,000 kr.

Trade.—In 1939 exports were valued at 808,172,000 kr.; imports, 1,361,835,000 kr. The imports rose rapidly in the last three months, while Norway built up stocks for the war period. Trade in 1940 and 1941 was badly disrupted, especially by the cutting off of ties with Great Britain, with which Norway formerly did about 25% of her total trade. Norway's chief imports were boats, machines, minerals, textiles, petroleum, rubber and metals; the chief exports were wood pulp and products, metals and meat.

Communication.—In 1939 there were 2,335 mi. of state railways and 25,677 mi. of highways (11,857 mi. improved, 13,820 unimproved). In 1938 there were 107,657 motor vehicles. Norwegian air lines flew a total of 85,000 mi. in 1938. Telephones numbered 122,664; telegraph lines extended 21,875 mi.; radio receivers (licensed) numbered 400,623.

Agriculture.—The total value of agricultural products in 1938 was 384,207,000 kr.; of animal products (eggs, milk, wool, etc.), 428,000,000 kr.; furs, 30,000,000 kr. Landholdings numbered 562,407 (298,360 operating units) with a value of 2,410,101,000 kr. Leading crops were wheat (15,791,000 kr.), rye (2,197,000 kr.), barley (22,382,000 kr.) and oats (31,479,000 kr.). In 1938 total productive forest area was one-quarter of the total land area, or 18,700,000 ac.

Fisheries.—The total catch of fish in 1937 was 903,646 tons, the value of which was 92,272,000 kr.; 523,000 tons of the total was herring of various kinds.

Manufacturing.—In 1937 there were 4,306 establishments which turned out products valued at 2,023,551,000 kr. According to value of the product, the most important industries were food and tobacco (411,109,000 kr.), paper, cellulose (309,733,000 kr.), iron and metal (308,169,000 kr.), mining (216,511,000 kr.), textile (144,488,000 kr.), and wood, furniture, etc. (140,756,000 kr.).

Mineral Production.—In 1938 the principal mineral product was iron ore, valued at 26,665,000 kr. Pyrites, valued at 18,168,000 kr., and copper, valued at 5,013,000 kr., were respectively the second and third minerals.

(F. D. S.)

Nose: *see* EAR, NOSE AND THROAT, DISEASES OF.

Notre Dame, University of.

An institution of higher learning at Notre Dame (South Bend), Ind.

A unit of the Naval R.O.T.C. was established on the campus in September. December, 1941, brought rumours of expansion of naval training facilities and a lengthening of the school year in conformity with a general college trend. One out of every 25 Notre Dame men was already in service. The university in 1941 had night defense courses, the N.R.O.T.C., civilian pilot training, four chaplains from the Congregation of Holy Cross and a number of faculty members and employees in the service. Further defense efforts were being co-ordinated rapidly.

William T. Walsh, Larchmont, N.Y., author and educator, was the 1941 Laetare medalist.

Former Ambassador Joseph P. Kennedy, elected a trustee of Notre Dame in 1941, and Monsignor Fulton Sheen headed a memorable 1941 commencement program. A forum in economics and a similar political forum were held at the same commencement for alumni. The fifth annual mathematics colloquium was held in February and March. Plans for observance of the university's centenary, set for September 1942 to September 1943, continued, subject to emergency measures.

Enrolment for the 100th academic year, 1941–42, was 3,197, including off-campus and graduate students. The 24th, and perhaps last, summer school enrolled 1,103 students in 1941. Under a proposed revision of the year program, the summer school would not be held.

(J. E. AR.)

Nova Scotia.

One of the four provinces which united to form the Dominion of Canada (*q.v.*) in 1867; area 21,428 sq.mi.; pop. (1941 census) 573,190. Capital, Halifax (69,326). The other cities are Sydney (28,081), centre of the coal, iron and steel industries, and Glace Bay (25,050). The population of the province is 97% native born, 45% urban. The lieutenant governor in 1941 was F. F. Mather; the premier, A. S. MacMillan.

History.—An election held in Oct. 1941 resulted in the return of the Liberal party to power. The party standing after the election was 23 Liberals, 4 Conservatives and 3 members of the Co-operative Commonwealth Federation party. Direct unemployment relief was largely discontinued in 1941 because of the great increase in employment, a result of increased expenditures for war purposes.

Education.—The public school registration in 1941 was 122,210, while there were 3,505 in private schools. The number of teachers was 3,409. Dalhousie university, in Halifax, is a semi-state institution with 851 students and 164 instructors. Acadia university, in Wolfville, had 383 students and 48 instructors in 1941 and St. Francis Xavier university in Antigonish had 365 students and 45 instructors.

Communication.—There were 6,111 mi. of surfaced and 4,278 mi. of earth highways in the province in 1941. The amount spent on highways during the fiscal year 1939–40 was $5,706,882. Railroad mileage was 1,396; number of telephones, 49,157.

Finance.—The provincial receipts in the fiscal year 1940–41 were $16,443,946; expenditure $15,497,608. The gross debt was $101,733,513; net debt $93,943,805.

Agriculture.—The acreage under cultivation was 556,700 in 1941, and the value of crops grown thereon $28,803,000, yielding a cash income of $23,751,000.

Table I.—*Leading Agricultural Products of Nova Scotia, 1941 and 1940*

Crop	1941	1940
Oats, bu.	3,265,000	3,325,000
Turnips, cwt.	3,511,000	3,090,000
Potatoes, cwt.	2,319,000	2,033,000
Hay and clover, tons	649,000	605,000

Manufacturing.—The value of manufactures in 1939 was $83,139,572. Employees numbered 17,627 and wages amounted to $16,651,685.

Table II.—*Principal Industries of Nova Scotia, 1938 and 1937*

Industry	Value of products	
	1938	1937
Steel works	$11,183,267	$14,883,039
Fish packing	6,471,510	6,308,091
Pulp and paper	5,933,523	4,944,848
Railway rolling stock	3,246,033	6,707,720
Sawmills	3,013,284	3,238,037

(J. C. HE.)

Noyes, William Albert (1857–1941), U.S. chemist, was born Nov. 6, near Independence, Ia., and was educated at Iowa (now Grinnell) college and at Johns Hopkins university, where he received his Ph.D. degree in 1882. He was chemistry professor at the University of Tennessee, 1883–86, and at Rose Polytechnic institute, 1886–1903. He was chief chemist of the government's national bureau of standards, 1903–07, and chemistry professor and director of the University of Illinois chemical laboratory from 1907 until his retirement in 1926. Noyes was one of the leading scientists in the United States in atomic weight research. He was awarded the Nichols medal, 1908; the Willard Gibbs medal, 1919; and the Priestley medal of the American Chemical society, 1935. In collaboration with his son, W. A. Noyes, Jr., he wrote *Modern Alchemy* (1932). He died at Champaign, Ill., Oct. 24.

Nuts. Of the four varieties of nuts grown commercially in the United States two—walnuts and filberts—showed increased production in 1941, while the total crop of pecans was 84,759,000 lb., compared with 88,426,000 lb. in 1940, and the 1941 almond crop was one of the smallest on record. As of Nov. 1, the department of agriculture reported the walnut crop as follows: California, 53,000 tons (1940: 42,200 tons; 10-year average: 43,330 tons); Oregon, 6,300 tons (1940: 4,200 tons; 10-year average: 2,655 tons).

Filbert production in Oregon for 1941 broke all previous records. The department of agriculture report on the filbert crop was: Oregon, 4,200 tons (1940: 2,700 tons; 10-year average: 1,321 tons); Washington, 830 tons (1940: 510 tons; 10-year average: 242 tons).

The 1941 almond crop of the United States, grown only in California, was one of the smallest on record: 6,000 tons compared with 10,200 tons in 1940 and a 10-year (1930–39) average of 13,720 tons. The almond crop, the department of agriculture reported, was almost a complete failure in the important Sacramento valley counties, where many trees were either killed or severely damaged by excessive winter and spring rains.

The pecan crop, grown commercially in 12 states, was estimated in 1941 as 25,799,000 lb. of improved varieties, compared with 20,446,000 lb. in 1940 and a 10-year average of 17,710,000 lb. The 1941 crop of wild or seedling varieties was 58,960,000 lb., compared with 67,980,000 lb. in 1940 and a ten-year average of 46,966,000 lb.

The United States imports about $14,000,000 of edible nuts annually, Brazil nuts constituting the largest variety. Cashew nuts also occupy an important place in such imports and increased in the year ending June 30, 1941, to 16,514 short tons, from 12,686 short tons the preceding year—practically all from India. From Brazil, 101 short tons of cashew nuts were imported in 1941 compared with none the preceding year; from countries other than Brazil and India, 13 short tons in 1941 and 80 in 1940. Reports of nut production from other countries were fragmentary. The 1941 almond crop of Spain was reported as 22,000 short tons (shelled basis), almost double the 1940 crop; filberts, 20,000 short tons (unshelled basis) in 1941, a decrease of about 10% from 1940. Filbert production in 1941 in Italy was reported as 30,000 short tons compared with a ten-year average of 23,400 short tons; Turkey, 27,500 short tons in 1941 and a ten-year average of 57,600 short tons (all on unshelled basis). (*See* also COCO-NUTS; PEANUTS.) (S. O. R.)

U.S. Pecan Production in Leading States, 1941 and 1940
(Improved varieties)

State	1941 lbs.	1940 lbs.	State	1941 lbs.	1940 lbs.
Georgia	9,497,000	7,929,000	Texas	1,925,000	2,870,000
Alabama	3,899,000	2,041,000	Florida	1,348,000	1,155,000
Mississippi	3,294,000	1,331,000	South Carolina	1,282,000	1,152,000
Oklahoma	2,100,000	1,556,000	North Carolina	984,000	715,000

(Wild or Seedling Varieties)

State	1941 lbs.	1940 lbs.	State	1941 lbs.	1940 lbs.

Nye, Archibald Edward (1896–), British soldier, one of the few British officers to rise from the ranks to a high command, was entered by his father in the Duke of York's Military school at Dover, where the sons of noncommissioned officers are trained for the services. He entered the army in 1914, served two years in World War I as a private, and won a commission. After the armistice he held a staff appointment at the war office and studied measures to coordinate the army and the R.A.F. for battle purposes. Soon after the outbreak of World War II he was promoted to brigadier general, and in 1940 he was advanced to major general. Gen. Nye was appointed vice-chief of the British imperial general staff Nov. 18, 1941, and a month later he accompanied Foreign Secretary Anthony Eden on a secret mission to Moscow.

Oats. Production of oats in the United States in 1941 was estimated by the department of agriculture Nov. 1 as 1,138,843,000 bu., about 8% less than the 1940 crop of 1,235,628,000 bu., but 13% more than the ten-year (1930–39) average of 1,007,141,000 bu. The acreage for harvest in 1941 was 37,236,000 compared with 34,847,000 ac. in 1940 and a ten-year average of 36,487,000 ac. The per-acre yield was 30.6 bu. in 1941 and 35.5 bu. in 1940, the highest on record. The ten-year average yield was 27.3 bu. per acre. In Canada the acreage planted to oats was substantially increased in 1941 because of the sharp curtailment in wheat planting. The Canadian acreage in oats in 1941 was 9,308,000 ac.; in 1940 it was 7,818,000 ac., and the five-year average was 8,695,000 ac. Canadian production in 1941, preliminary estimate, was 339,000,000 bu. compared with 404,309,000

U.S. Production of Oats by States, 1941 and 1940

	1941 bu.	1940 bu.		1941 bu.	1940 bu.
Iowa	178,240,000	206,640,000	Colorado	5,408,000	4,530,000

North Carolina	6,500,000	5,052,000	Florida	155,000	126,000
Mississippi	5,724,000	3,776,000	Delaware	120,000	87,000
Idaho	5,494,000	5,106,000	Rhode Island	64,000	60,000

bu. in 1940 and a five-year (1935–39) average of 359,201,000 bu. Other foreign data on oats production were almost entirely absent from trade and other reports in the United States. Canadian shipments of oats to the United Kingdom in the fall of 1941 were much larger than in the same period of 1940. Stocks of oats on United States farms Oct. 1, 1941 were about 10% smaller than the stocks of 1,026,452,000 bu. Oct. 1, 1940, the largest on record at that date. (*See* also CEREALS.) (S. O. R.)

Obituaries.

The following is a list of men and women who died during 1941. An asterisk (*) marks those for whom biographical notices are to be found in regular alphabetical position.

Name	Birth date	Death date
ABBOTT, NATHAN, U.S. educator	July 11, 1854	Jan. 29
ACHESON, ALBERT ROBERT, U.S. mechanical and electrical engineer	Oct. 12, 1882	Feb. 25
ADAMS, ALVA BLANCHARD, U.S. senator	Oct. 29, 1875	Dec. 1
*ADLER, GUIDO, Austrian writer and professor of music	Nov. 1, 1855	Feb. (?)
AFINOGENOFF, ALEXANDER, Russian playwright	1900(?)	Nov. 4(?)
*AGUIRRE CERDA, PEDRO, Chilean statesman	Feb. 6, 1879	Nov. 25
*ALBERTINI, LUIGI, Italian journalist and politician	Oct. 19, 1871	Dec. 29(?)
ALDRICH, GEORGE AMES, U.S. landscape painter	June 3, 1872	Mar. 7
ALDRICH, RICHARD S., U.S. congressman	Feb. 29, 1884	Dec. 25
*ALEXANDER, ROBERT, U.S. general	Oct. 17, 1863	Aug. 26
*ALPHONSO XIII, king of Spain	May 17, 1886	Feb. 28
AMSDEN, CHARLES AVERY, U.S. archaeologist	Aug. 18, 1899	Mar. 3
ANDERSON, JOHN E., U.S. art dealer	1855(?)	July 11
*ANDERSON, SHERWOOD, U.S. author	Sept. 13, 1876	Mar. 8
ANDRADA, DAVID DE COSTA, U.S. singer	Dec. 27, 1865	Jan. 3
APPLEBY, WILLIAM REMSEN, U.S. metallurgist	Feb. 11, 1865	Apr. 8
ARCHER, SAMUEL HOWARD, U.S. Negro educator	1870(?)	Jan. 15
ARMINGTON, FRANK MILTON, Canadian artist	July 28, 1876	Sept. 21
*ARMOUR, ALLISON VINCENT, U.S. yachtsman and scientist	Mar. 18, 1863	Mar. 6
*ARNAULD DE LA PERIERE, LOTHAR VON, German vice-admiral, commander of German naval forces in occupied France	Mar. 18, 1886	Feb. 24
ATWOOD, MILLARD V., U.S. newspaper editor	Aug. 6, 1886	Nov. 3
*AUSTIN, FREDERICK BRITTEN, British author and playwright	May 8, 1885	Mar. 12

YCAS, MARTYNAS, Lithuanian statesman	1884	Apr. 5
YOST, CASPER SALATHIEL, U.S. newspaper editor	July 1, 1864	May 30
YOUNG, ROSE, U.S. author, editor and suffragist	(?)	July 6
*ZAHLE, HERLUF, Danish diplomat	Mar. 14, 1873	May 4

O'Brien, Edward Joseph Harrington (1890 – 1941), U.S. author and editor, was born Dec. 10 in Boston. He was educated at Boston college and at Harvard, and at the age of 25 he persuaded a publisher to bring out a volume of short stories that he edited. In this volume, *Best Short Stories* (1915), he devised a method for grading short stories which made him famous in following years. His short story anthologies appeared annually after 1915. He edited *Best British Short Stories*, also an annual anthology (the first four volumes of which were co-edited with John Cournos) (1921–40), etc. He translated the works of Henri Barbusse and Paul Claudel from the French. O'Brien died at his home, Gerrards Cross, Buckinghamshire, England, Feb. 25.

Oceanography. So far as is known, very few field observations were carried out during 1941. Moreover, few oceanographic publications were received from European countries, so that it is only possible to summarize such developments as were reported in the United States.

Ocean Currents.—The rather detailed thermal structure of the surface layer in regions of great lateral shear was further investigated with the bathythermograph. Especially complete surveys were carried out by the "E. W. Scripps" off the coast of southern California.

The exchange of heat and water vapour between the sea and the atmosphere received considerable attention from a number of investigators, both from the meteorological and the oceanographical standpoints. The importance of evaporation from the sea surface became more generally recognized.

Plankton.—Additional detailed biological surveys were carried out by the "Atlantis" in the Georges Bank area, but so far as was known no other extensive biological field work was attempted. Most reports published during 1941 dealt with collections made previously. (*See* also FISHERIES; MARINE BIOLOGY; ZOOLOGY.)

O'Connor, Andrew (1874–1941), U.S. sculptor, was born June 7 in Worcester, Mass. His father was a tombstone cutter and the boy learned to carve figures in his father's stoneyard. Later, he studied art under John Sargent and Auguste Rodin. He began winning prizes early in the century and he is best known for his statue of Abraham Lincoln in Springfield, Ill., for which he received $50,000. In 1928 he won the Beaux Arts Salon prize for sculpture, the first time that this famous French award was ever conferred upon a foreigner; in 1906 he had won the Salon's second prize. Among his other works are "Mourning Woman," in the National gallery in London; "Tristan and Isolde"; a marble statue of Gen. Lew Wallace in Washington, D.C., and a bronze statue of the general at Crawfordsville, Ind.; and a bronze statue of Lafayette in Baltimore. O'Connor died in Dublin, Eire, June 11.

Ohio. A north central state of the United States, popularly known as the "Buckeye state." Area, 41,222 sq.mi.; pop. (1940) 6,907,612, of whom 2,294,626 were rural and 4,612,986

urban; foreign-born, 519,266. Capital, Columbus (306,087). Other cities of more than 100,000 were Cleveland (878,336), Cincinnati (455,610), Toledo (282,349), Akron (244,791), Dayton (210,718), Youngstown (167,720) and Canton (108,401).

History.—When Gov. John W. Bricker was inaugurated Jan. 13, 1940, it was the first time since 1904 that a Republican governor had taken the oath for a second consecutive term. Sworn in with him were Paul M. Herbert (Rep.) as lieutenant governor, Don H. Ebright (Rep.) as treasurer, Thomas J. Herbert (Rep.) as attorney-general, John E. Sweeney (Dem.) as secretary of state and Joseph T. Ferguson (Dem.) as auditor.

The state legislature, which remained in session from early in January to May 17, passed considerable important legislation. Notable new laws prohibited the sale and use of fireworks except for public display; established a new state guard to replace the national guard, which had been made a part of the United States army; set up uniform traffic regulations conforming with those of other states; legalized medical service associations; forbade sit-down strikes; required applicants for marriage licences to produce certificates showing freedom from syphilis; and exempted newspapermen from revealing the source of their information in any legal procedure.

Although the state budget of $352,800,000 for the 1941–42 biennium was the largest in the state's history, Democrats and representatives of the cities charged that Gov. Bricker was hoarding a huge surplus in the state treasury in order to make tax reductions in 1942, when he ran for re-election. Representatives of the local subdivisions met in Columbus Dec. 11 and demanded that the governor call a special session of the legislature to make a "more equitable" distribution of state sales tax receipts, asserting that those receipts had risen and that the cities, counties, villages and townships needed more money to meet extra expenses necessitated by the war. As the year closed, the governor had not yielded to these demands.

As new defense industries went into production and old ones expanded there was a great demand for labour and a consequent shifting of population. A serious housing shortage resulted in some regions, where it was necessary in some instances to set up trailer camps and begin emergency housing construction. The situation was most critical in Ravenna, Sandusky, Akron, Dayton, Warren and Youngstown.

Education.—Ohio in 1939–40 had 3,835 elementary schools with a total enrolment of 675,343 pupils and a total teaching staff of 21,079; 129 junior high schools with an enrolment of 87,441 and a teaching staff of 2,860; 1,078 secondary schools with an enrolment of 393,397 and a teaching staff of 14,775; 124 special schools with an enrolment of 23,110 and a teaching staff of 899; 197 kindergarten classes with an enrolment of 20,466 and a teaching staff of 392. Counting postgraduate students and special-subject teachers, the state had 5,363 schools with an enrolment of 1,200,769 and a teaching staff of 40,630.

The five state-supported universities in Ohio are: Ohio State university at Columbus with an enrolment of 17,568 and a teaching staff of 800 in 1941; Ohio university at Athens with an enrolment of 4,305 and a teaching staff of 251; Kent State university at Kent with an enrolment of 4,432 and a teaching staff of 149; Miami university at Oxford with an enrolment of 3,474 and a teaching staff of 239; Bowling Green State university at Bowling Green with an enrolment of 2,221 and a teaching staff of 155.

Public Welfare, Charities, Correction.—Ohio's relief-case load for Oct. 1941 was 42,020, the lowest since the state started keeping relief records. The average number of general relief cases for 1941 was 54,618 and the total spent was $16,877,736. Average of WPA employment, 72,404, at a total cost of $51,180,865; average number of cases of aid for the aged, 137,443, at total cost of $38,499,052; aid to dependent children, 11,725, at cost of $5,578,963; aid to the blind, 4,006, at cost of $967,238; average number of unemployment benefit recipients (11 months), 17,815, at total cost of $11,023,253.

State institutions as of Dec. 1, 1941, included nine hospitals for the insane with 19,814 inmates; three institutions for the feeble-minded with 5,605 inmates; four penal institutions with 7,929 inmates; two industrial schools with 1,128 inmates; one hospital for epileptics with 2,074 inmates; one sanatorium with 165 inmates; one soldiers' and sailors' home with 576 inmates. In 1940, $8,779,269 was spent on these institutions.

Communication.—Ohio had 82,488 mi. of highways in 1941 outside municipalities; 16,299 mi. were classified as rural. Expenditures on highways in 1941 were $40,283,734.43, of which $23,394,294.82 were for construction and $16,889,439.61 were for maintenance. The state had 8,870.26 mi. of railroads, 111 airports and landing fields and 1,426,697 telephones.

Banking and Finance.—There were 452 state banks in Ohio with deposits (Sept. 24, 1941) of $1,806,686,071 and resources of $1,995,155,268. On the same date there were 242 active national banks in Ohio with deposits aggregating $1,367,174,000 and resources of $1,517,327,000. As of June 30, 1941, there were 559 state-chartered savings and loan associations with total resources of $653,363,266.72. As of Dec. 31, 1940, there were 75 state-chartered savings and loan associations in liquidation with assets of $42,204,390.40. There were 121 federal savings and loan associations in Ohio with total assets of $250,519,099 as of Dec. 31, 1941.

The state budget for the 1941–42 biennium was $352,800,000.

Agriculture.—The total acreage harvested in Ohio in 1941 (46 crops) was 9,893,900; in 1940, 9,790,000. Total value of agricultural production in the state in 1940 was $346,226,000. Cash income from crops in 1940 was $101,136,000; from livestock and livestock products, $228,119,000; from government payments, $16,971,000. In general, 1941 was favourable for crop production in Ohio, with high yields prevailing in spite of a marked deficiency in rainfall.

Table I.—*Leading Agricultural Products of Ohio, 1941 and 1940*

Crop	1941	1940
Corn, bu.	160,974,000	122,360,000
Wheat, bu.	48,978,000	42,121,000
Oats, bu.	51,374,000	44,396,000
Barley, bu.	1,140,000	840,000
Rye, bu.	1,332,000	1,296,000
Buckwheat, bu.	158,000	288,000
Soybeans, bu.	13,143,000	8,835,000
Potatoes, bu.	10,614,000	9,476,000
Apples, bu.	7,064,000	5,074,000
Peaches, bu.	1,427,000	443,000
Pears, bu.	840,000	816,000
Grapes, tons	25,700	37,500
Tame hay, tons	3,325,000	3,842,000
Tobacco, lb.	26,025,000	28,943,000
Popcorn, lb.	14,525,000	7,700,000
Sugar beets, tons	42,600	45,000
Maple syrup, gal.	323,000	332,000

Manufacturing.—The total estimated value of manufactures in 1939 was $4,584,665,659; total employment, 598,397; total wages paid, $812,676,444.

Table II.—*Principal Industries of Ohio, 1939 and 1937*

Industry	Value of products	
	1939	1937
Steel works and rolling mill	$609,804,548	$733,351,272
Motor vehicles, bodies and parts	285,681,412	206,133,017
Tires and inner tubes	268,010,485	307,255,214
Meat packing, wholesale	132,483,991	139,069,127
Blast furnace products	131,824,375	154,655,026
Bread and other bakery products	84,324,585	105,261,182
Petroleum refining	84,137,190	97,297,783

Mineral Production.—The total estimated value of mineral production for Ohio (1940) was $61,457,191.

Table III.—*Principal Mineral Products of Ohio, 1940 and 1939*

Mineral	Value, 1940	Value, 1939
Bituminous coal	$37,114,560	$32,981,760
Petroleum	3,514,560	3,534,720
Sand and Gravel	*	6,142,642
Fireclay	*	1,175,976
Sandstone	*	528,891
Foundry sand	*	401,733
Natural abrasives	*	290,614

(P. Bv.)

Ohio State University.

Formally established as a land-grant institution in 1870, the Ohio State university opened its doors on Sept. 17, 1873, to a student body of 17. In the autumn quarter of 1940 the full-time, resident enrolment reached a figure of 13,007. The enrolment, including summer quarter, was 17,568 in 1941. Centrally located in Columbus, the capital city of Ohio, the university draws its student body from all 88 counties, as well as from other states and nations.

The university is open to women and to men. It has ten colleges: agriculture, arts and sciences, commerce and administration, dentistry, education, engineering, law, medicine, pharmacy and veterinary medicine; a graduate school; and five special schools: home economics, journalism, nursing, optometry and social administration. Graduate work is offered through the doctor of philosophy degree. Recent additions include an exploratory course for students undecided on their college plans, a general course for those not working for degrees, a marketing curriculum

for women. A new building program starting in the fall of 1941 included new facilities for music, agricultural laboratories and a library addition. Dr. Howard L. Bevis, president, took office Feb. 1, 1940. (H. L. B.)

Oklahoma. A west south-central state and the 46th of the United States. The people of the state are popularly known as "Sooners," from the name applied to those who crossed the starting line sooner than the time fixed by the government for the first land run into Oklahoma, April 22, 1889. Area, 69,283 sq.mi.; pop. (1940) 2,336,434, a decrease of 59,606 since 1930. The rural population in 1940 numbered 1,456,771; urban, 879,663. Approximately 87% of the population was native white, 7% Negro, 4% Indian and 2% foreign born, Mexican and miscellaneous. The state's two largest cities are Oklahoma City (204,424), the capital, and Tulsa (142,157).

History.—Perhaps the most important development during 1941 was the adoption, at a special election on March 11, of a constitutional amendment sponsored by Governor Leon C. Phillips, providing for the financing of the state government. This amendment required the state to operate with a balanced budget by making unlawful any appropriations or expenditures in excess of current income. Since the state's revenue may not be secured from ad valorem taxes—the income from these goes to local units—the state legislature found it necessary to increase the revenue from various tax sources to maintain the functions of government and to pay off the debt resulting from the deficits piled up from 1930 to 1940. As a result of the new levies and the rise in prices and volume of business, state revenues during the first quarter of the fiscal year 1941–42 were $4,000,000 over corresponding collections in the preceding year. It was anticipated in 1941 that the state would close the fiscal year with a surplus. Two other constitutional amendments were adopted at the March election. The first made possible more liberal old-age pensions. The second established a nine-member board of state regents for higher education, to co-ordinate all state educational institutions. Under Governor Phillips in 1941 were the following other state officers: James E. Berry, lieutenant governor; C. C. Childers, secretary of state; Frank C. Carter, state auditor; Mac Q. Williamson, attorney-general; Carl B. Sebring, state treasurer.

Education.—In the public elementary schools in 1940–41 were enrolled 466,597 children, with 20,980 teachers. In the 819 public secondary schools were enrolled 139,591, with 5,154 teachers. In the University of Oklahoma, Norman and Oklahoma City 8,527 students were enrolled during 1940–41, with a staff of 375. In the Oklahoma Agricultural and Mechanical college, Stillwater, 7,649 students were enrolled, with a staff of 411. In the six state-supported colleges at Ada, Alva, Durant, Edmond, Tahlequah and Weatherford, a total of 7,283 students was enrolled, with a staff of 328. The state also maintains the Panhandle Agricultural and Mechanical college, Goodwell, and the Oklahoma College for Women, Chickasha. The State College for Negroes at Langston had 1,028 students and a faculty of 73.

Communication.—Oklahoma maintained approximately 101,000 mi. of state and rural highways in 1941, not including streets in towns and cities. Expenditures for 1940–41 were $21,571,000, including $3,300,000 contributed by the federal government. In addition, the state apportioned $1,503,000 to cities and towns for the upkeep of streets. Within the state there were 6,487 mi. of railroad and about 750 mi. of airways with 46 airports.

Banking and Finance.—National banks numbered 207 in June 1941, with capital of $52,963,000 and deposits of $442,771,000. There were 184 state banks with capital of $9,071,000 and deposits of $65,177,000. There were 31 federal savings and loan associations with resources of $49,756,000 and 32 state associations with resources of $19,864,000. State receipts during 1940–41 were $74,353,000, including $13,000,000 from the federal government; expenditures were $80,429,000. The state funded debt stood at $39,037,735, with accrued reserves of $1,413,305, leaving a net debt of $37,624,430.

Agriculture.—The total value of agricultural production in 1941 was $204,626,000, as compared with $157,889,000 in 1940; the total number of acres harvested in 1941 was 13,420,000. The cash income to farmers in 1940 was $86,209,000 from crops, $88,839,000 from livestock and $25,638,000 from government payments, a total of $200,686,000.

Table I.—*Leading Agricultural Products of Oklahoma, 1941 and 1940*

Crop	1941	1940
Wheat, bu.	48,610,000	58,290,000
Corn, bu.	31,202,000	38,743,000
Oats, bu.	25,900,000	35,351,000
Grain sorghums, bu.	13,260,000	15,664,000
Barley, bu.	9,216,000	7,310,000
Cotton, bales	750,000	802,000
Hay, tons	1,716,000	1,555,000
Forage, tons	1,210,000	982,000

Manufacturing.—Total value of manufactures in 1939 was $312,168,499, as compared with $366,088,721 in 1937. State industries employed 33,528 persons in 1939. During the year salaries of $11,090,299 and wages of $30,465,185 were paid.

Table II.—*Principal Industries of Oklahoma, 1939 and 1937*

Industry	1939	1937
Petroleum refining	$106,666,837	$144,474,915
Meat packing	33,001,703	38,555,703
Milling—flour and other grain products	23,023,319	33,110,822
Creamery butter	13,162,718	15,149,654
Publishing and printing	10,288,905	12,066,319
Bakery products	10,052,666	10,787,412
Smelting and refining of nonferrous metals	9,122,686	13,537,488
Oil field machinery	8,523,190	8,320,390
Glass, clay and stone products	6,887,716	6,783,870
Boiler shop products	6,355,903	7,527,539
Cottonseed products	6,142,384	5,661,596

Mineral Production.—The total value of minerals produced in 1940 was $236,000,000, about the same as in 1939. The production of petroleum declined in 1940 and 1941 in some of the older pools, but four new pools were discovered, the Cumberland, Prague, Apache, and Hotulke pools, and six extensions were developed. Iron ore, a new product for Oklahoma, was mined in the Arbuckle mountains near Sulphur.

Table III.—*Principal Mineral Products of Oklahoma, 1940 and 1939*

Mineral	Value 1940	Value 1939
Petroleum	$162,500,000	$166,300,000
Natural Gas	31,603,000	28,103,000
Zinc	20,529,810	14,590,410
Natural Gasoline	8,026,000	15,502,000
Bituminous Coal (est.)	4,350,000	2,486,000
Lead	2,124,000	2,605,680

Ontario. One of the four original provinces of the Dominion of Canada (*q.v.*); area 412,582 sq.mi.; population 1941, 3,756,632. Capital, Toronto, 656,930. The population is 77% native-born and 60% urban. The lieutenant governor in 1941 was Albert Matthews; the premier, M. F. Hepburn.

Education.—The registration in the public schools in 1941 was 724,531; in the private schools 20,190. The state university is the University of Toronto, with 6,031 students and 1,057 instructors in 1941. The other universities are Queen's, in Kingston, with 1,819 students and 133 instructors, and the University of Western Ontario, in London, with 1,374 students and 245 instructors.

Communications.—There were 56,298 mi. of surfaced highways and 16,302 mi. of earth roads in 1941. The highway cost for the fiscal year 1939–40 was $36,054,382. The railroad mileage was 10,570 and the number of telephones, 629,096.

Table I.—*Leading Agricultural Products of Ontario, 1941 and 1940*

Crop	1941	1940
Wheat, bu.	23,400,000	23,821,000
Oats, bu.	86,554,000	86,639,000
Barley, bu.	15,519,000	16,600,000
Corn, bu.	6,956,000	8,007,000
Potatoes, cwt.	6,753,000	7,247,000
Turnips, cwt.	21,528,000	21,036,000
Hay and clover, tons	5,021,000	4,682,000

Finance.—Government receipts for the fiscal year 1939–40 were $106,384,670; expenditures $109,618,967. The gross debt was $607,788,555; net debt $596,890,132. The province had assets valued at $235,000,000. These assets include the Ontario Hydro-Electric and the Temiskaming and Northern Ontario railroad.

Agriculture.—The acreage of land under cultivation in 1941 was 9,156,800, crops produced were valued at $343,137,000.

Manufacturing.—The value of manufactures in 1939 was $1,745,674,707; number of employees 318,781 and wages paid $378,376,209.

Table II.—Principal Industries of Ontario, 1938 and 1937

Industry	Value of products	
	1938	1937
Smelting and refining	$166,012,623	$192,248,914
Automobiles	110,207,173	133,315,645
Meat packing	79,197,442	75,917,387
Electrical supplies	68,240,333	74,510,006
Flour and feed	66,763,154	70,815,603
Pulp and paper	60,946,197	72,048,378
Butter and cheese	54,850,365	54,744,598

Oranges. Indicated production of oranges in the United States in 1941 was 84,482,000 boxes, the department of agriculture reported as of Dec. 1, 1941. This estimate covered the crop from the 1941 bloom. The 1940 crop was 84,082,000 boxes; the ten-year (1930–39) average, 60,283,000 boxes. The 1941–42 early and midseason crops were estimated, as of Dec. 1, at 40,462,000 boxes, compared with 38,876,000 boxes in 1940–41 and 36,363,000 boxes in 1939–40.

U.S. Production of Oranges by States, 1941 and 1940

State	1941 boxes	1940 boxes	State	1941 boxes	1940 boxes
California			Texas	3,100,000	2,750,000
Valencias	29,520,000	30,006,000	Arizona	600,000	500,000
Navels & miscellaneous	19,764,000	19,472,000	Louisiana	192,000	253,000
Florida			Alabama*	5,000	1,000
Early & midseason	16,800,000	15,900,000	Mississippi*	1,000	.....
Valencias	12,700,000	12,500,000			
Tangerines	1,800,000	2,700,000			

*Production estimated in terms of standard boxes, each equal to about two of the "half-straps" commonly used.

Brazil adopted control of its orange market on Sept. 18, 1941 and fixed export quotas. Before war broke out in 1939, Brazil shipped between 5,000,000 and 6,000,000 boxes of oranges annually: more than 2,000,000 boxes each to the United Kingdom and the Argentine, about 500,000 boxes each to Belgium and the Netherlands and about 275,000 boxes to Germany. But the war greatly limited the market for Brazilian exports. The British ministry of food contracted with Jamaica orange growers for 4,480 short tons of bitter orange marmalade pulp and 6,720 tons of sweet orange pulp, to be preserved in sulphur dioxide and shipped in 50-gal. bbl.

The Spanish crop of oranges for 1941 was estimated at 14,172,000 boxes (70 lb. to the box), about 30% under the 1940 crop. The government's national orange syndicate controls the crop, about 8,000,000 boxes of which were marked for export, chiefly to Germany.

Canada lifted its ban on imports of U.S. tangerines and mandarines Oct. 28, 1941. Such imports from nonsterling countries had been prohibited since Dec. 2, 1940. Japan formerly supplied the Canadian market with tangerines and mandarines. (S. O. R.)

Oregon. A Pacific state of the U.S.A., admitted to the union Feb. 14, 1859. Area, 96,350 sq.mi.; pop. (1940) 1,089,684. Capital, Salem (30,908); chief city, Portland (305,394.) Governor in 1941, Charles A. Sprague.

History.—The state's financial situation being favourable, the legislature left taxation and everything else approximately as they found it at the beginning of 1941. This restraint proved wise as the year moved on, for the income tax and unexpected inheritance taxes piled up a surplus. Under existing constitutional limitations, the money could not be spent.

So far as the defense program was concerned, Oregon's chief contributions in 1941 were shipbuilding and expansion of lumber production to meet the nation's construction needs. At the end of 1941, there were many thousands of persons at work in the Portland shipyards. The yards had delivered several ships; more were at the outfitting docks, others were on order and still others were under construction. New yards were ordered. The state became one of the world's new centres of ship construction.

A giant aluminum plant was awarded to Oregon; a new air base was built. The Portland air base was expanded and two great cantonments were tentatively planned for the western part of the state.

Education.—In 1940 there were 205,928 pupils in the public schools, including 63,057 in high schools. There were 8,104 teachers and school properties were valued at $62,719,297. The school debt was $13,371,251.65.

Finance.—The state ended 1941 with a surplus of about $1,500,000. The state bonded debt (Jan. 1, 1941) was $35,141,285.

Communication.—On Jan. 1, 1939 there were 4,394 mi. in the primary state highway system, of which 4,254 mi. were surfaced. Highway expenditures for 1939 amounted to $16,182,000. In 1938 there were 3,428 mi. of steam railways in Oregon.

Agriculture.—The total cash income of Oregon farmers in 1940 was $115,547,000, of which $5,699,000 represented government payments. The production of the principal grain crops increased in 1941 with the exception of spring wheat, which showed a sharp decline from the harvest of 1940.

Table I.—Principal Agricultural Products of Oregon, 1941 and 1940

Crop	1941	1940	Crop	1941	1940
Corn, bu.	1,920,000	1,860,000	Barley, bu.	6,048,000	5,000,000
Oats, bu.	10,426,000	7,950,000	Spring wheat, bu.	3,105,000	4,700,000

Manufacturing.—The census of 1939 showed 2,248 manufacturing establishments in Oregon; 69,880 persons employed; salaries and wages, $91,326,581; value of products, $365,374,436. Major items: logging camps, $23,363,038; sawmills, $108,663,140; planing mills, $8,122,845; meat packing, $15,178,448; paper mills $15,698,747.

Mineral Production.—Mineral products of Oregon had a total value of $8,636,440 in 1939, as compared with $7,536,408 in 1938.

Table II.—Principal Mineral Products of Oregon, 1939 and 1938

Mineral	Value, 1939	Value, 1938	Mineral	Value, 1939	Value, 1938
Gold	$3,268,020	$2,860,515	Mercury	$477,293	$347,917
Stone	1,682,175	2,025,335	Clay products	410,963	226,312
Sand and gravel	1,233,320	926,601

Osteopathy. There never had been any bar in federal laws to the service of osteopathic physicians in the medical corps of the army or navy. But neither had there been expression of congressional recognition of eligibility until 1941, when the Military Appropriations act authorized employment of osteopathic interns in army hospitals, looking toward commissions in the medical corps.

The osteopathic colleges were represented in the National Council of Defense Committees of Colleges and Universities in February, which discussed educational institutions in preparedness. Curricula of osteopathic colleges were modified, and courses added, in view of current developments.

In view of health needs, the Office of Production Management recommended to the Selective Service system the deferment of osteopathic physicians and students, but many osteopathic physicians voluntarily entered service, from the officers' reserve corps, the national guard, or directly. They were active also in civil defense councils, and in the home guard, and under the Selective

Service law, serving as draft board members and examiners, as members of medical advisory boards, etc.

Numerically and institutionally, osteopathy advanced. The total number of osteopathic hospitals was increased from 132 in 1940 to 145 in 1941; accredited for training interns, from 27 to 33. The American Association of Osteopathic Colleges set up a council to correlate research activities. Electromyographic research into the nature of the osteopathic lesion was reported in the *Journal of Neurophysiology*. The College of Osteopathic Physicians and Surgeons, Los Angeles, Calif., announced a more comprehensive system of graduate and postgraduate education than any previously undertaken. (R. G. HU.)

Osumi, Mineo, BARON (1876–1941), Japanese admiral and supreme war councillor, member of an old noble family, was born in May at Aichi-ken. He was graduated from the Japanese naval academy in 1897 and was Japanese naval minister in 1931, 1933 and 1936, the year that Japan denounced the London-Washington naval pact. At that time he pressed Tokyo to join the shipbuilding race, regardless of the expense. He ranked next to the late Prince Saionji as the most outstanding leader of Japanese liberalism. Admiral Osumi was killed in the crash of a naval plane in Kwangtung province, China, in February while inspecting the Chinese war front.

Ottawa. The capital of the Dominion of Canada (*q.v.*) and the seat of the supreme court, is situated on the right bank of the Ottawa river near the mouth of the Rideau, both rivers having very beautiful falls. The city itself is divided into an upper and a lower town by the Rideau canal. The parliament buildings are situated on a series of high bluffs which overlook the river, in one direction toward the Chaudière falls and in the opposite direction toward the Rideau falls. The population of the city was 149,881 in 1941.

The gross value of manufactured products in 1940 was $26,482,490.

Its most important educational institution is the Université d'Ottawa.

Oxenham, John (? –1941), British author whose real name was William Arthur Dunkerley, was widely known as a writer of popular verse under the pseudonym of Oxenham. His volumes of war poems written during World War I were best sellers, especially his *Hymn for Men at the Front,* which reportedly sold 8,000,000 copies. Among his other works were *A Saint in the Making; The Hidden Years* (1931); *Anno Domini* (1932); *God and Lady Margaret* (1933); *Christ and the Third Wise Man* (1934).

He was reticent about his age, but was believed to be over 80 when he died on Jan. 24 at his home, High Salvington, near Worthing, Sussex, Eng.

Oxford University. The academic year 1940–41, which began with upwards of 2,750 undergraduates in residence, ended with 2,941. The number of men matriculating in Hilary (141) and Trinity (287) terms was far above the normal. This was doubtless due largely to the facilities given to men liable to be called up for national service to begin their courses in any term, and to their desire to get the best balance possible between school and university education.

The degree-giving examinations in all except medical and other scientific subjects (students of these subjects are normally reserved from military service to complete their courses) were divided into two shortened "parts," each representing a normal academic year's work, and were subdivided into "sections" which could be taken at the end of Michaelmas or Hilary term. Thus, however suddenly a man was called up, he could count on being able to record his progress up to date.

Most university scholarships and prizes remained suspended, but college scholarships were mostly awarded as usual.

Benefactions received during the year included £25,000 from Lord Nuffield to promote research in ophthalmology, £14,600 under the will of the late Dr. G. H. Fowler for the foundation of a readership in ancient Icelandic literature and antiquities, and £10,500 under the will of the late J. B. Lockey to be devoted to the interests of science.

Pacific Islands, British. Territories of the British empire in the Pacific ocean, of which certain statistics are given in the table on page 501. *See* BRITISH EMPIRE for population, capital towns, status and governors.

History.—Precautions of defense undertaken by the British Pacific islands in 1941 were redoubled after the outbreak of war in the Pacific Dec. 7. The war had not touched most of the islands by the end of the year, although the mandated island of Nauru, south of the Japanese Marshalls, was reported occupied by Japan Dec. 8. (*See* WORLD WAR II.)

In Fiji the budget rose in 1941 to the record of £1,034,742, compared with £835,887 in the previous year, and increased taxation was imposed. Defense was a main item of expenditure, for though Fiji's annual contribution of £5,000 towards imperial defense had ceased at the outbreak of war, this relief had been far outbalanced by her accepting entire responsibility for local needs. The 1941 revenue from the comparatively recent mining industry was estimated at £58,000, mainly from royalties; and it was announced that from the start of the industry in 1935 to 1940 inclusive the value of gold produced amounted to £2,782,609; it gave employment in 1941 to 2,000 natives and prospecting during 1941 caused expectation of the opening of new mines. Natives were trained as wireless operators, and at the medical school at Suva, supported by the Rockefeller foundation, about a dozen students graduate annually, after a four-year course, as practitioners in Fiji and the other Pacific islands.

Further evidences of progress were construction of aerodromes on Fiji and Tonga for the accommodation of Pan American Airways and of a British transpacific service when this was able to operate; the establishment at Sydney of a joint copra board which, while it assisted this important Pacific islands industry, did not in any way extend Australia's control over the islands' economic life; and the fact that Papua by 1941 was supplying Australia with some 15% of the latter's total rubber consumption.

In 1941 compulsory military training was in force for all men from 18 to 36 throughout the islands, and Fiji had an efficient and well-equipped home guard; every island contributed generously to the Red Cross, Spitfire, and other funds; and in the condominium of the New Hebrides, which was the first part of the French colonial empire to swear allegiance to Gen. de Gaulle, the postage stamps were surcharged "France libre."

Fiji experienced a bad hurricane in Feb. 1941, soon after the Archbold U.S. scientific expedition had left the island. In April

Pacific Islands, French.

The latest statistics available in 1941 for this French colony are given herewith: area (Society, Tuamotu, Tubai and Marquesas isls.), 1,540 sq.mi.; pop. (est. Dec. 31, 1938) 45,000 (whites, *c.* 3,700). Chief town: Papeete (in Tahiti), cap., 8,460. Governor: Commandant Georges Thierry d'Argenlieu.

Finance.—(1939): local budget (est.) 27,560,000 francs.

Trade and Communication.—Imports (1939) 80,482,000 francs; exports 63,536,000 francs; roads (1937): Tahiti 48 mi.; Raiaeta 19 mi.; shipping (1938) cleared, 162,927 net tons.

Production.—(1939): copra 23,000 metric tons; natural phosphates (export) 161,000 metric tons. (*See* also FRENCH COLONIAL EMPIRE.)

Pacific Islands, Mandated.

The former German possessions in the western Pacific comprise part of New Guinea with adjacent archipelagos, Western Samoa, the Marshall, Caroline, Palau and Ladrone, or Marianne islands, and the islet of Nauru. Statistics for these territories are given in table at bottom of page. For capital towns and governors of New Guinea, Western Samoa and Nauru, *see* BRITISH EMPIRE.

Pacific Relations, Institute of.

The institute is a private international organization founded in 1925 for the study of the peoples of the Pacific and their mutual relations. It conducts an extensive research and educational program and publishes its studies through an international publications office, its national councils and its quarterly, *Pacific Affairs*. Since 1937 it has carried on an international "Inquiry into the Sino-Japanese War," twenty volumes in the series having been issued. The last international meeting of the institute was held at Virginia Beach, Va., in Nov. 1939.

The chairman of the Pacific council, the institute's international governing body, in 1941 was Professor Philip C. Jessup, and its secretary general, Edward C. Carter. The International Secretariat was temporarily located at 129 E. 52nd street, New York city.

Prior to the outbreak of war the institute consisted of eleven active national councils in the following countries:

Australia, Canada, China, France, Great Britain, Japan, the Netherlands, New Zealand, the Philippines, the U.S.S.R. and the U.S.A.

As of the end of 1941, however, the French and Netherland councils were inactive and contact with the Japanese council was totally suspended.

The chairman of the institute's American council in 1941 was Dr. Ray Lyman Wilbur and its secretary, W. W. Lockwood. During the year the council continued its fortnightly periodical, the *Far Eastern Survey*, issued a number of volumes and a series of popular pamphlets.

Its educational work included far eastern seminars for teachers and round table discussions in Boston, Cleveland, Chicago, Des Moines, Honolulu, Los Angeles, New York, Princeton, San Francisco, Seattle, Spokane, Syracuse and Victoria.

A radio program with the title "Spotlight on Asia" was inaugurated through the facilities of CBS.

The council's nationwide activities centred in Honolulu, the Pacific northwest, Chicago, New York, Los Angeles and San Francisco.

Among its other activities the San Francisco division continued and enlarged the circulation of its fortnightly news summary, *Inparel*. (K. GE.)

Pacifism. While some pacifists in 1941 rejected war under every circumstance (the so-called "absolutist" pacifists) the majority of pacifists wished to create a system of international law for the settlement of all disputes between nations, backed by the necessary power to enforce peace. These pacifists believed in the necessity for a common defense against the forces of aggression, because only in such a way the forces of aggression could be stopped. Therefore they would participate in wars of defense, but they did not restrict the word defense to the narrow defense of what is called or what appears at the moment as national self-interest. Absolute pacifists, on the other hand, refuse military service as "conscientious objectors." While fascist countries did not recognize the rights of conscientious objectors, their rights were fully recognized and preserved in Great Britain and in the United States. They had the right to argue the sincerity of their convictions before special tribunals and be then assigned to noncombatant service and thus be exempt from military duty. In spite of the fact that Great Britain had been since 1939 involved in a life and death struggle, it put no restrictions on pacifist propaganda.

Pacifists evolved several schemes for a pacifist world order after World War II, and a number of committees in all democratic countries, especially in Great Britain and the United States were at work to lay the basis for such a peaceful world order. Among these plans the proposal of *Union Now* made by Clarence Streit for a federation of all democratic nations found itself widely sponsored. In Washington, D.C., citizens of 16 nations met in June 1941 to form the "Free World Association" with headquarters in New York city. It published a monthly *Free World* and wished to prepare a world organization which would organize for a concerted peace effort to establish a lasting peace on democratic foundations after the victorious conclusion of World War II. As the year 1941 drew to its end and as practically the whole world was drawn actually into a declared war, the conviction spread that World War II would result in either the establishment of a world order on the basis of Hitlerism and its principles which disregard and despise peace, or in a world federation in which all peoples of good will would share and which would maintain peace as the highly desirable goal of political human development, made possible by the concerted effort of all peace-loving peoples. On the 150th anniversary of the bill of rights, Federal Union submitted a petition to the president for forming a powerful union of free peoples to win the war and the peace by a gradual and peaceful extension of the American principles of federal union to all peoples willing and able to adhere to them as the nucleus of a universal world government of, by and for the people. (*See* also INTERNATIONAL LAW; RELIGION; UNION NOW.)

CONSCIENTIOUS OBJECTORS completing work on their home-made library at Camp Patapsco, Md. in 1941

BIBLIOGRAPHY.—*The World's Destiny and the United States.* A Conference of Experts in International Relations, publ. by World Citizens' Association (1941). (H. Ko.)

Paderewski, Ignace Jan (1860–1941), Polish pianist, composer and statesman, was born Nov. 6 at Kurylówka in Podolia, then a province of Russian Poland. For his career, see *Encyclopædia Britannica.* Paderewski's 20th and last concert tour in the United States ended abruptly in May 1939, when he collapsed from a heart attack in Madison Square garden, where he was scheduled to appear in a concert. A few days later he returned to his home in Morges, Switzerland, to convalesce, but the nazi invasion of Poland in Sept. 1939 again drew him into the arena of European politics. Paderewski immediately voiced full approval of Col. Beck's foreign policy, but later declined an offer to assume the presidency of Poland after the flight of Mościcki. In Dec. 1939 he joined the Polish national council, and in Jan. 1940 he accepted the presidency of the Polish parliament in exile, then sitting in Angers, France. Ill health, however, prevented his attendance at the diet's sessions and he again returned to Switzerland. In late 1940 he left for the United States and resided in New York, where he was active in Allied causes. He died of pneumonia after a short illness in New York city, June 29.

Page, Irvine H. (1901–), U.S. clinical research chemist, was born Jan. 7 in Indianapolis, Ind., and received his M.D. from Cornell university in 1926. He served his internship at the Presbyterian hospital in New York city and was then chief of the chemical division of the Kaiser Wilhelm institute in Munich, 1928–31. Upon his return to the U.S., he was associate member of the Rockefeller Institute hospital, 1931–37, and in 1937 became connected with the Lilly Laboratory for Clinical Research, Indianapolis City hospital, where he conducted investigations in high blood pressure. In April 1941, Dr. Page reported to members of the American Physicians college that he had obtained "distinctly encouraging results" in the treatment of high blood pressure with a purified renin extract from the kidneys of cattle. He said the problem of producing the extract in sufficient quantity to make its use widespread had not been solved. Dr. Page also stated that if the extract was available, thousands of high blood pressure cases (the annual mortality rate in the U.S. is 375,000) would be greatly improved. The substance is found in normal human kidneys, but when the kidneys fail to produce a sufficient quantity, arterial pressure mounts to dangerous heights.

Paget, Bernard Charles Tolver (1883–), British army officer, was born Sept. 15, son of the bishop of Oxford. He was educated at Shrewsbury school, served in World War I as a brevet major, was made a companion of the Distinguished Service order and received the Military cross and the Italian silver medal for military valour. He was commandant of the Staff college of Camberley, 1938–39, and was named commander of the college in 1939. In May 1940, he directed the successful withdrawal of the British force in the disastrous Norwegian campaign, and in the same month he was appointed chief of the general staff of British home forces.

Lt. Gen. Paget was made commander in chief of home forces on Nov. 18, 1941, to succeed Sir Alan Brooke (*q.v.*).

Pahlevi, Mohammed Reza (1919–) shah of Iran, was born Oct. 26 in Tehran. He was educated in Switzerland, was thoroughly schooled in military training and commanded his own regiment while in his teens. In Sept. 1941 his father, Reza Shah Pahlevi, failed to answer with sufficient dispatch British and Russian ultimatums to oust all axis nationals from Iran. As a result, troops from both countries overran Iran and Reza Shah renounced the throne in favour of his 21-year-old son, on Sept. 16, 1941. (*See* also IRAN.)

Painting. War and art have never been congenial bedfellows. In Europe, the first two years of World War II proved no exception. During that period many important artists, faced by the impossibility of working freely in their native lands, found their way to the United States. At the same time, much of the U.S. attention formerly accorded European art was turned toward work nearer home, or at any rate within the western hemisphere. Exploration of this latter field had been given generous official encouragement to the end of cementing a firmer cultural unity among the Americas. And art in the United States, during 1941, showed definite consequences of these developments. The presence of certain European artists whose work had been well known for years, and the work they were exhibiting, contributed a new immediacy to their influence. Hispanic-American work encouraged a boldness of colour and expression tonic to U.S. conservatism.

Certain of the European artists, notably the sculptor Jacques Lipchitz, caught attention with new work equal or superior in quality to that of any similar period of their production in Europe during the previous three decades. Central and South American group exhibitions brought to light the talent of several little recognized artists working in the United States in various centres along the Atlantic and Pacific seaboards. In the end, however, the most striking feature of the year in American art was the distinct advance in quality evident in native work; on one hand, the vitality shown by certain well established men, such as Max Weber, adding to their breadth and stature as artists; and on the other hand, the confirmation of younger reputations, as in the case of Julien Levi, and the appearance of several new figures of substantial promise.

Among the older men the most striking work shown in 1941 was unquestionably that of Max Weber. His large New York exhibition was the outstanding contemporary American one-man show of the year. Sensibility and an extreme subtlety and sophistication of technique were the keynotes of several large rooms of oils. A new freedom of brushwork marked his most recent expressions; a richer, deeper gamut of colour, sonorous, intense, yet under complete control; purples, greens, deep reds; a religious expression, with the haunted oppressive sadness of Hebrew music. In the latest work Weber had completely personalized his expression, returning for inspiration from the Paris of his brief apprenticeship between 1905 and 1908 to his racial background of generations. Through this exhibition he proved himself one of the leading figures in U.S. painting, for sensibility, individuality, technical mastery and emotional expression.

Weber's New York exhibition was followed almost immediately by wide national acknowledgment of the quality of the work it included. In Philadelphia Weber was awarded the Temple Gold medal by the Pennsylvania Academy of Fine Arts; in Washington, D.C. the $1,000 prize by the Corcoran gallery; and the Ada S. Garrett prize at the Art Institute of Chicago.

Another prominent prize winner of the year was Franklin Watkins, the winner of the Pennsylvania Academy of Fine Arts Beck award for portraiture, with his painting "Misses M. and M. deS." Watkins' baroque, dramatic compositions, such as "Suicide in Costume," and his delicate still lifes, had been widely recognized for several years; 1941 saw him also take a definite place in the forefront of U.S. portraiture.

Among the muralists, Anton Refregier won the $26,000 award of the section of fine arts competition to decorate the new San Francisco post office. At the New York World's Fair in 1939, Refregier had carried off first honours for his outdoor murals on the Federal Works agency building. In 1935 he painted the murals for the children's ward at Greenpoint hospital, New York. In San Francisco the decoration was to be constituted of 27 mural paintings for the 208-ft. main lobby and the 34-ft. "L"-shaped lobby opening into it. In these murals the artist was to tell the story of San Francisco in casein tempera to be painted directly on the walls.

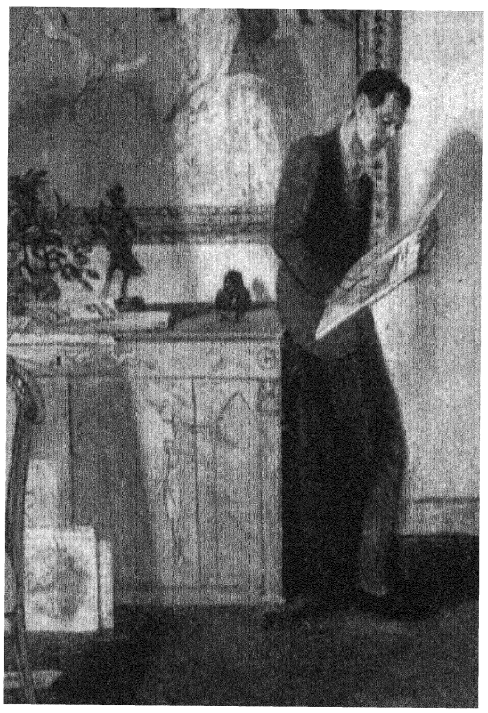
Probably the most striking one-man exhibition of the year after that of Max Weber was Charles Burchfield's large show of water colours. In these there was a notable brightening of expression over his work of previous years. No drama was sacrificed—the tones merely spoke out with a new clarity. For his "House of Mystery" Burchfield was awarded the 1941 Blair prize at the Art Institute of Chicago.

John Marin was another of the well known leaders whose 1941 exhibition showed a steadily growing mastery of his medium. Marin's work, as in the previous two years, was again principally seascapes in oil. But just as each of his 1939 and 1940 pictures in turn marked an advance over the other, Marin's work in 1941 showed him almost at the point where he found himself as much at home with oils as with water colours. Even the most tempestuous subject matter, and what appeared to be the most frenzied brushwork, steadily offered more and more of that subtle integrity of form that is Marin's extremely personal idiom.

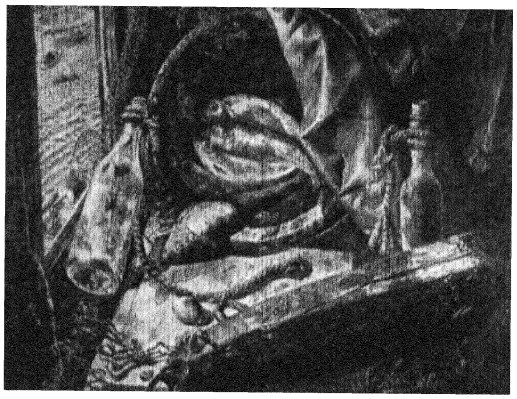
On the other hand, as a water colourist, the caricaturist Adolf Dehn came steadily to the front. The easy amplitude, the green distant slopes and "juicy," storm-laden clouds of his studies promised to put him in the van of U.S. landscapists. Edward Hopper, while his single one-man show of 1941 included only work of the years 1907–14, in isolated water colours and oils throughout the season showed a constantly growing technical subtlety in his characteristic romantic vein. Kuniyoshi and Sheeler likewise continued, without any notable innovations, an even level of quality of their work of the years preceding 1941.

Among the younger men, Julien Levi maintained the promise of his initial one-man show of 1940. Portraiture took a greater place in his work. Still his landscapes and figure pieces of 1941 kept the same qualities that had won him such wide recognition the year before and grew in vibrancy, subtlety and technical brilliance. Peter Blume, whose "South of Scranton" had won the Carnegie award in 1934, but whose work had not in later years been showing the vitality of its earlier promise, in 1941 produced several "Key West" studies in oil quite fresh in conception and execution. Abraham Rattner, better known in Paris than in the United States, won attention with the boldness of his colour handling and the brilliant, assured rhythms of his compositions. Still a trifle too reminiscent of Paris influences, his work showed him to be probably the most promising of the younger men growing out of the School of Paris tradition.

During 1941 among the newer names, Darrel Austin's has probably received the widest recognition. He was born in Raymond, Washington, in 1907. He studied art at Columbia and Notre Dame. Under the WPA he painted murals for the medical college of the University of Oregon at Eugene. He had his first one-man show in 1938 at the Putzel gallery in Los Angeles. Later his work was purchased by several of the leading U.S. museums; one of his strongest compositions, "The Black Beast" (1941), was acquired by Smith College Museum of Art, Northampton, Mass.

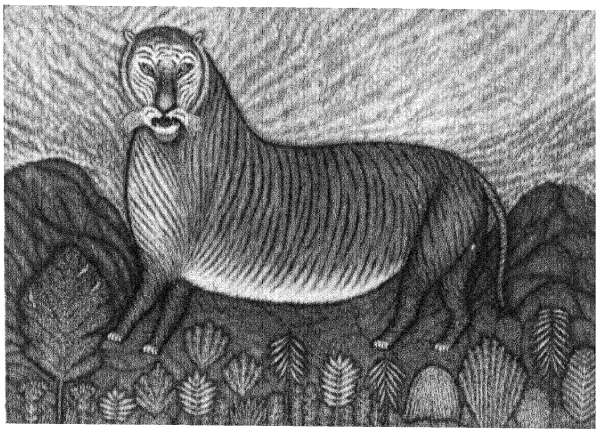


Above: "THE NIGHT CLASS" by Max Weber, whose New York exhibition in March 1941 was an outstanding one-man show of the year

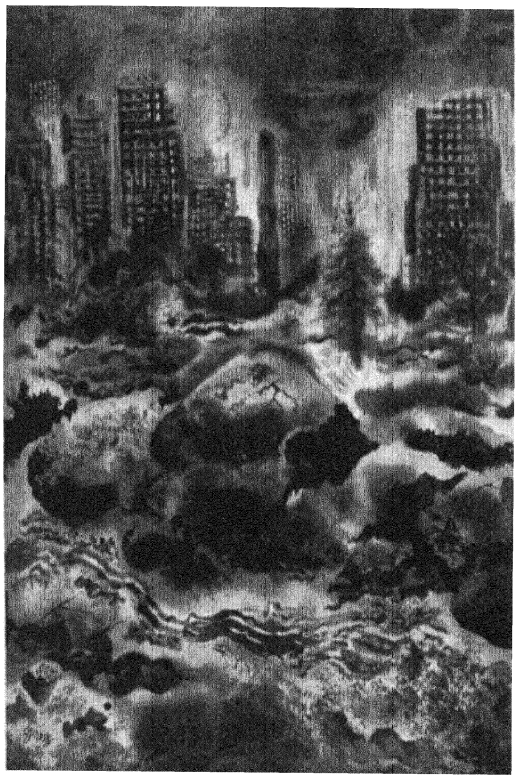


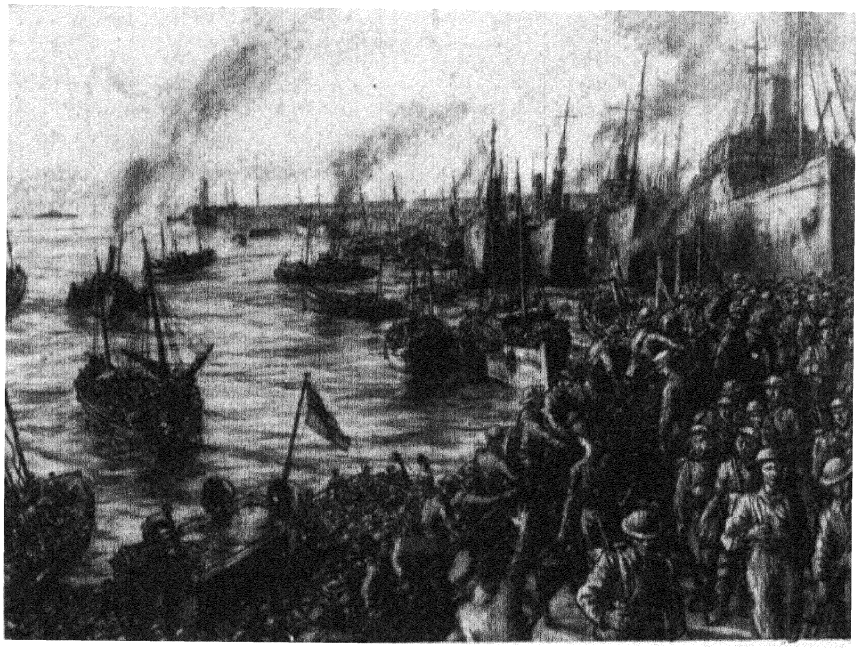
Above, left: "HENRY P. McILHENNY, ESQ.," by Franklin Watkins, painted in 1941. Watkins won the Beck award of the Pennsylvania Academy of Fine Arts in 1941 for his painting "Misses M. and M. deS."

Left: "AH, GOD—HERRINGS, BUOYS, THE GLITTERING SEA," a gouache by Ivan Le Lorraine Albright, was purchased by the Art Institute of Chicago in Nov. 1941



Right: "TIGER," an oil on canvas by Morris Hirshfield, painted in 1940





Above: MUIRHEAD BONE'S "The Miracle of Dunkerque—Arrival at Dover"

Left: "CENTRAL PARK AT NIGHT" by George Grosz, an expatriate German artist living in the U.S.

Two other young artists whose work attracted particular attention in 1941 were Hyman Bloom and Jack Levine, both from Boston. Bloom was born in Latvia in 1913 and emigrated to the United States in 1920. His work has a violent expressionist quality about it, at times too closely reminiscent of Soutine. Still he has an exceptional colour sense, technical ability and boldness of vision. Levine was born in Boston in 1915. Also expressionist in his use of colour and modelling, Levine tends to give an anecdotal emphasis to his subject matter in contradistinction to Bloom's emotional emphasis. And while Bloom also leaned toward Soutine in his early work, his forms later took on a much firmer character without any compromise in his colour effects.

But of all this generation, Morris Graves of Seattle, Wash., probably offered the greatest originality of vision. Graves was born in Oregon in 1910. The Seattle Art museum and the WPA art program, on which he worked for some time, own examples of his work. The technique and the symbolism he employs are peculiarly individual and his work in gouache shows a stubborn persistence in protecting this personal character against external influences.

In the field of sculpture, Alexander Calder continued to offer the most individual expressions in his metal and wood "mobiles" and "stabiles." His large one-man exhibition in the spring of 1941 conveyed a new sense of monumentality in the scale of both small and large pieces. A new dignity marked this group of his work, an increased seriousness of approach to his medium of expression which did not in any way militate against the gaiety of the result. The rhythms of the "mobiles" made no concession to the "expected," yet the architectonic relationships of volumes and planes and the organizations of coloured elements struck a new note of calm and assurance. (*See* also SCULPTURE.)

John Flannagan in 1941 made his first entrance into the Metropolitan Museum of Art in New York with his granite "Goat." He was working for a large one-man exhibition in the spring of 1942 when he committed suicide Jan. 6, 1942. William Zorach continued to hold his position of leadership in the conservative field; while among the experimenters with form and material, Hugo Robus and David Smith attracted most interest.

In the death of Louis Eilshemius in 1941 U.S. painting lost one of its most romantic, if pathetic, figures. A painter all his life, he did not win recognition till well in his 70s when too feeble to enjoy his long-awaited success: a type of American Douanier Rousseau in the stubborn confidence he always had in the eventual recognition of his genius. (J. J. Sw.)

USES OF LUMINOUS PAINT in blackouts were demonstrated in 1941 by Henry S. Prescott of Mt. Kisco, N.Y. This "blacked out" scene shows a girl with luminous necklace, spectacles and flower in her hair, playing checkers

Paints and Varnishes. United States sales of paints, varnishes and lacquers in 1941 valued at $555,398,819, topped the high year of 1929 by 20% and showed the even greater improvement of 35% over 1940 sales. Industrial sales, $227,400,363, showed a 42% gain over 1940 as compared to 25% gain for trade sales coatings.

The impact of World War II affected the formulation of practically all paint and varnish products, in some instances in a drastic manner. Much of the technical effort of the year dealt with the study of replacement materials and additional materials that could be used to make up for shortages and allow for an increase in production demands.

In the pigment field, rutile type titanium oxide was available commercially for the first time. This crystalline form as opposed to the older anatase crystalline form gives a pigment of greater opacity. Either can be used on a calcium sulphate base or as the pure oxide. Increased production of many pigments was announced, particularly in the field of iron oxide yellows which are so important to the production of military finishes as well as of camouflage colours. Zinc chromate reached a position of primary importance due to the requirements of huge volumes of primers for aircraft.

Paint vehicles and varnishes were greatly affected by shortages of not only certain oils such as china wood but of chemicals required for the production of many classes of synthetic resins. Because of the wartime need of nitrogen, much equipment that had been used for the production of methanol, which in turn was converted to formaldehyde, affected the availability of the phenol formaldehyde resins. Limited availability of phenols themselves also restricted the production of resins. Polyhydric alcohols other than glycerine were also the subject of much study, particularly pentaerythritol and mannitol. Pentaerythritol, requiring the use of formaldehyde in its manufacture, was of necessity a limited replacement for glycerine but for the first time commercial quantities of the rosin-ester of pentaerythritol became available as a companion product to the older ester gums. As a worthy companion to these available polyhydric alcohols came the first commercial quantities of polymerized rosin with its greater hardness and stability. Phthalic anhydride, used as a basis of many synthetic resins, was also limited in supply, due to military needs. There was much work done to make the maximum usage of natural resins to alleviate the shortage of the newer synthetics.

Lacquer solvents had their share of attention because of the shortage of alcohols, etc., which are used in the production of military powders. Nitrocellulose lacquer materials were definitely available short of the demand

toward the end of the year.

Resin emulsion paint continued to show improvement and became more favourable among the painter items. Blackout and camouflage paint continued to receive much attention, particularly in the United States. Emphasis was placed on developing paint for which materials would be reasonably available.

In the industrial field finishes were developed which would give even faster schedules in production of implements of war, and to the tools needed in their manufacture. Development of organic coatings to replace metal protective coatings such as galvanized iron was a major problem. Replacements for aluminum paint was a necessary development in the metal protective field. Much thought was also given to the replacement of tin-coated steel so essential to the food packing industry. (A. B. Ho.)

Palaeontology. In the United States, Barnum Brown and Erick Schlaikjer published an extended study of the Upper Cretaceous Mongolian dinosaur *Protoceratops*. Based on a large suite of specimens ranging from embryo to adult, they were enabled for the first time to describe the complete osteology and growth changes of a dinosaur. This contribution is excellently illustrated. A. S. Romer and L. W. Price thoroughly reviewed the Pelycosauria in all its aspects, thus bringing the knowledge of this important reptilian group up to date. The paper is profusely illustrated with 71 text figures and 46 plates. George Gaylord Simpson announced the discovery of jaguar bones and footprints in a cave in Tennessee; in another paper the species of *Hoplophoneus* were reviewed. Of the 11 described species Simpson concluded that 7 are either variants or females of the remaining 4 species. Charles W. Gilmore published a history of the Division of Vertebrate Paleontology in the United States National museum. It covers a period of more than 90 years. All phases of its development, organization, personnel, explorations, exhibits and records are discussed. Charles C. Mook described a new genus and species of the Crocodilia from the Upper Cretaceous of Wyoming.

Erwin Hinckley Barbour and Claude W. Hubbard announced the discovery in Kansas of an incomplete specimen of the shovel-tusked mastodon *Amebelodon fricki*. A detailed study and comparison of the osteology of the extinct aardvark *Orycteropus gaudryi* from the island of Samos, with the modern forms of northern Africa was published by Edwin H. Colbert. It is shown that there has been a progressive increase in size from Lower Pliocene time up to the present. C. Lewis Gazin reviewed the Palaeocene faunas of central Utah, of which three new genera and twelve new species of fossil mammals were described. The discovery of a new fossiliferous locality representing a lower stage nearly equivalent to the Puerco and having a new fauna was announced.

In Manchoukuo, Ruiji Endo described a new genus *Monjurosuchus splendens*, which is regarded as pertaining to the Thecodontia. This specimen comes from the Lycoptera beds in the Lower Mesozoic. In England, Guy E. Pilgrim published an interesting discussion regarding the dispersal of the extinct Artiodactyla. By a process of elimination the conclusion is reached that central Africa is the probable dispersal centre of this great group of extinct mammals.

A CARNIVOROUS DINOSAUR nearly 100 ft. long, believed to be the largest thus far found, was unearthed by an amateur palaeontologist near Edmonton, Alberta, Canada in 1941

Of outstanding importance in research upon invertebrate fossils was Dr. Charles W. Merriam's monographic study of the fossil Turritellas from the Pacific coast region of North America. A total of 95 species, subspecies and varieties (34 new) are described and illustrated. This comprehensive and beautifully illustrated monograph may well serve as a model for other students of invertebrate fossils.

A work of inestimable value to everyone working with Palaeozoic gastropods was Dr. J. Brookes Knight's extended research on the Palaeozoic gastropod genotypes of the world. This work has descriptions and illustrations of all of the genotype species of each generic name proposed prior to 1938. It was found that 80% of the type materials are still available.

L. W. LeRoy published a compact volume on the small fossil foraminifera of the Netherlands East Indies. The article is divided into three parts dealing with as many areas. In all, 326 species and varieties are described, of which 20 are new. The foraminifera range in age from the Miocene to the Pleistocene.

Palestine. Palestine lies on the western edge of Asia, being bounded on the west by the Mediterranean, on the southwest by Egypt, on the south by the gulf of Aqaba, on the east by Trans-Jordan, on the northeast by Syria and on the north by the Lebanon. Area 10,100 sq.mi.; pop. (est. June 30, 1939) 1,466,500. Chief towns: (pop. est. 1939): Jerusalem (cap. 129,800); Haifa (104,800); Jaffa (77,400); Tel-Aviv (130,300). High Commissioner: Sir H. A. MacMichael, K.C.M.G., D.S.O.; languages: English, Arabic, Hebrew; religions: (1939) Mohammedan 848,933; Jewish 424,373; Christian 114,624.

History.—Between the beginning of April 1941, when the German counterattack developed in Cyrenaica, and June 8, when Free French and British forces crossed the northern frontier into Syria, Palestine seemed for the first time to be directly threatened by the forces of the axis. And in June the invasion of Syria was followed by a number of air raids on Haifa and Tel-Aviv, in which, however, the casualties were not heavy.

The effects of the war upon Palestine's economic life became clearer in 1941. As a result of Italy's intervention in the previous summer, citrus exports, already seriously affected by the loss of many European markets, were brought almost to a standstill. The value of the citrus fruits exported in the first quarter of 1941 was only £P.7,000, as compared with £P.1,162,000 in the corresponding months of 1940. Since in normal years citrus fruits had constituted roughly 80% of Palestine's total exports, and

it was estimated that a fifth of the population was wholly or partly dependent on citriculture, the effects of this calamitous season were widespread. But the same shipping difficulties which cut off Palestine from its overseas markets also provided a compensating protection from competitive imports for some of its producers. Depression on the plantations and in the ports was thus to some extent offset by an increase in the manufacture of consumption goods, both for the civilian population and for the middle eastern army, and in food production. In addition, new demands created by the war resulted in an expanding production of potash and other chemical extracts from the Dead sea, and in the maintenance of the building industry by military contracts.

The government took a number of measures designed either to assist the readjustment of the country's economy to these new conditions or to reduce distress to a minimum. Among the positive measures, the most important dealt with the agricultural situation. Loans, amounting in all to £P.544,000, were again granted to the citrus growers; but they were made in order "to preserve in being a reasonable proportion of the matured and fully efficient groves," and applied only to 37,400 of the 55,000 acres in respect of which applications were received. The government probably took the view that, even in conditions of peace, the industry was threatened with a crisis resulting from overproduction, and the loan for maintaining a limited number of the citrus groves was accompanied by a further promise of £P.100,000 to assist citrus farmers to diversify their activities. Negatively, steps were taken to prevent speculation in foodstuffs; sugar and flour were imported on government account, and in October the government undertook the retail sale of these two commodities in Jerusalem. An attempt was made to keep down the figures of unemployment by suspending immigration from Oct. 1940 to March 1941, and again from April to June. Later, for the period from July 1 to Sept. 30, certificates were issued for 850 families.

Other decisions announced by the government in 1941 were to impose an income tax—this came into effect September 1—and to assume power to prohibit strikes and lockouts, while providing a procedure of compulsory arbitration.

Palestine continued to contribute, in both men and goods, to the war effort of Great Britain and her Allies. At the end of October, 7,985 Jews and 3,383 Arabs were serving with various units of the army in the middle east. In addition to these and to a number of casualties, 1,023 Jews and 421 Arabs had been reported as missing in Greece and Crete. Early in the year a War Supply board was established, to act as intermediary between the middle east command and the Palestinian manufacturers. Its chairman explained that there was no intention of attempting to create a munitions industry in Palestine, which lacked the necessary raw materials and could not import sufficient machines and tools; the object was rather to organize the supply of general stores.

Such internal political activity as existed remained for the most part below the surface. It was clear that the Arab population was pleased by Anthony Eden's speech of May 29, in the course of which he said that the British government would give their full support to any generally approved scheme for strengthening "the cultural and economic ties between the Arab countries, and the political ties too." Among exiled Arab leaders who were now permitted to return to Palestine were Husayn al-Khalidi, the ex-mayor of Jerusalem, and Auni Abdul-Hadi, who returned in July. The only remaining political refugees were the Mufti of Jerusalem and his immediate entourage; the Mufti, after broadcasting in support of Rashid Ali el-Gailani's revolutionary Iraqi government during its armed conflict with Great Britain, eluded British pursuit first in Baghdad and later in Tehran, from where he escaped to Berlin.

Jewish opinion was displeased by the continued refusal of the mandatory power to create distinctive Jewish units in the British army, and by the suspension of immigration schedules. The strength of Zionist feeling on the question of immigration was again illustrated by the report of the commission appointed to enquire into the destruction of the "Patria," a ship on which nearly 2,000 illegal immigrants had been assembled for deportation to Mauritius, in Haifa harbour on Nov. 25, 1940. The commission found that the explosion as a result of which the ship sank was caused by persons on shore who acted out of sympathy with the deportees. (H. By.)

Education.—1938–39, Arab public system maintained by government, 395 schools (12 with secondary sections), 50,020 scholars; Moslem schools, private 181 (2 with secondary sections) with 14,172 scholars; Jewish public schools (1939–40) 407 (including 6 training colleges and 18 secondary, 5 trade and vocational schools) with 56,056 scholars; Jewish private schools 308 (including 22 secondary schools and 2 training colleges) with 25,153 scholars; Christian schools 192 with 23,996 scholars; Hebrew university, Jerusalem (1939–40) 133 teachers, 1,106 students.

Banking and Finance.—Revenue and expenditure (actual 1939–40) revenue £P.6,768,352; expenditure £P.6,004,738; (1940–41) revenue est. £P.8,435,856; expenditure est. £P.8,857,584; public debt (March 31, 1939) £P.4,475,000; surplus balance (April 1, 1939) £P.2,533,265; notes in circulation (June 30, 1939) £P.5,931,967; exchange rate £P.1=£1 sterling=about $4.03 (Dec. 15, 1941).

Trade and Communication.—Overseas trade 1939 (merchandise): imports (excluding military stores) £P.14,632,822; exports, domestic £P.5,117,769; re-exports £P.348,682. Communications and transport: roads (1939) all weather 1,110 mi.; seasonal about 1,100 mi.; railways (1939) 649 mi.; airways (1938): passengers 600, mail 86.9 tons; shipping (1938) entered 1,971 vessels; 5,201,473 net tons. (Dec. 31, 1939) Motor vehicles licensed: 4,362 private cars, 1,157 public cars, 862 buses, 2,688 trucks and vans, 1,158 cycles, 10 tractors; wireless receiving set licences (1938) 35,708; telephone subscribers (1938), number 9,241.

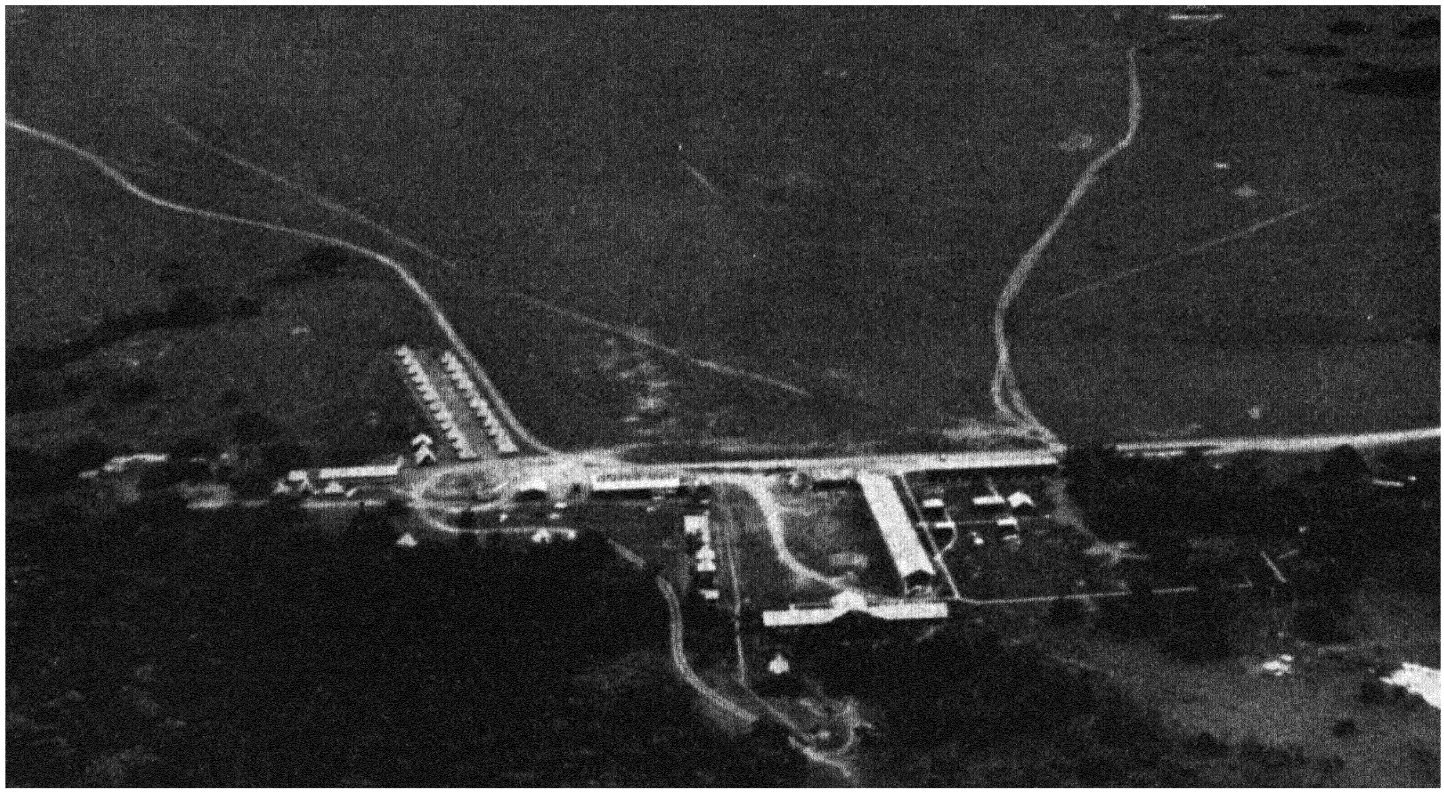
Agriculture and Mineral Production.—Production 1939: potash (exports) £P.381,162; citrus fruits (exports) £P.3,807,570; (in metric tons): barley 78,800; wheat 89,200; olive oil 3,000; maize 6,200; tobacco 500; potatoes 10,400; sesamum 3,800; wine (1938) 30,000 hectolitres.

Panama. A republic at the juncture of Central and South America: area, including the Panama Canal Zone (under United States jurisdiction), 34,169 sq.mi. Returns from the Sept. 8, 1940 census had not been made public at the close of 1941; the total, however, was estimated at somewhat more than 600,000, not including the Canal Zone (1940 census: 51,827). The chief cities are Panama, the capital (1930 census: 82,827; 1941 est., 100,000), and Colón (1930: 33,460; 1941 est., 50,000). President (after Oct. 1941): Dr. Ricardo Adolfo de la Guardia.

History.—The most important development in Panama during 1941, from both internal and external points of view, was the bloodless coup d'état of Oct. 7 which deposed Dr. Arnulfo Arias from the presidency. Behind this event were both domestic and external factors. On assuming office late in 1940, Arias had pushed through a new constitution (effective Jan. 2, 1941), which extended his presidential term and increased his powers. He then embarked upon numerous changes. In the ensuing months his supporters were able to claim among his achievements settlement of the long-standing boundary dispute with Costa Rica, judicial and administrative reorganization, a social security system, agricultural aid through a loan system and a homestead law, and other reforms.

On the other hand, a steadily increasing opposition, headed by the president's brother, Harmodio Arias, former president himself and later a leading editor, charged suppression of civil liberties, including freedom of the press and unfair discrimination against foreigners. The president's policy of defiant antagonism toward the United States, his refusal to co-operate in common defense measures, and his pro-axis declarations and countenancing of axis propaganda were also severely criticized, as was his domineering attitude toward his associates and subordinates.

In March, after considerable pressure from within and without, Pres. Arias granted to the United States permission to erect canal defense outposts in Panama. His refusal, however, in September, to permit arming of Panamanian merchants ships



U.S. AIR BASE at Rio Hato, Panama, outside the Canal Zone. On March 5, 1941 President Arnulfo Arias of Panama granted the U.S. permission to establish bases on his nation's territory to strengthen defenses of the Panama canal

(many of which were United States-owned) roused strong criticism and brought on a serious crisis. A few days later Arias secretly left the country for a brief visit to Cuba, and the opposition took advantage of the fact that his absence was a violation of the constitutional requirement that permission be obtained from the national assembly. On Oct. 9, in strict conformity with the constitution, the cabinet proclaimed Second Presidential Designate (*i.e.*, "second vice-president") Ernesto Jaén Guardia acting president (the First Designate being also out of the country). The cabinet then resigned, and a new cabinet, headed by Dr. Ricardo Adolfo de la Guardia, was installed. Pres. Jaén then resigned, and under the constitution, Dr. de la Guardia became president.

Meanwhile, from his exile, Dr. Arias charged the United States with conniving in his deposition. So, too, did the axis nations. No supporting evidence was presented, however.

Pres. de la Guardia promptly took steps to bring Panama into close accord with the United States, despite thinly veiled threats from Germany and Japan. The ban on armed merchant ships was lifted Oct. 20, and a German diplomatic attaché, accused of heading nazi propaganda activity, and the Spanish ambassador, who had publicly criticized Panama's foreign policy, were expelled. In December, Panama promptly aligned itself with the United States and declared war against the principal axis powers.

Education.—There were more than 600 primary schools in 1941, with some 60,000 enrolment, several secondary schools (nearly 4,000 enrolment), and the National university, with around 500 students, at Panama.

Finance.—The monetary unit is the balboa, equal to the U.S. dollar.

Communication.—Panama had 257 mi. of railway and 726 mi. of highway in 1941, not including a 55 mi. link of the Inter-American highway and the transisthmian highway (connecting Panama and Colón by road for the first time), under construction with completion expected by the end of 1942. Panama's strategic geographic position makes it the hub of inter-American air and maritime transport. The merchant marine is one of the largest in Latin America.

Trade and Resources.—In 1939 imports were $20,464,000, exports (excluding $3,339,000 re-exports) $3,487,000 in value. In the absence of complete official compilations, 1940 imports were estimated at $23,000,000, exports at $4,600,000. The United States supplied $19,070,324 of imports in 1940, 42% more than in 1939, and took $4,279,787 of all exports (1939: $3,851,632, or 85.8% of all exports). In the first nine months of 1941, Panama's imports from the United States alone aggregated $23,663,980 value, 80.7% more than in the same period of 1940, while exports to the United States rose 14%, to $3,342,921. Tourist and ship purchases and Canal Zone trade offset the unbalance between imports and exports. Imports comprise foodstuffs, textiles and miscellaneous manufactures. Domestic exports are mainly bananas (79% in 1939). Some other fruits are grown in quantity, and gold mining is important. The economic bases of national life, however, stem from the canal. (*See* CENTRAL AMERICA; HISPANIC AMERICA AND WORLD WAR II.) (L. W. BE.; L. C. DEA.)

Panama Canal and Canal Zone.

Area, 552·95 sq.mi., of which 190·94 are water; the population, as of the yearly census taken June 30, 1941, exclusive of U.S. army and navy personnel, 42,346, of whom 15,434 were United States citizens. The length of the canal from shore line to shore line is 40·27 mi. and 50·27 mi. from deep water to deep water. Both the canal and Canal Zone are under the jurisdiction of the United States.

The Panama canal connects the Atlantic and Pacific oceans through the narrow isthmus of Panama at approximately 9° N. latitude and 79° W. longitude. It was opened to traffic on Aug. 15, 1914. The canal was constructed because of the distances it saves ocean commerce. Between New York city and San Francisco, the distance of 13,135 nautical miles by way of the Straits of Magellan was reduced to 5,262 by the canal, a saving of 7,873 mi.; from Liverpool to San Francisco the distance by way of the Straits of Magellan, 13,502 mi., was reduced to 7,836 mi., a saving of 5,666 mi. It is estimated that the saving of four days at sea will pay the cost of tolls through the canal, not taking into account the commercial advantages that accrue from the time saved.

During 1941 there was a great increase in local activity in the Canal Zone. The total force employed by the Panama canal and Panama Railroad company in June 1941 was 7,260 on the "gold roll," and 25,994 on the "silver roll." As compared with June 1940 this represents an increase of 2,002 or 38% on the "gold roll," and an increase of 7,103 or 38% on the "silver roll." The terms "gold roll" and "silver roll" originated during the construction period of the canal from the practice of paying the United States skilled labour in gold and paying the native unskilled labour in silver. This classification has been continued, although all employees are paid in U.S. currency. The "gold roll" comprises the supervisory, technical, higher clerical and highly skilled mechanical employees; these employees are, with a few exceptions, citizens of the U.S.

The gross capital investment as of July 1, 1940 was $559,635,-

638, and the net investment, after deducting reserves, $509,170,281. An interest return of 3% on the net capital investment would have been $15,275,108 for the year's operations, or $5,414,330 more than was actually realized.

The increase in local activity evidenced by the increased working force in 1941 was due to the construction activities in the Canal Zone for national defense projects of the U.S. army and the U.S. navy, and the project for the improvement and enlargement of the capacity of the Panama canal by the building of a third set of locks. The latter project involves the construction of a complete new set of locks at Gatun, Pedro Miguel and Miraflores, with by-pass channels paralleling the existing facilities. The size of the new locks will accommodate the largest existing vessels. The length of each lock chamber in the new set of locks will be 1,200 ft., the width 140 ft. and usable depth 45 ft., as compared with the 1,000-ft. length, 110-ft. width and 40-ft. depth of the present locks. The third set of locks will consist of only 6 chambers as compared with the 12 chambers in the existing locks. The flights of locks in the existing sets are duplicate or "double barrelled," and ships may be passed in opposite directions simultaneously. The estimated total excavation for the third locks project is 71,837,000 cu.yd. of material; the estimated total cost for the third locks project is $277,000,000, including appurtenant works.

Revenues for the fiscal year 1941, principally from tolls, totalled $19,474,896 and the net appropriation expenses were $9,614,118, which left a net revenue of $9,860,778, or a return of 1.95% to the United States government on its investment in the canal enterprises.

During the fiscal year ended June 30, 1941, there were 4,727 transits of ocean-going commercial vessels in comparison with 5,370 in the fiscal year 1940. Net tonnage (Panama Canal measurement) of the 4,727 vessels transiting in 1941 totalled 20,642,736, and cargo carried aggregated 24,950,791 long tons.

Pan-American Highway: *see* ROADS AND HIGHWAYS; *Inter-American Highway.*

Pan American Union.

An international body created in 1891 and maintained by the 21 western hemisphere republics to promote peace, commerce and friendship between the republics by fostering economic, juridical, social and cultural relations. The union is supported by annual contributions from all member countries, in amounts proportional to population. Special divisions deal with trade, economics, agricultural co-operation, juridical matters, intellectual co-operation and other subjects, with an especially well organized division of economic information. Headquarters: Washington, D.C.; director general, Dr. Leo Stanton Rowe; assistant director, Señor don Pedro de Alba.

Among the functions of the union is the sponsoring of inter-American conferences, of both a general and a specialized nature, and the facilitating of the work of inter-American committees and similar organizations. During the year 1941 the union was especially active in promoting inter-American co-operation in the face of World War II. Under its aegis two important regional conferences were held, sequels to the second meeting of the foreign ministers of the American republics (popularly called the Havana conference) in July 1940: the Economic conference of the Río de la Plata at Montevideo in February (*see* URUGUAY) and the third meeting of the Inter-American Union of the Caribbean, at Port-au-Prince in May. Other specialized inter-American conferences during 1941 included a South American railway congress at Bogotá and a Pan American geography and history congress at Lima. The union issues several periodicals as well as numerous irregular publications on special topics of American interest (see below).

The Inter-American Financial and Economic Advisory committee, set up under union auspices in Sept. 1939, having effected a coffee quota agreement in 1940, turned its attention to studies of similar plans for the regulation of cacao and cotton.

Unofficial suggestions were made during the year that, in view of changing world conditions, the Dominion of Canada be invited to become a member of the union. The union itself, however, gave neither official nor unofficial consideration to the proposal.

As the year closed, the union was preparing for the third meeting of the foreign ministers of the American republics, which was scheduled to meet at Rio de Janeiro on Jan. 15, 1942. (*See* HISPANIC AMERICA AND WORLD WAR II.)

Paper and Pulp Industry.

The pulp and paper industry in 1941 was approaching wartime economy, with its problems of inflation, priorities, transportation, shortages of materials and high production requirements.

In brief, it was the greatest year in the industry's history from the production standpoint. More than 16,000,000 tons were produced, or 11% more than in 1940 (14,372,000 tons).

Every effort was being made to enable the industry to meet its 1942 production requirements of about 26,000,000 tons, including newsprint and paperboard. In 1941 the production, including these grades, was about 21,600,000 tons. It is interesting to note the 1941 productive capacity of the industry based on a 310-day basis as shown in Table I.

Table I.—*United States Paper Production Capacity for 1941*

Kind of paper	Capacity* (1 ton = 2,000 lb.)
Newsprint	1,080,000
Groundwood	700,000
Book**	2,105,300
Writing	758,000
Cover	30,000
Text	16,200
Sulphite and other wrapping	1,250,000
Kraft wrapping	1,700,000
Tissue	794,000
Paperboard	8,650,000
Building	938,000
All other	260,000
Total	18,280,500

*Including idle mills and equipment.
**Including coating raw stock and machine-coated papers.

In Oct. 1941 the industry was running at 106.7% of capacity. In the 36 years from 1904 to 1940 paperboard production increased 1,070%.

In the same period paper production increased 190%. This increase on the part of paperboard was due to the increased use of packages. In the same period per capita consumption of paperboard increased 630%, while the increase for paper was 93%.

Table II.—*United States Paper Production, 1937-40*
In Short Tons (U.S. Census)

	1937	1938	1939	1940

Total	6,993,334	8,851,740

Canada.—The rated capacity of Canadian mills is set at 4,300,000 tons, of which 2,869,266 tons represent newsprint. A new machine was installed in the mill of the Rolland Paper company. There were no other major improvements during the year.

Table VI gives the statistics of wood pulp production and consumption in Canada for 1939, the latest figures available.

Table VI.—*Canadian Production and Consumption of Wood Pulp, 1939*

Material in tons (2,000 lb.)	Production	Consumption
Sulphite, bleached	404,268	105,477
Sulphite, unbleached	624,552	534,726
Sulphate	292,066	184,309
Other / Soda	21,502	12,685
Chemical screenings	27,760	27,760

Mechanical screenings	58,082	47,992
Total, all grades	4,166,301	3,482,329

United Kingdom.—There were no up-to-date statistics available regarding pulp and paper production in the British Isles. In Great Britain there was established a Paper Control board. The size of newspapers was reduced. This was in part occasioned by the urgent need of shipping for other more important purposes. In Australia a similar action for the same purposes was reported.

World Pulp Production.—World statistics may mean little under the disrupting circumstances of war. The 1938 world production of chemical pulp was the latest for which world figures were available.

Table VII.—*World Production of Chemical Pulp*

1938 (thousands of short tons)

(R.G.M.)

Papi, Gennaro (1886–1941), U.S.-Italian conductor at the Metropolitan Opera house in New York city, was born in December in Naples, Italy. He began his musical education at the Conservatory of San Pietro a Maiella at Naples and was graduated from the Naples Conservatory of Music in 1904. He became assistant conductor at the San Carlo in Naples, 1905, was assistant to Richard Strauss, 1905–08, and assistant to Campanini at Covent Garden, 1911–12. He was engaged by Arturo Toscanini in 1913 as assistant director at the Metropolitan in New York city. In 1916 he conducted his first opera and thereafter he was one of the leading conductors of Italian repertoire at the Metropolitan. He died in New York city, Nov. 29.

Papua: *see* BRITISH EMPIRE; PACIFIC ISLANDS, BRITISH.

Paraguay. An inland republic in southern South America. Area, 154,165 sq.mi.; pop. (1938 official estimate: 954,848) approximately 990,000 in 1941. Capital: Asunción (104,819). Other important cities (with est. pop.) are: Villarrica (20,000); Concepción (11,000); Encarnación (10,000); Paraguarí (10,000). The population is almost entirely Roman Catholic, except for some 10,000–15,000 Mennonites in settlements in the Chaco area. Spanish is the official language, but most of the population outside of Asunción also speaks Guaraní, an Indian tongue. President in 1941: Gen. Higinio Morínigo.

History.—Political discord and uncertainty, accompanied by ironclad censorship and rigorous repression, marked the year in Paraguay. Scrapping of the progressive policies of Pres. José Félix Estigarribia, whose death in Sept. 1940 had brought to power Gen. Morínigo and the army group supporting him, caused two unsuccessful revolutionary outbreaks. Frequent rumours of an attempted comeback by totalitarian-minded former dictator Gen. Rafael Franco (exiled to Uruguay in 1936) failed to materialize.

Paraguay participated in the Río de la Plata regional conference at Montevideo in January (*see* URUGUAY), and in June concluded a comprehensive trade treaty with Brazil (*q.v.*). Relations with the United States, although lacking the cordiality which marked them under Pres. Estigarribia, were friendly, and on Dec. 10 the government announced Paraguayan solidarity with the United States "in the face of Japanese aggression."

Education.—There were nearly 2,000 primary schools in 1941 and a national university at Asunción. Education, however, is backward, since government efforts to expand facilities have failed to materialize, largely because of economic and political uncertainties.

Finance.—The monetary unit is the peso, valued at approximately ½ cent U.S. in 1941 (or 70 to the Argentine peso). The gold peso is used in foreign exchange transactions (value: 60.86 cents U.S. in 1941).

Trade.—In 1940 imports (chiefly textiles, tinplate for canning, foodstuffs and miscellaneous manufactures) totalled 14,832,657 pesos, a 16% rise; exports, 11,385,345 pesos, a 29% decline from 1939. Higher prices of imported goods and lower value of export commodities, both caused primarily by World War II, were responsible for the changes. The main exports were quebracho extract, 32,066 tons (22.1% of export values); canned meat, 9,100 tons (15%); yerba maté, 10,092 tons (12.9%); hides (12.5%); cotton, 19,347 bales (11.1%); lumber (6.1%); petit grain oil, 164 tons (4.5%). Exports went mainly to Argentina "in transit," 36.4% (1939: 44.7%); Argentina 22.5% (14.2%); United States 20.9% (14.7%); Great Britain 12.7% (7.8%); Uruguay 3.2% (2.6%). Latin American areas (including transit goods to Argentina) took 62.4% (1939: 61.6%). Imports were supplied chiefly by Argentina, 45.1% (1939: 37.5%); United States 21.3% (9.7%); Japan 12.7% (12.9%); British empire 8.6% (8.2%); Brazil 3.1% (3.1%).

Communication.—External communication is primarily by the Paraguay river to Buenos Aires (a route virtually monopolized by one steamship company), by rail to Argentina and by air. A railway from Asunción to Guairá, to connect with a Brazilian line already under construction, was being studied in 1941. There were, in 1941, 441 km. of railway. A highway system was being expanded through United States financial and technical aid obtained by Pres. Estigarribia's administration in 1939, at a total cost of $4,000,000.

Agriculture.—Paraguayan resources are agricultural, pastoral and forest.

Under the Agrarian statute of Feb. 29, 1940, provision was made for distribution of land to farmers, establishment of agricultural colonies and the setting of certain minimum cultivation acreage for leading crops, with areas as follows (in hectares): cotton 102,690 (1940–41 actual: 75,000); corn 71,190; mandioca 61,275; beans 26,984; peanuts 15,540; tobacco 7,926; rice 4,633; castor beans 3,850; wheat 1,235; potatoes 374; onions 160. Important crops not affected include sugar (1940 production: 12,447 tons), coco-nut oil and tung oil (1940 was the first important producing year of the latter). Cattle are raised extensively, with canned meats and meat extracts an important export item. Quebracho, source of tannin, is the leading forest product, with Yerba maté and petit grain oil next in importance.

Manufacturing.—Industry is chiefly textile manufacture, flour milling, and tannin extraction. (L. W. Be.)

Parents and Teachers, National Congress of.

The National Congress of Parents and Teachers, represented locally by parent-teacher associations, was established in Washington, D.C., Feb. 17, 1897, as the National Congress of Mothers. The membership, however, for many years included fathers, teachers and other citizens. On April 15, 1941, there were 2,480,188 active members enrolled in 28,050 units in the 48 states, the District of Columbia, Hawaii, Alaska and Puerto Rico.

A special war program was adopted in 1941 and was being translated into activity in all local associations. The program concentrated on the following seven areas of parent-teacher endeavour: Conservation of human and material resources; registration and identification of children; health through nutrition and increased production of protective foods; educational emergency; national victory book campaign; prevention of epidemics through immunization; purchase of U.S. defense savings bonds and stamps.

The *National Parent-Teacher* is the official parent-teacher magazine, issued ten times a year. The *National Congress Bulletin* is sent monthly from September to June to every local association. Among the many publications are the annual convention *Proceedings* and *Schools for Democracy*. The office of the National Congress is at 600 S. Michigan blvd., Chicago, Ill. President (1941): Mrs. William Kletzer of Portland, Ore. (V. M. K.)

Paris. Capital and largest city of France, Paris combines the features of an administrative and cultural centre with those of a large industrial town. Pop. (1936) 2,829,746; of Greater Paris, 4,933,855. On June 9, 1940, when the government, headed by Premier Paul Reynaud, quit the city because of the German advance (the German armies entered Paris June 14) Paris ceased to be the capital. The French government, headed by Marshal Henri Philippe Pétain, was located in Vichy (*q.v.*); Paris remained under German military occupation.

Like the rest of France, Paris lived on short rations as regards both food and fuel, and the people suffered a good deal from cold during the winter of 1940–41. There was a gradual drifting back to Paris, however, of the great numbers of refugees who fled from the city in June 1940; and unemployment, which at one time was estimated to be as high as 500,000, had fallen to about 100,000 by the end of 1941. The Germans encouraged the French factories to continue production and in some cases supplied raw materials from Germany and from German-occupied regions, exacting payment in the manufactured goods of the factories.

Despite the stern reprisals, including the mass shooting of hostages, which were inflicted for acts of revolt against the German military authorities, there were sporadic acts of violence in Paris during 1941. (*See* France.)

There were virtually no taxicabs or automobiles on the streets of Paris, apart from those belonging to the German officers or reserved for certain public services. Horse-cabs and bicycles became more common and the "Métro" (subway) was overcrowded because of the disappearance of other means of transportation. A curfew was enforced from midnight until 5 A. M., and anyone on the streets without special permission was liable to arrest, with the double danger of being treated as a hostage after the practice of inflicting merciless reprisals for attacks on German officers went into effect.

Food rations in Paris during 1941 were generally fixed at less than thirteen ounces of meat per week, a little over thirteen ounces of bread per day, and the following allotments: three and a half ounces of rice, eighteen ounces of sugar, nine ounces of noodles, seven-tenths of an ounce of soap, twenty-eight ounces of fats (oleomargarine, lentils and dried beans), eleven ounces of cheese. The allowance of potatoes was about five pounds a month. Sick persons and young children were allowed to purchase a pint of milk a day.

A card system was introduced for clothing, and there was an extreme shortage of cloth and thread. Tickets entitling the holder to purchase a new pair of shoes were doled out very sparingly, the applicant being required to prove that his old shoes were worn out beyond reasonable hope of repair. Silk stockings were at a premium because of the lack of new supplies and the wear and tear incidental to a mode of life in which walking and bicycling were often necessary modes of getting about.

There were a number of substitutions, pressed strawberry leaves being used as a compensation for tobacco. Some observers compared the bare aspect of Parisian shop windows under the nazi occupation to the impression of Russian shops in Moscow and other soviet cities. Another occasional feature of life in Paris that would recall the days of so-called war communism in the U.S.S.R. was the practice of paying in kind for services in some cases. Artists who took part in a benefit for French war prisoners received as a testimonial for their co-operation baskets of provisions. Each basket contained a duck, a chicken, some artichokes, a pound of mushrooms and two pounds of peaches.

Despite the undernourishment and the many privations of daily life, amusements in Paris went on much as usual. Both the Opera and the Opéra Comique played their regular repertories, and the German State Opera company gave some performances in Paris. Sixty theatres, 66 dance halls and night clubs and 175 motion-picture theatres were functioning in the summer of 1941. Audiences showed a distinct preference for old French pictures to new German films. Such fashionable restaurants as Maxim's, the Lido and the Boeuf sur le Toit were open for business.

A feature of life in Paris during 1941 was feverish speculation in luxuries, at a time when many necessities were short or were entirely lacking. The supply of jewels apparently overbalanced the demand, and prices fell somewhat. On the other hand, paintings, books, furniture and stamps were eagerly sought by purchasers, and some fine pieces of porcelain of the 18th century brought prices of 200,000 and 300,000 francs at the sales in the Hotel Drouot. Parliament, Houses of. The sixth session of the 37th parliament of the United Kingdom of Great Britain and Northern Ireland was opened by the king in person on Nov. 21, 1940, and it was not until many months later, after the destruction of the commons' chamber during the raid of May 10 (*see* London), that an interested public heard that the ceremony had taken place, not—according to invariable precedent—in the house of lords, but (as a rehearsal) in an entirely different building that had been prepared in anticipation of the disaster that eventually overtook the palace of Westminster. The catastrophe can be called so in the material sense only; it had no effect whatsoever on the continuity or on the spirit of the mother of parliaments.

House of Commons.—In the ten months Jan.–Oct. 1941 there were 21 by-elections, with no change in the representation of parties. From the outbreak of war to the same date 69 vacancies had been filled, 23 as the result of contested elections—the official candidates being rejected on two occasions, each time in favour of an unofficial supporter of the government. Before the end of the session an act prolonging the life of this parliament for a further year was passed; of the original 615 members elected in 1935, 147, or nearly a quarter, had been replaced.

Early in the year a simplified procedure had been adopted for determining the existence of a vacancy due to the presumed death of a member through enemy action; and in March, after Malcolm MacDonald had been appointed as high commissioner in Canada, the House of Commons Disqualification (Temporary Provisions) act was passed, which, for the war period only, prevented the disqualification from membership of the house on appointment to any office or place under the crown, on the prime minister's certificate. A select committee was also appointed to inquire into the whole matter of disqualification arising from this or other causes. Besides Malcolm MacDonald, other members serving the state abroad included Sir Samuel Hoare (Madrid), Sir Stafford Cripps (Moscow), Oliver Lyttelton (middle east), Sir Ronald Cross (Australia) and Duff Cooper (far east).

At the beginning of May the ministries of shipping and transport were amalgamated, and F. J. Leathers (who was given a peerage), a prominent industrialist and director of many coal companies, was put in charge; also, a new ministerial office was created, that of minister of state (£5,000 per annum), with a seat in the cabinet but without departmental duties. Lord Beaverbrook (unpaid), until then minister of aircraft production, was its first holder; on June 30, when he became minister of supply, he was succeeded by Oliver Lyttelton, who went to the middle east as the representative of the war cabinet.

House of Lords.—Following the appointment of Lord Halifax as ambassador in Washington, Lord Lloyd became leader in January, and on his death in February was succeeded by Lord Moyne, who also took Lord Lloyd's place as colonial secretary. Lord Addison was leader of the Labour party, and the marquis of Crewe of the Liberal; the chairman of committees was the earl of Onslow. Eleven new peerages were created during the session, two of them for sitting members of the house of commons—Herwald Ramsbotham (then president of the board of education) and Sir Hugh Seeley. One baron (Camrose) was raised to a viscountcy. (*See* also CABINET MEMBERS.) (L. H. D.)

Parmoor, Charles Alfred Cripps, 1ST BARON (1852–1941), British lawyer and statesman, was born Oct. 3. Lord Parmoor, a staunch foe of appeasement, resigned from the Labour party after his son, Sir Stafford Cripps, was expelled from the party in 1939 for his attempts to form a "popular front" in Britain. Lord Parmoor approved the principle of the League of Nations, but deplored the failure of the signatories to make it an effective instrument for peace. He died at his home in Buckinghamshire, Eng., June 30. (*See Encyclopædia Britannica.*)

Parr, Sir (Christopher) James (1869–1941), New Zealand statesman, was born James Christopher Parr, May 18, in Waikato, N.Z. He became mayor of Auckland in 1911, was knighted in 1914 and from 1920 to 1926 served in the New Zealand government as minister of public health, minister of justice, minister of education and postmaster general. He was then high commissioner in London (1926–29), during which period he also represented his government at the League of Nations. Sir James was a leader of the legislative council of New Zealand from 1931 to 1933 and was again high commissioner from 1934 to 1936. He died at his home in Berkhamsted, Hertfordshire, Eng., May 2.

Patents. New and important duties were imposed on the United States patent office by the country's preparations for defense and for actual war. The vital part certain to be played by inventions in the conflict was early recognized. It was accordingly imperative that all applications for patent currently filed or pending should be scrutinized to determine the military usefulness of the inventions they disclosed. A patent office defense committee, composed of examiners familiar with aeronautics, ordnance, explosives and other sources of warlike mechanisms and materials was appointed by the commissioner of patents to perform this task, in which it co-operates with experts of the army and the navy. In addition there was organized a division to decide in what cases licences should be granted to file outside the U.S. applications covering inventions originating in the U.S. These functions were originally fulfilled by the Export Control board. The activities of the defense committee and the division in charge of licensing were increased in volume and significance by the United States' entrance into World War II.

As one of the exigencies of war the patent office was ordered removed from Washington, D.C., to Richmond, Va., to remain there until the return of peace. Those of its sections most intimately related to the evaluation and safeguarding of warlike inventions revealed in applications, those assisting inventors in research, and the solicitor were retained in Washington, D.C.

Applications for patents filed in the year ended Dec. 31, 1941, numbered 69,857. This total was considerably below that for the preceding calendar year. The decrease was in large part attributable to the restrictions and difficulties of exchange and communication confronting inventors in foreign countries, especially those occupied by Germany and Italy.

Receipts of the office in 1941 declined heavily while expenditures mounted. Earnings totalled $3,979,310.16. The filing of fewer applications caused the decrease. Expenses were $4,728,929.94. Their increase was necessitated by the discharge of the additional duties assumed. (*See* also LAW: *Patents.*) (C. P. Co.)

Paxton, William McGregor (1869–1941), U.S. artist, was born June 22 in Baltimore, Md. He began painting at the Cowles Art school and continued at the École des Beaux Arts in Paris, returning to the United States in the early 1890s. He excelled in interiors, and his oils have frequently been compared with the early Dutch masters. Among his better-known canvases are portraits of Grover Cleveland and Calvin Coolidge. Many of his paintings are hung in the Boston Museum of Fine Arts and the Corcoran Gallery of Art, Washington, D.C. He died at his home in Newton Center, Mass., May 13.

Peaches. Unusually large peach crops were harvested in 1941 in all producing areas of the United States except in Iowa, Nebraska and Kansas, where many trees were killed or severely damaged by the low temperatures of Nov. 1940. The 1941

U.S. Production of Peaches in Leading States, 1941 and 1940

State	1941 bu.	1940 bu.	State	1941 bu.	1940 bu.
California			North Carolina	2,760,000	1,344,000
Clingstones*	13,626,000	14,709,000	Alabama	2,464,000	700,000
Freestones	8,626,000	8,876,000	Pennsylvania	2,308,000	2,500,000
Georgia	5,561,000	4,216,000	Illinois	2,254,000	200,000

Arkansas	3,042,000	2,040,000	Tennessee	2,186,000	264,000
Michigan	2,700,000	1,682,000	Virginia	2,017,000	1,392,000**

*Mainly for canning. **Includes 56,000 bu. harvested but not utilized because of excessive cullage owing to rain damage at harvest time.

crop was 69,610,000 bu., compared to 54,430,000 bu. in 1940 and a ten-year (1930–39) average of 54,356,000 bu. The Canadian crop in 1941 was 873,800 bu.; 787,000 bu. in 1940. In the year ending June 30, 1941, 88,000 cases of canned peaches were exported from the United States. Exports in 1940 were 1,920,000 cases and for the five years ending in 1936 the annual average of such exports was 1,672,000 cases. (S. O. R.)

Peanuts. The 1941 peanut crop for picking and threshing in the United States was estimated by the department of agriculture at 1,474,690,000 lb. This is about 15% less than the record 1940 crop of 1,734,340,000 lb., but almost 40% above the ten-year (1930–39) average of 1,063,374,000 lb. The yield per acre in 1941 was 772·9 lb. In 1940 the yield was 864·1 lb. per acre, and the ten-year average was 713·6 lb. per acre. The acreage in 1941 for picking and threshing, and not including that part of the crop used for forage, was 1,908,000 ac., compared with 2,007,000 ac. in 1940, and a ten-year average of 1,486,000 ac. November estimates by the department of agriculture are shown in the accompanying table.

U.S. Production of Peanuts by States, 1941 and 1940

	1941 lb.	1940 lb.		1941 lb.	1940 lb.
Georgia	488,250,000	577,500,000	Oklahoma	40,825,000	51,000,000
North Carolina	284,760,000	371,000,000	Mississippi	15,515,000	13,500,000
Alabama	224,000,000	205,800,000	South Carolina	13,050,000	23,250,000
Texas	168,000,000	179,200,000	Arkansas	10,500,000	12,100,000
Virginia	157,500,000	216,000,000	Tennessee	6,080,000	6,000,000
Florida	61,100,000	73,320,000	Louisiana	4,510,000	5,580,000

Chinese exports of peanuts to Germany and Japan increased sharply in the first six months of 1941, owing particularly to the European shortage of edible oils, and were 38,800 short tons (shelled) compared with 25,533 short tons in the first six months of 1940. Following the outbreak of war between Germany and Russia such exports to Germany ceased. (S. O. R.)

Pearl Harbor: *see* HAWAII; JAPAN; UNITED STATES; WORLD WAR II.

Pears. The 1941 pear crop in the United States was estimated by the department of agriculture at 30,819,000 bu. compared with 31,622,000 bu. in 1940 and a ten-year (1930–39) average of 27,278,000 bu. The three Pacific states, California, Washington and Oregon, produced 19,650,000 bu., of which 14,069,000 bu. were of the Bartlett variety. The Canadian 1941 crop was estimated at 510,400 bu., a decrease from the 576,300 bu. of 1940. United States exports of canned pears in the year ending June 30, 1941, were 55,000 cases compared with 1,376,000 cases in 1940 and an annual average of 1,619,000 cases in the five years 1931–36. The United States and Argentina made a reciprocal reduction Oct. 14, 1941 on import duties on pears and apples and certain other fruits. The 1941 Argentine pear crop was 3,256,000 bu., an increase of about 23% over that of 1940. From January through June 1941, Argentina exported 576,210 bu. of fresh pears. Swiss production was 8,846,000 bu. in 1941 and 1,276,000 bu. in 1940. The Swiss government fixed prices on fruit to prevent profiteering.

U.S. Production of Pears in Leading States, 1941 and 1940

Peat. Although peat is dug in a number of countries, production data are available only from the United States, where the output is comparatively small—70,097 short tons in 1940, which was supplemented by 21,689 tons of imports. In the past, imports had been greater than domestic production, and only a part of the reduction in imports incidental to war conditions had been offset by increased output. Most of the United States output is used as a soil conditioner, but in Europe peat is extensively used as a low-grade fuel. (G. A. Ro.)

Pellagra. Important to the affected person is the acceptance of the view that the early signs and symptoms of pellagra produce an extremely complex clinical picture. Such early nonspecific symptoms are common to many deficiencies and other diseases. Weakness is an early symptom arising in persons with pellagra, and the muscles of such affected persons contain less nicotinic acid than normal. Manifestations may appear months or years after deprivation of nicotinic acid has started.

Clinical pictures of pure deficiency disease, produced by lack of a single vitamin, rarely occur spontaneously. The following considerations are essential for the treatment of a given case of pellagra: (1) to make an accurate and early diagnosis; (2) to supply nicotinic acid or substances rich in it in sufficient concentration over a long enough period of time so that absorption, utilization and storage will be efficacious; (3) to supply also other essential nutrients in optimum amounts for adequate body function; and (4) to treat coexisting diseases, especially those which might increase the requirement for nicotinic acid. If all persons ate sufficient quantities of lean meat, milk, eggs and fish, and a variety of vegetables, pellagra would tend to become less prevalent. Many persons, however, who can afford such foods fail to consume or utilize adequate amounts, and consequently develop pellagra and other deficiency diseases. (*See* also DIETETICS; VITAMINS.)

Pemba: *see* BRITISH EAST AFRICA.

Penner, Joe (1904–1941), U.S. comedian, was born Joseph Pinter in Nagechkereck, Hungary, Nov. 11. His family emigrated to the United States when he was three and settled in Detroit, where he spent his youth. Vaudeville and burlesque houses were the early training schools where he perfected his comedy assets—good timing, a nasal laugh and a pathetic shuffling gait. Broadway audiences howled with laughter at Penner's antics, and his favorite expression, "Wanna buy a duck?" brought chuckles from motion picture spectators. But he made his biggest success on radio programs, and in 1934 he was voted the most outstanding comedian on the air. He was appearing in *Yokel Boy* on the Philadelphia stage at the time of his death, Jan. 10.

Pennsylvania. One of the original 13 states of the United States, Pennsylvania is popularly known as the "Keystone state." Area, 45,333 sq.mi. (288 sq.mi. water); population (1940) 9,900,180, of whom 973,260 were foreign-born whites, including 80,111 of German birth and 197,281 of Italian. Capital, Harrisburg (83,893). Cities with a larger population are Philadelphia (1,931,334); Pittsburgh (671,659); Scranton (140,404); Erie (116,955); Reading (110,568); Allentown (96,-

904); Wilkes-Barre (86,236).

History.—The general assembly met in its biennial session in Jan. 1941 and sat for 28 weeks—longer than in any previous year for about a century. One of the first acts provided for a state defense council. Under authority of the act the organization of a home defense guard of 5,000 was ordered. A state housing board of five members was also created. The state was authorized to co-operate with other states in the regulation of the production of oil. Retail and wholesale merchants were forbidden to sell goods at less than cost with a few exceptions. Penalties were fixed for coal dealers who sell short weight. The re-employment of state employees called into military service was guaranteed with half pay up to $2,000 a year while in the service. Participation in elections was forbidden to any group of voters who aim at the overthrow of the state or federal government by force, and all who advocate such measures were barred from public employment. A civil service board was created in the departments of public assistance, unemployment compensation and liquor control. Under the congressional reapportionment act the state's representation was reduced from 34 to 33. The general assembly was unable to agree on the district to be eliminated and adjourned without action. The validity of the state labour law recognizing the right of workers to organize and bargain collectively was sustained by the state supreme court.

In the November election the Republicans elected their candidates to the supreme and superior courts. They also elected 36 county judges to 9 elected by the democrats, and 10 mayors as against 9 elected by Democrats. The Republicans were also victorious in the special election in the 15th congressional district.

The principal officers in 1941 were: governor, Arthur H. James; lieutenant governor, Samuel S. Lewis; attorney-general, Claude F. Reno; treasurer, G. Harold Wagner; superintendent of public instruction. Francis B. Haas; chief justice, William I. Schaffer.

Education.—There were 57 colleges accredited by the state council of education in 1941, including the Pennsylvania state college, a land-grant institution with 6,720 students and a faculty of 624. In addition there were 14 colleges for the training of teachers with 9,007 students. Included in the public school system in 1941 were 9,253 elementary schools, 1,313 secondary schools, 276 special schools, 482 kindergarten and nursery schools and 667 extension and junior colleges. In the secondary schools there were 701,065 pupils; there were 1,119,459 in the elementary schools and 35,006 in the kindergartens. The teaching and supervisory force numbered 35,798 in the elementary schools and 23,525 in the secondary schools. Expenditures for the year were $218,165,051.

Public Welfare, Charities, Corrections.—The average number of WPA employees for the first ten months of 1941 was 96,690, to whom $61,776,000 was paid; old-age assistance to the amount of $2,295,688 was given to 102,347 persons; and $413,497 was paid in pensions to the blind. The average number of unemployed for the first ten months was 1,993,052, to whom $21,886,634 was paid. There were eight penal and correctional institutions maintained at a cost of $3,800,000. The department of public welfare took over control and direction of 12 county hospitals in June, relieving the counties of the cost of maintaining them.

Table I.—*Leading Agricultural Products of Pennsylvania, 1941 and 1940*

	1941	1940
Corn, bu.	56,594,000	53,640,000
Oats, bu.	32,163,000	31,080,000
Barley, bu.	3,969,000	4,030,000
Tame hay, tons	2,834,000	3,328,000
Tobacco, lbs.	53,203,000	49,590,000
Potatoes, bu.	23,674,000	25,570,000
Apples, bu.	9,313,000	9,100,000
Grapes, tons	16,500,000	23,000,000

Communications.—On May 31, 1941, there were 99,716 mi. of highways in the state, 40,510 mi. of which were classed as state roads, and 44,764 mi. as second-class township roads. The remainder included county and village roads. During the year the highway department spent $67,659,104.61, of which $9,132,187.06 was contributed by the federal government. On Jan. 1, 1941, there were 1,636,800 telephones in use. On the same date there were 11,966.33 mi. of main-line railroads in operation.

Banking and Finance.—On June 30, 1941, there were 399 financial institutions under the supervision of the department of banking. The total resources of these institutions were $3,462,256,725.97; deposits were $2,727,660,990.90. At the beginning of the year there were 1,313 building and loan associations with assets of $377,670,929. On Nov. 5, 1941, there were 686 national banks with a total capital of $163,035,000, assets of $4,068,379,000 and deposits of $3,493,273,000.

The general assembly appropriated $331,147,595 for the biennium beginning July 1, 1941, including $98,000,000 for public relief. Estimated receipts from taxation for the period were $414,141,822. The gross state debt on Sept. 1 was $112,929,000; the net debt was $83,101,196.

Agriculture.—The farmers received $5,723,000 in 1940 from the federal government. Table I shows leading crops, 1941 and 1940.

Table II.—*Principal Industries of Pennsylvania, 1940 and 1937*

	Value of Products	
	1940	1937
Metals	$2,944,848,400	$3,058,279,000
Textiles	795,457,200	819,402,500
Food	740,901,600	770,319,300
Chemicals	518,062,300	409,395,500
Paper and printing	372,074,400	350,436,600
Leather	174,963,900	175,288,000
Tobacco products	92,272,300	85,513,300

Manufacturing.—There were 17,366 manufacturing establishments in 1940, employing 1,419,051 persons to whom $1,940,045,800 was paid in wages. The capital invested was $4,223,471,300 and the value of the goods produced was $6,901,966,000. Table II shows principal industries.

Mineral Production.—The Federal Bureau of Mines reported that the value of the mineral production of Pennsylvania in 1939 was $552,355,651, as against $472,773,327 in 1938.

Table III.—*Principal Mineral Products of Pennsylvania, 1939 and 1938*

	Value	
	1939	1938
Bituminous coal	$188,900,000	$160,965,000
Anthracite	187,175,000	180,600,167
Pig iron	186,302,533	101,266,844
Petroleum	36,200,000	32,762,000
Natural gas	35,268,000	29,544,000
Cement	34,332,649	28,242,913

The state department of the interior reported that the production of anthracite for 1940 was valued at $192,539,500 and the value of the bituminous coal for the same year was $218,504,200. On Dec. 31, 1940, there were 81,946 oil wells which produced 17,434,626 bbl. during the year.

(G. W. Do.)

Pennsylvania, University of.

An institution of higher learning at Philadelphia, Pa. It opened its 1941–42 session with an estimated enrolment of 14,276 and a faculty of 1,597. The following changes in the administration occurred during 1941: Phelps Soule, director of the University Press, was appointed secretary of the university, vice Dr. Edward W. Mumford, deceased; Dr. Charles W. David appointed director of libraries of the university; Dr. George C. Vaillant appointed director of the university museum, vice Horace H. F. Jayne, resigned; Rev. J. Clemens Kolb appointed chaplain, vice Rev. W. Brooke Stabler, resigned; Dr. Edwin R. Keedy appointed dean of the law school; Dr. John M. Fogg, Jr., associate professor of botany, appointed dean of the college, vice Dr. William E. Lingelbach, retired; Dr. C. Canby Balderston, professor of industry, appointed dean of the Wharton school of finance and commerce, vice Dr. Alfred H. Williams, resigned; Dr. J. L. T. Appleton, professor of bacteriopathology, appointed dean of the school of dentistry, vice Dr. Charles R. Turner, resigned; Dr. Robin C. Buerki appointed dean of the graduate school of medicine, vice Dr. George H. Meeker, retired, and director of hospitals of the university.

The facilities and resources of the university were made available to the United States government in 1941 for the national defense program. Particularly significant were the research projects carried on in the various branches of chemistry, engineering, medicine, physics, psychology and surgery; 71 of the projects had to do with war problems. The engineering departments and the Wharton school co-operated in a program of training defense workers in factories; several thousand workers were trained under this program. Fifty-four members of the faculty were called to Washington or elsewhere to aid the government in its research program during 1941. (T. S. G.)

Performing Right Societies. Co-operative associations of composers, authors and publishers of music which function as clearing houses for the licensing of public performance of members' copyrighted music. Performing right societies exist in the principal countries throughout the world. They are founded on the principle of copyright law that the right to control the public performance is vested in the owner of music copyright. The extent of this right varies under the laws of different countries. In the United States an unauthorized public performance is not a copyright infringement unless the element of profit enters into the performance.

In certain other countries, where under the law the element of profit is not a consideration, no public performance of any kind may be had of a copyright work without permission of the copyright owner. Chief performing right society of the United States and sole affiliate in the U.S. of the principal foreign societies in 1941 was the American Society of Composers, Authors and Publishers, familiarly known under the alphabetical designation of ASCAP.

A prolonged impasse between ASCAP and radio over prices and method of payment for broadcasting copyright music was reflected for several months of 1941 in limited musical content of radio programs generally. Even before the end of 1940, the major networks began decreasing the proportion of familiar ASCAP music to minimize the expected break of Jan. 1. After that date, radio made generous use of music in the public domain, notably the works of Stephen Foster and familiar classics treated in modern idioms. Radio's chief source of music became Broadcast Music, Inc. (BMI), sponsored by radio interests when the impasse loomed early in 1940. (For further details *see* RADIO: *Musical Property.*)

ASCAP's extensive difficulties from state-by-state legislation waned during 1941. Several such laws had been found unconstitutional. Early in 1941, however, the U.S. supreme court upheld Florida's right to enact a law hostile to ASCAP's operation, although the constitutionality of its enforcement was not in question. Such difficult obstacles arose to the legal use of copyright music in Florida that a truce was called, with state officials agreeing to work for a rescission of the law. A similar situation developed in the state of Washington.

During 1941 ASCAP elected more than 100 members, its total reaching some 1,400. It continued its sponsorship of creative musical activities, such as fellowships for collegians writing prize musical plays and a national competition for amateur musical playwrights, and in some 100 of the leading law schools the now well established annual Nathan Burkan Memorial competition, with a $100 prize in each school for the best copyright law essay.

While ASCAP's radio revenue was largely depleted in 1941, it was expected that in 1942 it would be 20% to 25% less than in 1940.

Principal officers for 1941 were: Gene Buck, president; Louis Bernstein and Otto Harbach, vice-presidents; George W. Meyer, secretary; Gustave Schirmer, treasurer; E. C. Mills, chairman of administrative committee; John G. Paine, general manager.

Persia: *see* IRAN.

Peru. A republic on the west coast of South America and extending into the Amazon basin. Area, 532,185 sq.mi. including some 100,000 sq.mi. in dispute with Ecuador (*See* below). Pop. (June 9, 1940 census): 7,023,111, officially computed as white and mestizo 52.89%, Indian 45.86%, yellow 0.68%, Negro 0.47%, others 0.1%. Capital, Lima (522,826 in 1940). Chief cities: Callao, the port of Lima (69,601 in 1940), Arequipa (est. 60,000), Cuzco (est. 44,080), Trujillo (est. 33,435), Chiclayo (est. 31,609). President (1941) Manuel Prado y Ugarteche.

History.—The most important single factor affecting Peruvian development in 1941 was the century-old boundary dispute with Ecuador (*q.v.*). The controversy, which arose primarily from vagueness of colonial charters and disagreement as to bases of arbitration, involved an area normally regarded as embracing mainly the undeveloped, thinly populated and scantily explored Amazonian slope—a region long under at least technical Ecuadorian occupation. Since 1925 negotiations had been carried on intermittently at Washington, D.C., but owing to internal political uncertainties in both countries, little or no headway was made.

Following border friction in Jan. 1941, Argentina, Brazil and the United States offered mediation, which both countries accepted. Ecuador, however, insisted that any arbitration or mediation include sovereignty over the coastal province of Túmbez, thus reviving a long-dormant claim. Inasmuch as Túmbez had been under effective Peruvian occupation for more than a century and was inhabited by Peruvians (1940 census: more than 25,000, almost entirely white and mestizo), the effect of Ecuador's claim was to arouse strong Peruvian feeling.

By July, border incidents were almost daily occurrences. Peruvian troops expelled Ecuadorian forces not only from disputed points, but from unquestioned Ecuadorian territory as well—assertedly in retaliation for attacks by Ecuadorians.

Meanwhile, pressure on both countries was exerted by mediating nations and others. At length, an agreement was reached (Oct. 2) under which a 15-km. neutral zone, patrolled only by Ecuadorian civil authorities, was created, effective Oct. 10. This arrangement, although transitory, served to prevent further clashes while mediation efforts were continued.

Amid conflicting charges and countercharges, responsibility for the July incidents, as well as for earlier ones, was difficult to assess. In the background, however, lay Ecuador's political instability, which precluded repression of opposition jingoism, along with deliberate nazi stimulation of "patriotic fervor" in both countries in an effort to prevent achievement of continental solidarity.

Peruvian relations to World War II were marked by increasingly cordial co-operation with the United States in hemisphere defense and other measures. In May, upon the scuttling of axis ships in Peruvian ports by their crews, Peru clamped down upon axis agencies, froze German and Italian credits and closed the German Trans-Ocean propaganda agency. Some friction with the United States arose over U.S. seizure for diversion to the U.S.S.R. of Peru-bound bombers on Oct. 15, but the incident was soon closed. When Japan attacked the United States in December, Peru promptly froze Japanese credits and soon imposed strong restrictions on activities of all axis nationals, at the same time granting to the United States the right to use Peruvian ports and other facilities and placing rigid export control on strategic materials.

Internally the country suffered a serious catastrophe when a flood swept the city of Huaráz (est. pop. 24,000) on Dec. 13, with the loss of 500 lives and heavy property damage.

Education.—In 1939 there were 4,727 elementary schools (492,989 enrolment), about 216 secondary schools, several technical schools and five universities.

Defense.—Peru had a standing army of 15,000 and reserves of 100,000 men, a 10-vessel navy and 150 planes in 1941.

Finance.—The monetary unit is the sol, valued at 15.4 cents U.S. during 1941 (1940 average 16.2 cents). The national debt was 925,817,000 soles on June 30, 1941 (external: 546,078,000).

Trade.—In 1940 imports (foodstuffs, textiles, machinery and other manufactures) were valued at $51,668,000 (1939: $47,960,000), supplied mainly by the United States, 53.1% (1939: 41.1%), Great Britain, 9.2% (8.4%), Argentina, 7.8% (5.4%), Japan, 5.8% (3.1%), British India, 3.6% (2.5%), Canada, 3.3% (2.7%) and Italy, 2.5% (2.0%). Exports were valued at $65,782,000 (1939: $71,517,000), to the United States, 42.9% (1939: 30.4%), Great Britain, 12.1% (19.6%), Chile, 10.1% (7.8%), Japan 7.8% (2.4%). Latin-American areas supplied 12% of imports (1939: 9.5%) and took 28.18% of exports (23.9%). The leading export commodities were petroleum and its derivatives 24.8% (1939: 29.0%),

copper 18.5% (17.7%), cotton 17.4% (19.7%), sugar 10.7% (10.8%), ores and mineral concentrates 7.6% (5.8%), gold bars 6.0% (3.6%), wool 5.0% (3.8%). Gold exports in all forms totalled 8,963,110 gr. (1939: 6,873,206 gr.) valued at $10,085,804. In the first five months of 1941, import values rose 6%, export 17%, with Japanese purchases (chiefly cotton) increasing nearly twelve-fold (forty-fold in May).

Communication.—Peru normally has good maritime and excellent air communication (by Pan American airways) with other countries, supplemented by a railway connection with Bolivia. The National Air lines and one private company provide extensive internal air service. The German-owned Lufthansa, formerly operating external and internal service, was grounded by government order early in 1941. The highway system, greatly expanded under a 1937 program, was being extended and improved with direct connections from Lima to the Amazon basin over a 16,127-ft. pass.

During 1941 the newly built port of Matarani, expected to replace Mollendo as the principal sea outlet of the south, was completed, and work was begun on a dry dock at Iquitos, Peru's Amazon port.

Agriculture.—Cotton and sugar are the leading agricultural products, with rice, coffee, maize, wheat, coca and vegetable ivory also important. Cotton production in 1940 was 83,030 tons, domestic consumption 7,360 tons, exports 49,904 (1939: 78,663 tons). In the first nine months of 1941, 69,907 tons were exported, 64.5% to Japan. Great Britain took nearly 37,277 tons in 1939, 22,235 in 1940, while Japanese purchase rose from 8,320 tons to 13,439 tons. Sugar exports were 301,954 tons in 1940 (1939: 272,179 tons), almost half to Chile.

Mineral Production.—Metal production in 1940 (in bars, ores and concentrates) was: antimony 896 tons, bismuth 383 tons, copper 38,557 tons, manganese 222 tons, gold 8,963 kg., silver 573,867 tons, lead 37,072 tons, vanadium 2,167 tons, molybdenum 364 tons, zinc 31,588 tons. Under a 1941 agreement, the United States undertook to purchase all surpluses of Peruvian antimony, copper, lead, tungsten, vanadium and zinc.

Petroleum is found in several sections of Peru, but production centres in the north coastal region. Although it makes up the single greatest export category, the contribution to the material economy is limited, owing to foreign ownership and to the relative isolation of the oil fields. In 1941 estimated production was 12,800,000 bbls. (1940: 12,451,000 bbls.).

Rubber, formerly produced on a considerable scale, languished (1940: 70 tons), but special government studies were made during 1941 preparatory to renewed emphasis. (L. W. BE.)

Pétain, Henri Philippe (1856–), French soldier and statesman. See *Encyclopædia Britannica* for his biography. The venerable marshal was called from virtual retirement in 1939 to become French ambassador to Spain after Franco's triumph in the civil war. He remained in this post after the beginning of war in 1939 until May 18, 1940 when, with France's army falling back in a retreat approaching a rout, he was summoned to Paris to act as vice-president of the government council and adviser to the minister of war. On June 16, 1940, he succeeded Paul Reynaud as premier, and the next day he was forced to sue for an honourable peace. With an energy that belied his 84 years he then began the painful task of reconstruction under the watchful eye of France's conquerors. Moving his government to Vichy July 2, he secured from the national assembly authorization to prepare a new constitution. This task he allotted to Pierre Laval (*q.v.*) whom he named as his successor July 12 (but dropped from the cabinet Dec. 13 "for high reasons of internal policy"). On July 10, 1940, Pétain assumed dictatorial powers until such time as the new constitution was ratified. He had to face not only internal unrest but the external pressures of axis domination, Japanese aggressions in Indo-China, and the "Free French" movement of de Gaulle (*q.v.*). His meeting with Hitler at Montoire Oct. 24, 1940, gave promise of a *modus vivendi* with Germany, as did his appointment of the pro-axis Admiral Jean Darlan (*q.v.*) as vice-premier and next in line of succession in Feb. 1941.

Pétain in 1941 apparently followed a two-way policy in which he alternately submitted to Germany, then resisted German demands for the French fleet and for bases in North Africa. On April 7 he declared that "honour commands that we should undertake nothing against our former allies (Britain)." The next month, however, he approved "in principle" the Hitler-Darlan talks on collaboration.

Again, on Aug. 12, he announced that France would work with Germany in the European new order, and on Dec. 1 he met with Goering in occupied France to discuss collaboration. But in his New Year's address for 1942, he asked Germany for an "attenuation of the status imposed upon us following her victory" if there was to be a "sincere rapprochement between the two nations." (*See* also FRANCE.)

Peter II (1923–), king of Yugoslavia, was born Sept. 6, in Belgrade, the son of Alexander I of the house of Karagjorgjevitch. When Alexander I was slain by Croat terrorists in Marseilles in 1934, Peter succeeded to the throne and a regency headed by Prince Paul (Alexander's brother) was set up to rule until Peter reached his majority. When Premier Cvetkovitch signed an axis pact on Mar. 25, 1941, the army revolted, ousted Cvetkovitch and the pro-axis regency and placed Peter on the throne. The boy king's government refused to honour the axis treaty and announced a policy of strict neutrality. Enraged by this unexpected turn of events, Hitler turned his troops on Yugoslavia, crushing its army in a fortnight. Peter and his government fled to Jerusalem April 21, 1941; two months later they set up a government in exile in London. (*See* also YUGOSLAVIA.)

Petroleum. The spreading of the war to encompass most of the globe, translated into a struggle for oil—a prime requisite of all belligerents—focused attention on the location and production of the oil fields of the world. These are shown in Table I, the production figures being for the year 1940.

Table I.—*World Production of Crude Petroleum, by Countries*

(Thousands of Barrels)

Country	1940
North America:	
Canada	8,955
Mexico	40,350
Trinidad	20,219
United States	1,351,847
Other North America	.....
Total	1,421,371
South America:	
Argentina	20,486
Bolivia	110
Colombia	26,067
Ecuador	2,349
Peru	13,427

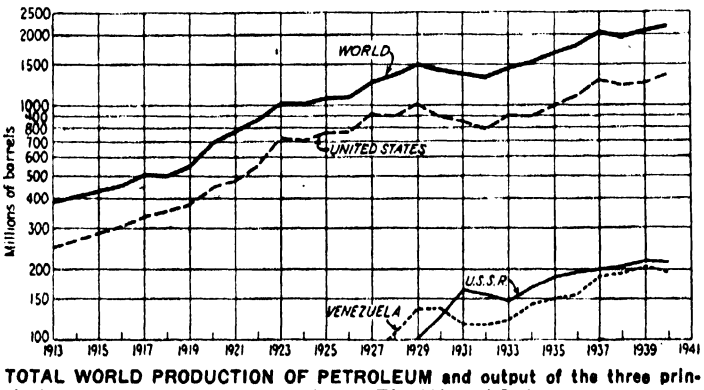
Authority: *World Petroleum*, preliminary figures.

Just as the geographical map was in transition, so was the oil map of the world in so far as control of oil sources by the axis on the one hand and the Allies on the other hand was concerned. A glance at Table I is enough to reveal the axis



TOTAL WORLD PRODUCTION OF PETROLEUM and output of the three principal producing countries, as compiled by *The Mineral Industry*

partners woefully behind the Allies, both as to actual control and as to sources open to them through military blockades. The statistical picture (Jan. 1, 1942) is about like that in Table II.

Table II.—*Oil Sources and 1940 Production*

Allies	Thousands of Barrels	Axis	Thousands of Barrels
Controlled by .	1,835,796	Controlled by .	63,109
Available to . .	247,200	Available to . .	none
Total	2,082,996	Total	63,109

In other words, statistically, Britain and the United States and their Allies, including Russia, controlled or had available to them at the close of 1941, 85% of all the oil produced, and directly controlled 30 times as much oil as the axis.

Actually, the indicated disparity, while great, was not that great. For example, Britain itself had no commercial oil production on the British Isles; therefore transportation—keeping the sea lanes open against axis blockade—was a factor. But essentially it was the great existing disparity that dictated military campaigns, blockades and counterblockades, with the axis partners trying to get more oil and the Allies trying to keep them from getting it.

In the case of Japan it was an outright war for oil, as well as for other raw materials. Normally consuming between 24,000,000 and 30,000,000 bbl. annually, and with a controlled production in Formosa and Sakhalin of less than 7,000,000 bbl., it had to supply its battle fleets and mechanized armies from war reserves it had been building up.

Previously Japan got 65% of its requirements from the United States and 25% from the Netherlands East Indies. The first U.S. embargo on shipments to Japan was put in effect Aug. 1940 applying only to shipments of high-grade motor fuel and aviation gasoline. Finally as Japan moved into French Indo-China, beginning its threatening advance southward, the embargo was made complete, covering crude oil and all petroleum products.

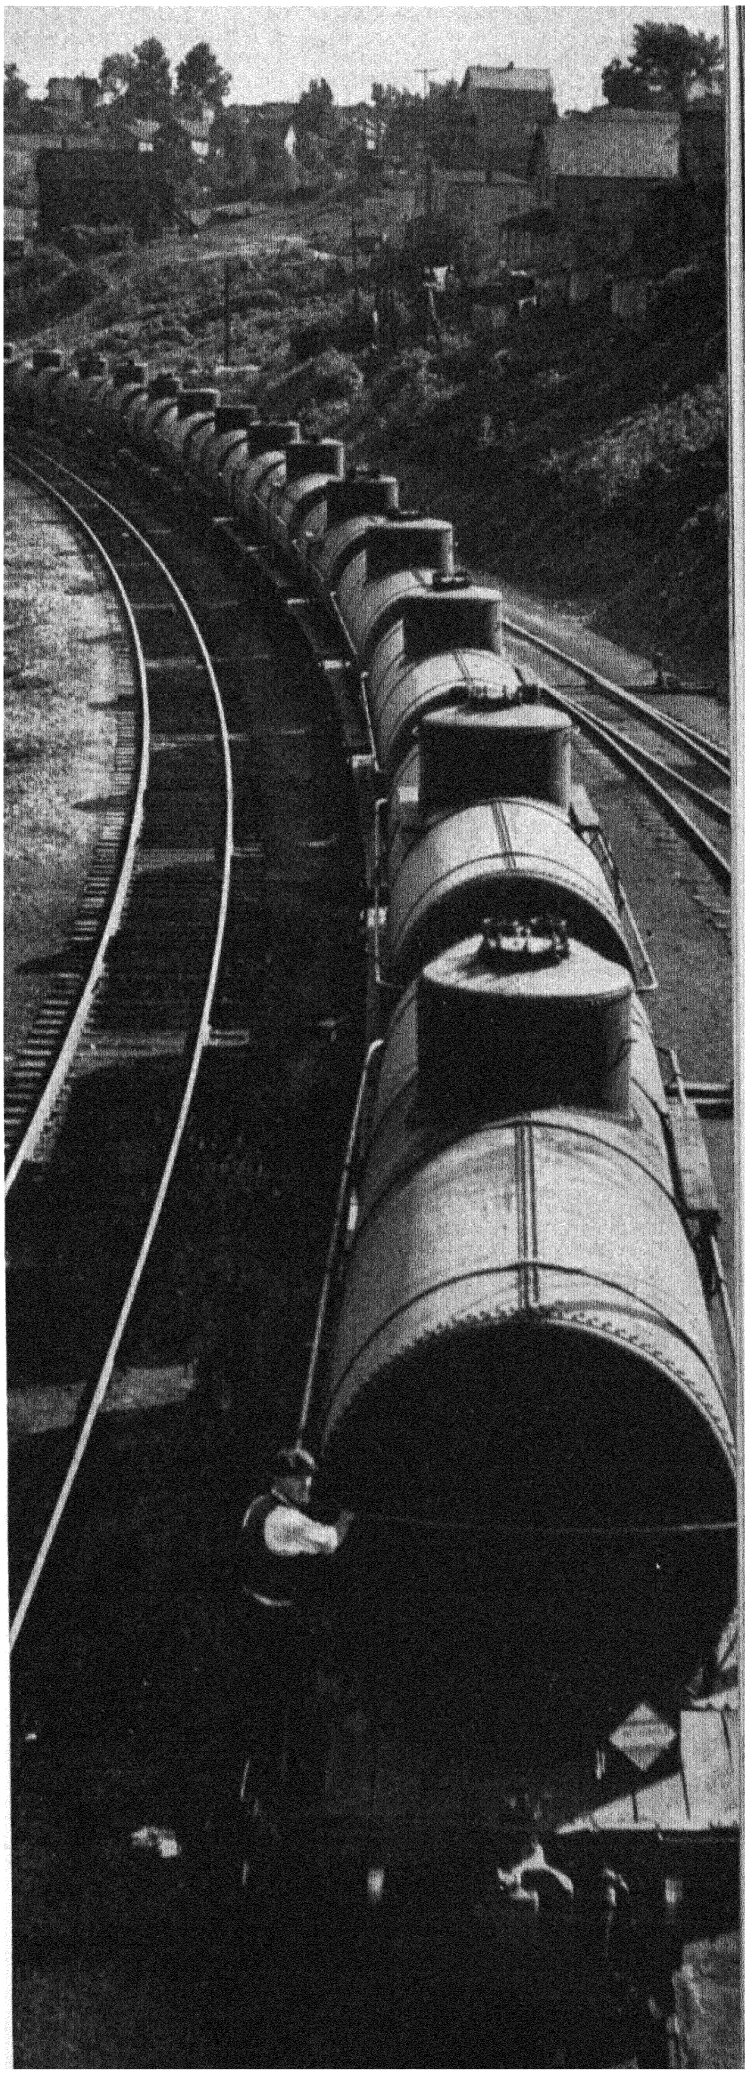
Japan had the choice to make, whether to ease its oil situation by relinquishing conquest or by making fresh conquest. It chose the latter, with its goal the rich oil fields of the Netherlands East Indies and of Sarawak and Brunei, together representing an annual production of more than 67,000,000 bbl.

Nazi occupation of Rumania gave Hitler full control of Rumania's annual production of 43,000,000 bbl. but, as this had previously been the chief axis source, together with Germany's large production of synthetic gasoline and oils from coal, it could not have made a considerable addition to the axis balance sheet of 1940–41.

The rich fields of Iraq and Iran beckoned. After the Greek campaign it appeared that they would be the goal of the next nazi thrust. Instead, the attack was against Russia, having as one of its most important objectives Russia's great oil fields in the Caucasus. Success in this would serve a triple purpose: First, to deprive Russia of much of its needed oil; second, to make it available to the axis, and third, to make even more attractive a thrust into Iran and Iraq.

Events must determine whether the nazi drive for oil was necessitous as an immediate need. There was no evidence to show that the German war machine was short of gas in 1941. However, it was safe to say that, as a need of the future in connection with a prolonged war, the drive was dictated by necessity from the standpoint both of bolstering reserves, which by this time must have been heavily drawn upon, and of depriving axis enemies of strategic oil sources.

As it was, the Iraq oil supply was cut from Britain temporarily



RAILROADS began mass transport of petroleum to the eastern U.S. seaboard July 8, 1941 for the first time in 20 years, as diversion of Atlantic oil tankers to Great Britain threatened a momentary oil shortage

A PETROLEUM PIPE LINE from Portland, Me. to Montreal, Canada was rushed to completion in 1941, to eliminate the circuitous tanker route from Portland around Nova Scotia and through the St. Lawrence river

and Iran sources were menaced until the military occupation of those countries by Britain was accomplished in 1941. Moreover, the success of the nazi air and submarine blockade early in the year, during which a high toll of tankers was taken, presented Britain with a serious oil problem. To help meet this situation the United States government diverted American tankers to the number of 50 from the Atlantic coastal trade and turned them over to the British. Before the end of the year, the abatement of the nazi submarine campaign and the commissioning of new British tankers had so relieved the situation that 40 of the American tankers had been returned to their usual service.

Of all the warring countries, the United States was by far the best situated as to vital petroleum supplies. With a production within its borders amounting to more than 60% of total world production, and with proved underground oil reserves known to be recoverable, estimated at more than 19,000,000,000 bbl. as of Jan. 1, 1941, it appeared assured of an adequate petroleum supply for all war needs.

On the other hand, this does not mean that there were no problems to be met in supplying greatly increased military demands.

The United States, while producing more than twice as much oil as the rest of the world, uses three-fifths of the total world consumption of petroleum products. Its 132,000,000 people own two-thirds of all the world's motor vehicles, and much of American life has been built around automobile transportation—far more so than in any other country. Thus, cutting or rationing of gasoline and other petroleum supplies for civilian use, as had been done in all other belligerent and occupied countries, is a much more complicated thing to do in the United States. Nevertheless it was highly probable that this would come unless complete curtailment in automobile production and voluntary conservation of gasoline for civilian use made such measures unnecessary.

With the United States in the war, military petroleum requirements came first—the supplying of a rapidly building two-ocean navy, an expanding mechanized and motorized army and an air force of huge proportions. In addition, the United States might be called upon to supply Britain and other Allies with greatly increased amounts of gasoline, lubricants and fuel oil should Japan succeed in its oil conquests in the Netherlands East Indies and should anything happen to Iraq, Iran or any other Allied oil sources as the war progresses.

Also, it is one thing to possess or be in control of great oil sources and another thing to have the finished products in adequate supply exactly when and where they are needed. In other words, transportation is always a potential bottleneck.

This bottleneck was felt on the eastern seaboard of the United States when the 50 American tankers were diverted to British service. One of the first acts of Secretary of the Interior Harold L. Ickes, upon his appointment as petroleum co-ordinator for national defense early in June 1941, was to call for voluntary civilian curtailment of gasoline consumption and to initiate closing of filling stations at night and on Sundays in eastern U.S. The curfew was lifted in November when many of the tankers were returned to usual coastwise service.

To guard against a repetition of the threatened east coast oil transportation shortage legislation for defense pipe lines was passed and a new giant pipe line from Texas to the Atlantic coast was advocated by the petroleum co-ordinator and the petroleum industry. The line was killed by a ruling of SPAB denying the line steel priorities.

Meanwhile, the United States was well launched on the biggest tanker building program in its history—one which would make its tanker fleet the largest in the world. With 360 American tankers plying the seas and 204 additional tank vessels building, the total of 564 in service on completion would surpass Great Britain's fleet, estimated by the maritime commission to comprise 432 vessels.

Gasoline.—American refinery capacity and output exceeded in 1941 all records of the past. During 1941 crude oil run through stills increased from 3,500,000 bbl. to 4,100,000 a day, greater by 17%. Since 1933 the increase in product output by American refineries was more than 50%. Thus in supplying war demand for gasoline and other products there was no refinery bottleneck in so far as quantity output and capacity were concerned.

But the war called for more new products, notably for 100-octane aviation gasoline and specially processed lubricants for aeroplane engines and the munitions plants. In 1938 100-octane gasoline came only out of laboratories. The commercial development of this high-grade fuel went hand in hand with the army's and navy's development of bombers and other aircraft and with the aeroplane expansion plan under the national defense program. Thus the fuel was a vital part, not alone of the U.S. air arm in war but of that of Britain, Russia and China to whom American planes were being and would be provided increasingly.

A nation-wide survey made by the petroleum co-ordinator as of mid-October, showed a manufacturing capacity of 100-octane gasoline amounting to 43,000 bbl. a day. Plants nearing completion were to add 2,500 bbl. daily by Jan. 1, 1942.

Inasmuch as it was estimated that a daily output of more than 120,000 bbl. would be necessary by 1943, a broad government-industry program was launched to triple output in from 10 to 12 months. The program contemplated an increase in the capacity of existing plants by providing additional charging stock, providing for minor processing changes, and diverting to 100-octane manufacture certain complicated processes used to make lower-octane fuel. It also called for construction of new plants, 25 of which

were building. All these plants were being given high priority rating.

It seemed that the American motorist might find a decline in the octane rating of motor fuel available to him, partly because of heavier demands of the military for high quality gasoline and partly because of the rationing of tetraethyl lead to refiners and marketers due to curtailment of pig lead for this purpose by OPM. In many cases this would mean carburettor and other adjustments. It would have the over-all effect of increasing unit consumption of gasoline.

This was but one of the many evidences that America at war meant a major adjustment for the motorist. Generally speaking, the picture appeared to be this: New cars greatly limited—or none at all—because of material priorities; new tires greatly limited because of material priorities; existing cars more expensive to run; the ever-present possibility of fuel rationing due largely to potential transportation bottlenecks; and the ever-present possibility of restrictions against pleasure driving. It was noteworthy that actual shortage of oil, and therefore of gasoline, was not the primary factor. Indeed, probably no industry was in better position to supply normal civilian needs than the petroleum industry.

In addition to meeting demands for regular products, the petroleum industry planned to furnish as much as 60,000,000 gal. annually of military toluene, the chief source of which has been coal tar, a by-product of coal.

Organization of Industry for War.—Organization of the petroleum industry for war effort in co-operation with the petroleum co-ordinator was effected by the formation of the Petroleum Industry Council for National Defense.

There was no question in 1941 but that the American petroleum industry faced a challenge far more serious and far more difficult in solution than the one it faced in World War I, although basically, it was in a better position because of tremendous oil reserves and of new discovery, production and refining techniques and of greatly augmented facilities.

Philadelphia. Third largest city of the U.S.A., Philadelphia had a population of 1,931,334 by the federal census of 1940. Mayor (Jan. 1, 1942), Bernard Samuel.

Mayor Robert E. Lamberton died suddenly on Aug. 22, 1941, and Bernard Samuel, president of the city council, succeeded him as acting mayor in accordance with provisions in the city charter. The political leaders immediately planned to nominate a man to be elected in November to serve out the unexpired term. It was soon discovered that the revised election law made no provision for nomination in the emergency. When the local courts were asked to interpret the law they decided that a nomination could be made, but the state supreme court overruled the decision and held that there was no legal way for making a nomination.

The election commission, acting in obedience to a law forbidding the participation in elections of parties whose members favoured the overthrow of government by force, ruled that the name of no communist candidate could appear on the ballots to be used in the November election. The voters were called upon to elect, among others, five judges of the common pleas court, a judge of the orphans' court and a controller, treasurer, registrar of wills and a coroner. The sitting judges, supported by the Republicans, were all re-elected. The Democrats had held the four other offices for eight years and sought to retain them but the Republicans elected all but their candidate for controller.

The appropriations for the support of the local government exclusive of the schools amounted to $81,418,943.17 for the year with estimated receipts of approximately the same amount. The board of public education, an independent taxing authority, appropriated $31,510,743 for the support of the schools and for debt charges in which was included $2,700,000 contributed by the state. The total cost of the local government was $112,928,686.77, of which $110,229,686.77 had to be raised by taxation.

Long-continued drought in the autumn lowered the rivers from which the city draws its water and revived the agitation for tapping new sources of supply and for completing the long-delayed sewage disposal plants. Of the total of $1,320,000,000 in primary contracts for national defense awarded to Pennsylvania manufacturers, $685,720,000 was awarded to manufacturers in the city. (G. W. Do.)

Philately. The year 1941 saw a further reduction in stamp issues, despite the upheavals in governments which in times of peace presage heavy emissions of postage and commemorative stamps. The heavy hand of war reduced the desire to print unnecessary stamps, except that the axis and axis-dominated nations kept up their usual prolixity, especially in semipostal issues—those stamps partly for postal use and partly for charities.

The Standard catalogue listed 1,335 new stamps of all categories issued during the year, with several occupational issues not included, as they were merely tentatively listed. Of these, 829 were purely postal-purpose stamps, 215 for air mail, 181 semipostal and the balance for official, special delivery, tax, parcel post and the like.

The largest number of issues was credited to the U.S.S.R., all of these before the government became involved in active warfare. Issues from Germany totalled 27, 19 of them semipostals. From Great Britain there were none, and from the whole commonwealth only a few surcharges from colonies whose supplies of the most used values had been depleted.

The War.—Typical of what happened to many collections in the war zones was the cable: "Philately house is no more. No salvage." This meant that F. Hugh Vallancey's library of over 10,000 philatelic volumes was destroyed, together with a magnificent 70-volume collection of the stamps of Great Britain and Ireland. Many collections were removed to places of safety; many dealers even sent stocks to the United States, but private collections suffered.

War issues were not many. The De Gaulle stronghold in French Equatorial Africa surcharged the stamps of that colony with the word "Libre," signifying the Free French dominion. In place of the Netherlands stamps bearing the portrait of Queen Wilhelmina, in exile, the German occupants surcharged stocks of the low value (three-cent) stamp bearing a simple design and figure with new values for all postal purposes. In Norway the King Haakon portraits were replaced with a coat-of-arms design.

Commemoratives.—The United States issued only one commemorative stamp during 1941, this marking a new low for the past decade. It marked the sesquicentenary of Vermont's admission to statehood. The U.S.S.R. issued 67, in various groups, most of them commemorating individuals or events practically unknown outside of the soviet union. Brazil commemorated the bicentennial of the founding of Porto Alegre, historical events and the fifth general census of the country. Cuba celebrated the 100th anniversary of its first medical journal.

The wide range of matters commemorated in postal paper shows the increased use being made of philately to spread knowledge of local matters to the world at large. Political propaganda—such as the German and Italian issues bearing portraits of their respective dictators and France's portrait of Pétain—was losing

favour to such matters as national heroes in fields of science, art, poetry and literature and music, to say nothing of national history heretofore unknown outside of the national borders, except to students and savants.

Literature.—Restrictions of wartime made the usual French contributions to the field nonexistent during 1941. British literature was also restricted, mainly because of wartime activities of students, but the usual catalogues from British sources were forthcoming, though the limitations on paper held down the number of copies available.

In the United States, despite a paucity of general books, the American Philatelic society's handbook no. 8, *The Bank Note Issues of the United States, 1870–1893,* by Lester G. Brookman, collated a great amount of material on those issues which had been discovered since 1903, when Luff wrote his memorable handbook.

Savings Stamps.—Every post office in the United States was in 1941 selling "defense saving stamps," of 10-cent, 25-cent, 50-cent and $1 denominations. As with the "thrift stamps" of 1917–18, and the various issues of postal savings stamps, these were not listed in the standard catalogues, but experience since 1917 showed that collectors in the United States found places for them in collections. Why these stamps, which have admittedly no postal value, should be debarred from catalogues while "hunting stamps," which have the same lack of postal connection (except the common point that these, like the savings stamps, are obtainable at the post office) are included, was again in 1941 one of the mysteries of cataloguing. (M. HA.)

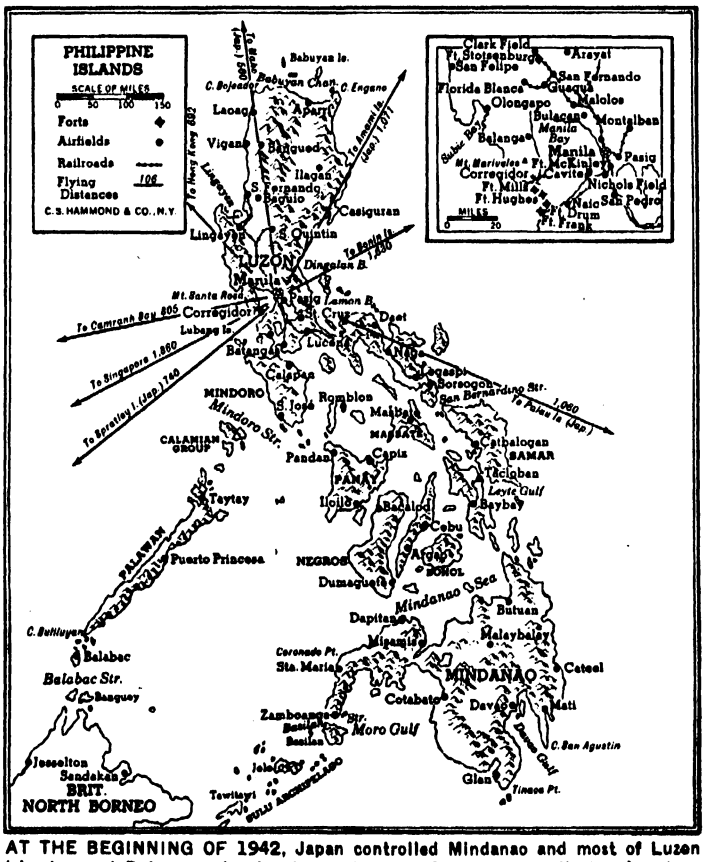
Philippines, Commonwealth of the.

The Philippine Islands lie almost directly east of French Indo-China. By the usually travelled steamship routes, Manila is 631 nautical miles southeast of Hongkong, 907 mi. northeast of Saigon, 1,370 mi. northeast of Singapore, 1,564 mi. north of Soerabaja, 3,855 mi. northwest of Sydney, 61 mi. south of Formosa, 1,757 mi. southwest of Yokohama, 4,838 mi. west of Honolulu, and 6,929 mi. southwest of San Francisco. The archipelago extends north and south for 1,152 mi. between north latitudes 4°21′ and 21°10′, and includes 7,100 islands with a total area of 115,600 sq.mi. Estimated population at the end of 1941, 17,000,000. Principal foreign nationalities in 1939: Chinese, 117,487; Japanese, 29,057; Americans, 8,709; Spanish, 4,627; Germans, 1,149; British, 1,053. Principal religions: Roman Catholics, 12,603,365; Aglipayans, 1,573,608; Mohammedans, 677,903; pagans 626,008; Protestants, 378,361. Capital, Manila (623,492). Other chief cities, Cebu (146,817), Zamboanga (131,455), Davao (95,546).

Basic laws are the Philippine Independence act (Public Law No. 127, 75th congress), 1935, as amended, 1939; and the Philippine constitution, adopted in accordance therewith, 1935, as amended, 1939 and 1940. The president and vice-president are elected at large; there is a bicameral congress with senators elected at large and representatives elected by districts. Status, a commonwealth under the sovereignty of the United States until July 4, 1946, when independence is provided for by the Philippine Independence act. U.S. high commissioner, Francis B. Sayre; Pres. Manuel L. Quezon; Vice-Pres. Sergio Osmeña.

History.—*Japanese Invasion.*—As part of the attack launched Dec. 7, 1941, upon the Pacific possessions of the United States, the British Commonwealth of Nations, the Netherlands and upon Thailand, the Philippines were invaded by Japan. The invaders were met and resisted by forces commanded by General Douglas MacArthur (*q.v.*), commanding general of the United States armed forces in the far east, composed of the U.S. troops in the Philippines augmented by troops of the Philippine army called into the service of the United States in accordance with the terms of the Philippine Independence law and the Philippine constitution and by the U.S. Asiatic fleet. For a considerable period before 1941 the United States had maintained approximately 10,000 troops in the Philippines, of which more than half were Philippine scouts, composed of Filipino enlisted men and U.S. and Filipino officers. Fort Mills, on the island of Corregidor at the entrance to Manila bay and its appurtenant forts was one of the world's strongest fortresses. A small Asiatic squadron was based upon a well-equipped naval station at Cavite, on the south shore of Manila bay, with additional facilities at Olongapo, some 30 mi. to the north on the Bataan peninsula. In 1936 the Philippine commonwealth began to build up its own system of national defense. Major General Douglas MacArthur, retiring chief of staff, United States army, assisted by a U.S. military mission, was made military adviser to President Quezon and energetically supervised the execution of the national defense act, the first law passed by the national assembly of the commonwealth. Under this law, some 30,000 recruits were trained each year, with the expectation of providing a reserve of 300,000 trained men when independence was achieved in 1946. The defense program also called for the development of a fleet of about 30 65-ft. fast motor torpedo boats and a small air force composed chiefly of bombers. By the spring of 1941 the reserve consisted of about 132,000 men, two motor torpedo boats were in commission, and the Philippine air corps had acquired from 40 to 60 planes, most of them training ships. The regular Philippine army consisted of about 450 officers and 3,600 enlisted men. Military expenditures under the commonwealth averaged about 16,000,000 pesos per year from 1936 to 1940, inclusive.

In Jan. 1941, active steps to strengthen the defenses of the Philippines were taken by both the United States and the commonwealth governments. President Quezon, speaking of the American national defense program, declared that as long as the Philippines remained under the U.S. flag the defense of the country remained "primarily the responsibility of the United States."



AT THE BEGINNING OF 1942, Japan controlled Mindanao and most of Luzon island except Bataan peninsula (insert, between Subic and Manila bays), where Gen. Douglas MacArthur concentrated the U.S.-Filipino forces

At the same time, he stated that "the Filipino people, desirous of co-operating with the United States in the execution of this defense program, are ready to bear their full share of that responsibility. To this end I have assured the government of the United States, on behalf of the commonwealth, that the entire Philippines—its man power and material resources—are at the disposal of the United States in the present emergency." In Jan. 1941, 5,500 Filipino reservists were taken into the Philippine scouts for one year of training. General MacArthur was subsequently placed in command of all the United States armed forces in the far east. Reinforcements of men, munitions and warplanes were rushed to the Philippines, and large sums were spent on strengthening the defense works of the islands. The Asiatic squadron was reconstituted as the Asiatic fleet. On July 26, 1941, the mobilization of the Philippine army and its incorporation into the forces under General MacArthur's command was begun, and by Dec. 7 a considerable proportion of the reservists were in active service.

The main Japanese attack upon the Philippines was made upon the island of Luzon. With powerful naval and air protection troops were landed on the north, west, south and southeast coasts. Within a comparatively short time their overwhelming numerical superiority enabled the Japanese to secure domination of the air and to force the stubbornly resisting U.S.-Philippine forces toward Manila from both the north and south. On Jan. 2, 1942, Manila, which had been declared an open city and had been evacuated by all military forces and the civil government, was occupied by the Japanese. The naval station at Cavite had been rendered useless by bombing and was abandoned. MacArthur's southern forces, however, slipped around Laguna de Bay and joined the main U.S.-Philippine forces on a line north of Manila and extending from the Pampanga swamps into the Bataan peninsula. With enormous superiority in the air and vastly greater ground forces, the Japanese gradually forced MacArthur's army south along the peninsula toward Corregidor which, some two miles from the mainland, guarded the U.S.-Philippine rear and denied the use of Manila harbour to the Japanese. The resourcefulness and tenacity with which the outnumbered Americans and Filipinos, early in 1942, threw back repeated attacks made by the veteran Japanese troops without regard for loss of life thrilled the whole world. By holding very large Japanese forces in the Philippines, MacArthur's army made a valuable contribution to the effort of the United Nations to delay the Japanese onrush into southeastern Asia and the island world stretching from Borneo and Sumatra to Australia until reinforcements could arrive.

After Manila had been declared an open city and evacuated by its defenders, the Japanese subjected it to repeated bombings in which churches, schools and residential sections as well as docks and other installations of military significance were destroyed. In many parts of the archipelago undefended cities, towns and villages of no military value were ruthlessly bombed and machine-gunned from the air. Sternly repressive measures were taken in dealing with the civilian population.

Up to Feb. 1, 1942, no definite information had been released in the United States as to the proportion of the Philippines which had been occupied by the enemy. Most of Luzon undoubtedly was in Japanese hands. Davao was known to have been seized early in the war. The situation in the remainder of Mindanao and the Visayan, or central, islands was in doubt. Jorgé Vargas, formerly executive secretary to President Quezon, with cabinet rank, was appointed by the Japanese commander as mayor of Manila. Later, the Japanese announced the formation of a "cabinet" of prominent Philippine political figures, headed by Vargas as chief administrator. President Quezon and High Commissioner Sayre were reported to be with the American-Philippine army. The former publicly declared that the Philippine people would remain loyal to the United States in defiance of Japanese force and intrigue. President Roosevelt in a message to the Philippine people issued Dec. 28, 1941, declared: "their freedom will be redeemed and their independence established and protected." (*See* also JAPAN.)

Political Developments.—The outstanding political event of 1941 was the election, held in November, for the choice of the president, vice-president, 24 senators (at large) and 98 representatives (by districts). Although numerous small opposition parties took the field, President Quezon, Vice-President Osmeña, all the Nacionalista candidates for the senate and all but three of those for the house of representatives won by large majorities. Complete returns from 35 of the 49 provinces gave President Quezon 1,273,864 votes against 273,735 for his nearest opponent, ex-Senator Juan Sumulong; Vice-President Osmeña polled 1,350,838 votes against 114,244 for his nearest rival, Emilio Javier. There were no fundamental political issues, all parties advocating independence on or before July 4, 1946. Senators serve for six years, representatives for four years. The newly elected officials were sworn in, but the Japanese invasion made it impossible for them to perform their normal functions. Under the terms of the 1940 amendment to the Philippine constitution, President Quezon would serve until Dec. 31, 1943, when he would automatically be succeeded by Vice-President Osmeña for the remainder of his four-year term.

Education.—Public schools, March 1940: number of schools, 12,057; enrolment, primary, 1,572,639; intermediate, 277,574; secondary, 90,579; collegiate (normal and technical), 3,777; total, 1,944,569. Private schools, June 30, 1940: number of schools, 439; enrolment, kindergarten, 2,844; primary, 41,861; intermediate, 22,578; secondary, 51,055; collegiate, 31,153; total, 149,491; in addition, recognized schools (136) offering special vocational courses, 9,188 enrolment.

Finance.—The monetary unit is the peso; value, 50 U.S. cents; exchange rate at par during 1941. Estimated general fund revenues, 1941, 91,200,000 pesos; estimated expenditures, 91,000,000 pesos. Total bonded indebtedness, Dec. 31, 1940, 148,757,000 pesos; total sinking fund reserve, 75,978,159.45 pesos. Treasury notes in circulation or available for circulation, Dec. 31, 1940, 163,143,955 pesos. Gold reserve: cash surplus, exchange standard fund, 51,631,446.35 pesos; cash balance, treasury certificate fund, 163,143,955 pesos. Bank notes in circulation and available for circulation: Bank of the Philippine Islands, 1,758,385 pesos; Philippine National bank, 2,599,853.47 pesos; reserve with treasurer of the Philippines, 1,125,325 pesos.

Trade and Communication.—*Trade.*—During 1941, Philippine foreign markets, except in the United States, were virtually closed on account of World War II. During October nearly 95% of Philippine exports were to the United States. In 1940, total imports were 269,720,000 pesos; exports, 231,826,000 pesos. Chief exports (per cent of total exports by value): sugar, 40; coco-nut products, 20; abacá, 11.2; embroideries, 4; tobacco products, 4. Chief imports (per cent of total imports by value): iron and steel and their manufactures, 16; cotton goods, 13; petroleum and products, 9.2; tobacco products, 5.3; paper and manufactures, 4.9; meat and dairy products, 4.4; wheat flour, 3.6; motor cars and parts, 3.4; chemicals, 3.1; electric machinery, etc., 2.9.

Communication (1940).—Railroads, 840 mi. Highways (kilometres) first-class, 11,771.9; second-class, 7,393; third-class, 3,795.1; trails, 4,912.1. Motor vehicles registered: automobiles, 33,898; trucks, 20,236; motorcycles 630. Airways: 1,171,453 passenger miles; 20,407 passengers; 3,083,415 lb. air express; 15,855 lb. air mail. Telephones 31,419. Telegraph lines, 14,716,930 kms. Broadcasting stations, 6.

Agriculture (1938).—Total estimated value, 417,144,000 pesos. Area planted and value, leading crops: palay (rough rice) 1,912,000 hectares, 136,423,000 pesos; sugar cane, 228,000 hectares, 113,559,000 pesos; coconut, 643,000 hectares, 92,126,000 pesos; abacá, 508,000 hectares, 22,672,000 pesos; corn, 703,000 hectares, 19,424,000 pesos; banana, 92,000 hectares, 10,312,000 pesos; tobacco, 75,000 hectares, 4,125,000 pesos. Livestock and poultry (1939) were valued at 141,514,451 pesos. Census and value: carabaos, 2,918,730, 78,826,516 pesos; hogs, 4,348,515, 26,100,326 pesos; cattle, 1,349,264, 20,077,610 pesos; chickens, 25,365,102, 8,994,591 pesos; horses, 340,433, 6,222,661 pesos; goats, 402,173, 874,155 pesos; ducks, 690,868, 418,592 pesos.

Manufacturing.—Chief manufactures are centrifugal sugar, copra, coconut oil, dessicated coco-nut, cordage, cigars and cigarettes and embroideries. Production of sawmills in 1940 was 332,908,721 bd.ft.; number of mills, 148.

Mineral Production (1940).—Total estimated value, 91,626,384 pesos. Chief products: gold, 1,096,745 fine oz., 76,563,888 pesos; iron, 1,221,126 long tons, 5,633,728 pesos; copper 20,014,918 lb., 3,487,701 pesos; chromite, 189,919 long tons, 2,661,764 pesos; silver, 1,394,736 fine oz., 1,874,094 pesos; manganese, 48,036 long tons, 1,287,011 pesos; lead, 2,080,381 lb., 117,927 pesos; platinum, 6.03 troy oz., 271 pesos. (J. R. H.)

Phillips, Sir Tom Spencer Vaughan (1888?–1941), British naval of-

ficer, entered the navy in 1903 and served in World War I as an acting captain. He was promoted to captain in 1927, chief of staff and flag captain to the commander in chief of the East Indies, 1932–35, and director of plans for the admiralty, 1935–38. From 1938 to 1939 he commanded the home fleet destroyer flotillas and was later named rear admiral and vice-chief of the naval staff at the admiralty. Phillips became head of Britain's far east battle fleet on Dec. 1, 1941. On the following day the far east fleet headed by the battleship "Prince of Wales," flagship of the fleet, and the "Repulse," battle cruiser, steamed into Singapore. A week later the two British warships were attacked by Japanese planes and both were sunk on Dec. 10. Admiral Phillips, one of the last to leave his post, was reported as lost.

Philoff, Bogdan Dimitrov (1883–), Bulgarian statesman, was born Apr. 10 in Stara Zagora, Bulgaria. He studied in the universities of Leipzig, Freiburg and Bonn in Germany, specializing in archaeology. In 1906 he was made conservator of the national museum in Sofia and in 1910 its director. For a number of years he taught archaeology and the history of art in the University of Sofia. In 1938 he became minister of public education and in 1940 premier of Bulgaria. During these latter years he developed strong pro-nazi leanings and on Mar. 1, 1941, he signed the Rome-Berlin-Tokyo pact, thus aligning his country with the axis. This move alarmed the Bulgar populace, which had begun to rely on its pan-Slavic ties with the U.S.S.R. for protection; the following day Philoff hastened to assure the parliament that the German mission in Bulgaria was there solely to "preserve peace" in the Balkans. (*See* also BULGARIA.)

Philosophy. With Russia in World War II the philosophies of both sides of the conflict, so far as they were consistent and articulate verbal systems, became rather more confused or were silent altogether in 1941. In terms of action and emotion, however, they became, if anything, more consolidated. What might be called the supremacy of the word, those once-stable systems of negotiable symbols running all the way from philosophic and religious rationalizations, international promises and obligations to financial patterns of exchange and money, received a severe shock in recent years.

Karl Mannheim's *Man and Society in an Age of Reconstruction* shows this characteristic lesion in modern philosophic thought and the scar tissue that comes with healing. Mannheim, who is the foremost student of the sociology of knowledge, attempts to reconcile what he considers the German and the English way of thinking. When living in Germany he had said that the "democratic system has already run its course." Now, living in England, he describes his effort "to free himself from his deep-rooted scepticism as to the vitality of democracy in our age." The man who wrote *Ideology and Utopia* 13 years ago was in 1941 making contact with democratic culture that revolutionizes his thinking. Although he still ignores America and the Scandinavian countries, he finds in English culture enough to make him hopeful of democratic survival and efficiency. Forces within western society that are working against the democratic process are, he says, concentrated control of materials and machines, the cult of experts which restricts significant social knowledge to the few, the centralization of administration in rigid bureaus, the professionalism of military affairs. It becomes indeed a conflict between what is called intelligence or substantial rationality and partial or functional rationality.

R. G. Collingwood's *An Essay on Metaphysics* treats the ultimate sanctum of formal philosophy as an historical science belonging to a time and a place and to a thinker with local predispositions. Metaphysics, he says, is a science of absolute presuppositions and must be treated never as an answer to questions but as a set of assumptions preceding them. Modern tendencies are not metaphysical. They are indeed antimetaphysical in three ways: first, progressive; second, reactionary; third, irrational. The first of these criticisms of metaphysics has the most validity. The second assumes many propositions to be absolute that modern thinking treats as relative. The third would devaluate systematic thinking and substitute emotion and other nonrationalistic processes. To this latter group, says Collingwood, belong the logical positivists. His conclusions are that the presuppositions of Christianity, and particularly of the Catholic church, are essential in western science and society.

Sir Charles Sherrington's *Man and His Nature* and John Laird's *Theism and Cosmology* are re-examinations of the old problem arising in the dualism inherent in Christian ideology. The conclusions in both cases are generally negative or at most much qualified assertions of uncertainty. Sherrington's book is a reply to the "fairy tale" that mind is separable from the rest of us. It is biological in background. Dualism is a problem, he says, because the individual is nevertheless one, "with a totalitarian behaviour doing just one main act at a time." Laird's book asks "whether and what we can learn about God in the natural way." The answer is, very little.

Reinhold Niebuhr's Gifford lectures are an effort to write a metaphysics for his social and ethical philosophy. Alfred J. Ayer's *The Foundations of Empirical Knowledge*, Andrew Paul Ushenko's *The Problems of Logic*, C. J. Ducasse's *Philosophy as a Science*, S. Dasgupta's *A History of Indian Philosophy*, Vol. iii, the symposium, *Science, Philosophy and Religion*, a conference on these subjects in their relation to a democratic way of life, and *The Bertrand Russell Case*, edited by John Dewey and Horace M. Kallen all have, in their respective ways, important bearing on recent philosophy.

In the field of what may be called occasional philosophy are four books on Nietzsche marking the revival of interest in that most occasional of philosophers. They are Crane Brinton's *Nietzsche*, Kurt Kassler's *Nietzsche und das Recht*, Alfred von Martin's *Nietzsche und Burckhardt* and George Allen Morgan Jr.'s *What Nietzsche Means*. But what Nietzsche really does mean will be hammered out one way or another, no doubt, with steel on battlefields. (B. B.)

Phoenix Islands: *see* PACIFIC ISLANDS, BRITISH.

Phosphates. World production of phosphates, chiefly phosphate rock, declined slightly in 1939 from the high of 12,123,000 metric tons, and in 1940 dropped heavily to an estimated 8,500,000 tons. Of this total both the United States and Ocean and Nauru islands contributed somewhat more than formerly, but the other leading producers, especially Tunisia and French Morocco, mostly showed declines of considerable magnitude. Exports from the northern Africa area, including Tunisia, Morocco, Algeria and Egypt, which were 33% of the world output in 1938 and 37% in 1939, dropped to 24% in 1940, while the United States output increased from 31% of the total in 1938 to 32% in 1939 and 48% in 1940. The 1940 imports into Europe, estimated at 2,798,000 tons, were 48% under the 1938 figure; on the other hand, total imports into other countries, at 2,469,500 tons, were somewhat greater than in 1938, but less than in 1939 by a small margin.

Mine output in the United States was 4,068,077 long tons in 1940, deliveries 4,002,700 tons and consumption 3,254,158 tons, all moderate increases over the preceding years. U.S. exports, which for several years had ranged well over 1,000,000 tons a year, dropped to 751,495 tons in 1940, but without adversely affecting production, the surplus being absorbed by the domestic consumption, which was 16% ahead of 1939 and 25% ahead of 1938. (G. A. Ro.)

Photography. **General Photography.**—The year 1941 was one of great photographic activity. World War II did not seriously restrict the supply of materials, although the manufacture of apparatus was to some extent affected by limitations on the use of metals and the diversion of skilled mechanics and optical workers to defense fields. Importation of foreign-made equipment naturally diminished, but American manufacturers produced cameras and lenses unsurpassed in quality. A new type of glass of high refractive index and low dispersion made by the Eastman Kodak company, and containing no silica, was used for making lenses for aerial cameras, and permitted a greater degree of correction than was previously attainable. In addition, surface treatment of glass components of lenses to reduce internal reflections was becoming common practice among lens manufacturers. Among the new cameras brought out during the year 1941 must be mentioned the Ektra, using 35-mm. film, interchangeable magazine backs, combined rapid film advance and shutter setting, focal plane shutter and coupled range finder; the Medalist, using roll film to take 2¼ x 3¼-in. pictures and possessing many of the features previously associated only with miniature cameras; new model Graflex and Graphic cameras; and the return of the Bantam Special. In addition there were new shutters, new range finders, new flash synchronizers and many other devices.

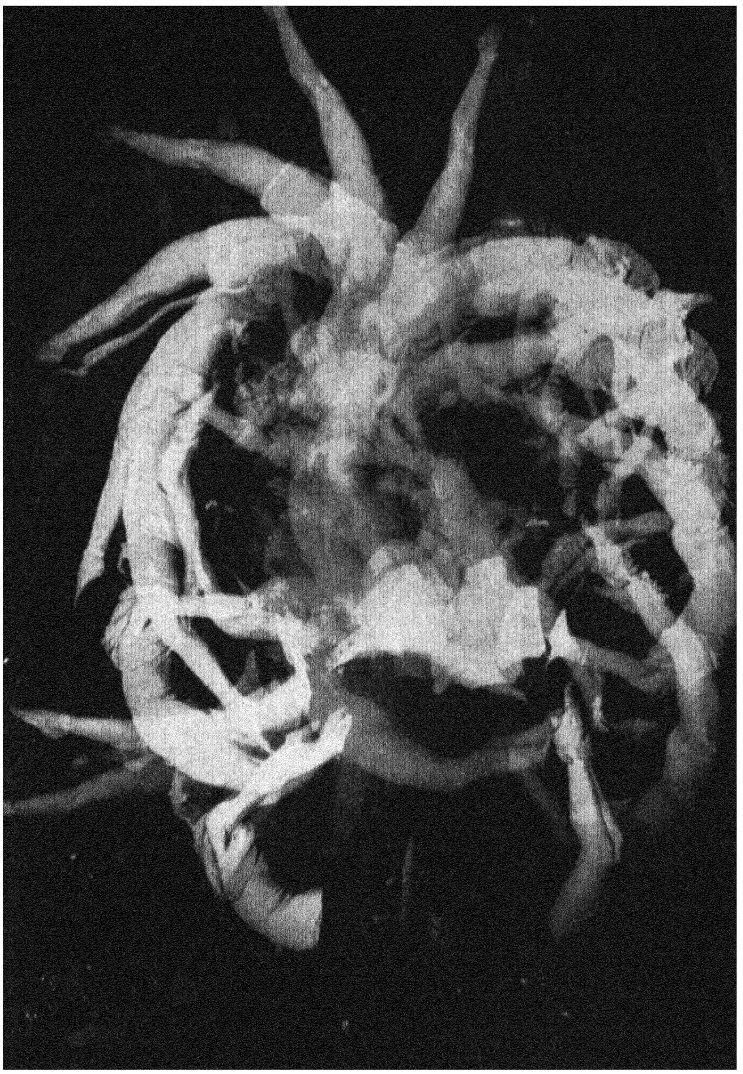
Flash Photography.—There was a steady growth of the use of flash lamps and synchronizers for all types of cameras. Flash lamps appeared in a variety of new forms. There was a tendency for the displacement of foil types of lamp by the wire and shredded foil forms, and an increase in the number of midget-size lamps. The SM lamp has a novel design, employing a combustible material massed on the lead-in wires and burned in an atmosphere of oxygen to give a peak of intensity in a very short time. Flash lamps were coated with lacquers transmitting very little visible light but passing the infrared freely so that photographs could be made on infrared film in the darkness of a black-out without bright flashes. First used in England, they were in 1941 made in the United States. Flash lamps were also coated with blue lacquers to give light matching daylight in quality so that they could be used for filling in shadows in colour photography out of doors. A portable variety of the Edgerton type of repeatable lamp was announced. It is intended for press use and gives over 5,000 flashes.

Films.—The craze for fine-grain developers fell off during the year 1941 as a result of the increasing use of films giving inherently finer grain. One interesting fine-grain developer introduced under the name Finex was claimed to give fine grain with a minimum of loss of speed provided the photographer exercised proper precautions. Wetting agents were introduced to prevent water spots in drying film, and they are also of some use for treating film before development to ensure uniform action. Concentrated rapid developing and fixing solutions were placed on the market, and a testing solution was made available by which the photographer could determine the extent of exhaustion of stop and fixing baths. Infrared drying lamps, introduced some time ago for rapidly drying such things as lacquers in the automobile industry were applied with some measure of success to the drying of films.

Colour Photography.—Kotavachrome and Minicolor were introduced as means by which amateur and commercial photographers could have colour prints made from Kodachrome transparencies. Until this time, colour prints could only be made by such methods as Wash-off Relief and Carbro, which involved making colour separation negatives and colour positives and bringing them into register on a final support. In Kotavachrome and Minicolor, the same types of coating are used as in Kodachrome, but coated on a white pigmented cellulose acetate support. The prints were made in the Kodak laboratories, the Kotavachrome from cut sheet Kodachrome and in sizes from 8x10 to 30x40 in., and the Minicolor from miniature size Kodachromes in sizes about 2¼x3¼ in.—known as 2X—and about 5⅜x7⅝ in. in size—known as 5X. There was a rapidly increasing interest in colour photography which was evident from the growth in the numbers of Kodachrome transparencies and 16-mm. and 8-mm. Kodachrome motion picture films. Survey of the popular magazines revealed the increase in the use of colour for advertising. One-exposure cameras were much used for the original negatives for this work, and printing by Wash-off Relief, Orthotone and Carbro were popular in the commercial field. Kodachrome in cut sheet form was also much used to provide originals from which photomechanical printing plates could be prepared, and the Crawford Flexichrome process was being successfully used for making advertising prints in colour from single black-and-white originals. A simplification of the Wash-off Relief process which was announced in 1941 consisted in using a solution of sodium thiocyanate instead of hot water for developing the relief.

On Dec. 17, 1941, Kodak announced still another important development in colour photography with the introduction of Kodacolor film and printing. The big feature of Kodacolor was that it could be used in most of the roll-film cameras. These sizes ranged from cameras making negatives 1⅝x2½ in. to 3¼x5½ in. in size. Kodacolor film was developed by the manufacturer into a negative colour film. This showed the complementary colours of the final colour positive print which was made on a paper base.

Military Photography.—Photography found a wide variety of applications in World War II. In tactics it was used largely from the air for mapping and intelligence. In the latter instance, which is the more important, it was used for photographing enemy troop concentrations, spotting targets for bombers, studying the effects of bombing and shellfire and studying camouflage. It was becoming regular practice to photograph the effects of bombing, by night as well as by day. In night photography from the air, flash bombs were used. They were timed to explode at desired distances below the plane and in such a position that the flash was just out of the field of view of the camera. Photoelectric devices, operated by the flash, were used to open or close the camera shutter. Much study was devoted to methods of developing negatives and making prints in a very few minutes. The development of camouflage was studied by making successive photographs on different days, and infrared photography was of particular importance because it usually permitted artificial pigments to be distinguished from natural colouring matters. Colour photography was also much studied, although it was not used in actual combat for lack of a film which could be readily processed in the field. Its chief use appeared to be in assisting the identification of objects, and in the study of one's own camouflage to obtain a record of its visual appearance to an enemy observer. Owing to the great heights at which aeroplanes must fly in order to avoid anti-aircraft fire and enemy pursuit planes, long-focus lenses were coming into use.



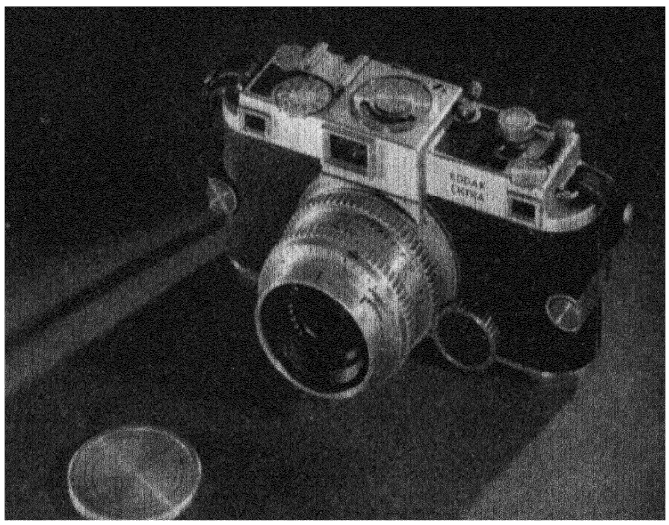
MULTIFLASH PHOTOGRAPH of two acrobats whirling their girl partner through space, taken by Harold E. Edgerton in 1941

The British made good use of Ciné camera guns, which used 16-mm. film. They were mounted in the wings of fighter planes to record the effect of machine-gun fire on enemy planes. The cameras were operated electrically when the firing buttons were pressed. Large numbers of motion and still pictures were made during operations to serve for instructional training and publicity purposes. In particular, the United States army had in preparation a large number of training films, produced with the co-operation of the motion picture industry.

An important development is the Airgraph system, which was launched during the year 1941 by the British post office in conjunction with Kodak Ltd. It is an application of the Recordak, and is used to facilitate transit of mail between England and the British forces in Africa and the near east. Letters are written on special sheets, photographed on 16-mm. film, sent to England by aeroplane on the rolls of film, and there printed on paper to a size of 4 in. by 5 in., and then handled as regular mail. Seventeen hundred letters can be photographed at a rate of 40 to 50 a minute on a single 100-ft. roll of film. About 85,000 Airgraph letters weigh only 20 lb., instead of an estimated 1½ tons if the letters were sent in the normal way.

Another important application of photography in national defense was in the aeroplane industry, where Eastman Matte Transfer film was used to sensitize metal sheets which were cut to serve as templates. The drawings were made on metal plates which had been coated with a white material which fluoresces under the influence of X-rays. These were printed by their fluorescent light onto metal sheets which had the sensitive layer of the Matte Transfer film stripped onto them. The sheets were developed to give negatives, or if a positive was required an intermediate negative was made on glass. The metal carrying the drawing was then cut to shape by a saw or mechanical shears, and served as a template accurate to 1/1,000 in. in a ft. The method resulted in very great savings of time and money in producing new aeroplanes.

Motion Picture Photography.—Although the production of motion pictures has tripled in the United States since 1920, there was a drop during 1941 owing to the loss of many foreign markets. The production of Technicolor pictures, however, showed an increase of some 25% over 1940, with a footage totalling some 100,000,000 ft. There was an increasing use of fine grain positive motion picture film for making release prints and for variable density sound recording. Many demonstrations were given of the stereophonic sound film system. In this system, several sound records are made on a film, and these are used to reproduce sound from several sets of loud speakers situated at the centre and sides of the stage. An illusion of sound perspective of high quality is realized. The production of 35-mm. Technicolor prints from 16-mm. Kodachrome originals was announced in September. The de-



THE KODAK EKTRA, a 35-mm. U.S. precision camera placed on the market in 1941, holds black and white or colour films interchangeably, has a compensating built-in view finder, a left-handed film advance lever and an antireflection f/2 50-mm. lens

velopment was expected to find application for industrial and documentary purposes as well as for theatrical shorts. A department of commerce survey of motion picture equipment in use in schools and colleges in the United States showed 12,443 projectors for 16-mm. film, 6,059 being fitted for sound; and 2,447 projectors for 35-mm. film. A group of five new Sound Kodascopes for 16-mm. sound film was put on the market, adaptable for home, school, institutional and industrial use. There was a steady increase in the use of substandard colour film in the form of Kodachrome, and a marked growth of interest in 8-mm. film and equipment for it.

There were also several finders and focusing devices marketed to enable the substandard cinematographer to approach the professional standard.

Applications.—Among the new applications were: improvements in X-ray film and equipment, especially for industrial purposes and the routine examination of conscripts; the contact screen process of rapid reproduction of photographs by high quality photolithography; photography of the ocean bottom by G. L. Clarke and M. W. Ewing at depths ranging from 125 to nearly 3,000 ft.; special methods of photographing documents charred by fire in air raids in England; and large-scale photography of documents on 16- and 35-mm. film in case the originals were likely to be destroyed by enemy activity.

One of the significant developments in photography for 1942 would appear to be the repairing and rehabilitation of cameras which had been left unused by the photographer or on the shelves of photo dealers. The Eastman Kodak company announced a special program for the repair of all cameras at a special 25% reduction in repair costs. This program started with the new year of 1942. As it was expected to be impossible to supply the tremendous demand for miniature cameras including all sizes from 35-mm. to 2¼x3¼, this special campaign for using older cameras would be timely.

New emphasis was being placed upon the use of present equipment. Photographers were encouraged to try out various printing processes and use their cameras in new photographic fields.

Blackout Bulbs.—A timely development in the latter part of 1941 was the introduction of the blackout or infrared flashbulbs. The Wabash Photolamp corporation developed the No. 2 blackout bulb first. Then followed the introduction of the No. 5R and 22R infrared-coated flashbulbs by General Electric and Westinghouse. When using these blackout flashbulbs with infrared film, it is possible to make photographs in darkness without showing the usual white flash. These infrared-coated bulbs can only be seen if one is looking directly at the bulb when a very slight reddish glow may be detected at the time of the flash. These flash lamps proved useful in places where the usual light from a flash might be disturbing.

Physics. The phrase, properties of matter, so nearly defines the province of physics that it seems unnecessary now to retain the artificial distinction between these two topics. They are here treated together.

The present summary deals chiefly with American publications, simply because in Europe the calls of martial science depleted the laboratories of pure research. With the U.S.A. an active belligerent, more and more of her skilled investigators had to turn from research to practical development work or to the training of scientific aides and technicians.

The Nucleus.—Neutrons, deuterons and photons have been known for more than a year to cause fission of the heavy elements uranium and thorium. The list of effective bombarding agents has been extended to include protons and alpha particles. From the University of Rochester came a report by Dessauer and Hafner of experiments in which a beam of 6·9 mev protons from a cyclotron caused fission in thorium. The beam was allowed to fall on one face of a sheet of thorium whose thickness was too great for the protons to penetrate. Two reactions might be expected. First, the protons might cause fission of thorium directly, in which case the heavy recoiling fragments could be collected from the front, but not from the back of the thorium sheet. Second, the protons might create neutrons which could then cause fission of the thorium. In the latter case, however, since neutrons can pass very readily through heavy materials, fission would occur not only on one face, but almost anywhere in the thorium sheet, and, if the fission process here were a secondary one, recoiling fragments ought to emerge from the back of the thorium sheet as well as from the front. On putting this to the test, Dessauer and Hafner found that fission fragments could be collected only from the face of the thorium sheet upon which the protons fell; hence the fission of thorium by protons was established. The threshold energy was found to be 5·8 mev.

Alpha particles have only half as much charge for the same mass as protons, and therefore the energy needed by an alpha particle to cause fission would naturally be far higher than that required by a proton. Theoretical estimates suggested that at least 30 mev would be needed; this happens to be just within the range of the 60-inch cyclotron of the Crocker Radiation laboratory. Fermi and Segrè therefore bombarded a compound of uranium with 32 mev alpha particles from this instrument and reported the successful fission of uranium; but they were not able to quote any reliable figures for the effective cross section which would give an indication of the relative probability of the reaction.

It has been pointed out frequently that the fission of the uranium 235 isotope by slow neutrons releases millions of times as much energy as is derivable from the ordinary chemical reactions (such as the combustion of oil) upon which man relies for the motive power of engines, and that if only this atomic power could be made available in large controllable amounts, a new era of transportation would be at hand. Rumour had it that work fostered by this hope was progressing both in the old and the new worlds, but no reports appeared in the literature for a long time, nor, in view of the world situation, would it be reasonable to expect them soon.

The fission of uranium by neutrons of energy below 10 mev proceeds in an unsymmetrical manner. Among the fission fragments are found elements of atomic number 35 to 43, and 51 to 57. Apparently each uranium atom splits into two pieces, one appreciably heavier than the other. Recently, both in the U.S. and in Japan, the fission process has been carried out with much faster neutrons, up to 17 mev, and a progressive but slow change toward more symmetrical fission occurs. Many new products have been detected chemically, and by Jan. 1, 1942, the only element of atomic number 35 to 57 inclusive not reported among the fission fragments was tin (50).

Isotopes.—There appear to be many situations in which it is not justifiable to assume that the various isotopes of an element are present always in the same proportions. A striking instance occurs in the study which Murphy and Nier made with a mass spectrometer of the distribution of carbon isotopes, C^{12} and C^{13}, whose relative abundances are usually quoted as 98·9 and 1·1%. C^{12} is therefore very closely 90·0 times as abundant as C^{13}. Murphy and Nier find, however, that this ratio varies from 89·2 to 93·1 depending on the source of the carbon. Limestones, no matter what their ages, give low values; carbon from plants is

unusually rich in C^{12} and gives high values; while in carbon from meteorites intermediate values occur. No adequate reasons for these variations have yet been given.

Unstable or radioactive isotopes of carbon are not found in nature but can be manufactured in the laboratory. Their importance lies in their use as tracer atoms in biological work of all kinds. One of the most useful promises to be C^{14}, which decays to nitrogen by emitting beta particles of energy 0·145 mev. These beta particles are energetic enough to pass through living tissue a few tenths of a millimeter thick, so that the movement of carbon through a small plant, for example, can be followed without dissecting parts of the plant from time to time. Two reactions are available for making C^{14}, either $C^{13}(d,p)C^{14}$ or $N^{14}(n,p)C^{14}$. Ruben and Kamen found no appreciable decay in a sample over a period of nine months, and estimated the half life to be between 10^3 and 10^5 years. Since the rate of decay is so slow the biologist will be able to conduct unhurried experiments with C^{14} as a tracer, but if his results are to be reasonably accurate he must wait for stronger preparations than are available at the present time.

Cosmic Rays.—During the last 15 years many temporary theories have been advanced in connection with cosmic rays. Most have been dropped either because they explained only a very limited group of phenomena or because they were rendered untenable by new experimental discoveries. In 1941 the situation improved considerably and there existed a working theory of the general nature of the rays which promised to stand for some time. Parts of it had been suggested at earlier times, but until the year 1941 the necessary experimental support was lacking. The theory, given in bare outline below, rests on experimental evidence obtained by Swann and his colleagues, and by Jesse, Schein and Wollan, as well as on evidence of much earlier date.

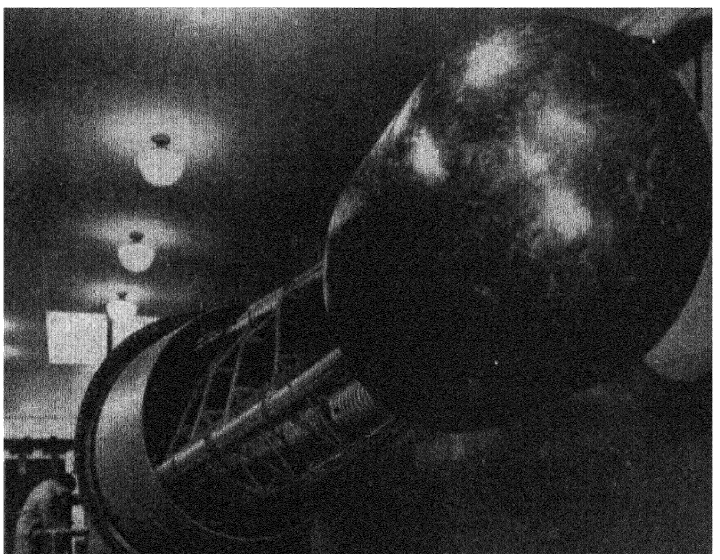
The primary radiation which comes to the earth from outer space is presumed now to consist of fast-moving protons. In the higher reaches of the atmosphere these protons create mesotrons by a process whose details are not known. Some of the mesotrons thus created move fast, others move slowly. Those which move slowly disintegrate before they have gone very far and thus give rise to electrons in the upper atmosphere, electrons which have more or less random directions of motion, since they come from slowly moving mesotrons. The fast-moving mesotrons travel far down through the atmosphere before disintegrating, and when they do so, the electrons to which they give rise will still possess, on the average, a marked downward component of velocity.

The key to this theory is the mesotron, a remarkably unstable particle, either positively or negatively charged, with a mass between 150 and 200 times that of the familiar negative electron. Within a few millionths of a second after its creation, it disintegrates into a neutrino and an electron. Since only the electron, but never the elusive neutrino, has been observed in such a disintegration, any indirect evidence bearing on the process is important. Two experiments may be quoted here. In the first, Rossi and Hall showed that the lifetime of a mesotron depends on its momentum, in agreement with theoretical predictions of the special theory of relativity. The faster a mesotron moves the longer it lives before disintegrating. Such an effect exerts an easily measurable influence on the absorption of various components of cosmic rays as they fly downwards through the atmosphere, and it is in such absorption measurements that the necessary experimental tests are found. In the second experiment, Rasetti set up an elaborate arrangement of cosmic ray counters, some measuring the absorption of mesotrons in aluminum or in iron, others detecting the delayed emission of particles which were presumably the disintegration electrons from the decaying mesotrons. Perhaps Rasetti's most significant observation was that the number of mesotrons absorbed by his apparatus was about twice the number of disintegration particles recorded. To explain this it is necessary to assume, with some theoretical justification, that positive and negative mesotrons are created in approximately equal numbers, but that they behave differently in passing through matter. Positive mesotrons are considered to undergo free decay in the manner just described, while the negative ones react with nuclei, raising them to excited states whose excess energy is subsequently removed by processes of β-decay.

The Betatron, otherwise known as the induction accelerator, was a new device developed by Kerst at the University of Illinois for the acceleration of electrons to very high energies. It does for electrons what the well publicized cyclotron does for much more massive positive ions, but operates on an entirely different principle. To understand the basic ideas, suppose that the magnetic field between the circular poles of a large electromagnet is changing. An electromotive force is set up in a loop of wire placed between the pole pieces. Indeed, the electric force is present whether the wire be there or not. If a vacuum chamber containing a source of electrons is placed between the poles, the electrons will be accelerated in roughly circular orbits by the electromotive force created by the changing magnetic field. The motion of the electrons is so fast that they could make millions of revolutions in a second. The scheme was not new, but Kerst was the first to make it work. The chief difficulty is to keep the circling electrons in a narrow beam, and this requires a magnetic field which is not, at any instant, uniform, but which varies radially in such a way as to keep the electron beam in a compact ring, whence it can, at the right instant, be diverted to a target. The design of the magnet and of its field controls the success or failure of the instrument. Already, in the second model of his machine, Kerst obtained electrons of 20,000,000 volts, capable of producing as much gamma radiation as 1,000 grams of radium. It was too early to estimate the full possibilities of the machine. Undoubtedly its applications to the field of medicine would be explored, and with it some cosmic ray phenomena might, later on, be duplicated in the laboratory. Such experiments would have an important bearing on questions of nuclear structure.

Low Temperature Phenomena.—Below the λ-point, at 2.19°K, liquid helium II possesses remarkable properties which set it apart from all other liquids. It has, for example, an extremely low viscosity, lower than that of hydrogen gas if measured by conventional methods; and it can transport heat at a prodigious rate. The reasons for this abnormal "conductivity" are not entirely clear since they depend on the theoretical concept of the liquid's structure. It is certain, however, that next to none of the heat transferred is carried by the classical process of conduction. According to two papers by Kapitza and by Landau (contributions from Russia, but published in the U.S.A.), a curious countercurrent is set up whenever a temperature gradient is maintained across a volume of He II, and the liquid behaves as though it were composed of two separate components. There is a current of normal He II which carries heat from the hot region to the colder one, and a countercurrent of "superfluid" liquid directed from the cold to the hot

TWENTY-TON ATOM SMASHER, capable of generating 8,000,000 volts, being assembled at Notre Dame university, South Bend, Ind., in 1941



part. In strong contrast to the ordinary process of convection, this counter-current carries no heat and has zero viscosity. Strange as this behaviour appears to be, it is nevertheless in agreement with earlier observations on the passage of He II through a porous plug and on the fountain effect.

Landau's explanation is that He II is a quantum liquid in which the transition from a state of potential motion to a state of vortex motion is impossible unless a finite discrete amount of energy is supplied. Only when the liquid is in the higher vortex state can energy be dissipated, and the motion of the superfluid is therefore thermodynamically reversible, since there is no entropy change associated with its transfer from place to place. The quantization is made mathematically in terms of longitudinal compressional waves, and, being macroscopic, must be entirely different from atomic or molecular quantization.

Miscellaneous Items.—Experts in the field of crystal structure have been wrangling amicably for more than a year about diffuse spots which appear on X-ray diffraction pictures when the incident radiation possesses noticeable monochromatic peaks. They are not Laue nor Bragg reflections, and their positions with respect to the Bragg spots change as the angle of incidence is varied. Two major points have been debated: (1) the origin of the diffuse spots and (2) their interpretation in terms of the structure of the crystal. Concerning the first point, Zachariasen of the University of Chicago and others have maintained that an elaboration of the classical theory of the effect of temperature on scattering furnishes an adequate explanation, but this view has been stoutly opposed by Raman and his school in India, who insisted that new quantum effects were involved. The latest work on the subject seems to show, however, that Zachariasen's theory should be acceptable to all investigators. The second point above has been examined with some care by Lonsdale in London, who reports that more precise experiments will have to be made and a more searching theory will have to be developed before much more than an approximate answer can be given.

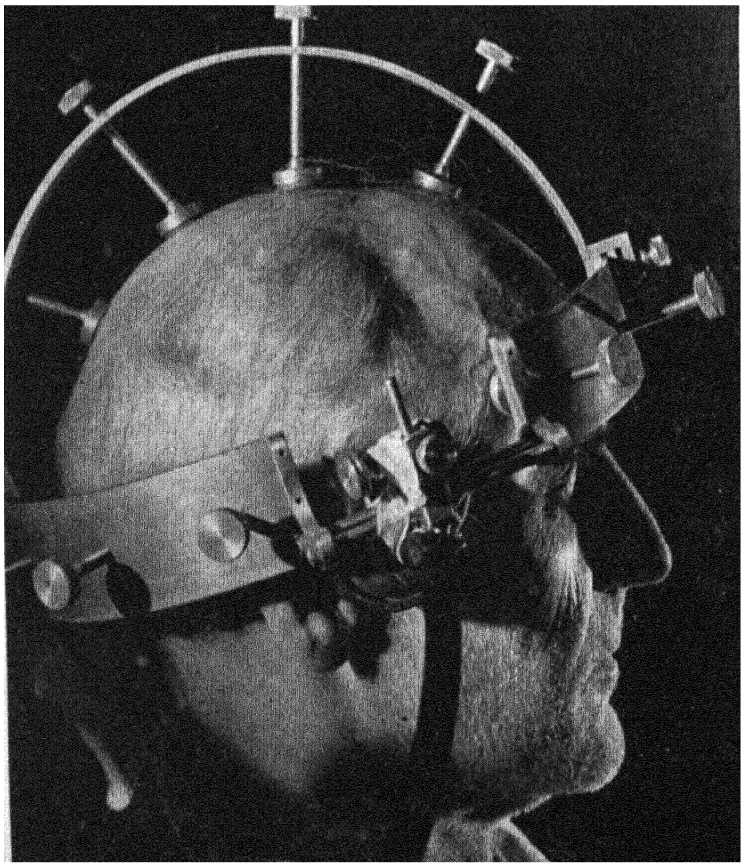
More reliable values of the magnetic moments of nuclei, and especially of the proton, have recently been reported by the method of radiofrequency spectra, originally devised at Columbia university by Rabi and his collaborators. Formerly, the accuracy was limited by the precision with which a magnetic field could be measured with a standard device like a flip-coil. In 1941 the necessary field measurements were made with much greater precision by means of the Zeeman effect.

Other advances during 1941 are found in studies of the electrical failure of crystals; in a new impersonal determination of the velocity of light; and in adaptations of the electron microscope to tasks of wider scope than it could handle before.

BIBLIOGRAPHY.—If the names mentioned in this article are looked up in the indexes of *The Physical Review*, vols. 59 and 60 (1941), papers will be found containing hundreds of additional references to work done both in the U.S.A. and abroad. (T. H. O.)

Physiology. **Central Nervous System.**—Physiologists have known that the retina is a sensitive sensory end-organ. Its sensitivity has been remeasured by a new technique. The minimal quantity of light required to stimulate was found to be only eight or nine quanta, each quantum causing the necessary chemical change in one molecule of the chemically sensitive rhodopsin in the retina. No physical system is known which even approximates the retina in sensitivity. The motor or anterior horns cells of the spinal cord are not autochthonous. They operate only under the stimulus of arriving nerve impulses and when they are not so activated they produce no impulses which influence the state of the skeletal muscle. The removal or injury of the frontal lobes of the brain, besides producing the well known effects of euphoria and certain other changes in personality, renders it more difficult to remember in the presence of distraction. Such an injury also interferes with the judgment of abstract time, *i.e.*, the judgment of whether a period of elapsed time has been 10, 20 or 30 seconds. A study of the records of "brain waves" or electroencephalograms has indicated that migraine and epilepsy are related diseases.

DEVICE developed at Cornell Medical college, New York hospital, for measuring pain caused by migraine headaches. Research at the college demonstrated that all humans have precisely the same sensitivity to pain



Heart and Circulation.—The question of the nature of the tissue in the heart which conducts the wave of excitation and maintains the co-ordinated contraction of the cardiac muscle was reopened. It was reported that the modified neuromuscular tissue generally assumed to conduct the wave cannot be identified in the human and canine heart.

Hypertension was studied with vigour. One new point of special interest was reported. Actual ischaemia or a reduction in the blood flow of the kidney is said not to be essential for the production of hypertension, since the condition may be produced experimentally by decreasing the renal pulse pressure without reducing blood flow. The investigation of the cause of traumatic shock was renewed because of the war. The problem is as resistant as ever to solution. The usefulness of plasma in the treatment of the condition was established and some evidence indicated that the active principles of the adrenal cortex may be of value.

Digestion and the Liver.—Enterogastrone, the hormone which inhibits the secretion of acid by the stomach, was shown to prevent the formation of experimental ulcer. The relation of the chemical structure of the various bile acids to their choleretic properties was systematically studied. Among other observations, it was found that the administration of bile salts does not flush sediment from the gall bladder. Cirrhosis of the liver, which can be experimentally produced by numerous methods, was produced by a diet low in protein and high in fat. The fatty infiltration of the liver and subsequent cirrhosis can be prevented by adding choline to the diet. Choline is a constituent of lecithin which is found in such foods as milk and eggs. Alcohol in the presence of a diet containing too little protein, too little of the vitamins of the B-complex or too much fat simply increases the rate of development of cirrhosis.

Radioactive Elements.—The use of radioactive or labelled elements in the study of physiological processes continued to supply interesting and valuable information. When radioactive iodine is ingested it begins to accumulate in the thyroid gland in a few minutes, where it is changed into thyroid hormone within two hours. Radioactive strontium given by mouth is soon deposited in the bones, radioactive strontium being used instead of calcium because it is more easily made in the cyclotron. Using radioactive iron, it was shown that more iron is absorbed by the intestine when the body needs iron than when it does not.

Changes Associated with Growth.—The fact that *acne vulgaris* commonly occurs during puberty is well known. The belief that acne is in some way related to the production of the sex hormones has been substantiated. It has been found that acne can be induced in males and females, whose gonads are absent or not functioning, by the administration of the homologous sex hormone. Of course, this does not indicate that the production of sex hormone is the sole factor in the causation of acne. Two

provocative papers appeared which indicate that hormones, other than the hormone of the thyroid gland, are concerned in controlling the growth of the brain. The brain of the male rat is heavier than that of the female. Removal of the testes decreases, and removal of the ovaries increases, the brain weight. Another report indicated that the administration of the "growth hormone" of the anterior lobe of the hypophysis to mother rats increases the number of neurons in the cerebral cortex of the offspring. The functional significance of these observations was conjectural. (*See* also VITAMINS.)

Pineapples. Only 30% to 40% of the pineapple crop of British Malaya was reported to have been harvested in 1941, because of the inability to ship to Great Britain. Britain ordinarily takes 80% of Malayan pineapple products. During the 1941 packing season (April to September), packers agreed to process a maximum of only 500,000 cases and to cease operations when unsold stocks reached 200,000 cases. Even before the outbreak of war with Japan and the invasion of British Malaya, it was reported that pineapple planting would be greatly reduced, and the practice of growing pineapples between young rubber trees would be curtailed. Shipments of pineapples to the United States from Hawaii, principal source of canned pineapple and pineapple juice, ceased in Dec. 1941 with the outbreak of war with Japan. Hawaii shipped annually more than 400,000,000 lb. of canned pineapples to the United States, but only a comparatively small quantity of fresh pineapples. Cuban shipments of pineapples to the United States in 1941 were greatly reduced because of shipping difficulties. Cuba exported to the United States in the first ten months of 1941 only 959,000 crates of fresh pineapples, compared with 1,021,455 crates in the same period of 1940. Bulk shipments of fresh Cuban pineapples to the United States in 1941 were 968,822 lb. for the first ten months; 3,704,580 lb. in 1940. Florida is the only state in the United States that produces pineapples. The Florida crop in 1941 was estimated at 10,000 boxes (70 lb. net to the box). The 1940 crop was 8,000 boxes, and the ten-year (1930-39) average was 14,550 boxes. (S. O. R.)

Pittsburgh. Tenth largest city of the United States, Pittsburgh had a population of 671,659 by the federal census of 1940. It is in the southwestern part of Pennsylvania, at the junction of the Monongahela and Allegheny rivers. Area, 54,295 sq.mi. (excluding rivers). It is the centre of a metropolitan district of some 130 contiguous cities, towns and boroughs, with a total population of about 1,954,000 in 1940. Mayor (Jan. 1, 1942): Cornelius D. Scully, re-elected in Nov. 1941.

The most significant development in Pittsburgh in 1941 was the almost complete absorption of industry in production for national defense. For the first time in 130 years a United States vessel of war was launched within greater Pittsburgh, when in October the "P C 490" went down the ways at the Neville island plant of the Dravo corporation. Fourteen more of these 165-ft. submarine chasers were scheduled to be launched from these boat yards. Steel mills operated at capacity or near-capacity throughout the year, and production figures showed a marked increase in every field.

As a result of a study made by traffic experts during 1941, the Pittsburgh Regional Planning association recommended a plan for the improvement of transportation facilities in the city. A part of this plan was to carry route 22 and route 30 through the city on an adequate boulevard. Work proceeded rapidly on this plan. The second part of the plan was to encircle the city by boulevards. The Water street section of this loop, along the Monongahela river, was complete in 1941, and work on the Duquesne way section, along the Allegheny river, was nearly completed.

Pittsburgh took steps during 1940 toward abatement of the smoke nuisance. A newly created smoke commission recommended, after a four months' survey, that industrial and domestic consumers burn either a smokeless fuel or use mechanical equipment for efficient coal burning. The recommendations of the commission were approved by the city council. (J. G. Bo.)

Pius XII (1876–), the 262nd successor to St. Peter in the See of Rome, was elected by the assembly of cardinals on his 63rd birthday, March 2, 1939, and was enthroned on March 12. (For details of his early life, see *Encyclopædia Britannica.*) As pope he is held to be the vicar of Jesus Christ on earth and supreme spiritual ruler of the universal church. He was born in Rome, the son of an ecclesiastical advocate, Filippo Pacelli, and given the baptismal name of Eugenio. Having entered the priesthood, he was attached to the papal secretariate of state, later was appointed papal nuncio to Bavaria and Germany, was created cardinal in 1929 and became papal secretary of state under Pius XI in 1930.

As supreme pontiff his spiritual power extends over the estimated 400,000,000 Catholics scattered throughout the world. These are to be found in all the warring nations, and his concern is for all of them, as for his spiritual children, no matter what their racial or civil allegiance may be.

His words and his actions have been solely directed toward the attainment of peace in a war-torn world, but a peace founded on justice and charity. His policy as the temporal ruler of the independent Vatican City state has been that of the strictest neutrality. Nevertheless, he has not ceased, nor has he feared, to brand as evil the tenets of a totalitarianism that would destroy human and divine rights and liberties. Out of a darkened Europe, his is the one voice that can be raised with courage and impunity.

His most notable pronouncement was broadcast on Christmas Eve. On the same date in 1939 he proposed the five points necessary for a just and honourable peace. In 1940 he outlined the "indispensable prerequisites" for any new world order. In 1941, in a long discourse condemning the war of extermination and blaming the ills of the world on the abandonment of Christianity and the adoption of a new paganism, he enunciated five conditions that must govern "a new order founded on moral principles": (1) there must not be a violation of the freedom, integrity and security of other states, no matter what their size or strength may be; (2) there must not be a professed or concealed suppres-

sion of the culture, language or characteristics of national minorities, nor the hindrance or restriction on their economic resources, nor the limitation of their natural fertility; (3) there must not be a cold and calculating greed that hoards the economic resources and materials destined for the use of all, to the extent that less favoured nations are not permitted access to them; (4) there is no place in the new order for a total warfare or for a mad rush to armaments. "The calamity of a world war, with the economic and social ruin and the moral dissolution and chaos which follow in its trail, should not be permitted to envelop the human race for a third time"; (5) there can be no place for the persecution of religion and the church. The address was interpreted as a condemnation of authoritarian government. Favourable reference was made to the Churchill-Roosevelt eight-point program.

Notable utterances were made frequently in the course of 1941, condemning the war and causes which led to it, seeking peace "in justice and charity, in honor and freedom for all." In May he ordered prayers for peace to be said continually through the month. At Easter he appealed to the warring nations to restrain from "still more homicidal instruments of warfare." Later, in April, he urged clemency on the part of the war victors.

In June, in a Pentecost broadcast, commemorating the 50th anniversary of the labour encyclical of Leo XIII and the tenth anniversary of that of Pius XI, he affirmed the "three fundamental values of social and economic life," namely, the proper distribution and use of material goods, the rights of labour, and "the right of the family to a vital space." Speaking in English on the occasion of the Eucharistic congress held in St. Paul, Minn., June 26, he deplored the "black paganism" sweeping over humanity today, and urged more intensive prayer and self-sacrifice. He stressed the same theme in the international broadcast to the Eucharistic congress held in Chile, Nov. 9, and begged that "the gift of faith" be preserved "despite the increasing immorality, dissolving incredulity and reborn paganism."

Under the immediate direction of the pope, diplomatic relations of the Vatican with various nations were conducted, relief work for war victims, prisoners and refugees was carried on. Personally, he held conference with foreign representatives, such as Myron C. Taylor, of the United States, and the Japanese foreign minister, Yosuke Matsuoka. In his spiritual function, he continued to spur the faithful to a more intensive following of the teachings of Christ. (*See* ROMAN CATHOLIC CHURCH; VATICAN CITY STATE.) (F. X. T.)

Plague, Bubonic. During 1941 plague infection was found in rats in San Francisco and in neighbouring cities along the Pacific coast. Sharp outbreaks occurred among ground squirrels in the southern and in the extreme northern counties of California, more than 500 mi. apart. The disease had never been found previously in the northern counties, nor was it known to have occurred among the ground squirrels (*Citellus douglasii douglasii*) prevalent in that area. At the time of this epizootic two fatal cases occurred in children in a northern county. The discovery of the disease in rats in San Francisco during 1941 arrested attention; no such finding had been made since 1908, although 30,000 or more rats had been collected and examined annually since that date.

During 1941 infected marmots (*Marmota flaviventris*) and ground squirrels (*Citellus armatus*) were found in the 11th state, Colorado, and with the extension of the investigations eastward, to include the western fringes of the plains states, infection was found in fleas from ground squirrels (*Citellus richardsonii*) in North Dakota within a few miles of the southern boundary of Canada.

Infected parasites have been found in practically all the locations in which diseased animals were obtained, and in some areas and locations in which infected animals were not obtained, and where the species usually found infected are not permanent inhabitants.

A sharp epizootic was also discovered in 1941 among ground squirrels (*Citellus townsendii mollis*) in the environs of the city of Boise, Ida., on the boundary of a military reservation. During 1941, 26,494 field rodents were collected and infection was found among rodents taken in 12 well separated locations in seven states other than California. With the discovery of infection in Douglas squirrels, it has been determined that a reservoir of plague exists in 24 species of wild and domestic rodents scattered over the western states. Fifty species of fleas have been collected from the various wild rodents, and many of the species included have been shown capable of becoming infected through experimental feeding on laboratory animals suffering with a septicaemia of plague.

The surveys to determine the prevalence of plague have been made by the federal government with the assistance of a few of the states involved. Since field rodents have been found to be infected within and near military reservations and near large civilian communities in which the rat populations may become infected, efforts were being made by the United States public health service to extend these investigations and to enlist greater participation by the states both in surveys and in measures to suppress rodents in and about civilian and military communities.

BIBLIOGRAPHY.—C. R. Eskey, V. H. Haas, "Plague in the Western Part of the United States," *Public Health Bulletin*, no. 254 (1940); Brock C. Hampton, "Plague in the United States," *Public Health Reports* (June 28, 1940). (N. E. W.)

Plastics Industry. The use of plastics for defense purposes, which was considerable in 1940, took on a major crescendo in 1941. They were not only sold in increased amount in their normal markets, but because of the mandatory withdrawal of many metals from civilian uses, plastics were called upon to act as substitutes for such metals insofar as their properties would permit.

It was not possible to obtain figures for the 1940 production in Germany or France. It was believed that the 1941 world production of all plastics was upwards of 450,000,000 lb., including plastic resins used in coatings.

The 1940 production in the United States could be given with reasonable accuracy. The total of all plastics, excluding alkyds used for coatings, was estimated to be approximately 180,000,000 lb. The output of phenolic resins increased about 17% to 33,000,000 lb. while urea resins increased 30% to 22,000,000 lb. Cellulose acetate moulding powder increased 28%, which more than offset the 11% decrease in cellulose nitrate, keeping the cellulose group at about the same level, namely, 35,000,000 lb.

Obviously, information as to use of plastics in Germany, and other belligerent countries, was slight, but study of captured German aeroplanes indicated a large use of fabric impregnated with phenol and urea formaldehyde, also methyl methacrylate, polystyrene and vinylite.

German production of synthetic rubber required the production of large quantities of styrene, butadiene and acrylonitrile, which are also intermediates in the production of plastics. The low cost secured by the large production induced a consequent increase in the amount of plastics made from these materials.

Scattered items of information from Germany indicated the use of cellulose triacetate for transmission belts, the use of polyvinyl chloride for wire insulation, for bristles and for chemical tank lining. Other reputed applications were those of moulded phenol formaldehyde for drive shafts and other parts of sewing machines. Because of its water resistance, melamine formaldehyde was used for bathroom fixtures.

In Great Britain there was an enormous increase in the use of plastics for defense; censorship, however, withheld vital information. Items that might be cited were melamine formaldehyde for plywood adhesives, development of many flexible substitutes for glass; urea formaldehyde for instrument scales, toilet flush bowl floats and stuffing boxes; polyethylene for insulated cables, fabric reinforced phenol formaldehyde for cams, screws, nuts and fittings in railroad cars; and cellulose acetate for eyeshields to protect against gas droplets.

It was stated in a letter from London that large quantities of "scratch-proof, unbreakable" polystyrene were moulded as ophthalmic spectacle lenses for soldiers, requiring 8,000 dies.

As in 1940, mechanical improvements in compression, as well as injection moulding machines continued and in 600 plants there were 11,000 compression and 1,000 injection moulding machines in use in 1941.

A new method of fabrication, namely, extrusion moulding, increased the use of cellulose acetate, cellulose acetate butyrate, methyl methacrylate and polystyrene. In this process moulding powder is fed into a screw stuffer from which emerges a formed strip of any desired cross section. These strips are used for wall mouldings, shelf edgings and other decorative trim, replacing aluminum and stainless steel.

The automotive industry continued to use quantities of cellulose acetate, cellulose acetate butyrate, methyl methacrylate, phenol formaldehyde and urea formaldehyde in interior fittings and outside decorations. There were some 110 plastic parts in the 1941 automobile, ranging from upholstery buttons to steering wheels, from accelerator pedal to laminated safety glass interlayer.

Another volume market was that of refrigerator parts. Certain refrigerators used 39 plastic parts. An insulating frame used in one make was said to be the largest piece ever injection-moulded.

Although not in commercial production, an automobile with a complete

plastic body was built, the material being phenol formaldehyde plus soybean, and filled with wood fibre pulp.

Phenol formaldehyde continued to be the largest volume item, especially in its laminated form and it invaded new fields. In the aeroplane industry it found use as follows: pulleys, instrument boards and control tabs. In its laminated form it was used as a floor covering and, in conjunction with soybeans, for tractor seats. In its cast form it entered the toilet brush back market in considerable quantity. Sulphonated, it was used in water-softening plants with a great degree of success. It was widely employed as a plywood adhesive.

Urea formaldehyde increased its application in novel types of lighting fixtures and was used in larger quantity for articles such as bed lamps, door chimes, piano keys and tissue dispensers. As an adhesive, with casein, it found wider use with plywood and as a generally useful cement. Plywood with urea formaldehyde adhesive was made into fabric-covered panel boards as large as 8x20 ft.

Cellulose acetate and cellulose acetate butyrate moulding powders increased their use in places too numerous to mention. Some of the newer articles were fluorescent fish lures and electric switches, children's bassinets, stage scenery, refrigerator parts, head protectors for baseball players, a wide variety of dress trimmings, beer-cooling coils, children's toys, clothespins, Christmas tree ornaments, book bindings, arch supports and oil dispenser cups. A compression moulded bus shade, 33 in. by 17 in. by 0.0195 in., made from cellulose acetate butyrate, was one of the largest compression-moulded pieces made up to 1941.

Cellulose nitrate, although in 1941 being substituted by cellulose acetate, continued to be made in large quantities.

Methyl methacrylate production continued its increase and this beautiful plastic found many new uses. Its toughness, clarity and light weight made it almost an essential material for cockpit and bomber enclosures in military aeroplanes. Other new uses were acid-resisting vegetable and fruit knives, brush backs, illuminated typewriter platens, all-plastic dentures, contact eye lenses, transparent silver chests, machine guards, beer dispenser boxes, machinery models, miniature furniture, house numerals, toothbrush handles and juice extractor parts.

The polyvinyl resins, as a group, were widely used for defense, the vinyl chloride-vinyl acetate copolymer being used in large quantities for wire insulation. As rigid sheeting, the same copolymer was used in shower curtains, aeroplane cockpits, in gas masks, sound records, storage battery separators, watch crystals, and dress trimmings. Its use was continued in flexible suspenders, belts and wallets. As vinyon it formed acid and alkali filter cloths.

Vinylidene chloride, a new plastic introduced in 1940, found added application as fishline leaders and water pipes.

Polyvinyl butyral was considered the best plastic interlayer for automobile safety glass.

Nylon, the new synthetic monofilament, was more widely employed for bristles, with added applications as tennis and badminton racket strings.

Polystyrene, because of its clarity and easy moulding properties, enjoyed a greater market, among the articles made being salad sets, fluorescent light diffusers, hair curlers, toys and bathroom tiles. (*See* also CHEMISTRY; INDUSTRIAL RESEARCH; PAINTS AND VARNISHES; RAYON; RUBBER AND RUBBER MANUFACTURE; TEXTILE INDUSTRY.) (H. W. PA.)

Platinum. Lacking data from both Canada and the soviet union, each of which supplies about 35% of the total world platinum output, no estimates could be made of world output. There was no news as to the effect of the war on Russian operations, and in Canada all that was known was that nickel output was being pushed to the limit, and presumably the output of platinum and palladium that accompany nickel was increasing proportionately.

Although formerly only a minor producer, the United States since 1938 had been producing a material proportion of its platinum requirements from deposits in Alaska. The 1940 output included about 36,500 oz. of crude and 4,500 oz. recovered as a by-product in the refining of copper and gold. The latter might be expected to increase with the growing demand for copper, but no information was available on the output of Alaskan crude in 1941. Imports of platinum into the United States in 1940 were at the highest level, the average monthly receipts being 15,580 oz. in 1939, 10,560 oz. in 1940 and 17,540 oz. in the first eight months of 1941. Corresponding figures for exports were 11,655 oz. in 1939, 5,280 oz. in 1940 and 2,000 oz. in the first eight months of 1941. Formerly much of the Alaskan crude had been sent to Great Britain for refining, but the export data would seem to indicate that this had been stopped. There was in 1941 no report of shortage in supply.

Production of crude in South Africa in the first half of 1941 was 25,814 oz., against 38,809 oz. in the same period of 1940. Colombia, the producer of nearly three-quarters of the total, reported 14,135 oz. of crude in the first half of 1941, against 24,294 oz. in the full year 1940. The South African material carries about 60% platinum and the Colombian about 80%.

(G. A. Ro.)

Plums and Prunes. Production of plums and prunes in the United States in 1941 averaged generally higher than in 1940. No production figures were forthcoming from Yugoslavia, the leading plum and prune producing area of Europe.

Table I.—*U.S. Production* of Plums and Prunes in Tons, Fresh Basis*

	1941	1940	1930–39 average
Plums			
California	74,000	69,000	64,600
Michigan	6,800	5,800	5,580
Prunes			
Oregon	93,300	42,700*	110,400
Washington	26,300	17,500	31,450
Idaho	22,100	21,500	17,570

*Estimates include quantities sold and used on the farm for household consumption.

Table II.—*Quantities of Prunes Used Fresh, Canned and Dried, in Tons*

	1941	1940	1930–39 average
Used fresh (fresh basis)			
Idaho*	22,100	21,500	16,900
Oregon	15,400	10,900	10,650
Washington	10,600	8,410	13,860
Canned (fresh basis)†			
Oregon	30,000	11,300	15,020
Washington	7,700	8,700	4,710
Dried (dry basis)‡			
California	182,000	175,000	207,100
Oregon	6,010	2,000	21,780
Washington	400	110	2,890

*Includes small quantities of prunes canned and dried. †Includes small quantities for cold packing. ‡The drying ratio in Washington and Oregon ranges from 3 to 4 lb. of fresh fruit to 1 lb. dried; in California, 2½ lb. fresh to 1 lb. dried. In 1941 the equivalent of 11,000 tons of dried prunes, and in 1940 the equivalent of 9,000 tons of dried prunes were not harvested in California because of market conditions.

(S.O.R.)

Pneumonia. Statistical evidence continued to accumulate indicating the effectiveness of the various sulphonamide derivatives in the treatment of pneumonia. The fatality rate, with such treatment, in general lies around 10%. In uncomplicated cases treated early in the course of the disease, it is even lower than this figure, ranging from 4% to 6%. This represents a tremendous reduction from the fatality rate of 25% to 35% expected in the pre-chemotherapeutic era.

Attempts have been made to define the type of case which should receive serum in addition to drug. Theoretically the combination should be better than either agent used separately: serum therapy provides a specific antibody, chemotherapy acts by bacteriostasis. However, statistical evidence has not demonstrated this to be the fact. Thus in a two-year study conducted at Bellevue hospital, New York city, Plummer and his associates found no significant difference in the fatality rate between a large group of patients with pneumonia half of whom received drug alone and the other half drug plus serum.

While these results have been disputed, the sulphonamide compounds have in general displaced the routine use of type specific antipneumococcus serum.

There are, however, two definite groups of patients in whom serum is indicated: those who are hypersensitive or tolerate the sulphonamide compounds poorly, and those in whom there is no response to chemotherapy in 36 to 48 hours.

The newest of the sulphonamide derivatives, sulphadiazine, would appear to be the drug of choice for the treatment of pneumonia. It is as effective as either sulphapyridine or sulphathiazole, and in addition possesses other advantages. The troublesome nausea and vomiting encountered so frequently with sulphapyridine is practically absent with sulphadiazine, and other toxic reactions also seem to be less frequent. It is more readily absorbed from the intestinal tract, and excreted more slowly so that

higher blood levels are more readily reached and maintained. It is less prone to conjugation than the other sulphonamides and its acetyl form is more soluble in the urine than the conjugated products of sulphapyridine and sulphathiazole, with the result that renal damage is less apt to occur.

Reports of toxic reactions to the various sulphonamide derivatives continued to appear. These range from slight nausea to disappearance of white blood cells. Compared with the widespread use of sulphonamides, the number of disastrous reactions was relatively small. The potential toxic dangers from chemotherapy have probably been overemphasized. If the rare patient who is hypersensitive to the sulphonamide derivatives is eliminated, the majority of toxic reactions can be prevented by careful observation of the patient, including frequent examination of the blood and urine and the discontinuance of the drug promptly on any signs of toxicity. (*See* also CHEMOTHERAPY; EPIDEMICS AND PUBLIC HEALTH CONTROL; MEDICINE.)

Poland.

The area of Poland prior to the German invasion on Sept. 1, 1939, was about 150,470 sq.mi.; the population was estimated Jan. 1, 1939, as 34,775,700. On Sept. 29, 1939, after the conquest of the country was virtually completed, Germany and the U.S.S.R. partitioned Poland and set up a new boundary which, running from north to south, roughly followed the Pissa, Bug and San rivers. The Germans then divided their territory into two sections; one, including the provinces of Pomorze, Posen, Upper Silesia and Lodz, was directly annexed to the Reich; the rest was constituted as the Gouvernement General of Poland, under German administration, with Cracow as the capital.

History.—When on June 22, 1941, Hitler launched his attack on the U.S.S.R. and the Russians resisted, a basis was created for collaboration between Poland and the U.S.S.R. The following day Gen. Wladislaw Sikorski, the Polish prime minister and commander in chief, expressed his readiness to terminate the abnormal situation existing between the two countries, on honourable terms acceptable to both sides. Moscow responded. But the negotiations for an agreement creating a basis for future relations were not easy, in view of the fact that the soviet government had proclaimed the annexation of the eastern provinces of Poland—an area of 77,800 sq.mi., with a population of 13,800,000. The Polish government insisted on the renunciation of all territorial consequences of the 1939 German-soviet agreement. The soviet government agreed, however, only to declare "the soviet-German treaties of 1939 regarding territorial changes in Poland as having lost their validity." Three members of the Polish cabinet disagreed with this formula and resigned. None of them, however, opposed the principle of a settlement with the U.S.S.R. On the recommendation of the prime minister the Polish president, Wladislaw Raczkiewicz, appointed Count Edward Raczynski, the ambassador in London, acting foreign minister; he also named Stanislaw Mikolajczyk (Peasant party) deputy prime minister; and Karol Popiel (Christian Democratic party) minister without portfolio. On Dec. 5 a Russo-Polish pact of mutual assistance and collaboration was signed in Moscow.

The second outstanding event in Poland's foreign policy in 1941 concerned its relations with Czechoslovakia. Animated by the solidarity which inspired their joint declaration of Nov. 11, 1940, the governments of Poland and Czechoslovakia announced at the Inter-Allied meeting in London on Sept. 24, 1941, that they were convinced of the necessity of establishing after the war a confederation between the two countries.

Following the extension of hostilities to the Pacific, the Polish government declared war on Japan on Dec. 12.

The Struggle Outside Poland.—During 1941 the Poles continued to wage war on the enemy outside their own country, by the side of their allies. The Polish air force, commanded by Air Vice-Marshal Stanislaw Ujejski, had twice the strength it had at the time of the German attack on Poland. From the time of their arrival in Great Britain in June 1940 to the end of Nov. 1941, Polish fighter squadrons destroyed 410 enemy aircraft. Polish

CIVILIAN POLES being marched through a Silesian town on their way to execution by German military police, according to the photographer who smuggled the picture out of Poland in 1941

bomber squadrons took part in 277 raids, with 1,302 aircraft. The Polish navy, under Vice-Admiral Swirski, had in action six destroyers and three submarines. Polish land forces included an army corps co-operating in defense of Britain and a Polish brigade fighting in Libya. After the signing of a Polish-soviet military accord in Moscow Aug. 14, a Polish army of four to six divisions under Gen. Wladislaw Anders was in formation somewhere beyond the Volga; finally, General Bronislaw Duch was recruiting a Polish unit in Canada. On Sept. 4 President Roosevelt authorized lend-lease aid to the Polish forces. The Polish merchant navy actively co-operated with Great Britain. Four ships, including the transatlantic liner "Pilsudski" were lost; and the Polish merchant navy at the close of 1941 numbered 32 vessels totalling 100,000 tons.

Under German Occupation.—After the Russian-occupied territories of Poland had been taken by the German forces, eastern Galicia was included in the Gouvernement General on Aug. 1, 1941. Wolyn (Volhynia) was left as a separate district. The northeastern parts of Poland, with Lithuania and Latvia, were incorporated in a new German creation, known as the "Ostland." Hans Frank, head of the Gouvernement General, in a speech in Berlin on Nov. 18, thus defined German policy toward the Polish nation, "The Polish nation must be freed from bearing the responsibility for its own political destiny, because it has again sacrificed the peace of other nations; it must be restricted to a small area of settlement, since by numbers it belongs to the secondary nations of Europe; strict and unequivocal demarcation between what is German and what is Polish is the right of the German nation."

The Poles refused Hitler's repeated suggestions of a joint campaign against Russia (cf. *Polish White Book*), and showed unwavering determination in their resistance against the invader. With some 140 secret newspapers and broadsheets, Poland in 1941 had the largest underground press in German-occupied Europe. German rule in Poland was therefore more ruthless than anywhere else. (K. SM.)

Police. The existence or imminence of war continued to be the greatest single factor in police development. In those portions of Europe, Asia and South America which had organized their police under national rather than under local auspices, police became to all intents and purposes organic parts of the military machines on the home fronts. The same influences toward centralization were apparent in the British Isles and the dominions, in the United States and in Latin America. Even though in the English-speaking countries police retained their essentially civil character despite the impact of war conditions, there was a noticeable tightening of central (*i.e.*, national) direction and control over the operations of local police agencies which still were commanded, organized and supported on a local basis. All found themselves heavily engaged in air-raid precautions, with additional responsibilities for assisting the civil population to meet unrestricted air warfare in both military and nonmilitary zones. Threats of invasion and occasional blackouts in Canada and the United States imposed new and unfamiliar duties upon the police of both countries. Police commanders were besieged at every turn by local vigilance committees, by state and county defense councils and by a wide variety of national agencies, to tighten the existing regulatory devices, to devise new types of regulations to meet anticipated emergencies, to provide special training for the rank and file of police, to organize auxiliary police, to add this or that type of equipment, to prepare plans for the speedy evacuation of civilians in extensive areas and to serve on a host of co-ordinating committees. As the year closed the over-all situation was still greatly confused, with some evidence that too much rather than too little had been attempted, and that only in the relatively familiar field of counterespionage and antisabotage investigations had police generally succeeded in showing tangible results for so much feverish effort.

In the United States, the Federal Bureau of Investigation (*q.v.*) extended its supervision over espionage and sabotage cases, handled in the first instance by state and local police, and it appeared probable that local police trained in the FBI national police academy since 1935 would be called into federal police service.

New York, New Jersey, Virginia and Connecticut, which had led the way in developing state-wide police mobilization plans in 1940, increased their efforts along these lines. Maine, Delaware, Maryland and Michigan took similar action in 1941, with Rhode Island, Ohio and other states preparing to do so. In addition, an extensive training program for local police was instituted in anticipation of the war emergency, with many temporary zone schools set up by the FBI and collaborating agencies. Particularly on the east and west coasts, auxiliary police were sworn in by local authorities, with a number of states instituting state guards (militia) to take the place of the national guard organizations that had been called into federal military service.

The burdens imposed upon local communities by the recruitment of auxiliary police evoked demands upon the federal government for financial aid in meeting such extraordinary demands, but no well defined plans to that end were in existence at the close of 1941.

The ever-widening effects of military censorship and the increasing difficulties of oceanic transport served to limit still further the free interchange of specific information on the extent and character of police establishments and the changes and developments that the year had brought. Even in Great Britain the free flow of official and unofficial reports on police was finally stemmed, and for the time being, at least, these sources of information were no longer available.

In the United States, however, there was no such interruption. So far as the regular police personnel was concerned, it was clear that no important changes in numerical strength, organization or control as yet had occurred. Latest figures (1940), covering 2,609 cities, towns and villages, are summarized from the *Uniform Crime Reports* in Table I.

Table I.—*Numerical Strength of Municipal Police in U.S.*

Population Groups of Cities	Number of Forces Filing Returns	Population Represented	Number of Police per Thousand of Population
Group I—over 250,000	37	30,195,330	2.12
Group II—100,000 to 250,000	55	7,792,050	1.45
Group III—50,000 to 100,000	106	7,204,710	1.37
Group IV—25,000 to 50,000	213	7,417,093	1.23
Group V—10,000 to 25,000	596	9,030,389	1.05
Group VI—Under 10,000	1,602	8,301,918	1.01
Totals	2,609	70,101,108	1.61

These figures represent a slight reduction from the levels of the preceding year (when the ratio for all cities represented reached a total of 1.65 police per 1,000 of population). The impact of the war upon seaboard communities now promised, however, to raise police quotas to hitherto unexampled heights, owing to the addition of auxiliary police (most of them part-time and partially trained) to the regular establishments. Crimes cleared by arrest in 1940 showed a further falling off in this form of police efficiency, as measured against the peak year of 1938, in all major categories except murder. As usual, police cleared more crimes against the person, ranging from 88.7% (for murder and nonnegligent manslaughter) down to 73.7% (for aggravated assault). Arrest clearances of crimes against property again reflected a less favourable situation than in the case of crimes against the person, ranging from 23.4% for larceny or theft (a decline from 25.4% in 1939) up to 41.8% for robbery. Table II summarizes the record of crimes cleared in 1940 in 1,212 cities having a total population of 41,146,894.

Reasons for the continued decline in the index of police effectiveness were by no means clear. Aside from the very real possibility that the somewhat inferior records for 1939 and 1940 represented a mere reaction from the peak figures attained in 1938, it seemed probable that the dispersal of considerable numbers of police on strike duty, and the effects of impending war in diverting police attention from the suppression of crime toward preparations in national defense, were probably responsible.

Concurrent with such changes were the marked declines in the number of police killed by criminals. During much of the prohibition era, and the years immediately following it, police in the United States had been subject to unusually high fatality rates, which in turn gave rise to conjecture concerning the degree of their freedom from underworld association, and their effectiveness in the use of police weapons for self-defense. The figures ap-

Table II.—*Per Cent of Crimes Cleared by Arrest, in U.S. Cities, 1940*

Murder and Non-Negligent Manslaughter	Negligent Manslaughter	Rape	Robbery	Aggravated Assault	Burglary, Breaking or Entering	Larceny, Theft	Auto Theft
88.7	83.4	79.4	41.8	73.7	33.1	23.4	23.8

pearing in Table III, if later confirmed by the records of succeeding years should go far toward removing public anxiety on this score.

Table III.—*Police Killed by Criminals—Rates per 5,000,000 Inhabitants in Cities over 25,000 Population, 1937–40*

Year	Rate	Year	Rate
1940	1.24	1938	3.91
1939	1.79	1937	3.91

Highest rates (1940) were recorded in the south Atlantic and Pacific states (4.33 and 2.06 respectively). In three of the nine geographical regions —namely, in the New England, west north central and east south central states—no police were killed by criminals during 1940. For the cities of the United States as a whole, the lowest rates were recorded in cities of the lowest population group (from 25,000 to 50,000 population). Their combined rate of 0.67 was but slightly more than one-half that for cities throughout the country as a whole.

The ever-widening effects of war were not conducive to international conferences on police techniques. However, the International Association of Chiefs of Police (in which U.S. and Canadian memberships heavily predominate) held its 48th annual police congress at Buffalo, N.Y., in Sept. 1941. Special emphasis was there placed upon the extraordinary traffic conditions that might be anticipated in the war emergency, together with the experiences of British communities in handling air-raid precautions and defense. Also notable were the numerous regional meetings of state police executives from the United States and Canada. Sponsored by the state and provincial section of the International Association of Chiefs of Police, they served to consolidate portions of the police defenses along both the criminal and the war emergency fronts.

The Office of Civilian Defense (*q.v.*) dispatched a special police mission to London for the purpose of studying at first hand the organization and functioning of English police establishments under war conditions, and particularly the various techniques employed in protecting life and property from the effects of intensive air raids. (*See* also CRIME; KIDNAPPING; SECRET SERVICE.)

Polo. In the U.S. in 1941 all the usual events of the season were held, with the National Open and Monty Waterbury Memorial Cup tournaments, most important of all the championships, both being won by the Gulf Stream team, which consisted of J. H. A. Phipps, Michael G. Phipps, Charles S. von Stade and Alan L. Corey, Jr.

The National Twenty Goal championship was won by the Bostwick Field team of Sidney Culver, George H. (Pete) Bostwick, Charles S. von Stade and Alan L. Corey, Jr. All these events were played at the Meadow Brook club, Westbury, L.I.

The Oak Brook club, near Chicago, Ill., was the site of the year's National Inter-Circuit and Twelve Goal championships, with the Houston Huisache team of Texas winning the Inter-Circuit for the fourth time since 1935 while the home club captured the Twelve Goal. Huisache played with Robert D. Farish, William Dritt, Robert S. Nichoalds and Rudolph Humberson, while Oak Brook lined up with Harry Owen, Jr., Paul Butler, Dan Peacock and Charles Aaberg. Yale won the intercollegiate championship for the second successive year.

There was no formal international competition during the year although two high-goal teams went to Mexico City, one in February and one in November, for a series of games with the Mexican army. The latter team was organized and captained by Winston Guest.

Cecil Smith was dropped from ten goals to nine on the Polo association's handicap list, thus leaving Stewart Iglehart as the only ten-goal player in the United States in 1941. (R. F. K.)

Poorten, Hein ter (1887?–), Dutch army officer, was trained at Holland's Royal Military academy. He took an early interest in aeronautics, was one of the first Netherlands officers to obtain a pilot's licence, and won an international prize for a balloon flight. Poorten, who long advocated increasing the air arm of Dutch armies, made several visits to the United States to study aircraft and purchase planes. A veteran of 30 years' service in Holland's Asiatic colonies, he was made commander in chief of the Netherlands East Indies army and head of the war department in Oct. 1941. Aside from his achievements in aeronautics, Poorten is rated as an expert in gunnery and jungle warfare. After Japanese invasion forces landed on the island of Borneo in late December 1941, he called upon the Allies for more bombers, fighting planes and anti-aircraft guns.

Porter, Edwin S. (1869?–1941), U.S. motion picture director of the silent film era, was born in Pittsburgh, Pa. In the 1890s he joined the Edison company as a cameraman. Porter experimented with a narrative technique and screened, in 1903, *The Life of an American Fireman*, the first story film. Two years later he produced *The Great Train Robbery*, a western "horse opera" packed with thrills and romance, which was given its première at a Pittsburgh nickelodeon. The film, an immediate success, became a milestone in the history of the movies. Porter's fame boomed, and from 1905 to 1917 he turned out scores of box-office successes, starring such favourites as Pauline Frederick, John Barrymore and Mary Pickford. In later years he devoted himself to designing new devices for the camera and projector. He died in New York city, April 30. (See *Encyclopædia Britannica.*)

Porto Rico: *see* PUERTO RICO.

Portugal. A republic of western Europe, forming part of the Iberian peninsula and bounded on the N. and E. by Spain and on the S. and W. by the Atlantic ocean. Area (including Azores and Madeira), 35,670 sq.mi.; pop. (est. Dec. 31, 1939), 7,539,000. Chief towns: Lisbon (cap. 594,300), Oporto (232,280). President: Gen. Antonio Carmona; language: Portuguese; religion: Christian (mainly Roman Catholic).

History.—Notwithstanding abnormal conditions, the second budget report to be published since the beginning of World War II showed a surplus of 500 contos (=500,000 escudos). This was due to a slight increase in ordinary revenue (despite a considerable drop in customs revenue) and to a decrease in public debt charges resulting from the conversion of the external debt. The report foreshadowed increased taxation, a limitation of certain services (severe cuts in railway services had already been made) and the suspension of plans approved under the ministry of public works. It believed that, thanks to 12 years of prudent administration and financial equilibrium, no major crisis was likely to occur. This hope was subsequently confirmed by the publication of the 1940 balance sheet, which showed an actual credit balance of 174,000 contos. The figures for Portuguese foreign trade for the first half of 1941, on the other hand, showed a large decline

in both exports and imports.

In mid-February almost the whole of Portugal was swept by a cyclone, which was followed by extensive floods. An approximate estimate of the damage put it at some 12,000,000 contos, or nearly half the country's total revenue during 1940.

Maintaining its neutrality in the war, Portugal started a national scheme which, by co-ordinating the efforts of other countries, collecting grants and setting up an assistance bureau, as well as by private hospitality, would help some of its child victims.

Relations with Britain were excellent. The new ambassador, Sir Ronald Campbell, presented his letters of credence on Jan. 8. In April a delegation from Oxford university held a convocation at the University of Coimbra and conferred the honorary degree of D.C.L. upon Dr. Oliveira Salazar, who on his 52nd birthday (April 28) was accorded a striking demonstration of popular confidence in Lisbon. In July and August the British and Portuguese governments concluded a large sardine contract and agreed upon measures to avoid a rice shortage in Portugal. In September leaders of the Portuguese Youth movement visited Britain to study youth organizations. Imports and exports between the two countries increased by about 20% in 1940.

The landing of Allied troops (Dec. 18) in Portuguese Timor necessitated by Japanese submarine activity in that region (the Japanese acquired a commercial airport on Timor in October) was immediately discussed in the Portuguese national assembly. It was then revealed that Portugal had previously accepted a British offer of help if Timor were attacked and that Portuguese reinforcements for the garrison were in preparation. Britain had undertaken to withdraw the troops as soon as the emergency was over.

An extensive literature relating to the centenary celebrations of 1940 began to appear. More than 30 volumes of historical studies were announced. (E. A. P.)

Education.—Elementary (1937) schools 7,890; scholars 734,922; secondary (1936–37) schools 45; scholars 18,055; universities (1936–37) 3; students 5,871.

Banking and Finance.—Revenue, ordinary (est. 1940) 2,041,800,000 escudos; expenditure, ordinary (est. 1940) 2,029,900,000 escudos; public debt (1939) 7,192,100,000 escudos; notes in circulation (May 31, 1941) 3,093,000,000 escudos; gold reserve (Dec. 31, 1939) 920,000,000 escudos; exchange rate (average 1940): 1 escudo=3.711 cents; (June 1941) 1 escudo=4.003 cents.

Trade and Communication.—External trade (merchandise): imports (1940) 2,523,500,000 escudos; exports 1,612,600,000 escudos. Communications and transport (Dec. 31, 1937): roads, first and second class 8,858 mi.; railways, open to traffic, 2,187 mi.; motor vehicles licensed (Dec. 31, 1937): cars 34,442; commercial 11,410; cycles 4,536; shipping (June 30, 1939) 269,000 gross tons.

Agriculture and Minerals.—Production 1939 (in metric tons): wheat 516,100; maize 364,700; wine 7,718,000 hectolitres; coal 308,000; rye 98,800; oats 91,100; rice (1938) 68,400; barley 39,200; potatoes 606,000; olive oil 33,400; sea fisheries (excluding cod fishing) 180,400. (*See* also PORTUGUESE COLONIAL EMPIRE.)

REFUGEES IN LISBON during 1941 had little to do except await their turn for coveted steamship and airline tickets to America. Every room in Lisbon and its suburbs was taken

Portuguese Colonial Empire.

Total area (approx.) 839,506 sq.mi.; total population (est. Dec. 31, 1938) 9,460,000, excluding Portugal, the Azores and Madeira. Certain essential statistics of the colonial possessions of Portugal (*q.v.*) are given in the table below.

History.—In 1941 interest centred chiefly round the Azores and Cape Verde islands. President Roosevelt having declared on May 27 that the United States would not permit the axis powers to occupy these islands, Portugal requested a clarification of this statement. Secretary of State Hull then handed the Portuguese minister a note expressing anxiety at the "expanding acts of ag-

gression on the part of a certain belligerent power," and disclaimed for the United States any aggressive aims but reserved the right to take self-defensive action.

During the first half of 1941, and again in the late summer, large contingents of reinforcements were sent by Portugal to the Azores and from July 23 to Aug. 11 President Carmona was on an official visit there. A "colonial week," organized by the Portuguese Geographical society, was observed throughout Portugal at the end of May.

Following the concordat and the missionary agreement with the Vatican (May 1940), a missionary statute was promulgated which, besides implementing the agreement, made the recognition of missions dependent upon the colonial ministry and safeguarded the rights of the Portuguese language and jurisdiction. (E. A. P.)

Post Office.

Revenues and expenditures for the fiscal year 1941 reached an all-time high in the postal history. From a previous high of $705,484,098 in 1930 the postal revenues decreased to a low of $586,783,165 in 1934. Beginning in 1935 there had been a yearly gain, and the fiscal year 1941 was the fifth consecutive year in which postal revenues reached record highs.

For the fiscal year 1941, the comptroller general stated the audited revenues as $812,827,735.71, an increase of 5.9% over 1940. The audited expenditures were $836,945,548.14, an increase of 3.6% over 1940. The postal deficit for 1941 was $24,117,812.43 as compared with $40,784,238.74 for 1940, or a reduction of 40.8%. The audited revenues shown represent cash earned during the fiscal year. However, the amount shown as audited expenditures includes $23,932,225.41 of items paid during the fiscal year 1941 which arose under obligations of prior fiscal years. Furthermore, audited expenditures do not reflect $26,778,094.63 of obligations incurred and chargeable against appropriations made for the fiscal year 1941, payments for which would be made during the fiscal year 1942. If expenditures were to be stated on an accrued basis the postal business for the fiscal year 1941 would be revenues $812,827,735.71 and total audited expenditures $839,791,417.36, which includes all obligations incurred and chargeable against appropriations for the fiscal year 1941. Therefore, the operating deficit for the fiscal year 1941 would be $26,963,681.65.

Other branches and other agencies of the government rely upon the postal establishment to perform numerous tasks in addition to carrying the mail for the public. Through the post offices there was sold, during the 1941 fiscal year, a total of 3,967,581 United States savings and defense savings bonds, having a maturity value of $981,768,250; internal revenue stamps valued at $4,828,545 and migratory bird hunting stamps valued at $1,373,080. In addition, the postal establishment was directed by statute to register and fingerprint more than 5,000,000 aliens for the department of justice. An unusual task accomplished by the co-operative efforts of all branches of the postal establishment during 1941 was the safe transportation of more than $9,000,000,000 in gold from New York, N.Y., to Fort Knox, Ky. This movement required 45 trains with a total of 337 cars. In co-operation with the civil service commission local civil service boards composed of post office personnel were set up in practically all first and second class post offices for the purpose of conducting examinations and making investigations. The public and the government have found it effective, economical and convenient to utilize the postal service facilities in carrying out these and similar activities, thereby enabling other agencies and branches of the government to perform governmental activities at a minimum of expense to the federal government.

Through its 44,095 post offices and 6,553 branches and classified contract stations the postal establishment was hired, during the fiscal year 1941, to transport and deliver approximately 28,000,000,000 pieces of mail, weighing some 3,000,000 tons, which was an increase of 250,500,000 pieces of mail and 45,142 tons over the fiscal year 1940. In the conduct of its work the postal establishment had 338,114 employees and accounted for over $8,000,000,000 in financial transactions. The expenditures for personnel for the postal establishment amounted to 75% of the total postal expenditures.

On June 30, 1941 there were 4,958 contract stations being conducted under two-year agreements. The average cost per unit was $317 and the total cost of operation amounted to $1,573,000, whereas the receipts from the sale of stamps at these contract stations amounted to $35,433,000.

City delivery service was established in 23 additional cities, thereby extending service to 24,456 blocks of territory serving 524,574 families and 26,411 new places of business.

Postmasters.—There were 1,630 postmasters confirmed by the U.S. senate and appointed, without term, by the president. Also, postmasters were commissioned at 2,890 offices of the fourth class where vacancies occurred for various reasons. There were 10,789 postmasters at offices of the first, second and third classes entitled to the benefits of the retirement act on June 30, 1941. Of this number 48 presidential and 419 fourth class postmasters were retired from the service.

Dead Letters.—Dead letters and dead parcel post packages were handled in a unit in Washington, D.C., and in an additional 14 dead parcel post branches and 1,192 dead letter branches in various cities. A total of 13,744,889 dead letters was received in the division, which was an increase of approximately 5%. Of this total, 2,432,000 letters were delivered to the senders and 11,247,000 were destroyed as undeliverable. Upon examination, 69,052 letters were found to contain money amounting to $94,058. The number of unclaimed parcels and articles found loose in the mails was 210,860.

Air Mail.—At the close of the fiscal year 1941 there were in operation 43,411 mi. of domestic air mail routes as compared with 37,943 mi. at the close of the previous fiscal year. A total of 74,297,154 mi. of service was performed as compared with 59,177,525 mi. of service in 1940. The total cost for the fiscal year 1941 was approximately $21,000,000 as compared with approximately $18,855,306 for the fiscal year 1940. Service was established on 13 new domestic routes serving an additional 53 cities with direct air mail supply.

Rural Delivery.—On June 30, 1941 a total of 1,411,753 mi. was travelled by rural carriers in providing service to approximately 29,000,000 patrons. The cost of the rural delivery service was $91,504,046 as compared with $91,447,713 for the fiscal year 1940. The extensions of this service to rural patrons resulted in an increase of 10,063 mi. of travel by the rural carriers during the fiscal year 1941

On Feb. 10, 1941 the first experimental highway postal service was established between Washington, D.C. and Harrisonburg, Va. This route is 146 mi. in length and serves 22 intermediate post offices. A second experimental route was established on May 3, 1941 between South Bend and Indianapolis, Ind., a distance of 152 mi.

Postal Savings.—The postal savings system on June 30, 1941, held the sum of $1,346,764,255 for 2,882,886 postal savings depositors. This was an increase of 66,478 depositors and $16,855,532 over the previous fiscal year.

On May 1, 1941 the treasury department launched a nation-wide defense bond and stamp program and requested the postal establishment to sell the defense series of savings stamps. The sales amounted to $6,086,925 during the period from May 1 to June 30, 1941. During the same period a total of 994,199 defense savings bonds were sold, having a maturity value of $121,977,050.

The sale of postage stamps through the philatelic agency amounted to $1,158,000, which was an increase of 5.2% over the previous fiscal year.

Buildings.—During the 1941 fiscal year 200 new additional government-owned post office buildings were placed in operation; 29 extensions to existing buildings were completed and occupied and 10 new federal buildings replaced a similar number of old buildings which had become inadequate for government purposes. A total of 179 new leases was made, including 162 for offices previously occupying space on a monthly rental basis. In renewing leases improvements were secured in the quarters especially in communities adjacent to large military establishments or in places where civilian activities had increased on account of the defense program. (H. F. A.)

Great Britain.—The 1941–42 budget estimate at £93,700,000 showed an increase of £12,000,000 over the estimate for the previous year, but this was more apparent than real, for in 1941 expenditure arising out of World War II, including the staff war bonus of £2,400,000, was included, whereas in 1940 this had been the subject of a separate vote of credit. The surplus for the year ended March 31, 1940 was down by £2,828,000, though the deficit on telegraph account was lower by £273,826 and the telephone surplus higher by £725,517, results attributable to the heavy demands for defense and rearmament purposes and the temporary suspension of reduced night rates for trunk phone calls. Increase of salaries and wages

(amounting in 1941 to some £7,000,000) and war bonus account largely for increased expenditure, but receipts showed a heavy decline, due partly to the increased charges and partly to the restriction of advertising circular distribution and the almost total elimination of football-pool business, and also because of the loss of poundage on postal orders during the time they were used as legal tender.

Despite the many, though trivial, criticisms levelled at the post office, this vast organization overcame the difficulties caused by the sudden transformation of Great Britain from a base to a battlefield. Several methods were successfully improvised to meet the situation arising after the destruction of offices and homes, mail bags and sorting offices during the raiding season; collections and deliveries were maintained even in the most bombed areas and were generally speeded up; and arrangements for the expeditious receipt of letters by prisoners of war were, through neutrals, successfully concluded with the enemy. Mails, naturally, tended to be erratic; some, mostly incoming, were lost by enemy action, but all that reached British ports were promptly delivered; outgoing mails were dispatched by every suitable ship, but they were usually obliged to follow devious routes and, as the war spread over Europe, more and more countries were barred to them. At the beginning of the year the staff numbered 267,000 (a rise in 12 months of 3,000), of which the proportion of women had greatly increased; and by June 1941, 52,000 of the regular employees were serving either in the armed forces or as civil defense workers, more than 5,000 of these being skilled sorters from the London area.

In February telegraphic service to the near east was speeded up by the adoption of a code system in which often recurring phrases could be signalled very briefly; in April a special 3*d*. air mail post card service was introduced for troops in the middle east; and shortly after came the "airgraph" letter service for the same theatre of war; the letters, written on a special form, being microphotographed and sent by aeroplane as part of a miniature film to be enlarged on arrival. By this means a load of letters normally weighing 1½ tons was compressed into under 20 lb. (*See* also PHILATELY.) (L. H. D.)

Potash. With the bulk of the world potash production in Germany, France, Russia, Poland and Spain, there was in 1941 naturally little information available concerning current conditions; about all that was known was that the French producing area reverted to Germany, the Polish to Russia, and that Spanish production again approached normal. The Palestine output was growing rapidly, and while no specific figures were made public, exports were expected to be of the order of 125,000 tons in 1940, or about double those of 1939. The only country in the entire production group on which definite figures can be given is the United States, where sales exceeded production in both 1939 and 1940. The 1940 output increased 20% over 1939, to 658,249 short tons, equivalent to 379,679 tons of K_2O, while sales increased 7% to 677,892 tons, equivalent to 393,058 tons of K_2O. Imports in 1940 totalled 258,061 long tons, equivalent to 117,656 tons of K_2O; while this is an increase of 20% over 1939, it is a drop of nearly two-thirds since 1937. In the same time exports increased, and were of the order of 100,000 tons of potash salts, mostly for fertilizer use. (*See* also FERTILIZERS.) (G. A. Ro.)

Potatoes. The 1941 crop of potatoes in the United States was reported by the department of agriculture on Nov. 10 as 376,701,000 bu. from 2,904,000 ac., compared with 397,722,000 bu. from 3,053,000 ac. in 1940 and a ten-year (1930–39) average of 370,045,000 bu. from 3,296,000 ac. The per-acre yield average was 129·7 bu. in 1941. In 1940 it was 130·3 bu.; the ten-year average was 112·6 bu. No figures were available in 1941 from the huge potato-producing areas of Germany and former Poland. Before the war, European production (excluding the U.S.S.R.) averaged 126,400,000 metric tons annually. In the United States the potato market began the year with its customary surplus and depressed prices; the per capita consumption of potatoes in the United States declined steadily after 1900. In Feb. 1941, the secretary of agriculture authorized a subsidy of 25 cents per cwt. on potatoes diverted to livestock feed, up to 12,500,000 bu. The government also subsidized the production of potato starch in Maine. Although large purchases of potatoes were made for army camps and the government bought canned potatoes for export under the lend-lease act, potato prices lagged until late summer, when speculators selected potatoes as a "sleeper"; that is, they decided that potato prices were behind the general advance of commodity prices. The activity of speculators in the futures market for potatoes (the Chicago Mercantile exchange) resulted in a sharp advance in prices during the autumn months. During 1941 there were persistent rumours that an increase in production of dehydrated potatoes for shipment to Great Britain might broaden the United States potato outlet. As pointed out, however, by the *Potato World*, monthly publication of the National Potato association, dehydrated potatoes were not widely used during World War I, and it was not practical to construct a sufficient number of dehydrating plants to affect consumption materially. In Sweden the government arranged for 15 alcohol distilleries to convert 11,000 short tons of potatoes into potato flakes to be used as a substitute for bread grains.

Table I.—*U.S. Production of Potatoes by States, 1941 and 1940*

State	1941 bu.	1940 bu.	State	1941 bu.	1940 bu.
18 surplus late potato states			Vermont	2,059,000	2,142,000
			New Hampshire	1,472,000	1,634,000
Maine	45,360,000	44,055,000	Rhode Island	814,000	878,000
Idaho	28,560,000	32,860,000	New Mexico	432,000	480,000
New York	28,078,000	26,838,000	Arizona	302,000	276,000
Pennsylvania	23,674,000	24,570,000	*7 intermediate potato states*		
Michigan	20,600,000	20,640,000			
Minnesota	17,082,000	23,750,000	New Jersey	9,700,000	10,150,000
Wisconsin	16,608,000	15,054,000	Virginia	7,007,000	10,412,000
North Dakota	15,010,000	18,920,000	Missouri	5,995,000	5,616,000
Colorado	12,775,000	15,210,000	Kentucky	3,760,000	4,140,000
California	11,470,000	12,480,000	Kansas	2,860,000	2,548,000
Nebraska	9,490,000	11,340,000	Maryland	2,342,000	2,898,000
Washington	8,600,000	8,325,000	Delaware	323,000	443,000
Oregon	8,460,000	8,510,000	*12 early potato states*		
Wyoming	2,185,000	2,400,000			
South Dakota	2,015,000	2,016,000	California	10,335,000	10,260,000
Utah	1,836,000	2,040,000	N. Carolina	6,723,000	8,720,000
Montana	1,840,000	2,040,000	Texas	6,076,000	3,200,000
Nevada	330,000	391,000	Alabama	5,400,000	4,176,000
12 other late potato states			Florida	3,306,000	4,312,000
			Arkansas	3,139,000	3,895,000
Ohio	13,000,000	11,800,000	Tennessee	2,745,000	3,388,000
Iowa	6,099,000	6,120,000	S. Carolina	2,730,000	3,192,000
Indiana	4,324,000	4,335,000	Louisiana	2,684,000	2,280,000
W. Virginia	3,960,000	3,630,000	Oklahoma	2,170,000	2,550,000
Connecticut	3,402,000	3,402,000	Mississippi	1,365,000	1,240,000
Illinois	3,312,000	3,549,000	Georgia	1,140,000	1,482,000
Massachusetts	2,726,000	3,135,000			

Sweet Potatoes.—Production of sweet potatoes in the United States in 1941 was estimated by the department of agriculture, Nov. 10, as 70,844,000 bu. from 843,000 ac.; average yield per acre, 84 bu. In 1940 it was 61,998,000 bu. from 772,000 ac.; the per-acre yield, 80·3 bu. The ten-year (1930–39) average was 73,208,000 bu. from 882,000 ac., or 83 bu. per acre.

Table II.—*U.S. Sweet Potato Production by Leading States, 1941 and 1940*

State	1941 bu.	1940 bu.	State	1941 bu.	1940 bu.
Alabama	7,840,000	4,920,000	Louisiana	6,138,000	4,088,000
Georgia	7,194,000	6,930,000	Texas	5,580,000	4,335,000
North Carolina	6,960,000	7,104,000	South Carolina	5,525,000	5,040,000
Mississippi	6,035,000	4,485,000	Tennessee	5,192,000	4,335,000

(S. O. R.)

Poultry. Commercial hatcheries in the United States produced 1,052,460,000 baby chicks in 1941, 28% more than the output of 1940 and 17% above the previous record year of 1930, the department of agriculture reported. During the first six months of 1941, the number of laying hens on U.S. farms was slightly less than in 1940, but during the second six months, in response to the government's request for increased production, farm flocks were steadily increased until December. They averaged 341,256,000 layers throughout the latter month, an increase of 7% over Dec. 1940. All except one state showed an increase in farm flocks at the end of the year, with prospects for still larger numbers of layers in 1942. The holdings of young chicks at the beginning of 1942 were the largest in the seven years of record; they were 12% larger than at the beginning of 1941 and 11% higher than the five-year (1936–40) average. Of these holdings, 68% were laying pullets, 17% were pullets under laying

age and 15% were cockerels. The rate of lay in Dec. 1941 was the highest on record for that month; on Jan. 1, 1942, the rate was 9% above that of Jan. 1, 1941. (*See* also EGGS.)

Receipts of dressed poultry (fresh and frozen) at the four principal United States markets in the first ten months of 1941 were about the same as in the same period of 1940, but in the last two months the 1941 receipts increased greatly. By December the current consumption of chicken meat in the United States had broken all previous records. Older layers were held back on the farms longer than usual to increase the egg output, as requested by the government. The marketing of these older hens, fed to heavier weights, plus the increased autumn operations of hatcheries to augment broiler and fryer production, resulted in record cold-storage holdings of poultry Jan. 1, 1942—218,374,000 lb. compared with 208,365,000 lb. Jan. 1, 1941, and a five-year (1937–41) average for that date of 165,300,000 lb. Prices received by farmers for chickens ran about 18% higher through most of 1941, as compared with 1940.

U. S. Stocks of Frozen Poultry Jan. 1, 1942 and 1941 and 1937-41

	1942 (lb.)	1941 (lb.)	5-yr. (1937–41) av. (lb.)
Broilers	14,048,000	11,170,000	14,245,000
Fryers	18,186,000	14,327,000	14,636,000
Roasters	45,582,000	35,118,000	33,173,000
Fowls	44,269,000	41,461,000	30,012,000
Turkeys	49,956,000	60,626,000	39,277,000
Ducks	6,876,000	7,992,000	6,169,000
Miscellaneous frozen poultry	21,412,000	20,819,000	27,788,000
Unclassified frozen poultry	18,045,000	16,852,000	*

*Reported as miscellaneous poultry previous to Jan. 1, 1940.

(S. O. R.)

Power, Sir D'Arcy (1855–1941), British surgeon and medical scholar, was born Nov. 11 in London. A prolific writer on medical subjects, Sir D'Arcy was an authority on William Harvey, discoverer of the circulation of the blood, and John Hunter, famed British surgeon. He also wrote extensively on war surgery, syphilis, cancer, intestinal obstruction and diseases of children. Sir D'Arcy was a visiting lecturer at Johns Hopkins university in 1930–31; a consulting surgeon and archivist at St. Bartholomew's hospital, London; Hunterian trustee of the Royal College of Surgeons of England and honorary fellow of both the Royal Society of Medicine and the American Surgical association. Among his works are *Selected Writings* (1931) and *A Mirror for Surgeons* (1940). Sir D'Arcy died at his home in Northwood, Middlesex, May 18.

Pownall, Sir Henry Royds (1887–), British army officer, was born July 29 in Blackheath, England. He was educated at Rugby and the Woolwich Royal Military academy and served in the royal field artillery in England and India, 1906–14. He won the distinguished service order and the military cross for his services during World War I as an artillery officer. He participated in operations on the northwest frontier of India, 1930–31, commanded the school of artillery, Larkhill, England, 1936–38, was a director of military operations and intelligence in the war office, 1938–40, and became chief of the general staff of the British expeditionary force in 1940. Later, as inspector general of the home guard, he swiftly reorganized and armed British home units to forestall the possible German invasion which threatened after Dunkirk. He was named temporary lieutenant general in 1940 and was also made vice-chief of the imperial general staff, May 1941. On Dec. 27, 1941, Pownall was designated commander of British forces in the far east, to succeed Sir Robert Brooke-Popham (*q.v.*). His immediate task was to check the Japanese invasion of Malaya, which threatened to engulf the Singapore naval base, and to co-ordinate British military activity in the Pacific with that of her allies.

Prajadhipok (1893–1941), prince of Sukhodaya and king of Siam, seventh monarch of the Chakri dynasty, was born Nov. 8 to the title Prince of Sukhodaya, at Bangkok. He was the third son of King Chulalongkorn and Queen Sowabha Pongsi. His schooling was planned by his parents to include military training at Bangkok, a general education at Eton and later a course for young British officers at Woolwich. In 1918 he married Rambai Barni, a royal princess. Upon the death of his second brother, King Rama VI, he succeeded to the throne, Nov. 26, 1925. In 1931 the young monarch went to the U.S. to undergo an eye operation. When Prajadhipok was in England later, undergoing medical treatment for cataracts, the Siamese parliament wrested from him his last royal prerogatives and he was forced to abdicate March 2, 1935, in favour of his 10-year-old nephew Ananda Mahidol. But the exiled monarch had insured himself against the loss of his throne with British and French insurance underwriters and derived a substantial income from this investment. He died at his country home, Virginia Water, Surrey, May 31.

Presbyterian Church. The Reformed churches holding the Presbyterian system, within the United States of America, are 12 in number and included, in 1941, 18,354 ministers, 18,639 churches and 3,864,681 communicant members with approximately 7,500,000 adherents. Outside of continental United States they had 2,179 American foreign missionaries and 13,813 native workers in a total of 21 countries with a communicant membership of 237,652.

In order to meet the extraordinary problems emerging from the war, all of the churches of the Presbyterian family united in raising funds for numerous crisis-born causes. Among these causes, totalling many hundreds of thousands of dollars, were orphaned missions in foreign lands where income from Europe had been cut off by the war, war emergency needs of boards of foreign missions, Christian refugees from totalitarian tyranny, Bible distribution, China civilian-relief, spiritual care of American soldiers and sailors and special religious needs in national defense industrial areas. A noteworthy effort was the completion of a $10,000,000 Sesquicentennial fund for Christian education by the Presbyterian Church in the United States of America, the total sum raised being $10,279,855.

The General assembly of the Presbyterian Church in the United States of America, in the matter of church co-operation and union, directed its three boards of foreign missions, national missions and Christian education to appoint committees to confer with similar committees of the Presbyterian Church in the United States (Southern), regarding means to co-ordinate all the missionary and educational work of the two churches, hoping that "such a procedure would lead to a form of organic union which would be acceptable to both"; urged its members to "forward the process of union" with the Protestant Episcopal Church; and approved the continuance of union negotiations with these two churches during the year. By a vote of 154 to 101 the Southern Presbyterian Church voted to rejoin the Federal Council of Churches of Christ in America, from which it had withdrawn in 1932. All churches renewed their endorsement of the World Council of Churches.

The western section of the World Presbyterian alliance, representing the Presbyterian and Reformed Churches in the United States and Canada, with delegates from Great Britain and the far east, held its annual meeting in Baltimore, Md., Feb. 1941.

Europe.—All reports from the Reformed Churches in Europe revealed the fact that the ecumenical church remained alive even if in practice it was stopped by the impossibility of correspondence. The Swiss churches alone were able to demonstrate it

by aid to prisoners of war, refugees and suffering churches.

In Great Britain more than 500 Presbyterian church buildings were either wholly destroyed or badly damaged by enemy action. All the meetings of the Supreme Judicatories in Scotland, England, Wales and Ireland were held in spite of the difficulties and inconveniences incident to war.

The Reformed Church in France made every effort to maintain its unity among the three zones into which it had been divided by the war: the occupied, the unoccupied and the prisoners' camps in Germany. At the annual meeting of the National Synod in August, all zones were represented. The Reformed churches of Holland and Belgium, although feeling in growing measure the pressure from a foreign regime, were experiencing a real unification of their church life. The Reformed churches in eastern Europe, particularly in Poland, Lithuania and the Ukraine, were practically ended as organized bodies. Authentic information indicated that in Germany the Reformed Church was in open or silent opposition to naziism. The Church of the Czech Brethren in Bohemia was a silent church trying to continue its work as quietly as possible. The two chief bodies of the Hungarian Reformed Church met in May, representatives of the reattached areas being able to take part for the first time in 23 years.

The 650th anniversary of the Swiss confederation was celebrated by the Swiss Christian Youth organizations at large youth gatherings in various parts of that country. (W. B. Pu.)

Presidents, Sovereigns and Rulers

The following list includes the names of those holding chief positions in their countries at the beginning of 1942.

Country	*Name and Office*	*Accession*
Afghanistan	Muhammad Zahir Shah, King	1933
Arabia, Saudi	Abdul Aziz ibn Sa'ud, King	1926
Argentina	Ramón S. Castillo, Acting President	1940
Australia	Alexander Gore Arkwright, Baron Gowrie, Governor General	1936
	John Curtin, Premier	
Belgium	Leopold III, King (German occupation)	1934
Bhutan	Yigme Wangchuk, Maharaja	1926
Bohemia-Moravia	Dr. Emil Hácha, President (German protectorate)	1939
Bolivia	General Enrique Peñaranda del Castillo, President	1940
Brazil	Dr. Getulio Vargas, President	1931
Bulgaria	Boris III, King	1918
	Bogdan Piloff, Prime Minister	
Burma	Sir Reginald Hugh Dorman-Smith, Governor	1941
Canada	Earl of Athlone, Governor General	1940
	W. Mackenzie King, Prime Minister	
Chile	Gerónimo Mendez Arancibia, Acting Vice-President	1941
China	Lin Sen, Chairman of National Gov't	1932
	Gen. Chiang Kai-shek, President of Executive Yuan	1939
Colombia	Dr. Eduardo Santos, President	1938
Costa Rica	Rafael A. Calderon Guardia, President	1940
Cuba	Col. Fulgencio Batista y Zaldivar, President	1940
Czechoslovakia	Dr. Eduard Beneš, President (German occupation)	1940
Denmark	Christian X, King (German occupation)	1912
Dominican Rep.	Manuel de Jesus T. de la Concha, President	1940
Ecuador	Carlos Arroyo del Rio, President	1940
Egypt	Farouk I, King	1936
Eire	Dr. Douglas Hyde, President	1938
	Eamon de Valera, Premier	1930
Ethiopia	Haile Selassie I, Emperor	1930
Finland	Risto Ryti, President	1940
France	Henri Philippe Pétain, Chief of State, Marshal of France	1940
Germany	Adolf Hitler, Fuehrer and Reich Chancellor	1933
Great Britain	George VI, King and Emperor	1936
	Winston Churchill, Prime Minister	
Greece	George II, King (German occupation)	1935
Guatemala	Gen. Jorge Ubico, President	1931
Haiti	Elie Lescot, President	1941
Honduras	Gen. Tiburcio Carías Andino, President	1933
Hungary	Admiral Nicholas Horthy, Regent	1920
	László de Bárdossy, Premier	
Iceland	Sweinn Björnsson, Regent (U.S. Protection)	1941
India	Marquess of Linlithgow, Viceroy, Governor General	1936
Iran	Mohammed Reza Pahlevi, Shahinshah	1941
Iraq	Feisal II, King (Regency)	1939
Italy	Victor Emmanuel III, King	1900
	Benito Mussolini, Premier, Chief of Gov't, Sec'y of State	
Japan	Hirohito, Emperor	1926
	Gen. Hideki Tojo, Premier	
Lebanon	Alfred Naccache, President	1941
Liberia	Edwin Barclay, President	1932
Liechtenstein	Franz Joseph II, Sovereign Prince	1938
Luxembourg	Charlotte, Grand Duchess (German occupation)	1919
"Manchoukuo"	Henry Pu Yi ("Emperor Kangte")	1934
Mexico	Manuel Avila Camacho, President	1940
Monaco	Louis II, Prince	1922
Morocco	Sidi Maulay Mohammed, Sultan	1927
Nepal	Maharaja Sir Joodha Shumshere Jung Bahadur Rana, Prime Minister and Supreme Commander in Chief	1932
Netherlands	Wilhelmina, Queen (German occupation)	1890
Newfoundland	Sir Humphrey T. Walwyn, Governor	1936
New Zealand	Sir Cyril Newall, Governor General	1941
	Peter Fraser, Prime Minister	
Nicaragua	Gen. Anastasio Somoza, President	1937
Norway	Haakon VII, King (German occupation)	1905
Oman	Sir Sayyid Said bin Taimur, Sultan	1932
Palestine	Sir Harold Alfred MacMichael, High Commissioner	1938
Panama	Ricardo Adolfo de la Guardia, President	1941
Paraguay	Higinio Morínigo, Provisional President	1940
Peru	Manuel Prado y Ugarteche, President	1939
Philippines	Manuel Luis Quezon, President	1935
	Francis B. Sayre, U.S. High Commissioner	1939
Poland	Wladislaw Rac.kiewicz, President (German occupation)	1939
Portugal	Gen. António Oscar de Fragoso Carmona, President	1926
	Dr. António de Oliveira Salazar, Premier	
Rumania	Mihai, King	1940
	Ion Antonescu, Premier-Dictator	
Salvador, El	Gen. Maximiliano Hernández Martínez, President	1931
"Slovakia"	Joseph Tiso, "President"	1939
South Africa	Sir Patrick Duncan, Governor General	1937
	Gen. Jan C. Smuts, Premier	
Spain	Gen. Francisco Franco Bahamonde, Chief of State, Prime Minister	1936
Sudan	Lt. Gen. H. J. Huddleston, Governor General	1940
Sweden	Gustaf V, King	1907
Switzerland	Dr. Philippe Etter, President	1942
Syria	Taj-ed-Dine-el-Hassani, President	1941
Thailand	Ananda Mahidol, King (Regency)	1935
Trans-Jordan	Abdullah ibn Hussein, Emir	1928
Tunisia	Sidi Ahmed II, Bey	1929
Turkey	Ismet Inonu, President	1938
U.S.S.R.	Mikhail Ivanovich Kalinin, President	1936
	Joseph V. Stalin, Premier and Communist Secretary	
United States	Franklin D. Roosevelt, President	1933
Uruguay	Gen. Alfredo Baldomir, President	1938
Vatican City	Pius XII, Pope	1939
Venezuela	Gen. Isaias Medina Angarita, President	1941
Yugoslavia	Peter II, King (German occupation)	1941
Zanzibar	Seyyid Sir Khalifa bin Harub, Sultan	1911
	Sir Henry Guy Pilling, British Resident	1940

Prévost, Eugène Marcel (1862–1941), French novelist, was born May 1 in Paris. He had his first story published when he was 19. His early novels were in the romantic vein, but his fame rests more securely on the series of novels probing the social and moral problems of his time, the most famous of which is *Les Demi-vierges*. He was elected to the French academy in 1909 and at the time of his death he was directing publication of the *Revue de France*, a monthly he had founded in 1921. Among his later works are *L'Homme vierge* (1930); *Voici ton maître* (1931); *Marie des Angoisses* (1932); *Febronie* (1933) and *Clarisse et sa fille* (1934). He died at his estate in Vienne in southern France, April 8. See *Encyclopædia Britannica*.

Price Administration, Office of. The Office of Price Administration (formerly called the Office of Price Administration and Civilian Supply) was created by executive order of the president issued April 11, 1941. The agency combined into one organization the activities formerly carried out by the commissioners in charge respectively of price stabilization and consumer protection in the advisory commission to the Council of National Defense. This commission had been created in May 1940 to direct the armament program of the United States.

The Office of Price Administration was charged in the executive order creating the agency with the task of taking "all lawful steps necessary or appropriate in order to prevent price spiralling, rising costs of living, profiteering and inflation resulting from

market conditions caused by the diversion of large segments of the nation's resources to the defense program, by interruptions to normal sources of supply, or by other influences growing out of the emergency." In addition the OPA was given responsibility, through the consumer division, for seeing that the standard of living was maintained on the highest possible level consistent with military defense requirements.

The Office of Price Administration was headed in 1941 by an administrator appointed by the president. Under the administrator, Leon Henderson (*q.v.*), is a deputy administrator (John E. Hamm in 1941). Under the latter is the director of the price division (J. K. Galbraith in 1941), a deputy director in charge of the consumer division (Harriet Elliott in 1941) and the general counsel (C. David Ginsburg). The price division was composed of 14 commodity sections, each headed by a price executive in charge of price work for the commodities in his section, a research division, and a division of accounting, analysis and review. The commodity sections included the following: consumers' durable goods; industrial and agricultural machinery; copper and brass; chemicals, drugs and paints; rubber and rubber products; paper and paper products; automobiles and trucks; textiles, leather goods and apparel; food and food products; fuel; lumber and building materials; zinc, lead and tin; and steel, iron, and steel products. There was also a section which handled rent problems. The consumer division operated through three separate sections dealing respectively with consumer relations, consumer standards and needs and consumer publications.

Price actions by OPA fell into the following general classifications: warnings concerning unjustified price increases; informal agreements with individual concerns regarding prices they charge for their products; letters to individual concerns asking them not to charge prices higher than those prevailing on specified dates; and formal price schedules establishing maximums which may be charged for commodities covered in the schedule. It was the practice of the agency to hold frequent conferences with representatives of companies whose prices were under consideration, and in a number of cases in 1941 industry panels were created composed of representatives from various concerns in the industry to meet with OPA officials to give advice in working out details of price schedules or other proposed action.

There were 60 price schedules issued as of Dec. 23, 1941, of which two were revoked. They covered the following commodities:

1. Second-hand machine tools
2. Aluminum scrap and secondary ingot
3. Zinc scrap materials and secondary slab zinc
4. Iron and steel scrap
5. Bituminous coal (revoked)
6. Iron and steel products
7. Combed cotton yarns
8. Nickel scrap and secondary materials
9. Hides, kips and calfskins
10. Pig iron
11. Cotton gray goods
12. Brass mill scrap
13. Douglas fir peeler logs and Douglas fir plywood
14. Raw silk and silk waste
15. Copper
16. Sugar
17. Pig tin
18. Burlap
19. Southern pine lumber
20. Copper scrap
21. Formaldehyde
22. Pennsylvania grade crude oil
23. Rayon gray goods
24. Washed cattle tail hair and winter hog hair
25. Fats and oils and their products
26. Douglas lumber
27. Anthracite (revoked)
28. Ethyl alcohol
29. Coke
30. Wastepaper sold east of the Rocky mountains
31. Acetic acid
32. Paperboard sold east of the Rocky mountains
33. Carded cotton yarn
34. Wood alcohol—methanol
35. Carded gray and coloured yarn cotton goods
36. Acetone
37. Normal butyl alcohol
38. Glycerine
39. Upholstery furniture fabrics
40. Builders' hardware and insect screen cloth
41. Steel castings
42. Paraffin wax
43. Used steel barrels or drums
44. Douglas fir doors
45. Asphalt or tarred roofing products
46. Relaying rail
47. Old rags
48. Flashlights, flashlight batteries and flashlight bulbs
49. Resale of iron or steel products
50. Green coffee
51. Cocoa beans and cocoa butter
52. Pepper
53. Fats and oils
54. Douglas fir peeler logs
55. Second-hand bags
56. Reclaimed rubber
57. Wool floor coverings
58. Wool and wool tops and yarns
59. Kapok
60. Direct consumption sugars

Following is a brief outline of the steps taken in preparing a price schedule:

(1) A factual background is built up regarding any price problem by research workers in conjunction with technical consultants, business advisers and other government agencies;

(2) A representative panel of industry members are invited to Washington to discuss the price problem under study;

(3) An appropriate plan of action is formulated, taking into account the following principal objectives: the prevention of inflationary price movements, the encouragement of an adequate supply of vital materials, the maximum use of existing trade practices, and the least possible disturbance to the existing structure and operations of an industry.

Completion of this preparatory work is followed by preparation of an economic brief outlining in detail the economic aspects of the problem and the reasons for recommending a particular line of action.

A legal brief is also prepared which discusses in detail the legal problems inherent in the proposed price schedule. These economic and legal briefs, together with the schedule recommended by staff members, are carefully reviewed by the responsible department heads before submission to the administrator for his approval and signature. (L. Hn.)

Two orders issued by the OPA after the outbreak of war with Japan had immediate and drastic effect upon U.S. consumers. The sale of new automobile tires was stopped in December, and rationing of all rubber products began Jan. 4, 1942. Civilian consumption of rubber was cut by an estimated 80% under the rationing plan. On Jan. 2, 1942 the OPA announced that all production of automobiles in the United States would stop after Jan. 31. Sales of new cars were prohibited after Jan. 1. (*See* also Canada: *War Price and Wage Control;* Defense, National [U.S.]; Leather; Municipal Government; Priorities; Supply Priorities and Allocations Board.)

Prices. Prices of commodities in the leading markets of the world were dominated during 1941 by the economic effects of wars and preparation for wars on all the continents. Early in the year, following sharp advances in 1940, prices were relatively stable. This reflected chiefly an extension of governmental controls affecting prices, continued curtailment of the European market, relatively large crops and supplies of industrial raw materials available to markets outside the continent of Europe, and a temporary improvement in the shipping situation.

Beginning in March, however, with the passage of lend-lease

"IT'S AN ILL WIND THAT BLOWS NOBODY SOME GOOD," commented Lewis of the *Milwaukee Journal* in surveying the rapid rise of U.S. farm prices in 1941 under the national defense and lend-lease programs

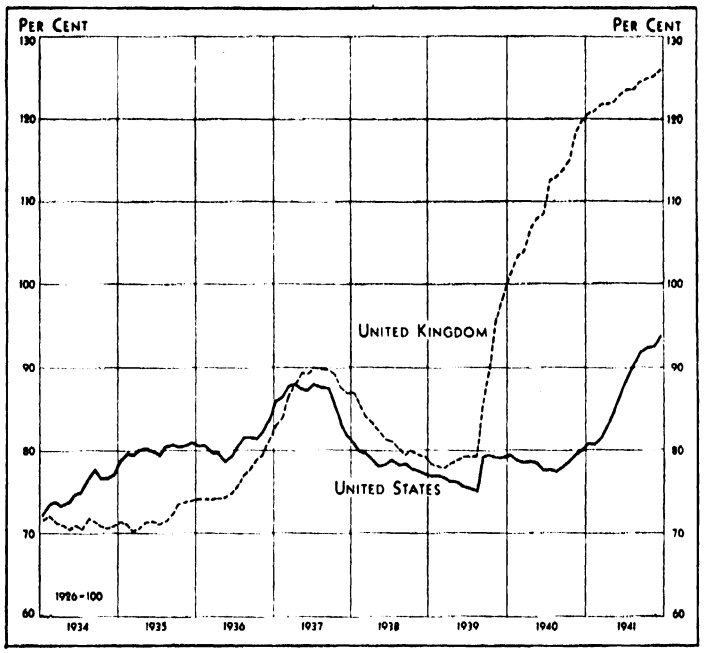

Fig. 1.—WHOLESALE PRICES IN THE UNITED KINGDOM AND THE UNITED STATES, 1934–41 (Source: United Kingdom—Board of Trade, converted to 1926 base; United States—Bureau of Labor Statistics); December 1941 estimated. War conditions in the United Kingdom made many price quotations nominal; undoubtedly the index for that country understates the price rise after August 1939

legislation, the military program of the United States was greatly expanded and the resulting vast new demands led to widespread price advances in the United States and also in Canada, Argentina and the far east, which supply raw materials. Canada adopted a general ceiling over prices of goods and services in November. In France, Switzerland and Japan, which were completely or in large part cut off from their usual sources of supply, prices continued to advance throughout the year. In the United Kingdom and Germany, domestic resources were less limited and governmental controls were greater so that price increases were more effectively restrained despite restricted imports and extensive military activities.

In the United States, governmental controls affecting prices were extended considerably during 1941 and during the autumn months price increases were generally small; in December, however, when hostilities broke out with Japan, Germany and Italy, prices in the United States and related countries showed further substantial increases.

The cost of living rose considerably in most countries throughout the year and a growing number of commodities became unavailable at any price.

United States.—Wholesale commodity prices in the United States showed a rapid advance from 81% of the 1926 average in Feb. 1941 to 92% in the early part of September and then were relatively stable for three months, as shown in fig. 1. With United States' entry into World War II in December, wholesale prices rose further to a level 25% above that of Aug. 1939, before the beginning of the war in Europe. This is indicated in the table, which also shows the widespread nature of the advance. Retail prices, illustrated in fig. 2, began a sharp rise early in 1941, reflecting chiefly advances in wholesale prices; by the end of the year the total cost of living was 10% higher than in March. Retail prices of foods and textile products showed the largest increases. In December, retail foods were about 17% higher than in March and 23% above Aug. 1939.

The rise in wholesale prices beginning in February was initiated by advances in imported commodities accompanying the prospect of increased shipping difficulties. In March, price advances extended to domestic commodities, reflecting chiefly anticipation of important changes in the underlying situation as a result of the rapidly expanding defense program. Before that time, the program was of limited character involving armament expenditures of $17,000,000,000 over several years. With authorization of lend-lease aid and further additions to the military program, it became evident that expenditures for armaments and facilities to produce them would be vastly expanded and that government purchases of both industrial and agricultural commodities would be in great volume. Moreover, it became apparent that expenditures would become more urgent and have important direct effects in commodity markets as well as indirect effects in increasing consumer incomes, restricting supplies of consumers' goods and raising costs of production and distribution.

Wholesale prices had already risen considerably in the autumn of 1940 and the prospect of these new developments brought unprecedented buying by manufacturers, distributors and consumers during the spring and summer. The volume of buying was reduced somewhat in the autumn as inventories and commitments accumulated and federal restrictions on purchasing of materials and output of finished products were extended; in December, however, buying and prices increased once more. Factors restricting market supplies and consequently increasing the pressure on prices during the year included the withholding of stocks on the part of private concerns and public agencies; shifts or reductions in coastwise and foreign shipping facilities; concentration of large federal contracts with relatively few producers; and reluctance at the start of the defense program in 1940 to expand plant facilities.

Production of both agricultural and industrial commodities—particularly the latter—was larger in 1941 than in 1940 but output was not great enough to meet the rising demands from the government and from civilian consumers. Income payments to individuals at the end of the year were about 30% higher than in the summer of 1940 when the defense program was inaugurated. This rise was an important element contributing to the advance in prices. An important part of the rise in payments reflected increases in wages and salaries reflecting chiefly additional employment and increased hours of work. As demand for workers increased, wage rate advances became widespread, and the pressure for higher rates was stimulated by the sharp rise in living costs and by a further substantial increase in corporate profits after allowance for increased taxes. During 1941 measures for limiting civilian demand were put into effect—particularly higher taxes, sale of defense bonds to the public and regulation of consumer credit. Also, by the end of the year there were important instances of the curtailment of incomes and consequently of demand for goods because of dislocations arising from the transition to armament production and the reduction of activity in industries using certain imported materials. But the underlying situation with regard to increasing expenditures and reduced supplies indicated a continued upward movement in prices unless more drastic direct federal action was taken.

Federal measures were adopted early in 1941 to limit advances in metal prices, including those from secondary sources and scrap, and, as shown in the table, prices of metals showed the smallest rise during the year of any major group. During the summer selective price controls affecting mainly industrial raw materials were extended further. Also, official concern was expressed regarding the danger of inflationary developments and emergency price legislation was introduced in congress, but passage was

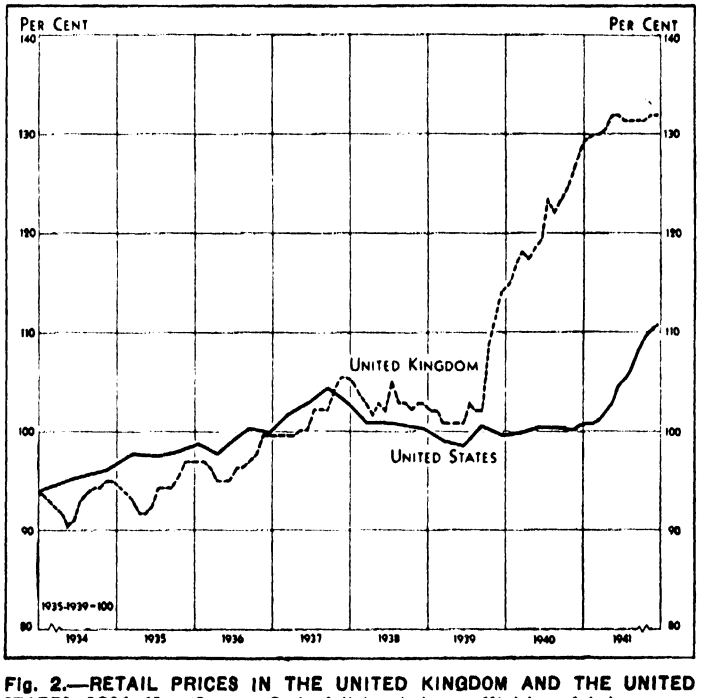

Fig. 2.—RETAIL PRICES IN THE UNITED KINGDOM AND THE UNITED STATES, 1934–41. (Source: Cost of living indexes. Ministry of Labour, converted to 1935–39 base, first-of-month data; Bureau of Labor Statistics, mid-month data, selected dates before Sept. 1940.) Dec. 1941 estimated. Because of the war, price quotations for the United Kingdom, 1939–41, are only nominal and are probably understated

not secured by the end of the year. Generally, prices of commodities not subject to federal maximums continued to advance sharply, and some maximum prices were also raised. By the end of December, about 65 maximum price schedules had been issued for a wide variety of goods; federal representations and warnings had been made regarding numerous other commodities; and in some instances informal requests had been made or agreements arranged to maintain existing prices.

Prices of farm products, which were largely excluded from maximum price action, rose by one-third during the year reflecting increased consumer and speculative demand, higher rates on federal loans to producers withholding crops from market, and federal support of prices of a number of livestock and vegetable products by open-market purchases for domestic relief and foreign aid. The sharp price advances for farm products, which are the chief raw materials for food and textile products, were an important factor in the rise in the cost of living in 1941.

United Kingdom.—Prices of commodities in both wholesale and retail markets in the United Kingdom generally showed small increases during 1941, according to published indexes. This was in contrast to the rapid and widespread advances which had begun with the outbreak of World War II in Sept. 1939 and continued in 1940 (see figs. 1 and 2). The price increases earlier had occurred, despite governmental attempts to control the distribution and prices of many commodities, largely because of rises in prices of imported materials and foodstuffs, increases in production and fabrication costs and speculative demands. After the spring of 1940 the effects of war effort were more fully felt and the pressure on prices was intensified. Domestic output and imports of civilian goods were more drastically reduced; there were dislocations accompanying the shift of productive facilities to armament products; and supplies and equipment were destroyed by military action. On the other hand, demand continued to increase as the result of large-scale national expenditures for military products and other activities associated with the war effort. These expenditures added to the demand for commodities both directly in purchases by the government and indirectly by increasing consumer incomes as a result of greater employment, increased wage rates and overtime payments. By the middle of 1941, however, the operation of the United States lend-lease program began to supply quantities of armaments and foodstuffs without payment of gold or dollar resources of the United Kingdom. Also these supplies, in the United Kingdom and in other areas of the empire, reduced the national expenditures required and thus relieved pressure on domestic prices.

Various governmental price arrangements undertaken early in the war were extended further in 1941. The program for bulk purchases of empire and dominion products such as wheat, cocoa, wool and nonferrous metals was continued. Rationing of many basic foods to individual consumers and control of retail food prices and margins were widened. Also, increased government subsidy payments were required to limit retail prices of major foods. Control of prices of other essential consumers' goods under the Prices and Goods act of 1939 had only limited success, partly because supplies available to the public were sharply curtailed further in 1941. In June the Goods and Services act was passed, conferring on the board of trade power to fix maximum prices of both goods and services and to control stocks of goods and multiple transactions. The first order issued under this act was on "essential clothing," which covered conditions of production and distribution, and maximum prices. A system of rationing clothing and footwear had been instituted earlier with coupons required for articles purchased from retailers.

The various control regulations were not fully effective, however, and concern was expressed regarding the growth in illicit trading, particularly for foods. These and other developments make price movements and the importance of price movements uncertain in the United Kingdom. (*See* also AGRICULTURE: *Foreign Trade and Agriculture;* BUSINESS REVIEW: *Commodity Prices;* CANADA: *War Price and Wage Control;* COTTON; COST OF LIVING; PRICE ADMINISTRATION, OFFICE OF; and articles on individual commodities.) (C. GN.)

Prien, Guenther (1908?–1941), German U-boat commander, was one of the most popular and renowned of Germany's war heroes. On Oct. 14, 1939, Prien guided his submarine through the British defenses at Scapa Flow and sank the British battleship "Royal Oak" while she was riding at anchor in the harbour. For this daring feat he was honoured by Adolf Hitler and even won the acclaim of Winston Churchill, then first lord of the admiralty, for his "remarkable exploit." He was credited with sinking 235,941 tons of allied shipping. The "Arandora Star," carrying axis prisoners to Canada in July 1940, also fell victim to Prien's U-boat. A London report that Prien had been missing since April 13, 1941, was confirmed by the German high command on May 23.

Primary Education: *see* EDUCATION.

Prince Edward Island. The smallest in area but the most densely populated province in Canada, Prince Edward Island lies in the Gulf of St. Lawrence in the shape of a crescent, its inner side toward the north. The island is 137 mi. long, and varies in width from 2 to 32 mi. Area, 2,133 sq.mi.; pop. (census 1941) approximately 94,000, of which about 81% was rural. Capital, Charlottetown (approximately 16,000). Of the island's population about 80% is of British descent; 14% French; 42% is Roman Catholic and 58% Protestant, of which 28% is of the United Church, 18% Presbyterian; and 6% Anglican.

The island is nine miles from the mainland; across the separating strait powerful ice-breaking ferry-boats ply in winter and summer carrying railway cars, automobiles, passengers and freight, the crossing taking 40 minutes. There was also in 1941 a daily air mail and passenger service, two flights each way, connecting with transcontinental Canadian airways and American and Canadian Colonial airways.

Finance, Agriculture, Fishing.—To Dec. 31, 1941, the estimate of revenue was $1,700,000; estimated expenditure, ordinary, approximately the same; capital expenditure, including provision for sinking fund, $800,000, of which interest absorbed more than $300,000. The dominion subsidy was approximately $650,000. Of the revenue, $360,000 went to education, the total cost of which was $550,000. Pupils enrolled were 18,600; cost per pupil $30; teachers 700; average salary $505. The public debt Dec. 31, 1941, was approximately $6,000,000; per capita $67. Income, real estate and succession taxes are moderate.

The main occupations are agriculture and fishing; in 1941 about 485,000 ac. were under cultivation. The capital investment in agricultural industry in 1941 was $53,300,000; in manufacturing industry, $2,200,000. The estimated total value of farm products in 1941 exceeded $12,000,000; potatoes (approximately) 7,000,000 bu.; turnips 5,000,000 bu.; oats 5,000,000 bu.; wheat 250,000 bu.; hay and clover 300,000 tons; mixed grain 1,400,000 bu.; barley 300,000 bu.; butter 2,500,000 lb.; cheese 500,000 lb.

The estimated value of fisheries was $750,000; oysters 800,000 lb.; estimated fox pelts, 75,000, valued at $1,000,000. There is little serious crime, and practically no illiteracy. (CY. M.)

Princeton University. An institution of higher education at Princeton, N.J. During 1941—its 194th year—Princeton made a beginning upon contributions to national defense. The year, despite its emotional stresses, was also marked by an extraordinary record of student achievement in all fields and by advances in the university's long-range program. The impact of the national emergency was illustrated by statistics drawn from two extremes: one faculty member in three was engaged in national defense work in 1941; three freshmen in four were receiving training for service in the armed forces or in employment in defense industry.

Other significant developments of 1941 were the establishment, for the various departments, of advisory councils composed of alumni and others; provision of a building for the school of public and international affairs; extension of the creative arts program to include drama; creation, in the library, of an archives of American letters as a repository for contemporary manuscripts; and founding of the bureau of urban research. The endowment in 1941 was $33,273,602; gifts totalled $1,154,135; expenditures $4,381,758; enrolment 2,701; teaching staff 391. (H. W. Do.)

Principe: *see* PORTUGUESE COLONIAL EMPIRE.

Printing. A printing press functioning upon an entirely new principle was all but ready for unveiling during 1941 but remained under cover. It was to be not only adaptable to all three major processes, relief, planographic and intaglio (letterpress, offset and gravure) but, to mention the new principle, work might be done without contact between the cylinders, ink with metallic properties "jumping" from inked plates to paper through electromatic or electrostatic force. In principle this should effect greater speed, and it was claimed that cleaner, sharper print would also result. Too, it was one answer to the demand for lighter weight of materials, forms and presses.

Noted in 1941 was a press convertible from offset to relief printing production. One convertible from relief (letterpress) to intaglio (gravure) was announced during 1941, but use was expected to be delayed because of metal priorities. Both of these machines were developments of large manufacturers.

Letterpress.—Actually, developments chiefly outstanding during 1941 were in the field of relief platemaking. In the step-and-repeat process, offset had long had an individual efficient method of putting down on one press plate—to micrometer exactness for position and register—the number of pages or forms required for capacity of press or sheet to be printed. In the time required for preparation before starting a press, letterpress was at a distinct disadvantage, since forms had to be made up from separate units, register being finally achieved by trial and error. Equipment providing the single plate of multiple pages or items, exactly spaced as in offset, came to letterpress during the year.

Letterpress achieved a further advance during the year in the development of facilities for original plates curved to fit the press. For all rotary relief printing in the past it had been necessary to make flat original plates and from these cast electrotypes or stereotypes (duplicates) in the required curved form. The new invention obviated, or could obviate, the need for the duplicate plates. Furthermore, because a duplicate plate cast from mat or mould from an original plate does not retain the sharpness of detail, depth and full printing qualities of the original, the invention should tend to improve quality. Use of the method was not contemplated in 1941 for newspapers, but only for fine magazine and catalogue work.

Gravure.—Although not entirely new, a pioneering step in gravure printing in colours was undertaken in the application of photo-electric equipment to register automatically three colours on one side of a web and four on the opposite, with the roll of paper running through the press at the rate of approximately 1,200 ft. a minute. All but the first impression units of each section were equipped with photo-electric register devices consisting essentially of a cylinder scanning head, a web scanning head, control panel and correcting motor. The correcting motors operated compensating rolls which served to maintain register by shortening or lengthening the paper run between units rather than, as in some earlier installations, by changing the angular displacement of the printing cylinders.

Ink.—The year saw further development in the quick drying of ink. Following heat-set and cold-set inks, so-called water-set inks were developed during 1941. Water applied as a vapour, either as a spray or steam, causes ink to set quickly. The comparative simplicity of the equipment required was given as the main reason for adopting this method. On the side of product, it was claimed that excess penetration of ink is prevented, thus making the method particularly adapted to containers and cartons.

(J. L. F.)

Printing Office, U. S. Government. The office was established by authority of congress in 1860 to execute printing and binding for the executive and judicial departments and the court of claims. Its functions (1941) extend to all branches of the government and include the sale of official publications, reports and technical bulletins. Many of its publications are printed in foreign languages and find circulation in other countries. Total area occupied by the government printing office in 1941 was 1,396,973 sq.ft. or 33 ac. Value of the buildings $9,634,825; machinery and equipment $5,865,933, making the total value of the plant $15,500,758. At the end of the fiscal year 1941 there were 7,149 employees on the rolls with a pay roll of approximately $15,000,000. The office produced a total of 249,422,716 copies of publications of all classes. This total included 9,056,589 copies of the *Congressional Record*, 6,212,932 copies of specifications of patents, trademarks, designs, etc.; and 256,726 copies of the *Official Patent Office Gazette* and annual indexes. Postal cards delivered amounted to 2,560,560,000; money orders delivered, 281,572,075; and the stores division handled approximately 3,311 carloads of paper. During the fiscal year 1941 the division of public documents mailed out 646,376,829 publications and forms; its receipts from the sale of government publications during the year amounted to $1,342,699.15. The total value of all printing done was $28,593,638.71.

(A. E. Gi.)

Priorities. As the U.S.A. began to gear its vast energies for a war effort early in 1941, following preliminary attempts to launch a defense program in the last half of 1940, it quickly became apparent that the job could not be done without some governing force, some technique for regulating the flow of both raw and fabricated materials so that war production could be expedited.

This governing power was supplied by the priorities system, administered by the division of priorities of the Office of Production Management (*q.v.*). It was not a system completely thought out in advance, but one developed from week to week, in accordance with overall policy, as new problems arose. Nor was it copied after the priorities system of World War I, for the problems in 1917–18 were very different from those confronting the country in 1941, when the nation was much more highly industrialized and the demand for the machines of war was far greater.

As it gradually developed, the priorities system was intentionally kept flexible, on the theory that it was far more important to fit the treatment to the problem than to fit any given problem to a rigid and preconceived formula.

The primary job of the priorities system administrators was to take control of scarce materials and regulate their distribution, so that military producers could get these materials when necessary. This control was also imposed on fabricated parts, subassemblies and accessories as well as raw materials. As control was extended, more and more goods were diverted to military use, and this, plus shortages, caused a very considerable diminution in supplies of civilian goods.

Throughout the early part of 1941, shortages first appeared and then rapidly grew worse. More materials were brought under priorities control—aluminum, then magnesium, and then all other critical metals and many other materials. And as the supply situation became more crucial, a pattern of control began to emerge.

Priority Ratings.—The outline of the pattern of control can best be shown by listing briefly the principal tools with which the priorities system operated at the end of 1941.

1. *Individual Preference Rating Certificates.*—The individual preference rating certificate was the most common device used. The certificate was used to give priorities assistance to some individual manufacturer, who needed some particular commodity or part, for some particular purpose. A manufacturer who needs

a motor, for example, can apply for an individual preference rating certificate (by filling out the standard application form, PD-1) and, if granted, the certificate can be served by the manufacturer on his supplier, to require prompt delivery of the material the applicant needs to complete a military or other important order. Individual certificates can be given either by the priorities division or, if army or navy orders are involved, by field contracting officers of these agencies, under the control of the priorities division. The armed services, of course, use individual certificates to require prime contractors as well as sub-suppliers to turn out necessary products when needed.

2. *Blanket Ratings.*—Some manufacturers could not operate successfully by constantly filling out applications for each and every order with which they had difficulty. Because of this, the "blanket" preference rating order was worked out. A blanket rating, issued usually to a company or companies engaged almost wholly in important military or civilian work, grants the manufacturer or manufacturers one preference rating which can be used continuously, over a stated period of time, to obtain materials. Blanket ratings were issued, for example, to machine-tool builders, freight-car builders and aeroplane manufacturers who, otherwise, would have had to make out thousands of individual applications all the time—an intolerable burden of paper work.

3. *Project Ratings.*—Construction of new plant facilities also required priorities assistance, since shortages existed in building materials (for example, structural steel). The project rating was worked out to meet this need. A project rating can be used by the builder to obtain materials going into the project, but it cannot be used to obtain raw materials going into production lines. The project rating is similar in form to a blanket rating.

4. *Production Requirements Plan.*—As the system developed, it became apparent that a large number of manufacturers faced another kind of problem—they had to have materials in stock, and in some cases had to begin production, before they received actual orders. They also needed to know in advance what materials they could reasonably expect to get. A typical case would be that of a manufacturer of small hand tools, who is often called on to make immediate delivery. To meet this kind of problem, the priorities division worked out the defense supplies rating plan, which was later supplanted by the production requirements plan. Under the production requirements plan, a manufacturer is permitted to fill out a special form (PD-25A), showing his requirements for scarce materials over a coming calendar quarter, and showing also the kind of business in which he is engaged, the grade of orders on his books, and the general importance of his products in the economy. When this has been done, the division of priorities may assign the manufacturer a rating, or ratings, which he can use continuously over a calendar quarter to obtain materials for approved production. This simplifies the manufacturer's problem, because, after his requirements have been approved, he can use a single rating or a combination of ratings continuously, during the time permitted, and thus does not have to fill out new applications every day. This plan is similar in some ways to the usual blanket rating, but it can be used to assist manufacturers who are not necessarily putting all their efforts on primary military production. A plant 40% on defense, that is, might get a rating under this plan which would help it get materials going into that 40% of important production. But such a plant might also get another rating to facilitate production of nonmilitary items considered of general importance in the economy.

"THE NEW BOARDER." Priority rulings of 1941 as seen by Carlisle of the *Des Moines Register*

5. *"M" Orders.*—When priorities control is imposed on the distribution of some raw material—for example, zinc—this is done by means of an "M" order. An "M" order states that the material is under the control of the director of priorities. It usually sets up a formula telling producers that they must fill defense orders ahead of nondefense orders and also giving other specific directions about the permitted operations of producers. An "M" order is one of the most important used, since it specifically and rigidly controls the distribution of a basic raw material.

6. *"E" Orders.*—The "E" order is like the "M" order in that it regulates distribution, but the "E" order applies only to equipment, such as machine tools and cutting tools, and tells how they may be distributed.

7. *"L" Orders.*—These are limitation orders and are designed to cut down the production of less essential commodities which are large consumers of critical materials. For example, the production of automobiles, washing machines and refrigerators was limited by "L" orders.

8. *Conservation Orders.*—From time to time, conservation orders (usually in the "M" series) are issued to shut off the use of some scarce material in nonessential items. For example, order M-9-c, a conservation order, was issued in 1941 to prevent the use of copper in nonessential products like ash trays and screens.

These are the basic types of priorities orders. The ratings assigned in the priorities system (the same ratings are used, whatever the kind of order involved) are graded in a ladder-like structure, starting with AA at the top and running down to B-8 at the bottom. A preference rating shows the relative importance of the contract or order to which it is attached, and thus permits a producer to give priority to the more important orders.

It should be noted that the instruments listed fall into a definite pattern. If we regard the economic machine as having a "top" and a "bottom"—the "top" representing finished goods and the "bottom" representing raw materials—it would be seen that some of these instruments impose regulation at the top, and others impose regulation at the bottom.

The devices which impose regulation at the top, or give assistance for the production of finished goods, are generally known as "identification instruments." That is, they identify the end importance of some finished item, such as a tank, a plane or a transformer.

The individual certificate, the blanket rating, the project rating and the rating or ratings given under the production requirements plan—these are all identification instruments, facilitating the final production of a finished item or class of items.

On the other hand, the "M" order and the "E" order are obviously distribution instruments—that is, they regulate the distribution of raw materials or production machinery. The "L" order is similar to the "M" and "E" orders in that, although it limits production of finished goods, its real purpose is to free raw materials so that they can go into the production of military goods. The conservation order has a similar purpose, and this was also true of the first civilian rationing order, issued during the last week of 1941, to conserve the nation's rubber supply for war purposes and the most essential civilian needs.

By means of these instruments—identification instruments at the "top" and distribution instruments at the "bottom"—the priorities system can be administered so that goods and materials required for war products can be made available in the defense plants of the nation, even if this means cutting off the supply from less essential channels.

By the end of 1941, "M" orders had been issued to control the distribution of 50 materials and classes of materials. The priorities division had issued 69 blanket rating orders to various industries, and had issued 17 limitation orders, 2 "E" orders and 3 conservation orders. (The rubber rationing order was issued by the Office of Price Administration [*q.v.*].) In addition, the priorities division and the armed services together had issued well over 1,000,000 individual preference rating certificates on prime certificates and extensions of these certificates to sub-suppliers.

Allocations.—Toward the end of 1941, it was announced that increasing emphasis would be given to the allocation of materials. The word "allocation" caused considerable confusion. The allocation of materials was a logical development of the priorities system, and did not take its place, although there was a continued trend toward increased use of the allocation technique.

The reason for the shift toward allocation stems from shortages, the real progenitors of the priorities system. As shortages of raw materials increase, priorities certificates, of whatever kind, become less effective. When too many "pieces of paper" are floating through the economic system, the "currency is debased." Thus, to make absolutely sure that materials go where they are needed most, it is more effective to allocate—that is, to order specifically what amounts of what material must be shipped

to what plant. Allocation had been used since the very start of the defense program, in fact, and some of the first materials put under priorities control—aluminum and magnesium, for example—had always been allocated month by month.

An allocation system is a priorities system—a tight and effective one. The main difference between the two is a matter of technique. The original priorities system gave a producer a "tag," which sometimes wasn't high enough to get him the material he wanted; the priorities technique known as allocation is virtually a flat stipulation that the material allocated will be shipped, since allocations can only be made within the limit of material available.

Special Activities.—During 1941, officials charged with administering the priorities system put increasing emphasis on the following points:

1. *Inventory Control.*—An effort was made to keep inventories to the lowest possible practicable working minimum. Inventory clauses were included in all priority orders.

2. *Scheduling.*—Emphasis was given to proper scheduling, so that manufacturers and military services would not order materials for delivery before the time actually required.

3. *Substitution.*—Because of scarce raw materials, an effort was made to get manufacturers producing civilian goods to substitute less scarce materials in their products. Successful efforts were also made to help the armed services substitute less critical materials wherever possible.

4. *Compliance.*—The priorities division set up a field service and compliance section with two broad functions. Through the field service it assists businessmen and manufacturers in all parts of the country to solve their priorities problems. Through its compliance section it checks inventories, operations and other procedures in plants everywhere to see that rules and regulations are obeyed.

Legal Authority.—During its early days, the priorities system was badly hampered by lack of sufficient legal authority. The original authority for the operation of the system was found in Section 2A of Public 671, 76th congress, approved June 28, 1940. This paragraph provided that the president, in circumstances of emergency, could give priority to army and navy orders. This authority, however, was not sufficiently broad to provide backing for allocations or for priority orders affecting purely civilian operations. Because of this, the congress later amended Section 2A of Public 671 by Public 89, 77th congress, approved May 31, 1941 (the Vinson act). This amendment gave the president additional authority to give priority treatment or allocation treatment to almost any order whenever necessary in the interests of defense. Later, specific authority to requisition articles, materials and property for defense purposes was granted the president by Public 274, 77th congress, approved Oct. 16, 1941.

These authorities, together with other related legislation and executive orders, gave the president and, through him, the OPM and its division of priorities complete legal authority for the priorities system.

Closely related to the legal authority previously cited is Priorities Regulation No. 1, a basic document which the division of priorities issued originally on Aug. 27, 1941, amending it on Dec. 23, 1941. This regulation requires the acceptance of defense orders and other orders bearing preference ratings, even if these ratings apply to civilian orders; includes provisions designed to keep inventories to minimum levels; and sets forth other detailed regulations applying to all transactions unless provisions to the contrary are included in any specific order.

Personnel.—In the early days of 1941, the priorities division, as one of the principal operating arms of the office of production management, was under the direction of E. R. Stettinius, Jr. (*q.v.*). Later, however, the Supply Priorities and Allocations board (*q.v.*) was created, and Donald M. Nelson (*q.v.*), executive director of SPAB, was also named director of priorities. Then, in Jan. 1942, both OPM and SPAB were abolished and priorities and allocations were taken over by the new War Production board, of which Nelson was named chairman.

At the end of 1941, following the entry of the U.S. into the war, the priorities system was being simplified in all ways possible. The facts and figures of the situation indicated that it would be more necessary than ever before to divert increasing amounts of required materials and products from ordinary channels into the channels of war production. The nation was faced with an unprecedented demand for orderly production of the materials of war. (*See* also BUSINESS REVIEW; DEFENSE, NATIONAL [U.S.]; SUPPLY PRIORITIES AND ALLOCATIONS BOARD.) (S. E. F.)

Prisons. Various new buildings were constructed in prisons of the United States during the year 1941. A factory to house all industries, except jute manufacturing, was added at San Quentin, Calif.

The Oregon penitentiary completed a dormitory, kitchen and dining room for the farm on which only trusties were employed. Utah opened a new state prison and farm.

A stainless steel, streamlined cafeteria was installed at the Connecticut state prison and did away with the old and inefficient method of serving food in the aisles between tables. The Iowa state penitentiary completed a modern power plant containing a water softener and purifier. At the Kentucky, Wisconsin and Virginia state prisons, modern cell houses, each containing approximately 600 single cells, were erected. These structures eliminated the previous congestion in those institutions.

Maryland reported the opening of a new prison and farm for women, thereby eliminating the practice of incarcerating female offenders in separate wings of male institutions. Minnesota constructed a dormitory on the prison farm where approximately 250 men were employed the year round and not returned to the institution proper. New Hampshire likewise constructed a dormitory for prisoners working outside the walls.

TIER OF CELLS in the prison opened at Green Haven, N.Y. Oct. 1, 1941 to relieve congestion at Sing Sing and other "maximum security" prisons of New York state

In California and Nevada, radio earphones were installed in each cell, and in the former state as well as Tennessee, classification boards were appointed. These boards functioned along the lines of those already established in other jurisdictions. Inmates were to be thoroughly examined and subjected to correctional treatment designed to effect their rehabilitation.

Iowa, Montana, North Dakota and South Dakota instituted new school systems and in many of the other states the scope of vocational training was considerably enlarged. The reasons were twofold: It was felt that the teaching of trades would afford offenders opportunities to eke out a living upon release. Furthermore, prison factories, manned by skilled labour, could function more efficiently.

The year 1941 saw many institutions commence the manufacturing of articles for defense. As a result, idleness, the most deteriorating aspect of penal life, diminished considerably. In fact, in some prisons the inmates worked on two to four shifts and in all instances patriotism rather than compulsion was the motivating factor. Some institutions reported that offenders gave their blood to Red Cross units and that others purchased defense bonds from their penal earnings.

Of importance was the enactment of congress permitting certain types of released felons to join the armed forces of the United States.

Europe.—Because of the war, little information was available about crime or prisons in Europe. Great Britain, however, was the exception. In that country there was a decrease in offenses of violence, but an increase in property crimes and juvenile delinquency. That can be expected during periods of conflict when the community is seriously disorganized. Many short-term prisoners, however, were released on parole and allowed to join the home defense units. In all penal institutions, even though some were subjected to bombardment, the manufacture of war materials continued.

South America.—In Brazil, Chile and Uruguay new cell blocks were constructed in the prisons and educational programs inaugurated. It was also reported that offenders in those countries received compensation for work performed in prison factories. Mexico, which previously restricted

connubial visits to short-term prisoners, afforded that privilege to all who lived up to institution regulations. Those visits were permitted bimonthly in some prisons and monthly in others. (L. E. L.)

Production Management, Office of.

The Office of Production Management was established Jan. 7, 1941 by President Roosevelt as the principal instrumentality for effecting a speedy production of weapons for defense. William S. Knudsen, General Motors executive, was appointed director general, and Sidney Hillman, labour leader, was named associate director general.

Originally organized in three divisions—production, priorities and purchases—the OPM later added a labour division to deal with this aspect of national defense.

As the defense program grew and the need for speed in production became imperative, the OPM was reorganized to centralize and simplify its procedures.

Commodity sections were first set up, but with the creation of the Supply Priorities and Allocations board August 28, 1941, industrial branches were substituted. The order that established SPAB also gave OPM broader powers.

The 30 industrial branches thus created were allocated among four of the seven OPM divisions for administrative supervision. These were (1) the production division, (2) the purchases division, (3) the materials division, (4) the priorities division, which really had no branches but assigned specialists to each branch that had priority problems.

Among other OPM divisions, the contract distribution section was set up to spread defense orders and thus help industries affected by priority restrictions; this "subcontracting" was also designed to speed the conversion of such industries to defense work. The labour division was established to handle the many labour problems incident to creation of a wartime economy, and the bureau of industrial conservation worked closely with any or all OPM divisions to turn waste into useful production channels.

When Harry Hopkins returned from a four-week trip to England early in 1941 as President Roosevelt's personal emissary and said that Britain was in desperate need of munitions and supplies, OPM was already under way as a functioning organization. In response to Britain's plea, the lend-lease bill was signed March 11, 1941, and the United States added another huge task to its already great defense effort—that of becoming "the arsenal of democracy." (*See* LEND-LEASE ADMINISTRATION, OFFICE OF.)

Responsibility for the successful completion of this task resided largely in the OPM. The building of factories, retooling of existing plants for new production uses, the provision of adequate raw materials, the priority listing of scarce metals and materials—all such day-to-day problems were handled by OPM in 1941.

This new large-scale manufacture of war weapons created many dislocations in civilian life. Families moved to new industrial centres. The price structure underwent strains as equitable wage levels were sought. Wage earners had to be protected against profiteering at the same time that production was being forced to new highs. Employer-labour disputes had to be held to a minimum and settled swiftly.

Some of the dislocations that the U.S. wartime efforts created showed up in Feb. 1941, when the demand for aluminum for plane production became so great that OPM was compelled to place the metal on the priority list. Subsequently OPM placed priority bans on a host of other metals and materials needed for arms. As a result, defense production soared. In June 1941, the United States produced 1,476 military planes; two months later this figure jumped to 1,854.

On Oct. 1, 1941, the United States and Britain agreed to back the Russian war against Germany with supplies. The main burden of producing more war weapons fell on the U.S., and OPM had to devise ways and means to squeeze still another notch from the nation's straining economic machine.

After the Pearl Harbor attack drew the United States into the war, congress passed a $10,500,000,000 bill providing funds for new army and navy defenses, and at the same time the navy department asked congress for authorization to build 165 new warships. Prior to the outbreak of war in the Pacific, industrial production in the United States surpassed even 1929 records; and unemployment, except in cases of temporary dislocations caused by conversions of peacetime factories into wartime plants, was becoming a memory of the past. But OPM was now preparing to throw the complete industrial resources of the United States into an all-out war effort. The earlier "business as usual" attitude of U.S. industry went by the boards, and OPM, acting in conjunction with the Office of Price Administration (*q.v.*), moved to take over almost complete control of the U.S. economy. On Dec. 26, 1941, the OPA placed new tires under permanent rationing to conserve rubber for military use, and on Jan. 2, 1942 all motor car production for civilian use was halted "for the duration."

A gigantic task faced OPM for 1942 as the president asked for production of 60,000 planes, 45,000 tanks, 20,000 anti-aircraft guns and 8,000,000 tons of merchant ships.

Criticism of the OPM in 1941 was as varied as the many special interest groups from whom it came. Labour charged that OPM exercised too little control over big business interests; capital charged that it exercised too much control; small business groups complained that they were being "squeezed out" of the defense contract picture. But one fact was frequently lost sight of in the welter of complaint and criticism: that the OPM was purely a consultative and administrative body, lacking decisive powers of action. Virtually all the new agencies set up by the president to meet U.S. defense needs were organized with the idea in mind of better utilizing already existing agencies within the government. Thus, the OPM, although charged with the responsibility of facilitating and implementing the production of war and defense materials, had no power to place contracts. All contracts were let by the army or navy or similar governmental agencies. This serious hiatus between plan and achievement was a principal point of criticism in 1941. (*See* also DEFENSE, NATIONAL [U.S.]; EMERGENCY MANAGEMENT, OFFICE FOR; HILLMAN, SIDNEY; KNUDSEN, WILLIAM S.; LEATHER; MUNICIPAL GOVERNMENT; SUPPLY PRIORITIES AND ALLOCATIONS BOARD.)

The War Production Board.—By executive order of Jan. 16, 1942, President Roosevelt established the War Production board, with Donald M. Nelson (*q.v.*) as chairman. The order defined the duties and prerogatives of the chairman as follows: (1) to "exercise general direction over the war procurement and production program"; (2) to "determine the policies, plans . . . and methods of the several federal departments . . . in respect to war procurement and production . . ."; (3) to take over the functions of the Supply Priorities and Allocations board which was abolished by the order, and (4) to supervise the OPM. The latter board was abolished by Nelson Jan. 21, and its functions and personnel were incorporated into the new WPB. On the same day Nelson announced the organization and executive personnel of the new board. Serving with the chairman on the general board were Henry A. Wallace, William S. Knudsen, Sidney Hillman, Leon Henderson, Harry L. Hopkins, Jesse H. Jones, Henry L. Stimson and Frank Knox (*qq.v.*). Six main divisions were set up, as follows: the purchases division, headed by Douglas MacKeachie; the production division, headed by W. H. Harrison; the materials division, headed by William L. Batt; the division of industry operations, headed by J. S. Knowlson; the labour division, headed by Sidney Hillman and the civilian supply division, headed by Leon Henderson. In addition, Nelson provided in his organization for a planning committee, a requirements committee, a progress-reporting committee, a statistics division, a legal division, an administrative division and an information division. Further, he appointed Ernest C. Kanzler to supervise the conversion of the motor car industry into arms production.

Propaganda.

In a broad sense, propaganda is persuasion, or an attempt to persuade. Usually it is thought of as an expression of opinions or facts or alleged facts. Occasionally, however, acts or events are more potent than words in shaping the beliefs, emotions and actions of people. Propagandas of 1941 fell into four main categories.

I. *The Government Preparedness Program*—consisting of recommendations and executive acts by President Roosevelt and legislation by congress to safeguard the United States against attack, to aid the anti-axis powers and to prepare for possible military offense. In this category, for example, were: passage of lend-lease act; American seizure of axis shipping; establishment of bases in Greenland, Iceland and Dutch Guiana; declaration of state of unlimited "emergency"; establishment of office of civilian defense; allotment of lend-lease to Russia; freezing of axis assets in the United States; Roosevelt's order to navy to "shoot first"; Roosevelt's "Four Freedoms"; formulation of the Atlantic charter, the Roosevelt-Churchill statement of peace aims; Roosevelt's personal peace appeal to Japanese emperor.

II. *The Great Debate* between those, on the one hand, who supported the program of President Roosevelt and, on the other, the many noninterventionists and isolationists and the smaller groups of pacifists and of fascist sympathizers.

Among the opponents of intervention, until June 22, when Hitler attacked Russia, were the communists and some communist sympathizers.

III. *The Attack on Pearl Harbor* Dec. 7—an event which launched the United States into war with Japan, Germany and Italy, which overnight ended the great debate and, in conjunction

THE U.S. SENATE CAUCUS CHAMBER was crowded Sept. 9, 1941 as senators opened their investigation of alleged war propaganda in U.S. motion pictures

with Allied dependence upon the Russian army, seemed to mark the beginning of the end of Hitler's amazing career as the most effective propagandist of modern history.

IV. *The Building of Morale for Fighting and Sacrifice*—a program stemming from the federal government and embracing and stimulating all manner of propaganda activities by national, state and local governments; by banks, business and labour; by schools, colleges and churches; by civic groups and patriotic societies; by the newspapers, magazines and radio stations.

All four categories were interrelated—a fact that is clearly revealed when one examines category III—the attack on Pearl Harbor. This was not only the most influential event of the year, but it had the effect of being the most significant occurrence in a score of years as counterpropaganda against fascism.

Its significance is seen in the light of the following background facts:

Since the start of World War II, the American people had debated intervention and nonintervention. As the war grew in intensity, this "great debate" both reflected and stimulated the most profound division of the American people since the Civil War.

Pearl Harbor ended this division instantly; more, almost overnight it cancelled out more than 20 years of propagandas which had had two effects: first, to condition millions against participation in another world war; second, to condition many to fear communism and to welcome or tolerate fascism as a safeguard against it. (*See* also PSYCHOLOGY: *Public Opinion and Morale.*)

Rudolf Hess.—On May 10, 1941 there developed one of the most spectacular propaganda acts of the war—the landing in Scotland of Hitler's deputy fuehrer, Rudolf Hess (*q.v.*), persistent anti-communist. Of the many conjectures associated with the Hess episode, the most reasonable in terms of Hitler's propaganda pattern is that Hess was sent to inform important personages in Britain of Hitler's intention to attack Russia, and through them to persuade the British government to make peace with the nazis. The duke of Hamilton, to whose estate Hess had flown, was a member of the Anglo-German fellowship, a group which in the appeasement era had urged close British collaboration with the nazis.

If this was the propaganda carried by Hess, it was not effective. Churchill promised parliament a full revelation, but he did not make it in 1941.

Morale.—The main objective of U.S. and Allied propaganda in the closing days of December was to maintain and strengthen the high morale created by a propaganda of events and of deliberate acts. In the field of foreign policy the main object was to eliminate mistrust and suspicion existing between the soviet and Allied powers, and this was largely accomplished in the last three weeks of December. To build morale among haters of fascism in conquered nations, England, during the year, launched its V-for-Victory propaganda.

In the field of U.S. domestic policy there were areas of weakness which had to be corrected by a propaganda of word and of deed. All of these were associated with the disparity between promises associated with the preachment of democracy and performances in actual practices. Equally important in these areas of weakness were problems of discrimination against aliens and Negroes and the problem posed by the demand of labour organizations for full participating share in government in carrying forward the wartime production program.

It was recognized by the administration, and particularly by the attorney general Francis Biddle, Jr., that in World War II the nation would seriously weaken its morale if it permitted discrimination against foreign born and the children of foreign born merely because they had alien names. Accordingly, the department of justice in 1941 went to extraordinary pains to prevent injustice to aliens loyal to the democratic cause.

Discrimination against Negroes was another weakness in American morale. It had been brought to the president's attention repeatedly in the months and years preceding Dec. 1941. Many Negroes were resentful because Negroes were not being employed in defense industries. Various Negro organizations had planned a "march on Washington" for July 1941, to demand that congress end such discrimination. This propaganda act of the Negro groups was forestalled by President Roosevelt who appointed a fair employment practice committee and who on June 25, 1941, issued an executive order which provided that all companies working on defense contracts were obliged "not to discriminate against any worker because of race, creed, colour or national origin."

Another factor which threatened to be increasingly destructive of morale through the months of 1941 was the persistence of labour organizations for representation in the national defense program on a par with that of management and industry. Coupled with this was the issue brought about by numerous strikes, lockouts and labour's demand for a closed shop. Until the attack on Pearl Harbor it seemed that the bitterness of the propaganda battle between labour and capital would be increasingly destructive of the morale required in an adequate defense program. After Pearl Harbor this propaganda battle ended as the result of an agreement reached by the president's labour-industry conference to outlaw strikes and lockouts for the duration of the war. It was decided to set up a new labour board on which labour would be equally represented with capital to adjudicate labour disputes. This, as a joint act, participated in by government management and labour, worked as propaganda to build national morale.

Intervention vs. Nonintervention.—Had the attack on Pearl Harbor been deferred until 1942, this account of significant propagandas for 1941 would have dealt almost entirely with the greatest battle of propagandists which the U.S. had beheld since the time of the Civil War: the interventionists vs. the noninterventionists and isolationists. Millions of humane, patriotic and democratically-minded men and women in the U.S. were saying in the years which followed World War I, "America fought once to make the world safe for democracy and as a result got only depression in all countries, and dictatorship and an end of democracy in most of the countries of the world. Why fight again when the result this time may bring dictatorship to our own shores?" Others less humane, less patriotic and anti-democratic repeated this theme. Some, like nazi bundists, did so with the belief that fascist dictatorship in Europe and perhaps in America was a desirable means of stabilizing a society rent by economic dislocation and social unrest and bringing it under the control of a governing elite. The interventionists, through such organizations as the Committee to Defend America and the Fight for Freedom, Inc., and the noninterventionists, as represented by such groups as the America First committee and the Keep America Out of War congress, had utilized every propaganda technique and every channel of communication in their tremendous efforts respectively for intervention and nonintervention. In great mass meetings, in radio broadcasts, in newspaper advertising, booklets, hand bills, folders, group meetings, sermons, school and college assemblies, the participants, through the year and up to the very day of Dec. 7, had carried forward what became known as the "Great Debate."

As men like Col. Charles A. Lindbergh (*q.v.*), John T. Flynn, Gen. Robert E. Wood (*q.v.*), and Senators Gerald P. Nye and Burton K. Wheeler (*q.v.*) spoke against participation in the war, and as others like

Wendell Willkie (*q.v.*), Herbert Agar and Senator Claude Pepper spoke for participation, the debate grew in intensity and bitterness. Even the president resorted to name calling when he designated Col. Lindbergh as a copperhead. The president, however, made no move to stop the debate—an act which was itself highly important propaganda for a nation which he was asking to prepare to fight for democracy with its freedoms of speech, press and assembly. Many newspapers were interventionist. The most powerful newspapers ranged on the side of the noninterventionists were the *Chicago Tribune* and the *Daily News* of New York. Most of the newspapers, regardless of editorial conviction, printed the news of both sides in the debate. Radio chains almost universally carried the speeches and news of both sides.

Participating in this debate, too, were numerous groups and individuals representing movements and organizations ranging from the extreme left to the extreme right. There was, for example, the Communist party. Prior to Hitler's attack on Russia June 22, 1941, its propaganda had been strongly noninterventionist. It saw the war as "just another imperialist struggle." The communist propaganda line changed overnight with the Hitler attack on Russia. The communists then propagandized for the support of President Roosevelt's war measures and for U.S. participation in the war "to bring justice and democracy to all people."

At the extreme right was Father Coughlin and his magazine *Social Justice*. This magazine consistently opposed participation in the war until Dec. 7. Even after Pearl Harbor it continued to see Stalin's communism as the chief foe of the U.S. and of the world, continued to disseminate anti-Jewish propaganda and to link the Roosevelt administration with Jewry.

Between extreme rightists and extreme leftists were such pacifist organizations as that of the National Council for the Prevention of War and the Fellowship for Reconciliation. These and similar organizations, pacifist in platform and preachment, continued to exist after Pearl Harbor and to propagandize for a warless world. There were religious organizations like the Quakers and the Brethren which followed the same line. There were religious publications like *Christian Century*, strongly pacifist and noninterventionist through the war period, which continued after Pearl Harbor to see the war as something which should not have the sanction of God.

As the year 1941 ended, nearly every noninterventionist and every isolationist, outside of conscientious objectors and pacifists like the Rev. Dr. John Haynes Holmes of New York, dropped all opposition to U.S. participation. On the foundation of national unity thus achieved, President Roosevelt looked forward to a 1942 which would see larger realization of an international unity against the axis, a unity to bind and co-ordinate even closer the propaganda and military power of the United States, Great Britain, Russia, China and other powers. The nation was to be prepared for great material sacrifices. This called for a combination of propaganda of exhortation (of which Churchill and Roosevelt were masters) and of factual information, complete machinery for which had been set up by the United States government under the leadership of Archibald MacLeish in 1941. (*See* also GERMAN-AMERICAN BUND; UNION NOW.)

Proportional Representation.

Proportional representation was applied in several cities on Nov. 4—in New York, N.Y., for the third time in electing the city council, for which there were 88 candidates. The *modus operandi,* typical of other places where the system prevails, was described in the *New York Times* as follows: "After he records his choices for other offices on the voting machine, the voter receives a . . . ballot bearing the names, in alphabetical order, of the council candidates for his borough, (which) he is instructed to enter a separate booth and there mark. Instead of indicating his choice by X, he writes 1 before his first choice, 2 before his second and so on until he has expressed all his preferences." Profiting by the experience of previous years, the P.R. vote was larger (thus ensuring more councilmen, whose number is determined by the size of the vote) and the count more rapid, thereby removing a chief ground of criticism. In Richmond (Staten Island, N.Y.), with but two candidates, the result was announced on Friday following the election. The identity of all councilmen-elect was definitely known within a week. There were 26 in all, of whom 17 were Democrats; but their two-thirds majority in the previous council (sufficient to override the mayor's veto) was lost.

That 378,393 blank and invalid ballots were cast shows that a large fraction of the electorate had not yet learned how to use the greatly amplified voting power which the new system gave it; but both the Australian ballot and the voting machines required many more than three trials to teach the electors how to use them intelligently.

The council on Dec. 9 voted, 12 to 5, to repeal sec. 43 of the New York city charter which provided the P.R. machinery. The repeal measure must still be adopted by the board of estimates, approved by the mayor and ratified by the voters. In Yonkers, N.Y., also, the city council was chosen by P.R., three of its five members having campaigned on a platform of rigid economy.

Cambridge, Mass., adopted P.R. (25,875–18,323) at the 1940 general election, after an active campaign in its behalf promoted by a committee of which Dean Landis of the Harvard Law school was chairman. On Nov. 4, 1941 the voters chose a city council of nine members and a school committee of six, both by P.R. For the former there were 82 candidates (of whom 11, about equally divided between the parties, were endorsed by the reform committee) and for the latter, 27. (*See* also ELECTIONS.)

Protestant Episcopal Church.

During the year 1941 the life and work of the Episcopal church, and the whole religious life of the United States, was powerfully affected by the obligation, and the ever-increasing necessity, of full participation in World War II, in which the very principles of Christian and civilized life were at stake.

In the Episcopal church this was shown by a deepened spiritual earnestness, by a marked general increase in church attendance, by the continued response to the Forward in Service program, and by the fact that, considering the serious financial outlook, the contributions for the work of the church were well maintained.

The statistics for 1941 show slight losses in some items and gains in others. The total number of baptized persons reported in 1941 was 2,162,022, a slight increase over 1940, and the number of communicants reported was 1,519,483, an increase of 34,434 over 1940.

The foreign missionary work of the church necessarily was much affected by World War II, especially in the far east. As a result of measures adopted by the Japanese government, U.S. bishops in that country were obliged to withdraw from their fields of service before the end of 1940 and to leave the work of the church to be carried on by native Japanese bishops and clergy.

An event in 1941 of high importance and interest to the Episcopal church and to the cause of religion generally was the opening of the entire length of the cathedral of St. John the Divine in New York, the largest cathedral in America and the largest Gothic cathedral in the world. In a time of world crisis, and in view of what had occurred in other lands, the opening of this great cathedral in a metropolis of the United States had far-reaching significance. (W. T. M.)

Psychiatry.

War and Mental Disease.—The general influence of war conditions on mental disease was summarized by Hemphill, who had had a wide experience during 15 months of warfare and six months of intensive air-raid attacks in Bristol, England. The civil population of Bristol had to endure

as much war as any other great city in England outside of London. The total population of the city increased by many thousands after the outbreak of war, but the number of patients admitted to the Bristol mental hospital in 1940 was the lowest in five successive years. There was a falling off in the number of patients suffering from psychoneurosis and the milder types of mental disorder, especially among women. Hemphill observed that the psychogenic importance of war on civilians is negligible and that, moreover, it has even proved beneficial to persons of certain mental constitutions, as shown by the fall in the female voluntary admissions. The communal life that has been developed as the result of air activity both within and without the hospital was found to be of importance in combatting fear and anxiety. War gives freer rein, reported Hemphill, to instinctive tendencies, to aggressiveness and also adds to individual responsibilities.

Report by Fox related to the effect of the air raids on persons suffering from epilepsy, both adults and children. In a large hospital in England where groups of about 250 epileptic children and 200 adults were hospitalized, there was no general increase in the number of attacks on days or nights of air raids, nor was there any evidence found of increased seizures in individuals. This bears out the theory that has long been held by many that epilepsy is a physical rather than a mental disease and thus can be sharply contrasted with the psychoneuroses.

One of the most striking phenomena developed during World War II in 1941 was that of Quislingism and its variants. A study of the type of individual who becomes a Quisling was made by Ernest Jones. He concluded that the key to the understanding of Quislingism and other phenomena connected with it is based on the fact that all Quislings have a peculiar inability to face or even recognize an enemy. Most of the people who become Quislings are in the group either of the dissatisfied or of the insecure. In Austria the nazi invasion took place largely among the dissatisfied and ambitious, often junior members of firms or banks, or members of government departments. Those people most subject to nazi propaganda, moreover, were not securely established in the community.

Schizophrenia.—Many patients with severe mental disease may be cured through various means of psychotherapy, "shock" treatment and hospitalization. Cures are apparently possible in diseases such as schizophrenia (dementia praecox). Rennie gave 100 instances and believed that the most striking single factor for recovery is a long-term contact with a physician or a clinic. Patients with schizophrenia are capable of accepting guidance or of solving personal conflicts with the help of a psychiatrist. Important also are the presence of a favourable environment to which the patient can return and the help to be obtained from co-operative families in carrying out recommendations. The patients who do best are those whose symptoms begin in the third decade of life, with an acute onset, followed by a short period of hospitalization and rapid recovery within six months. In this group recurrences are rare and in no case observed by Rennie did more than two relapses occur. In this group of patients, moreover, the effect of "shock" therapy is most likely to be efficacious. The recovery rate in schizophrenia is not appreciably increased by "shock" treatment.

Treatment.—One of the chief aims of psychotherapy has always been to give the patient insight into his own condition. The inability of the normal or even of the extremely intelligent person to see the obvious facts in his life situation is a familiar observation. In many psychoneurotic states, moreover, the loss of insight is one of the chief symptoms of the disease. Cleckley warns against the attempt to give patients insight into their conditions rapidly. At times it may be extremely unpleasant and if insight should come too suddenly, psychoneurotic patients are sometimes overwhelmed and attempt suicide or suffer the personality dissolution of a psychosis. In severe instances, therefore, insight should be disclosed in a gradual manner. As Cleckley says, "The patient may have to build positively some edifice for his personality before he can abandon the old building of his illness. Once a start, however small, has been made in normal living, the biological tendencies that make for health may find a foothold." This is a timely warning, for the handling of psychoneurotic patients by physicians not qualified to do so has often led to disaster, particularly in regard to the forcing of insight into the patient's condition more rapidly than is advisable.

The subject of "shock" treatment in psychiatry continued as the leading subject of investigation. Each of the three current methods of producing "shock"—by insulin, metrazol and the electric current—has its adherents. Enough time has elapsed since insulin treatment was inaugurated so that a comparison between one group treated by the usual psychotherapeutic methods of a large mental hospital, without added insulin "shock," and a similar group treated in the same way, plus insulin, can be made. Cheney and Clow found that 12% recovered and 42% were benefited by psychotherapy alone, contrasted with 16% recovered and 36% benefited in the group having the additional insulin "shock." Thus, it is concluded that both methods are important and that the insulin treatment does not materially alter the prognosis in the most serious of mental diseases, namely schizophrenia. As previously indicated, fewer permanent cures are reported year by year and, in some institutions, insulin "shock" treatment has been abandoned, or replaced by other methods. Metrazol treatment, also, with the possibility of spine fractures from sudden convulsions, was less used in 1941 than in 1940. Although most writers feel that no patient is made worse, as far as his mental symptoms are concerned, by this form of therapy, and permanent brain damage has not been observed except in rare instances, the consensus was in 1941 that metrazol "shock" can only, as pointed out by Cheney, Hamilton and Heaver, "bring about a change which facilitates other forms of treatment and accelerates recovery so that hospital residence is shortened, sometimes in a strikingly dramatic manner." There were some indications, moreover, that both insulin and metrazol treatments may be supplanted by electric "shock" therapy. Each form of "shock" produces a convulsive seizure, with momentary loss of consciousness. In the electric method, the dosage is easily controlled, a factor long a deterrent to the use of the other methods. With a known stimulus, dosage can be graded until the best results are obtained, without injury to the patient. Reports from various clinics indicated that the effects produced on the mental disease with electric "shock" are equally good, when compared with insulin or metrazol as a stimulant. It was too early to completely evaluate this form of treatment, but encouraging reports were being received in 1941 from clinics both in the United States and abroad. The whole subject of "shock" treatment in psychiatry has been well summarized in a small manual by Jessner and Ryan.

The surgical treatment of certain mental diseases, particularly the depressions and anxiety states, by frontal lobotomy, or cutting of the fibre tracts of both frontal lobes of the brain, was extensively discussed before the section on nervous and mental diseases at the annual meeting of the American Medical association in 1941. The operation was first reported in 1936 by Moniz of Lisbon and since that date more than 100 patients have been treated by this radical method, in the United States and elsewhere. The operation was reported to have relieved patients of excessive anxiety, suicidal and homicidal tendencies and the agitation in schizophrenia. Patients after frontal lobotomy lose much of their concern with self and with their own visceral and mental activities, developing at the same time a more normal and healthy attitude toward their environment. Sufficient information was at hand in 1941 to warrant further experience with this procedure, but the operation remained of necessity an experimental one. No psychiatrist was in a position to state that this operation is or is not a worthwhile procedure. The ultimate decision must await the production of more scientific evidence.

Alcoholism.—There was a renewed interest in the subject of alcoholism, along with the investigation on drugs as a cause of mental disease. The dangers of overemphasis of the role of vitamins was stressed, as well as the feeling that all alcoholics were essentially psychoneurotic. Large groups of the population, it was pointed out, who have equally severe social and emotional difficulties, and who have a high incidence of other psychoneuroses and even psychoses, do not become alcoholics. Some investigators felt that alcoholism was part of contemporary culture in that so many social habits have been developed in response to cultural sanctions. This cannot be eliminated by legislation, and the teetotaler is equally as abnormal from the cultural standpoint as the habitual drinker. (*See* also INTOXICATION, ALCOHOLIC; NERVOUS SYSTEM.)

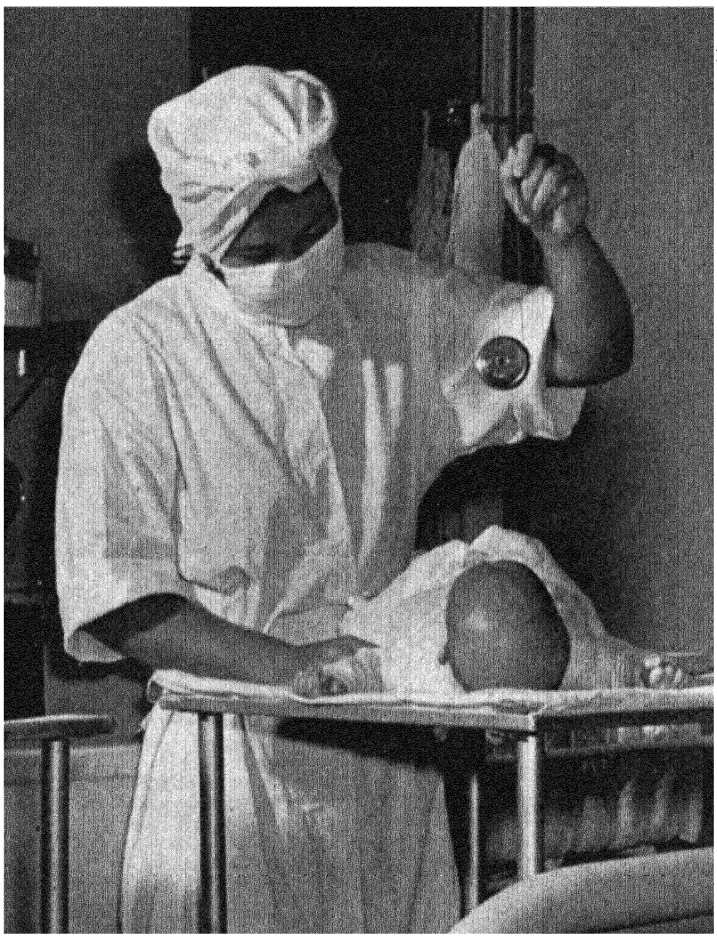
Psychology. The impact of the war upon psychological research and upon the activities of psychologists made itself felt long before the formal declaration of war against Japan. Three areas of defense work occupied the attention of psychologists for well over a year: (1) the classification of military and government personnel, (2) technical research on problems of fatigue, sensory acuity and perceptual discrimination and (3) the study of public opinion and morale. In spite of increasing attention to these pressing problems, the usual fields of academic and applied research were still very fruitful during 1941.

War Activities.—The war activities of psychologists were coordinated through two committees, both of which made substantial contributions to scholarship and practical needs. The Emergency Committee in Psychology of the National Research council took the first step in mobilizing psychological knowledge by preparing bibliographic surveys of the many aspects of military psychology. These bibliographic articles appeared as a special



PSYCHOLOGICAL TESTS to measure the mental capacities of infants were devised in 1941 at the Cradle, nursery in Evanston, Ill. A shiny tape measure dangled above normal eight-week-old babies holds their attention; sub-normal babies of the same age ignore it

number of the *Psychological Bulletin* in June 1941 and covered the following subjects: army motor transport personnel, aviation, classification of military personnel, effects of certain drugs on mental and motor efficiency, German military psychology, morale, motivation and learning in relation to the national emergency, perception, propaganda techniques and public opinion, psychological causes of war, rehabilitation and war neuroses.

The Committee for National Morale, headed by A. U. Pope, included leading psychologists and had a special subcommittee on psychology. In Sept. 1941 it published a comprehensive survey and bibliography entitled *German Psychological Warfare*. The classified, annotated bibliography contains 561 titles and the survey shows how thoroughly the Germans have applied psychological knowledge to every phase of total warfare. The psychological section of the German general staff is organized into four divisions: (1) Technical research is concentrated in the Central Psychological laboratory of the high command, composed of 20 scientific departments. (2) The selection of personnel is carried out by 17 army and 2 naval-testing stations. (3) A special staff for the prosecution of psychological campaigns collaborates closely with the propaganda ministry, the foreign office, the Gestapo and the numerous party organizations. (4) A psychological intelligence service, closely linked to other intelligence services, is occupied with the study of foreign cultures and personalities. These four divisions thus go beyond the traditional psychological function of testing and concern themselves with principles of indoctrinating officers and men, problems of relationship between officers and men, morale, surprise, panic, the exploitation of and the defense against rumour, the analysis of the character of a foreign nation, combat psychology and propaganda techniques.

Personnel and Selection.—The growth of vocational psychology owes much to World War I, for the Army Alpha not only gave scientists a vast mass of data concerning the normal adult population but it also established the usefulness and validity of group testing as an important methodological tool. Similarly in 1941 the war situation was stimulating research in vocational selection. The need, however, was not so much for tests for the classification of men into broad categories on the basis of general intelligence as it was for techniques in measuring highly specialized aptitudes and specific personality traits. Modern mechanized warfare is warfare by technicians and specialists, and the correct appraisal of the requisite abilities and potentialities is the personnel problem of this conflict.

American procedures for the classification of military personnel differ from German procedures in keeping with the different emphases of American and German psychology. The Germans give more attention to the total personality, the Americans stress independent abilities; the Germans rely less upon verbal testing methods but are more subjective in their over-all evaluation: and finally the Germans are more interested in the characterological and qualitative side of mental testing and the Americans in the quantitative side.

Germany has probably devoted more study to the selection and training of officers and military technicians than any other nation. But significant research has been done in the U.S. on the psychology of aviation since 1939 under the auspices of the committee on selection and training of aircraft pilots of the National Research council and the Civil Aeronautics authority. In pilot and bombardier selection, as in all vocational selection, the crucial problem is one of adequate and valid criteria against which test results can be checked. For success in warfare—the ultimate but impractical criterion—have been substituted the evaluation of trained observers reporting on behaviour in standardized and relevant situations, objective scores in performance and the washout records of the training school. Interestingly enough, paper and pencil tests of personality traits have proved useful in predicting pilot success. The Germans select combat pilots on the basis of soldierly qualities of tenacity, emotional stability and ready habituation to tension and danger, but they also test specifically for the candidate's aptitude in adapting himself to his machine and in regarding the components of the plane as he does parts of his own body.

Technical Research.—The customary work of the psychological laboratory deals with many processes related to technical problems of warfare, such as sound localization, the perception of movement, visual acuity under various conditions, dark adaptation and twilight vision, fatigue and its alleviation, the effects of oxygen deprivation upon motor and sensory functions and the effects of drugs. Accordingly, the Emergency Committee in Psychology of the National Research council has formed special subcommittees to bring together research findings helpful to the military services. Moreover, technical problems as yet unsolved, are being assigned to various laboratories for further experimentation. To achieve, as have the Germans, the co-ordination and translation of ideas and findings into practical use was the real unfinished business of 1941.

Of scientific as well as practical import were the systematic studies of R. A. McFarland of the Harvard fatigue laboratory on the effects of oxygen deprivation (which occurs in altitude flying). These investigations showed that oxygen deprivation is accompanied by a decrease in visual acuity, and increase in dark-adaptation thresholds, a widening of the blind-spot retinal area and an impairment of neuromuscular co-ordination. This general loss of biological efficiency was to be expected, but the significance of the contribution lies in the exact quantitative relationship between the amount of oxygen lack and the amount of impairment.

Public Opinion and Morale.—The advances in the measurement of opinion, propaganda analysis and social psychology generally since World War I opened up new spheres of usefulness for psychologists in World War II. Thus they were assisting in propaganda analysis in the foreign political monitoring service of the federal communications commission, in surveys of public information and opinion for the office of fact and figures and in the study of military and civilian morale.

Since the start of World War II the Princeton public opinion project in collaboration with the American Institute of Public Opinion had been charting trends of opinion in relation to world events. From the outset American opinion was opposed to the axis powers but the willingness to take warlike measures was a slow development. Up to the attack upon Hawaii the majority of the American people were not in favour of a declaration of war against any axis power but they were in favour of all aid to Great Britain short of war. Noninterventionist sentiment was strongest in the middle west and among the lower income groups. The significant fact about trends in American opinion is that they have been characteristically ahead of congressional action. The figures show that the administration both in its foreign policy and in its social reforms could have moved faster than it did, as far as public opinion was concerned. The majority of the people opposed furnishing Japan with war materials for almost two years before the government shut off these supplies. Similarly, the policy of appeasement of aggressor nations and even of the Vichy government was rejected by the people before it was rejected officially.

Methodological difficulties in opinion measurement were slowly yielding to experimental attack. The problem of intensity, *i.e.*, the degree of feeling with which an individual holds an opinion, had been the greatest obstacle for the clear interpretation of all attitude studies. Experimentation on this problem was proceeding through systematic variation in the wording of questions and through the use of graphic and even pictorial scales. Another problem of method is the effect of the social status of the interviewer upon his respondents. This was solved through the employment of interviewers of social status equivalent to the responding group. The suggestive influence of the wording of questions was explored by A. Blankenship, who reported significant differences between positive and negative, personal and impersonal question forms. George Gallup, however, demonstrated that question wording exerts little influence on respondents when opinion on an issue has really crystallized. (*See* also PROPAGANDA.)

Before the outbreak of war, civilian morale was the subject of considerable investigation, largely in relation to industrial problems. In peacetime high morale was associated with high occupational level, high income, economic security, deep religious convictions, enjoyment of leisure activities, participation in organized group activities and with democratic as contrasted with autocratic group discipline. No relation was discovered between morale and educational level or between morale and health save among the aged. A negative relation was reported between morale and intelligence.

A scale for measuring morale was devised by weighting questionnaire items according to their acceptability by a high criterion group as compared with a low criterion group. The high criterion group consisted of distinguished social scientists and men in public life who were devoting considerable time to the development of national morale. The low criterion group comprised members of a settlement house known for their negativism and men found loafing during working hours on the Boston common.

In an analysis of the morale problem G. W. Allport distinguished between segmental morale, in which only part of the personality is motivated at the risk of conflict with other segments, and integral morale, in which the whole personality is integrated toward the social goal. The liabilities in the U.S. morale situation he lists as the cynicism of the deadly parallel, the ravages of the depression, the habit of destructive criticism, the taking for granted of basic liberties, the habit of expecting personal profit and the fear of factionalism. Psychological factors making for *esprit de corps*, on the other hand, are: the realism of the postdepression years, the democratic participation in group decisions and activities, the emerging sense of national unity, the American habit of intense co-operation, the hatred of tyranny and persecution, the alleviation of anxiety through a division of labour, the American sense of humour and inventiveness. Military morale has its particular problems because of conditions of danger, the reaction to killing, the regimented conformity of army life and sexual and other deprivations. I. Child urged that the negative program should be the reduction of the intensity of these conditions as far as possible. On the positive side pride in group membership, congenial relationships within the small primary group, prompt bestowal of rewards such as decorations and promotions, belief in the cause of the struggle and the development of the soldier's military skill are among the more important factors productive of high morale.

Learning and Motivation.—The mechanistic system of Hull, which seeks to reduce modifications of behaviour to the operation of logically and experimentally derived principles and postulates elementaristically conceived, was applied to social learning and imitation by N. Miller and J. Dollard. These authors reported their own experiments and observations on animals and children to show that imitation of leaders and models generalizes on the basis of reward. Reward for non-copying behaviour destroys imitation. Imitation can hasten the process of independent learning by eliciting the first correct response but handicaps independent learning in other respects. The application of the theorems of the imitation experiments to lynching and crowd behaviour, however, merely demonstrates that such occurrences can be interpreted in terms of a stimulus-response psychology and fails to add to our knowledge of these events.

Systematic exploration of the conditioned response continued as one of the important areas of laboratory experimentation. Baker's exciting discovery of subliminal conditioning in human subjects was seriously questioned as a result of the negative findings of other investigators. A number of experimenters, however, reported successful conditioning of animals under anaesthesia. These experiments are significant in their bearing on the role of consciousness in associative learning. Other work on conditioning showed that vasoconstriction can be conditioned to a compound stimulus in humans, that under repeated stimulation unconditioned reflexes yield the same type of extinction curve as conditioned reflexes, that intervals of long and short duration between conditioning trials were both more effective for learning than intervals of intermediate length and that spreading the reinforcement, or reward, over the whole interval between conditioning trials gave a progressively greater effect to the longer intervals.

Motivational studies fall into three main groupings: internal drives and their chemistry, conditions facilitating laboratory learning and social incentives and symbolic rewards. Typical of the research on internal drives is Richter's experimental evidence confirming the thesis that the organism seeks to maintain a constant internal environment. The body tries to sustain a constant temperature, a constant water balance and constant mineral, carbohydrate and fat levels even after the removal of the usual physiological means for such regulation. Any physiological imbalance thus may have a motivating effect upon the individual. In human learning Muenzinger found that obstacles placed after a choice point accelerate the learning process. Delay after the choice point has the same effect, but delay before the choice point does not. In the field of social incentives the effects of frustration were being studied extensively. For example, in one experiment it was discovered that memory for unfinished tasks was greater when the problems were presented informally than when they were presented as an intelligence test. In the latter case the ego-defensive reaction was evoked and the memory of failure repressed.

Physiological and Sensory Processes.—In the study of the sensory functions the unity of science is more and more manifest with clinicians, endocrinologists, physiologists, mathematicians and psychologists attacking the same problems with the aid of electrical techniques and refined measurements made possible by the advances in physics and biology. Progress continued in the identification of sensory mechanisms, both peripheral and central, through clinical studies of human injuries and through extirpation experiments on animals. The technique of electroencephalography, the recording of changes in the electrical potentials of the brain, was being applied more thoroughly to psychological problems. The relation between the electroencephalogram and intelligence not only was demonstrated for extreme cases but was being studied for the normal range of the population, with such factors as chronological age held constant. Some evidence existed, moreover, for regarding the electroencephalogram as a more sensitive indicator of "mental work" than physiological measures of muscle tension. The student in this specialized field in 1941 had the advantage of a text which describes the techniques, presents a fairly complete set of sample electroencephalograms and summarizes the findings in the Gibbs *Atlas of Electroencephalography*.

A contemporary development in physiological psychology was the study of the effect of vitamin deficiencies upon sensory acuity. Since the various vitamins have differential effects upon types of tissue, the loss of function accompanying a specific deficiency may establish the type of tissue mediating the function. A survey of recent work in vision with emphasis upon its neurophysiology is found in Bartley's treatise, *Vision, A Study of Its Basis*. As a result of their experiments W. Crozier and E. Wolf declared in favour of a central rather than a peripheral theory of the control of flicker discrimination. Another visual study, that of B. Crawford, reported the precise effects of field size and pattern on the change of visual sensitivity with time. The influence of the physical sciences upon psychology is evidenced both by the methods employed and by the theoretical interpretations made. For example, S. Stevens and J. Volkmann set up experiments in auditory discrimination to show that the quantum theory with its rectilinear functions describes the discriminal process for pitch and loudness.

Social Functions.—The emphasis upon the socialization process as the explanation of adult personality and social phenomena can be seen in two volumes of the Yale Institute of Human Relations, which are detailed studies of personality development in primitive cultures. Whiting's *Becoming A Kwoma* is an account of the training and sanctions in a New Guinea tribe and their effects upon the growing child. Kwoma children, for example, are not punished for deceitfulness but for obvious and frank nonconformity. The result is the development of secretiveness and arts of deception. In *Smoke From Their Fires* C. S. Ford presents the life story of a Kwakiutl chief, much of it from the lips of the chief himself. The Kwakiutl illustrate one aspect of the frustration-aggression hypothesis in the simulated bloodthirstiness of their ceremonials, which are in marked contrast with their rigorous prohibitions on physical violence and so seem a vicarious release for thwarted aggressive tendencies.

Methodology was still the important problem for the social psychologist. Lundberg's thorough revision of his *Social Research* made available the many technical advances in field studies, attitude measurement, the study of institutional behaviour and sociological indices. This volume not only is a practical handbook for the research worker but it also contributes to theory in its consideration of the assumptions and limitations in the various methods. The outstanding contribution of the year, however, came from the 450 page monograph of the Social Science Research council entitled *The Prediction of Personal Adjustment*. This volume is primarily a study of predictive methods as they apply to the field of personality. It contains a compact outline of the statistical theory of prediction, new and important sampling formulae, a method for determining the scale values of items by maximizing the internal consistency of the system, an investigation of differential systems of weighting and suggestions for the reduction of prediction items without the loss of essential information. Theoretical implications are discussed and practical applications considered.

The envisaging of complex social problems in terms of the behaviour of individuals led to many empirical investigations of the U.S. economic, political and familial institutions. *Life, Liberty and Property*, by A. W. Jones, reports a precise type of Middletown study of the class structure of an industrial town. Attitudes on corporate property were ingeniously obtained from a cross section of the population and reveal the different degrees of class consciousness in various groups. In his *Psychology of Social Movements*, H. Cantril interpreted such varied phenomena as the Oxford movement, the kingdom of Father Divine, the Townsend group and the nazi movement on the basis of social context and ego psychology. (*See* also NERVOUS SYSTEM.)

Public Health Engineering.

Air Sanitation.—A two-day symposium upon air-borne infection at the fall meeting of the American Association for the Advancement of Science, medical section, attested the growing interest in this subject. The manner of formation of droplet nuclei, by evaporation of liquid atomized during sneezing, coughing or speaking; the rate of settling of such material and its measurement by plate collection or by the air centrifuge; the longevity and virulence of air-borne pathogenic organisms and their destruction or removal by ventilation, air filters, aerosols and ultra-violet light; and both laboratory and clinical studies were discussed as a basis for a general theory of air-borne infection. The actuality and the public health significance of this mode of transmission of certain contagious diseases, especially those of the respiratory tract, appear to be well on the way to general acceptance.

War and Water Supply.—Among the realignments necessary to prevent general disorganization under war conditions are those related to the water supply. Two critical features are involved: excessive requirements of large-scale fire fighting and interruption of services by destruction of dams, pumping stations or distributing lines. Incidental possibilities include chemical poisoning and bacterial contamination, either by direct assault or through sabotage.

The complete destruction was reported of the Warsaw, Pol., water filters, constructed in 1933 and then said to be the largest plant of the rapid-sand type in Europe. The great Tirso power dam in Sardinia, Italy, was hit by bombs, according to official admission.

An anonymous writer in *Civil Engineering* (Brit.) planned an extensive emergency equipment, in standardized units, capable of being transported rapidly and installed during restoration of damaged works. The equipment, electric-driven, includes booster pumps, large-bore, lightweight steel pipes with quick-acting couplings. Electric power would be provided from an aircraft engine coupled to a dynamo. Equipment for the application of excessive doses of chlorine or hypochlorite to water mains, after partial destruction and emergency repairs, was successfully employed in London.

Civilian defense authorities in the United States were likewise taking thought of possible emergency measures. Special guarding of all vulnerable points and extra precautions in the operation of purification plants are of first concern. In general, duplication of plant and equipment is a first consideration, and in certain states along the eastern seaboard plans for intercommunication between the water systems of adjacent municipalities were being developed.

Finally, water waste assumed new importance. T. Alexander Cecil writing in *Surveyer* (Brit.) and Norman Howard in the *Engineering News-Record* (New York, N.Y.) discussed the increased normal demands due to war industries apart from the more extensive wastage resulting from bombings. Economy in the use of water and a general reduction of waste through leakage are justifiable defense measures.

Standards of Hygienic Quality in Water and Food.—In many administrative fields, including that of public health, standards of quality or performance are employed to define minimum requirements, maximum tolerances or allowable impurity. Generally such standards are expressed in direct terms of useful or undesirable constituents: as, for example, milk shall contain not less than 3.5% butterfat, or catsup shall not contain more than 0.1% benzoic acid.

In other instances, however, indirect measures or indexes are employed. Thus, when it is stated that pasteurized milk should not contain more than 30,000 bacteria per millilitre, it is recognized that the "standard" plate count is arbitrary and in no sense measures the total number of bacteria present, and, furthermore, that the bacteria reported are in all probability harmless forms such as would be drunk with impunity, and occur up to millions per millilitre, in sour milk or buttermilk.

Standards for potable water when based upon the number of bacteria present are of this indirect sort. Indexes more commonly used, as in standards for water for shellfish and the waters in which shellfish are grown, and for swimming pools and bathing places, are based upon the numbers of *E. coli*, a characteristic organism of domestic sewage and the intestinal tract. This organism has only indirect significance as an indication of danger by reason of its associations. A consideration, therefore, that underlies all such indirect standards is the numerical relation that exists between the concentration of the test organism and a harmful or undesirable concentration of the objectionable substance, sewage or, more specifically, of pathogenic organisms associated with sewage.

Rarely is it possible to establish this relation by experiment, and experience yields only indefinite limits. Artificial purification of a badly polluted domestic water supply invariably results in a substantial decrease in water-borne diseases, and pasteurization of city milk supplies has practically eliminated milk-borne epidemics, but whether treatments one-half as effective, in terms of the indirect indexes, would have given essentially the same benefits or whether more nearly perfect treatments would yield increased benefits cannot be learned from these experiences.

Hence the rule of expediency has been employed, and although frequently unrecognized, it forms the basis of most of the current standards of hygienic quality. The rule is to aim for as high a degree of quality, measured by the indirect criterion, as is feasible within reasonable cost or other existing limitations. The suitability of this rule was being challenged in several fields. The department of health of the city of New York abolished the 30-year-old system of grading milk into A and B grades, holding that the distinction, based on general sanitation and measured in terms of bacteria, had no public-health significance and that the extra cost of producing and marketing the higher grade was not justified.

Public Utilities.

Speaking generally, the year 1941 was marked by progress in the United States along several lines in the public utility field. First and foremost there was great improvement in the sale of utility service, reflecting itself in the substantial advances in the gross earnings position of these industries. The growing war-born prosperity and re-employment stimulated both the consumption of utility services as consumers' goods and as producers' goods. However, the gradually rising costs of labour and material, together with the very substantial increase in public-utility taxes, left no great amount of room for improvement in the net earnings position of these industries, because the rate level either remained constant or continued its declining trend.

The growth in normal service requirements and the rapidly developing shift to wartime industrial demands was raising utilization and load factors everywhere, so that as the year 1941 progressed questions were being raised as to the adequacy of capacity for further increases in service.

The more important developments of unusual events in this general picture can be most conveniently summarized under separate headings.

Regulation.—The demand for strict regulation, both state and federal, of the utility industry continued, though the pressure was more largely exerted by the professional regulators as distinguished from consumer pressure. With the greater economic prosperity there was less insistence upon rate reductions and some slight trend was observable toward the close of the year for a rectification of rate levels to comport with the rapidly rising costs of operation. The year also saw the close of the period of inordinately low money rates and hence also a let-up in the refinancing program of the older and higher priced securities.

The Securities and Exchange commission (*q.v.*) continued to press forward in its program of corporate simplification of holding company structures. The commission's integration report for the United Gas Improvement company, generally regarded as of a yardstick character, was believed in some quarters to be designed to afford an early test of the constitutionality of the commission's procedures and objectives.

The Federal Power commission announced its intention to apply the prudent investment theory in fixing the rate base for such utilities as come within its gradually developing jurisdiction over public-utility rates in interstate commerce. The use of this rate standard together with a policy of deducting a full allowance for accrued depreciation and of making interim rate reductions was believed to presage also an early court test of rate-making policies. In this same connection there was some apprehension that there would be a clash between the federal agencies and some of the more aggressive state commissions who were, as it were, fighting rear guard actions. There was a rising interest in this general problem of federal encroachment on the domain of state regulation.

Investigations.—When the effect of the Federal Power commission's investigation into electric rates is recalled, it is of more than passing interest that the senate adopted a resolution, sponsored by Senator La Follette, directing the commission to investigate and publish a comparison of rates for gas supply in cities in excess of 50,000 population. This might have some effect upon the mooted increases in gas rates since it is known that the artificial gas industry is usually the first to feel the effects of higher fuel costs.

The Transportation board created under the Transportation act of 1940 was finally appointed and was organizing a staff of experts to study and report on the adequacy of existing rail, water and truck transportation

facilities. This board was designed to pick up the work of co-ordinating the various types of transportation facilities where that task was left by Co-ordinator Eastman when his appropriation ran out.

National Defense.—All utilities, including transportation, communication, electric, gas, central heating, water and sanitation services, were given an A10 priority rating which rendered the supply of maintenance and operating materials automatic.

The rapid increase in peak demands for power of the months of 1941 over the corresponding months of 1940 called attention to a national power situation which in certain sections, notably the southeastern states, verged on emergency. In this section the increasing demands put forth by electrochemical and other war industries, coupled with a long-continued drought which emptied reservoirs, produced a shortage which could only be met by making arrangements for emergency supplies and by power curtailment for less essential uses. Power pooling, use of submarginal sources of supply, construction of transmission lines and emergency connections with reserve sources of supply outside the area were some of the means adopted for continuing an uninterrupted and adequate supply for war industries.

A critical bottleneck in defense power was the production of turbines and generators for hydro and steam plants. Since the organizations capable of constructing large turbines were few in number and also supplied the requirements for naval and other construction, these equipment manufacturers constituted the most strategic factor in the war economy. The supply of additional power capacity, therefore, had to be scheduled in the light of this limiting factor. The Federal Power commission watched the national power supply and made forecasts of the demand and anticipated the following power capacities: 1941, 33,331,130 kw.; 1942, 36,554,410 kw.; 1943, 39,252,810 kw.; 1944, 40,265,452 kw. The only way to meet these unprecedented demands quickly was to speed up the schedule of generator installations at those public projects where reserves were available. The federal congress through appropriations therefore expedited the program of dam construction, generator installations and transmission line construction at least 3 to 5 years.

Public Power Projects.—The continuous power output of the TVA was to be increased by 387,000 kw. during 1942 and 1943. Additional capacity planned for 1943 and 1944 would add 415,000 kw., making the total of emergency installations 802,000 kw. at an estimated cost of $126,800,000. (*See* also TENNESSEE VALLEY AUTHORITY.)

In the Pacific northwest national defense industries caused an even more rapid acceleration of the installation of power units. Here the private utility industry also depended upon public sources for its future supply and hence Bonneville and Grand Coulee dams, thanks to the emerging war economy, would be producing power years ahead of the most sanguine expectations.

The Boulder canyon and other southwestern projects on the Colorado river were likewise feeling the impact of national defense. The schedule of generator installations was being speeded up; new power projects such as the Bulls Head dam site below Boulder were groomed for early construction; and surplus power originally designed for use by the Metropolitan Water District of Southern California for water pumping was diverted to the production of magnesium.

New Projects.—With the signature of the revised agreement between the United States and Canada respecting the use of the waters in the St. Lawrence river basin, the development of 900,000 kw. of power in the international section of that stream in New York was definitely contemplated and included in the $1,000,000,000 Omnibus Rivers and Harbors bill before congress. The Federal Power commission in co-operation with the power division of OPM, the TVA and other public power supply agencies worked out a construction schedule for hydroelectric and steam-electric power plants, both public and private, which was designed to keep the supply ahead of the demand. Publishing (Book).

As was to be expected in wartime, technical books showed the greatest numerical increase among the various classifications issued by U.S. publishers in 1941. The number rose from 452 in 1939 to 611 in 1940 and to 741 in 1941, according to the final tabulation of the *Publishers' Weekly*. The total number of books in all classifications published in 1941 was 11,112—a decrease of about 2% from the 11,328 titles published in 1940. Macmillan again had the largest output in 1941, 434 titles. Grosset & Dunlap (305) and Harper (275) followed. There were 263 houses which published five or more books apiece. Table I gives a summary of new books and new editions in the U.S. according to international classification of subject.

Best Sellers.—By all standards of comparison, A. J. Cronin's *The Keys of the Kingdom* was the best-selling novel of 1941 in the United States. According to the *Publishers' Weekly*, 236,496 copies of the book were sold in retail stores and 234,328 book-club copies were distributed. (The ranking of best sellers is based only on bookstore sales and does not consider club sales.) Second on the fiction list was *Random Harvest*, by James Hilton (162,500), followed by *This Above All*, by Eric Knight, *The Sun Is My Undoing*, by Marguerite Steen, *For Whom the Bell Tolls*, by Ernest Hemingway (published in 1940), *Oliver Wiswell*, by Kenneth Roberts (published in 1940), and *H. M. Pulham, Esquire*, by John P. Marquand.

William L. Shirer's *Berlin Diary* led the nonfiction list in 1941. Published June 20, it had sold 284,407 copies, plus 281,440 book-club copies, by the end of the year. *The White Cliffs*, by Alice Duer Miller, published Sept. 16, 1940, was second, with 142,538 copies sold. *Out of the Night*, by Jan Valtin was next, followed by *Inside Latin America*, by John Gunther, *Blood, Sweat and Tears*, by Winston S. Churchill, *You Can't Do Business with Hitler*, by Douglas S. Miller, *Reading I've Liked*, edited by Clifton Fadiman, and *Reveille in Washington*, by Margaret Leech (*q.v.*).

Retail Sales.—U.S. bookdealers polled by the *Publishers' Weekly* reported an average increase of 16% in sales in 1941, as compared with sales of 1940. Despite the fact that the week of Dec. 7, 1941 was an exceedingly poor one for booksellers, December continued to show by far the largest sales of any month, because of Christmas buying; November was second best, followed by July, August and October. The slump caused by U.S. entry into World War II, however, had apparently not ended at the close of 1941.

Great Britain.—Numerically, British book publishing continued to decline in 1941, to 7,581 new titles, reprints and new editions, as compared with 11,050 in 1940. Table II, compiled by the publishers of *The Bookseller* and *Whitaker's Cumulative Book List*, gives the breakdown of British publishing by classification. Most government publications and all books and pamphlets priced at less than 6*d.* are not included in the tabulation. (*See* NEWSPAPERS AND MAGAZINES.) (J. V. Do.)

Puerto Rico. A United States insular dependency in the West Indies. Area, 3,400·6 sq.mi.; pop. (1940) 1,869,255, an increase of 21·1% over 1930 and a density of 544·2 per square mile; 30·3% urban. Whites aggregated 76·2%, Negroes 23·8%. The chief cities are San Juan, the capital (169,247); Ponce (65,182); Mayagüez (50,376); Caguas (24,377); Arecibo (22,134); Río Piedras (19,935); Guayama (16,913); Bayamón (14,596); Aguadilla (13,468). Languages: Spanish and English; religion, predominantly Roman Catholic.

Puerto Rico has a governor appointed by the president of the United States, and an elected bicameral legislature, and is represented in the United States congress by a resident commissioner. On Jan. 6, 1941, Guy J. Swope, auditor of Puerto Rico since Nov. 1939, was appointed governor, succeeding Rear Admiral William D. Leahy (resigned Nov. 1940). Governor Swope resigned July 24, and was succeeded by Rexford Guy Tugwell.

History.—During 1941, internal problems held the centre of the stage in Puerto Rico, although Caribbean defense development continued unabated, with strong economic effects.

The year started with a new governor, and a new legislature in which the Popular Democratic party, headed by Senator Luis Múñoz Marín, held a precarious control. Under the senator's leadership, his party's reform program was pressed in the legislature, with partial success. Efforts were made to implement a law (originally enacted in 1900) limiting corporation landholdings to 500 ac., essentially an attempt to encourage diversified agriculture and small holdings. Court suits, however, prevented enforcement. Acts were passed, however, which exempted from taxation real estate under $1,000 value, prohibited nepotism in government jobs, created an insular power authority similar to the Tennessee Valley authority in the United States and authorized purchase of private utility properties, and abolished the salt tax and a 2% sales tax.

Following Governor Swope's resignation in July, to accept a post in Washington, D.C., Rexford G. Tugwell, who had just been named to the chancellorship of the University of Puerto Rico, was appointed governor. Tugwell's intention to hold both positions, which was specifically legalized, aroused strong criticism both in Puerto Rico and in the United States, and in September he resigned the university post.

CREW MEMBERS of an Italian steamer at San Juan, P.R. were each sentenced to three years in prison June 24, 1941 for sabotaging their ship

Economically, the island was relatively prosperous, as defense construction absorbed part of the previously large number of unemployed, and higher sugar, coffee and tobacco prices and an increased export demand for rum stimulated economic activity. At the same time, however, rising living costs, with 11 food staples up 6% to 80% within a year, necessitated a price control act (passed in November) to stabilize food prices.

Defense and other construction activity caused a 30% increase in building permits in the first half of 1941, more than 90% of it in government projects. The most important new defense project was the beginning of a new naval base on Vieques (Crab) island, Puerto Rican territory to the east of the main island, with an authorized initial expenditure of $35,000,000.

Full appreciation of the increasing war threat was generally confined to the military and naval authorities. In October a practice blackout of the entire island was made under army direction. War department efforts to facilitate defense measures were thwarted, however, when the house of representatives rejected (Nov. 11) a bill to permit emergency declaration of martial law. In December, after outbreak of formal hostilities, preparations were made to evacuate families of military and naval personnel to the mainland.

Education.—In 1940 there were 1,733 public schools, with 286,098 enrolment. The University of Puerto Rico, with nearly 6,000 students in 1941, is an important cultural link between the Americas.

Finance.—The monetary unit is the United States dollar.

Trade and Communication.—Official policy in 1941 was to withhold publication of complete statistics. In the year ending June 30, 1940, however, imports were valued at $107,030,482, the United States supplying 93.9%. The remainder, represented chiefly petroleum products from Curaçao, jute from India, fish from Newfoundland and Canada, corn and other foodstuffs from Cuba and the Dominican Republic. The United States supplies mainly foodstuffs, textiles and miscellaneous manufactures, and takes sugar (1939–40: 62.9%), needlework (16.7%), tobacco (6.6%), rum (6.0%), fruits (1.6%), coffee (0.46%). In the calendar year 1940, imports from the United States alone were $103,972,709 in value, 23% more than in 1939; exports $83,733,274, 5.8% less than in 1939. In the first nine months of 1941, exports to the United States rose 25%, imports, 32½%.

Puerto Rico by 1941 had daily air service to the United States and southward to Panama, and frequent, regular shipping service to other parts of the West Indies and to the United States. Internal communication is by railway (387 mi.) and there was a 1,487-mi. main highway system in 1941, supplemented by local roads.

Agriculture.—Puerto Rico is essentially agricultural. Sugar is the leading product, with a 1939–40 production of 1,018,803 tons (export: 868,-

568 tons, valued at $57,328,790). Tobacco (1941: 40,000 ac.) is second, with a 1941 production of 267,500 cwt., and 1940–41 exports valued at $7,780,917, all to the United States. Fruits (mainly grapefruit, pineapple, oranges and citron) had an export value of $1,479,819 in 1940. Coffee (1940–41: 117,000 bags) is largely for domestic consumption.

In 1940, there were 51,494 work cattle, 112,585 other cattle, and 22,709 horses, mules and donkeys. Pasture land aggregated 1,005,560 acres.

Manufacturing.—Manufacturing is for domestic consumption, except needlework (1940 exports: $12,514,429), sugar processing, and cigar and cigarette making. Puerto Rico supplies half the U.S. imports of rum.

Purdue University.

An institution of higher learning at Lafayette, Ind., created under the Morrill act of congress of 1862 which granted each state public lands for the establishment of a university for the teaching of "agriculture, science and the mechanical arts." Enrolment on Oct. 1, 1941, was 6,575, the largest engineering enrolment of any U.S. university or college. The faculty and staff numbered more than 1,300.

Research on the campus was expanded in agriculture, science, engineering and pharmacy in 1941, with many new projects of value in the defense program. A study of tomato diseases was begun to develop a variety resistant to Fusarium wilt, a serious problem of the tomato growing and canning industry of the state. Research in radio and television, formerly supported for 12 years or more by private industry, became a governmental project as an aid to defense and greater safety in acroplanes. Experiments with high temperature and high pressure steam, pioneered by Purdue, assumed new importance in national defense, with results applied to ship and industrial plant boilers. New basic knowledge in highway construction and maintenance of value throughout the entire north temperate zone was developed in a research program conducted by the university with finances provided by the Indiana State Highway commission.

The year 1941 saw completion of an addition to the university's airport hangar, a physics building and a high-tension laboratory. Buildings on the campus and adjoining farms in 1941 numbered 74. During 1941 a total of 43,551 persons attended the 88 conferences or short courses held on the campus, while some 2,500,000 attended the agricultural, home economics and engineering meetings held throughout the state by representatives of the university. (T. R. J.)

Pyrite or Pyrites.

World production of pyrite is about 10,000,000 metric tons annually, containing 4,300,000 tons of sulphur. Spain was formerly the leading producer, but before production had been able to recover from the effects of the Civil War, it was again reduced by the war beginning in 1939. The 958,000 tons shipped in 1940 was less than one-third of the former output. United States production in 1940 increased by 20% to 617,513 long tons; imports declined by almost the same tonnage, to 407,004 tons, so that consumption, at 1,024,517 tons, was little ahead of 1939. Four-fifths of the imports came from Spain, and one-fifth from Canada. No 1940 data were received from any of the other important producers, the latest returns being as follows: Canada 206,500 metric tons of sulphur content in 1939, Cyprus 856,800 tons, Finland 103,000 tons in 1938, France 147,000 tons, Germany 415,300 tons, Greece 217,200 tons in 1939, Italy 920,300 tons in 1938, Japan 2,000,000 tons in 1937, Norway 1,027,800 tons in 1938, Portugal 533,000 tons, Russia 978,000 tons, Sweden 191,700 tons in 1939 and Yugoslavia 128,000 tons. Quebec.

One of the four original provinces which united in 1867 to form the Dominion of Canada (*q.v.*); area 594,534 sq.mi.; population (1941) 3,319,640, of whom 94% were native born and 63% were urban. Capital, Quebec (151,502). The only city with larger population is Montreal (910,002). The lieutenant governor in 1941 was Sir Eugène Fiset; the premier, Adelard Godbout.

Education.—The registration in the public schools in 1941 was 617,838; in the private schools 60,693; the number of teachers was 21,721. School attendance is not compulsory. The principal universities are the University of Montreal, a semistate institution, with 8,539 students and 748 instructors in 1941; McGill university in Montreal, with 2,726 students and 520 instructors and Laval university in Quebec city, with 1,484 students and 275 instructors.

Communication.—There were 19,050 mi. of hard-surfaced and 17,620 mi. of earth highways in 1941. The amount spent on highways in the fiscal year 1939–40 was $21,750,452. The railroad mileage was 4,836; number of telephones 311,932.

Finance.—Government receipts for the fiscal year 1939–40 were $59,153,857; expenditures $66,441,210; gross debt $294,673,099 and net debt $252,719,282.

Agriculture.—There were 6,104,000 ac. of land under cultivation in 1941, having a crop production valued at $203,429,000 and a cash value of $188,844,000.

Table I.—*Leading Agricultural Products of Quebec, 1941 and 1940*

Crop	1941	1940
Wheat, bu.	522,000	577,000
Oats, bu.	44,200,000	45,203,000
Barley, bu.	3,888,000	4,055,000
Corn, bu.	552,000	550,000
Potatoes, cwt.	13,125,000	10,737,000
Turnips, cwt.	5,975,000	6,107,000
Hay and clover, tons	5,223,000	4,017,000

Manufacturing.—The value of manufactures in 1939 was $1,045,757,585; the number of employees was 220,321 and the wages paid $223,757,767.

Table II.—*Principal Industries of Quebec, 1938 and 1937*

Industry	Value of products	
	1938	1937
Pulp and paper	$88,990,115	$107,196,316
Smelting and refining	78,954,445	69,800,390
Cotton, yarn and cloth	39,568,088	40,815,471
Tobacco, cigars and cigarettes	39,156,515	38,338,640
Women's clothing	39,113,490	40,077,126
Railway rolling stock	37,874,224	45,313,773
Men's clothing	36,702,455	28,303,883

Queensland.

A state of the Australian commonwealth lying in the northeast and occupying 670,500 sq.mi.; pop. (est. Dec. 31, 1940) 1,029,613. Chief cities (pop. Dec. 31, 1939): Brisbane, cap., 326,000; Rockhampton 32,600; Townsville 31,450. Governor: Sir Leslie Orme Wilson.

History.—At the state elections held March 29, 1941, the labour government, under Forgan Smith's premiership, was returned for its fourth successive term, all the ministers being re-elected with large majorities. In April, a new political party, known as the Country Nationalist party, was formed as the result of a union between the United Australia and Country parties.

The first floating dock constructed in Australia was successfully launched from a Queensland shipyard in April.

Seasonal conditions in both the agricultural and pastoral areas were satisfactory. Sugar production was estimated at some 800,000 tons, but it seemed that shipping and storage problems might prevent the manufacture of the entire crop, although it might be required to augment production of power alcohol. The cotton harvest was estimated at 13,000 bales, compared with 8,500 bales in the 1939–40 season. The timber industry was flourishing and more than 50,000,000 super feet of hoop and bunya pine were freighted to the southern states to replace previously imported timbers.

Substantial additions to the beef storage capacity of Brisbane were made to enable 70% to 80% of the exportable surplus processed in the peak of the season to be stored. This would not only help the industry in case of shipping delays, but would enable regular monthly shipments to be made throughout the year on account of army contracts. In August the federal government announced that government factories would be built in Queensland to manufacture marine engines for the standard merchant ships which were already under construction.

Education.—In 1938: schools 1,951; scholars 194,246.

Finance.—Revenue (1940–41) £A21,410,000; expenditure (1940–41) £A21,380,000.

Communication.—In 1939: roads, motor 41,073 mi.; railways, 6,567 mi. Motor vehicles licensed (June 30, 1940), 77,037 cars and taxis; 44,689 commercial; 8,031 cycles. Wireless receiving set licences 151,110. Telephones 82,226.

Agriculture, Manufacturing, Mineral Production.—Production in 1939–40: sugar, cane 759,000 tons; wheat 6,500,000 bu.; maize 3,733,424 bu.; wool 190,000,000 lb.; gold (1939) 145,667 fine oz.; silver (1939) 3,600,000 oz.; coal 1,121,000 tons. Industry, manufacturing, 1938–39: factories 3,087; employees (average) 53,000; production, net value £A19,301,475. (W. D. Ma.)

Quicksilver: *see* Mercury.

Quidde, Ludwig (1858–1941), German pacifist, was born March 23 in Bremen. He was educated at the universities of Strasbourg and Goettingen. In 1889 he founded the *German Review of Historical Sciences*. He organized the Munich Peace society in 1894 and after 1920 was vice-president of the International Peace council. Exiled because of his pacifist activities prior to the outbreak of war in 1914, he lived in Switzerland until hostilities ceased, then returned to Germany. There he collaborated with Gustav Stresemann, who with Briand won the Nobel peace prize in 1926. The following year Quidde was awarded the Nobel peace prize. After Hitler's rise to power, he again left Germany in 1933 and remained in Switzerland until his death in Geneva, March 4.

Racing and Races: *see* Air Races; Automobile Racing; Dog Racing; Horse Racing; Track and Field Sports.

Radio. The total number of receiving sets in the United States in 1941 was estimated at 57,000,000. There were 915 licensed stations, 16 experimental stations and 52 new ones under construction. It is estimated that there were 3,500,000 receiving sets in the western hemisphere south of the United States, including 1,000,000 in Argentina, 1,000,000 in Brazil, 300,000 in Mexico, 175,000 in Cuba. Approximately 2,500,000 could hear New York city stations. (D. St.)

Radio's chief sources of advertising revenue are foods and drugs (including soaps and similar housekeepers' supplies). Because merchandise of this type was not materially affected by shortages, and, in fact, sometimes benefited immensely by increased purchasing power, the radio industry likewise could contemplate a steadier continuation of revenue in 1942 than most other advertising media. On the other hand, as in 1940, the hand of the government lay heavy on the industry. "The heart of the abuses of chain broadcasting is the network-outlet contract."

With that philosophy in mind, the Federal Communications commission (the government supervisory body under whose authority radio operates) once more attempted to limit the financial powers of the major networks, and forcibly place the industry on a newer, different plane of competition. Intramurally, this continuation of a much-hated government policy caused a good deal of pain, though the average listener, whose judgment of the industry is based on what comes out of the loud-speaker of his radio, may not have been aware of it.

Revenue and Finance.—During 1940 (1941 figures were not available) the broadcasters financially outstripped 1939, also a record year, by about 19%. Prior to all discounts, the advertising revenue of the industry divided itself as shown in Table I.

Table I.—*Radio Advertising Revenue, 1940 and 1939*

	1940	1939
Major and regional network advertising revenue	$99,000,000	$85,000,000
National "spot" advertising*	44,000,000	36,000,000
Local advertising†	54,000,000	45,000,000
	$197,000,000	$166,000,000

*Advertising by nationwide distributors placed over individual stations (as opposed to chain, or network, advertising).
†Advertising placed by local advertisers over the individual stations in their market areas.

Compilations of "net" revenue by the Federal Communications commission showed the same encouraging picture ("net" revenue means revenue from which all discounts and similar enticements have been subtracted). The industry's 1940 balance sheet, as computed by the FCC, is shown in Table II.

Table II.—*Revenue and Expenses of Radio Industry in 1940*

	1940	Pct. change over 1939
Station revenue:		
Sale of time to major and regional chains	$27,732,201	+19
Sale of time to national spot advertisers	37,140,444	+22
Sale of time to local advertisers	44,756,792	+20
Total sale of station time	$109,629,527	+20
Network revenue:		
Revenue retained after paying affiliated stations	$45,194,260	+17
Total industry time sales	$154,823,787	+19
Deduct commission to advertising agencies	20,859,018	+19
Total industry net time sales	$133,964,769	+19
Incidental revenue	13,181,948	+16
Total net industry revenues	$147,146,717	+19
Expenses:		
Total deductions	$113,850,009	+14
Broadcast Service Income (Total Revenue in Excess of Expenses)	$33,296,708	+39

In the year 1941 radio revenue appeared to have overshot the foregoing intake by a minimum of 10%. The exact figure, when issued by the government in June 1942, might prove to be higher.

That radio should, year after year, find itself able to keep up such a record-breaking performance is largely due to its successful use by advertisers whose merchandise (1) relies heavily on a "name" or trade-mark value, and (2) is in a highly competitive field, either with other trade-mark merchandise, or with "private brand" goods. Thus in 1940 nearly 90% of all network advertising revenue came from the makers of confectioneries, drugs-toiletries, foods, petroleum products, tobacco products, and soaps and housekeeping supplies. In turn, the leading manufacturers in each of these fields, despite strong competition, were large, financially successful firms who found it advisable to protect their position by continued advertising. In essence, this means that radio is chiefly supported by a handful of big advertisers from a handful of big competitive consumer industries. By way of example, here are the ten leading 1940 network advertisers with their gross time expenditures (talent not included):

Procter & Gamble	$10,999,000
Sterling Products	5,975,000
General Foods	5,887,000
Colgate-Palmolive-Peet	4,334,000
Campbell Soup	4,044,000
Liggett & Myers	3,357,000
Lever Bros.	3,171,000
General Mills	3,140,000
Brown & Williamson	2,973,000
American Home Products	2,822,000

Profit.—During 1940 (1941 figures were not available as of Jan. 1942) a total of 578 stations, representing 75% of the 765 operators, showed an excess of revenue over expenses amounting to $26,336,460. This is an average of about $45,600 per station.

On the other hand, 187 stations (25% of the total) showed a combined loss of $1,551,812, or an average of $8,300 per station. Breaking down the excess-revenue-over-expenses picture, we get the following tabulation.

	Excess of revenue over expenses
Networks	$8,512,060
31 network-operated stations	5,661,039
734 other stations	19,123,609
Total	$33,296,708

As against 1939, expenses for the entire industry increased $13,806,000, whereas excess revenue increased $9,459,000. In short, expenses increased by a greater amount than excess revenue; but the rate (per cent) of excess revenue increased much faster than the rate of expense, the former being 39% and the latter being only 14%.

A further breakdown of 1940 revenue by individual stations will serve to illustrate, in more detailed form, the incidence of profit and loss (*see* Table III).

Table III.—*Incidence of Profit and Loss in 765 U.S. Radio Stations in 1940*

Revenue Group	No. of Stations	Total Expenses	Excess Revenue Over Expenses
$1,000,000 or more	8	$ 9,279,585	$4,587,798
500,000 to $1,000,000	42	19,959,416	9,336,703
250,000 to 500,000	69	16,914,938	5,968,440
225,000 to 250,000	14	2,363,876	868,963
200,000 to 225,000	11	1,955,533	302,405
175,000 to 200,000	23	3,048,848	1,049,297
150,000 to 175,000	22	3,326,200	168,305
125,000 to 150,000	27	2,826,691	771,294
100,000 to 125,000	41	3,689,366	693,958
75,000 to 100,000	65	5,078,447	573,709
50,000 to 75,000	101	5,666,563	475,842
25,000 to 50,000	154	5,648,346	102,306
15,000 to 25,000	105	2,195,059	62,133*
1 to 15,000	83	853,007	52,239*
	765	$82,807,375	$24,784,648

*Deficit.

After 1939 the Federal Communications commission greatly extended its studies on the origin of loss in order to help the weaker financial elements in the industry to improve their position. In this connection it is interesting to note that of the 187 stations which lost money in 1940, 45% appeared to be chronic money-losers, having shown losses for the years 1938 and 1939 as well. Another 14% consisted of new stations, in operation less than a full year. The high percentage of chronic losers would undoubtedly be examined carefully in the future to determine whether losses were due to (1) competition, (2) market, (3) power, or perhaps (4) management.

Industry Assets.—The tangible property of the entire industry in 1940 had a composition as shown in Table IV.

Table IV.—*Composition of Tangible Property of Radio Industry in 1940*

	765 stations	Major networks	Regional networks	Total
Original cost	$57,811,991	$11,920,128	$1,184,193	$70,916,312
Depreciated cost	31,978,281	7,373,996	702,835	40,055,112

Programming.—*Network Commercial Programs.*—The ten most popular network programs as of Dec. 1[1] were:

1941	*1940*
1. Chase & Sanborn Program (Edgar Bergen)	1. Jack Benny
2. Jack Benny	2. Chase & Sanborn Program
3. Fibber McGee & Molly	3. Fibber McGee & Molly
4. Lux Radio Theatre	4. Lux Radio Theatre
5. Aldrich Family	5. Bob Hope
6. Bob Hope	6. Kate Smith Hour
7. Maxwell House Coffee Time	7. Major Bowes
8. Walter Winchell	8. Kay Kyser
9. Kate Smith Hour	9. Aldrich Family
10. Fitch Bandwagon / Kraft Music Hall	10. One Man's Family

[1] These ratings are supplied through the courtesy of A. W. Lehman, manager of the Cooperative Analysis of Broadcasting, and are copyrighted by the latter. The CAB is the industry's major fact-finding body in the field of programming.

Changes in network programming have been relatively minor in the past several years, barring only the fact that dramatic programs have greatly increased while the expensive "variety" programs have diminished in numbers (though not in their ability to attract an audience). This comparative stability in programming is a natural historical growth. Radio passed by 1941 the period of experimentation. All the feasible alternatives in programming were explored. An era of relative quiet was in progress.

Network Programs by Types.—As mentioned above, the only noteworthy change in network programs was the increase in dramatic programs. The general composition of network evening programming may readily be ascertained from Table V.

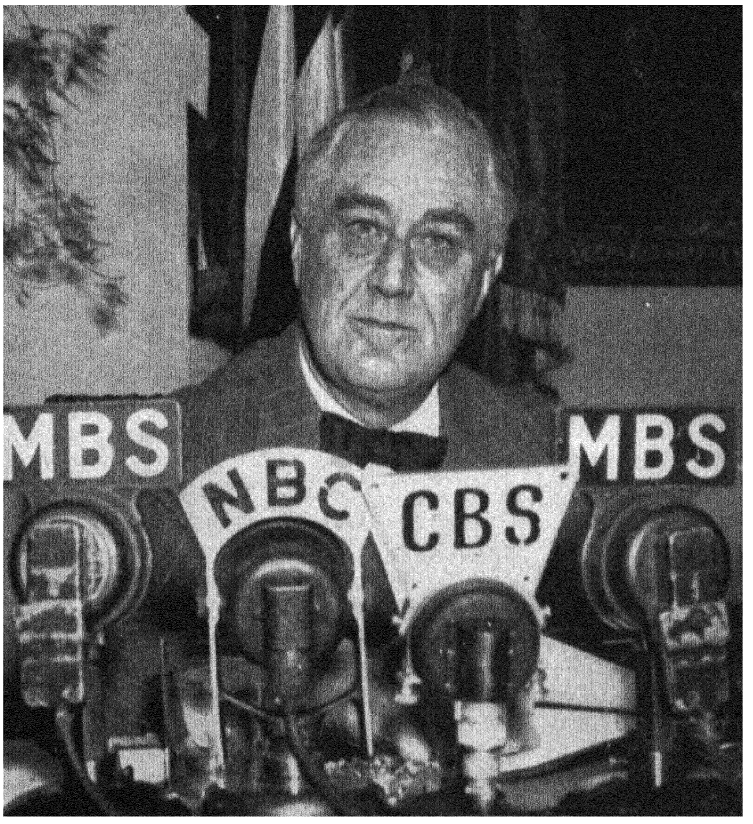
Table V.—*General Composition of Network Evening Programs*

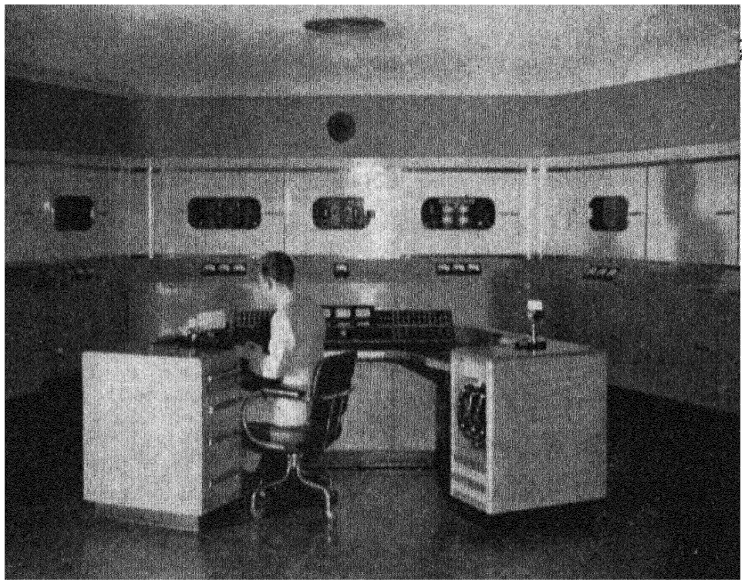
Type of program	1940–41		1939–40	
	No. of programs	% of time on the air	No. of programs	% of time on the air
Drama, serial drama	40	28	30	24.3
Audience participation	28	21.6	20	15.9
Variety	24	18.9	33	26.3
Commentators, news and talks	14	12.3	9	10.0
Popular music	13	11.1	15	10.5
Familiar music	7	4.9	7	5.3
Classical, semiclassical music	3	3.2	3	4.2

Data supplied by the Cooperative Analysis of Broadcasting. The 1939–40 percentage figures are slightly low due to a different grouping of programs at that time, but not enough to cause any serious distortion.

Daytime network commercial programs continued to show an immense preponderance of serial dramas and need not be broken into categories for that reason. The reign of the serial drama had been a long one, and although it had frequently been predicted that these programs—the equivalent of the comic strips in news-

AN ESTIMATED WORLD AUDIENCE of 90,000,000 people—largest in the history of broadcasting to that date—listened to President Roosevelt Dec. 9, 1941 as he told the nation, "we are going to win the war and . . . the peace that follows."





CONTROL ROOM of the WABC transmitter, in Long Island sound, New York

papers—would in due time "wear out," the end was far from being in sight.

Talent Costs.—According to data compiled by *Variety*, the aggregate talent costs (including certain production expenses) of network commercial programs in the 1940–41 season were in the neighbourhood of $30,000,000 for nighttime programs and $7,500,000 for daytime programs. The Federal Communications commission meantime reported that the total programming expenses of the industry in 1940 were $45,500,000. The *Variety* figure and the FCC figure contain a slight overlap, but on the whole are complementary. A total talent-production cost estimate for the industry could well be placed at $80,000,000 or over.

Individual Station Programming.—As in the past, individual stations relied heavily on news, music and sports. So successful had this formula become that it got network imitation. Trade advertisements by the Mutual Broadcasting system stressed the fact that it, too, was basing its policies on that stalwart trio: music, news, sports.

Programs During the War.—Although the broadcasters had a dress rehearsal for the 1941 phase of the war via their experiences in Europe after 1939, additional cautions and mild censorships were mandatory. This was especially true because the war had been creating record audiences at intervals when important national events were transpiring. For instance, President Roosevelt's speech to congress asking for a declaration of war (noon, Dec. 8) commanded the greatest daytime listening audience ever assembled. Almost 66% of all radio homes were reported by the Cooperative Analysis of Broadcasting as tuned to the president. The following evening the president set a new nighttime listening record with a C.A.B. rating of 83%.

Censorship of radio was officially in the hands of J. Harold Ryan, who acted as assistant to Byron Price, director of censorship. Additionally, radio stations had to obey the war regulations of their localities, and special army-navy orders.

In a manual issued by the National Association of Broadcasters (industry trade association) the following items were listed as not permissible in broadcasts:

1. Rumour and unconfirmed reports.
2. War production figures (unless officially released).
3. Movement of naval vessels.
4. News of troop movements (unless officially released).
5. Location of vessels under construction.
6. Figures on Selective Service enrolments and inductions.
7. Weather conditions, unless received from local weather bureau.
8. Imperatives such as "Attention all men! Report to . . ."
9. Overestimations of U. S. strength or underestimations of enemy strength.
10. Commercial announcements which may be confused with genuine news.
11. Sound effects which may be confused with air-raid alarms.
12. Long lists of casualties.
13. "Master-minding" or "second guessing" of military strategy.
14. Any verbal aid or comfort to the enemy.
15. Location of plants engaged in war production (unless approved by the government).

While these rules were an unofficial guide, they nonetheless carefully reflected the wishes of censors and military officials. The N.A.B. also advised stations that they should continue their foreign language broadcasts until notice from the government to the contrary. The object of continuing these programs was to bolster the morale of those loyal Americans who happened to be more familiar with a foreign tongue than with their adopted language. On the whole, the broadcasters did a conscientious job of aiding morale and quashing hysteria in 1941.

Radio v. Government. *The Network "Monopoly" Investigation.*—Since 1937 the Federal Communications commission (*q.v.*) had the major networks under investigation on the ground that they constituted a "monopoly" in the field of chain broadcasting. On June 12, 1940, the FCC brought forth a report on the lengthy investigation, and therein ringingly condemned the networks—especially the National Broadcasting company and the Columbia Broadcasting system—for keeping such an alleged iron grip on their affiliated stations that competition was virtually squelched.

In 1941 this condemnation was carried a step farther. On May 2 a series of rules was issued to break up the so-called "monopoly." These rules specified that (1) a station may not exclusively affiliate itself with any one major network; (2) it may not have a network contract which prevents other stations in the same area from accepting programs of the network; (3) it may not enter into contracts with a network for longer than one year; (4) it may not option (or promise) a network time-periods unless the network really intends to use them; (5) it may not surrender to the network the right to control or reject programs; (6) a network may not own more than one station in any single area, or in areas where facilities are so few as to give the network complete domination; (7) one network may not operate more than one hookup—a clause obviously aimed at NBC which controls both the Red and Blue networks; and (8) a station may not allow a network to fix its rates.

Except for certain minor objections, the Mutual Broadcasting system—younger and smaller than NBC and CBS—heartily agreed with the commission on the content of the rules, and thus split the industry into several factions. NBC and CBS, on the other hand, protested that the rules were a "death sentence" and would "kill" chain broadcasting.

There followed a congressional investigation, during which time the rules were held in abeyance. Although this congressional gesture never progressed into anything tangible, it patently did inform the FCC that the rules were too stringent and would have to be amended. So in October a new version was brought forth, somewhat milder in content. Neither NBC nor CBS was asked to dispose of any of its stations, and no forced sale of one of NBC's two networks was demanded. However, exclusive network affiliation was still prohibited, and options (that is, a network's right to demand time from affiliated stations) were limited to an absolute minimum.

Again the Mutual Broadcasting system expressed itself as pleased over the fairness of the rules, and again NBC and CBS claimed they were death sentences. Therefore, both of the latter networks asked for a court injunction to stop the FCC from enforcing its edicts. Hearings on the injunction pleas had not yet (Jan. 1, 1942) been held, and until there was some official interpretation of FCC power, the rules would again be held in abeyance.

It seemed (Jan. 1, 1942), however, that neither NBC nor CBS could hope to win a complete victory over the FCC. That the networks recognized their plight was evident from the fact that both sold their profitable artists' bureaus—evidently as a gesture of appeasement, for the FCC passed no rules against artists' bureaus, although it did informally condemn network ownership

of them. Additionally, NBC was in the process of making a separate corporation of the Blue network so that it would not overlap into the personnel and property of the bigger Red network.

While it was possible that the pending injunction plea might halt the commission, or tone down its demands, this breathing spell would be short-lived at best. For the commission in the interim turned all its "antimonopoly" materials over to the department of justice, which in turn filed a suit under the Sherman act against NBC and CBS.

Launched in Chicago on the very last day of 1941, this action charged that the two networks worked various restraints of trade in commercial network broadcasting, and asked that the following changes be made: (1) Disposition by NBC of one of its two networks; (2) disposition by CBS and NBC of stations owned in markets which have very little competition; (3) nonexclusive contracts between networks and stations, and limitations on option-time; (4) limitation of network-affiliate contracts to two years' duration; (5) alleviation of certain alleged injustices by NBC and CBS against transcription companies.

The Mutual Broadcasting system was not mentioned in the suit, and in fact indicated that it would institute a $10,000,000 suit of its own against NBC on the claim that NBC wilfully stifled Mutual's growth.

All in all, this turn of events presaged difficult days. Obviously the department of justice' action was aimed toward a consent-decree finish, and unless the networks agreed to such a consent-decree, they must undertake a long, costly, legal proceeding whose outcome naturally would be dubious.

Other FCC Investigations.—On the heels of its campaign to stamp out the alleged domination of the major networks, the commission launched two additional investigations having to do with possible monopoly. One (begun in midsummer) was a probe to see "whether or not the joint control of newspapers and radio broadcasting stations tends to result in an impairment of radio service."

Between a quarter and a third of the nation's radio stations are jointly owned with newspapers. The other probe concerned the multiple ownership of stations in the same community by a single person or corporation.

Although hearings were held on both topics, nothing tangible resulted up to Jan. 1, 1942. Trade opinion was that the commission was not on very safe ground in these latest investigations and might drop them, or issue only very mild rules. The newspaper-radio hearings, as an example, began inauspiciously for the commission when the latter, through some inexplicable slip-up, presented data so easily identified as in serious error that it had to withdraw to revamp its offense.

Musical Property.—The radio industry in 1940 began a struggle with the American Society of Composers, Authors and Publishers (ASCAP) over licence-fee payments for the use of ASCAP's copyrighted popular music. Under existing contracts, individual stations had paid ASCAP 5% of their receipts, but the networks had paid nothing on the moneys retained by them from chain advertising. Hence ASCAP demanded that as of Jan. 1, 1941, individual stations pay from 3% to 5% (depending on size), while the hitherto nonpaying networks would be charged 7½%.

This contract was flatly turned down by virtually the entire industry, and on the first day of 1941 ASCAP music was banned from the air.

What the warring factions of course knew from the beginning of their feud was that public opinion would be the decisive factor in determining the winner. ASCAP obviously hoped for a loud clamour over the banning of Victor Herbert, Irving Berlin and other well known music. The broadcasters, for their part, put their faith in "public domain" music (out-of-copyright tunes), and on works of Broadcast Music, Inc. (a music publishing venture supported and founded by the radio industry). When the public evidenced little more than apathy over the feud, ASCAP's cause was doomed.

By May it had brought down its original steep demands to the point where it granted the Mutual Broadcasting system a licence for 3%. Six months later it came to terms with NBC and CBS, granting them licences for 2¾% (Mutual's contract simultaneously was revised downward to meet this lower figure). Individual stations were offered a variety of licensing plans—all of them cheaper than the terms of the old contract.

In short, ASCAP not only failed to better its revenue as against the old radio contract—it even failed to do as well. Happily, however, the settlement between the warring factions contained one clause heartily approved by everybody: The new contract would run until Jan. 1, 1949, and on Jan. 1, 1950 (barring another financial squabble), would automatically renew itself for nine years.

In short, one of radio's oldest, most persistent headaches at last succumbed to a contractual aspirin.

Employment.—Once more radio pay rolls reflected the high compensation standards to which the industry had traditionally adhered. Latest data (from a sample for the week of Oct. 13, 1940) is shown in Table VI.

Table VI.—*Employment Figures of the U.S. Radio Industry*

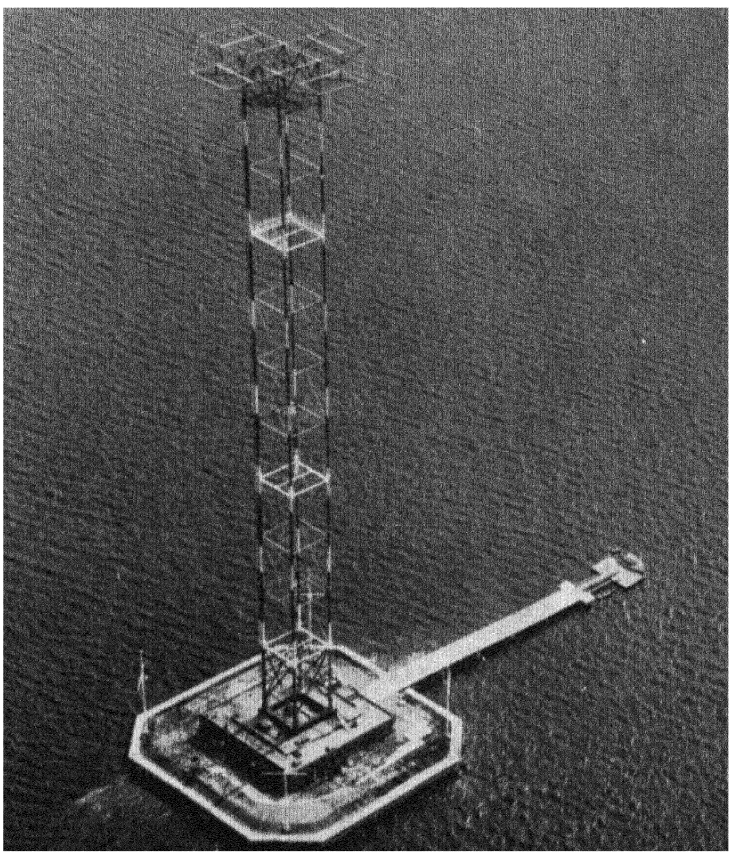
	1940	1939
Full-time employees	21,646	18,359
Average weekly compensation	$46.95	$45.20
Part-time employees	4,007	4,377
Average weekly compensation	$27.49	$23.55

Union difficulties, as in 1940, remained at a minimum. While minor flare-ups took place on isolated occasions, no serious controversies occurred.

Television and Frequency Modulation.—The progress of these two arts, from the technical standpoint, is discussed elsewhere in this article and in TELEVISION. It is worth noting here, however, that in 1941 both took their place alongside standard radio broadcasting as commercial media. The significance of this development, of course, was that the new money provided by advertising would hasten the value of FM and television as purveyors of entertainment and information.

With respect to television, the decision of the Federal Communications commission to allow commercialization was a reversal of an earlier attitude to keep the art purely on an experimental basis. But in May the commission ruled that the "green light" would be given as of July 1. Resultantly, on that date NBC staged the first commercial television broadcasts in his-

THE TRANSMITTER for WABC, key station of the Columbia Broadcasting system, is located on a man-made island in Long Island sound, a mile off New Rochelle, N.Y. The 50,000-watt signals from the 410-ft. tower first went on the air Oct. 18, 1941



tory. The sponsors included Procter & Gamble, Lever Bros., Bulova, Missouri Pacific railway and Sun Oil Co. From these pioneer advertising attempts, it was apparent that advertisers envision the new art—from the commercial standpoint—as best suited to (1) demonstrating their products and (2) showing the audience what the package or container looks like.

With the advent of war, and restrictions on the use of metal, television suffered a setback. Both NBC and CBS, however, continued to broadcast programs on a regular basis (CBS was experimenting with colour-television). What prompted this continuation was the feeling that in postwar days television might turn out to be as important a new industry as standard broadcasting became after the end of World War I. (*See* also TELEVISION.)

Frequency modulation, cheaper to put into the hands of both the broadcaster and the listener, would undoubtedly suffer from the war, too, but it had a "head start" by the time the gloomy period set in. The first commercial FM transmitter went on the air March 1, although prior to that time there had been 18 experimental stations. By mid-December, 24 commercial stations were in operation, and a total of 62 authorizations had been made by the FCC.

Concurrently, set ownership exhibited an immense rise. Twenty radio set manufacturers began supplying the FM market with receivers, ranging from table models to highly expensive "combinations" (combined FM-phonograph sets, or combined FM-AM receivers). Estimates indicated that almost 250,000 sets were in use as of Jan. 1, 1942. Twelve months before, the figure was 15,000.

It is difficult to indicate the exact geographic distribution of sets, inasmuch as the high rate of sales keeps changing the picture. However, figures pertinent to Nov. 15, 1941, show the more important FM cities, from the standpoint of set ownership, as given in Table VII.

Table VII.—*FM Sets in Various Cities and Areas, Nov. 15, 1941*

City or area	Set owners	City or area	Set owners
New York city	30,000	Pittsburgh	3,500
Chicago	15,000	Hartford	2,700
New England	10,000	Albany-Schenectady	2,500
Detroit	6,000	Cleveland	2,000
Los Angeles	6,000	San Francisco	1,700
Philadelphia	5,000	Kansas City	1,600
Milwaukee	3,800	St. Louis	1,600

FM's great virtue is that it is practically "staticless," and represents the ultimate in high-fidelity transmission and reception. And like the *video* art, FM is earmarked as a postwar industrial "cushion," and a candidate for widespread public acceptance.

Radio in the Western Hemisphere.—*North American Regional Broadcasting Agreement.*—On March 29, 1941, the painstakingly planned agreement governing the allocation of radio facilities among the United States, Canada, Cuba and Mexico went into effect. The purpose of this pact was to minimize radio interference among the four nations via the orderly granting of wave lengths and power. To comply with the agreement's stipulations, 802 of the 893 U.S. stations had to change their place "on the dial." But this was accomplished with a minimum of confusion inasmuch as the industry had carefully informed the public of the coming switch-over.

Superpower.—It is interesting to note that the agreement allowed the use of power in excess of 50,000 watts for a certain class of station, but the FCC in 1941 failed to assign such "super-wattage" to any commercial broadcaster. The reason for this reluctance, of course, was that the FCC did not wish smaller stations to complain that they were being forced to compete with giants. On the other hand, it seemed probable that the FCC might change its attitude in the not too far distant future. There were two reasons: (1) national defense, and (2) high-wattage stations might provide uncomfortable competition for the major networks which, in the eyes of the FCC, had far too little competition in the past.

U.S.-Latin-American Broadcasts.—There was a vigorous trend toward "internationalizing" U.S. networks in 1941, particularly with respect to the western hemisphere. Both NBC and CBS enlarged and perfected hookups which covered all the nations in the western half of the world. Similarly, the Crosley corporation (of Cincinnati) set up a regional network to cover certain portions of the Latin-American market.

International networks operated thus: A powerful U.S. short-wave station "beams" programs to the other western hemisphere nations; there, affiliated stations "pick up" the short-wave emissions and rebroadcast them locally via long-wave. NBC, CBS and Crosley sell time over their networks in a manner comparable to the sale of time over the regular U.S. networks. (The CBS Latin-American network as of Jan. 1, 1942, was not completely in operation; certain tests were still being made.)

Advertisers who did not wish to buy an entire hookup, might buy only the short-wave facilities of the American unit, and rely on listeners in the Latin Americas to pick up the U.S. beam. Single-station time sales of this kind were being made not only by NBC and Crosley, but also by General Electric and Westinghouse (both of which own short-wave units, but not networks).

Aside from their commercial aspects, however, these attempts at welding the solidarity of the western hemisphere had a high good will value and thus were favoured by the government. Nor was the effort unilateral. Many Latin-American broadcasts were, in turn, picked up and rebroadcast to U.S. listeners as a reciprocal feature.

With government aid (financial and cultural) this type of broadcasting apparently was destined for a favourable future. In postwar days its value would be the creation of a great market for western hemisphere commercial interchange. During the war it would keep all the sister republics in touch with each other. And finally, the interchange of programs would serve to maximize the quality of broadcasting over the greatest democratic land area in the world. (*See* also ADVERTISING; AIRPORTS AND FLYING FIELDS; CIVIL LIBERTIES.) (E. A. GD.)

Other Scientific Developments.—One of the scientific accomplishments of 1940, the small and economical high-efficiency tubes that were the basis of the camera-size or "personal" radio receiver, had great recognition during 1941. Not only did more than 500,000 of these little battery-operated portable sets go into use, but the same principles were applied in the military field. The army in 1941 had portable, battery-operated radio telephone transmitters and receivers which a soldier could carry without difficulty and use for two-way communication while on the march or on scouting duty. This so-called "walkie-talkie" outfit proved its value. The little, easily carried broadcast receiver from which it was derived had also a wartime value, for householders began to realize that such receivers provided the mechanism for picking up broadcast air raid warnings or other instructions even though the central power supply stations should be put out of action.

Another important wartime development was the "Radar," a new application of newly developed vacuum tubes which were capable of generating surprisingly large amounts of ultrahigh frequency power. The British disclosed in the press that this device was exceedingly effective in the detection and location of enemy planes, and the United States was understood to have adopted it also as an important item in air defense.

The year 1941 saw striking improvements in direction-finding apparatus, used for the precise location of radio transmitters. Since their utility was principally in the military field, little more can be said about them. Velocity modulation tubes and small vacuum tubes for the generation of intense pulses of very high frequency power were further developed and applied.

Facsimile.—Facsimile, the radio printing press which transmits text or pictures by wire or over the air and, at the receiving point, provides an exact black-and-white copy on paper, was further improved and applied. The system was in commercial use for the transmission of radio messages between Los Angeles, Calif., and New York, N.Y., in addition to providing a number of military services. Its application in the home broadcasting field, while technically feasible, was expected to be postponed for the duration.

FM and Air Raids.—One unexpected advantage of FM broadcasting was brought out by the war. It was known that (particularly at night) the waves of a high-power standard broadcasting station might be picked up by an enemy bomber some thousands of miles away and used as a "homing" beacon to guide the plane to its objective. Therefore provision was made to close down standard broadcast stations in time of threatened air attack, although the closing of those stations deprived the authorities of their means for instantaneous mass communication with the public. Inasmuch as the range of the FM stations was in 1941 normally less than 100 mi., day or night, and probably not more than a few times that when received by a high-flying plane, it seemed safe to leave the FM transmitters on the air until the enemy planes were very much closer in. Thus an effective means of issuing instructions to the air and fire wardens, as well as the people in general, might be preserved.

Electron Microscope.—The electron microscope, developed from radio practice by Dr. Zworykin and his associates, had remarkable recognition. About 16 of these instruments were in use in various laboratories, where their high resolving power was making possible scientific work heretofore blocked by the limited magnification of the optical microscope, only about 1/50 as powerful as this new tool. As an example, Drs. Chambers and Henle, of the University of Pennsylvania, announced the isolation and photographing of the influenza virus and the subsequent production of a new and more effective influenza vaccine. Industrial applications of the electron microscope were perhaps of equal significance.

With the beginnings of the great new research laboratories of the Bell system at Summit, N.J., and of the Radio Corporation of America, at Princeton, N.J., 1942 should see still further and even more striking scientific developments of radio. (*See* also DEFENSE COMMUNICATIONS BOARD; FEDERAL COMMUNICATIONS COMMISSION.) (J. V. L. H.)

Great Britain.—The British Broadcasting corporation carried on an uninterrupted service through 1941, in spite of enemy action. The audience for the home service sometimes amounted to more than 23,000,000 listeners for a single broadcast.

The main purpose of the BBC was to speed the war effort by supplying the latest news, and supplementing it with eyewitness accounts, official explanations of projected measures, useful talks about health, food and civil defense and messages to and from men on active service. The BBC was not only often first with the news, but, because its news was trusted, had a powerful effect abroad. For instance, its straight-from-the-shoulder talks were a principal factor in the fall of the Persian shah and the flight of the nazis from Iran.

The program for the forces increased to 17 hr. daily. It carried many items such as "Radio Reconnaissance" discussing the progress and meaning of the war; its "Any Questions?" with extemporary answers, enjoyed great popularity. The resident "Brains Trust" (C. E. M. Joad, Julian Huxley and Commander Campbell, with compère Donald MacCullough) became household names.

Thirty programs weekly were directed to different branches of the services. Examples were: "News from India," "Greetings from Cairo," "The Blue Peter," "Hello, Diggers!"—linking men in the war zones with all parts of the empire. Personal messages between children evacuated overseas and their parents gave great pleasure. Industrial workers, from their factories, contributed programs of their own, like "Works Wonders," and to them, at their benches and in their rest time, the BBC brought entertainment.

The oversea services expanded greatly. There were broadcasts in 43 languages, including Chinese, Thai, Malay, Bengali and Arabic. Until Russia was attacked, the BBC alone represented the Allied cause in Europe. Exiled governments had their regular place in these broadcasts. The oversea service comprised an empire service in English, daily, for 23 hr., reaching all parts of the world in the evening (local time). Empire and eastern languages were alternative to English. Parallel was the European service, covering 25 program hours daily. Two hours were devoted to the near east and four to Latin America. Daily programs were addressed to German and Italian soldiers, to Austria and to German women.

The prime minister, Winston Churchill, made notable and challenging broadcasts, of which the firm acceptance of Germany's challenge on the day of the invasion of Russia was outstanding. This speech, widely translated, was rebroadcast in Russian. The premier also spoke vividly of his ocean

meeting with Pres. Roosevelt and the resulting Atlantic charter.

The queen broadcast national thanks to the women of America. The kings of Norway and Yugoslavia, the queen of Holland, Crown Prince Olaf, Prince Bernhard and the Princess Tsahai of Ethiopia were other royal broadcasters.

Wendell Willkie, Robert Gordon Menzies, John Winant, Drs. Quo Tai-Chi and Wellington Koo, successive Chinese ambassadors, Harry Hopkins, I. Mikhailovich Maisky, Raymond Gram Swing, Dorothy Thompson and Alexander Woollcott were among those who were heard on the air. Writers included T. S. Eliot, Robert Sherwood, Desmond MacCarthy, J. B. Priestley, Quentin Reynolds and A. P. Herbert, who were widely heard in "postscripts" to the Sunday evening news bulletin. Service speakers commanding great attention included Air Marshal Sir Philip Joubert de la Ferte, Commander Kimmins, Air Commodore Goddard and Major General Collins.

Separate medium wave lengths for the forces and the European services were introduced. Short-wave reception for the British Isles and ships at sea was first used, home and forces programs being each made available on the 6 megacycle (49 m.) band.

The BBC symphony orchestra and the other regular combinations continued to make music under difficult conditions. Dramatic features reflected the progress of the war, often reconstructing tales of heroism and endurance from the services and from the civilian front as well. In news talks too, service men and others who had played an active part told simply, but with great effect, of remarkable experiences. The hunt for the "Bismarck," the various escapes from occupied Europe, the sufferings of men at sea in bringing food and munitions to Britain, the constant peril from fire and bomb in the great cities, all these were recounted at the microphone.

Meanwhile, the "show went on." Variety programs, amongst them such diverse features as "Hi, Gang!" and "Everybody's Scrapbook" contributed to light entertainment. A puzzle program drew 500,000 entries, and in nine months produced £50,000 for the Red Cross. "Good Cause," appeals were made by Mrs. Churchill, Madame Chiang Kai-shek, Lord Trenchard, Anna Neagle and others.

The BBC's board of governors, reduced to two members when war began, was increased to its full peacetime strength of seven. The BBC worked to the direction of the ministry of information in all matters affecting the war effort until the autumn, when a new government organization for political warfare became responsible for broadcasts to enemy and enemy-occupied territories. The governors, however, remained trustees to the public to see that the standards and traditions, established by the BBC over many years, were maintained. (*See* also ADVERTISING.)

Radiology.

Radioactive Isotopes.—The radioactive isotope of any element is chemically identical with the stable form of the element. Wherever it is deposited it undergoes radioactive disintegration and in so doing it irradiates the cells containing it. If cells of a particular type of tumour should concentrate several times as much of some radioactive substance as the normal tissues, then in its decay this substance would irradiate the tumour cells correspondingly more strongly than the rest of the body. If this differential absorption between the two were great enough, a clinically effective dose of radiation could be thus applied to the diseased cells without damaging the normal structures or the patient as a whole.

Tracer Studies.—Very small amounts of the material are administered, to find out how it is localized in the various tissues and organs. This results in the establishment of differential absorption ratios: $\frac{\text{amount of isotope administered per gram of tissue}}{\text{amount of isotope administered per gram of body weight.}}$ If this is less than three it is probable that the substance will be of little use; if it is greater than four or five, the outlook is encouraging.

Radioactive phosphorus is concentrated in the bone, liver and spleen of normal persons. In leucaemic patients it deposits with a favourable absorption ratio in white blood cells, bone marrow and any tissues infiltrated with leucaemic cells. In carcinoma of the breast it does not appear to concentrate in the primary lesion, but does in both normal and metastatic lymph nodes. In osteogenic sarcoma it concentrates in the primary tumour to a much greater extent than in normal bone. In lymphosarcoma the differential absorption ratio in diseased lymph nodes is high. Hence the administration of radiophosphorus in any of these conditions might be expected to be of value in treatment. Radioactive strontium is found to concentrate almost entirely in the growing parts of bone, suggesting its use in rapidly growing bone tumours. Radioactive iodine deposits almost entirely in the thyroid gland. Thyroids containing nontoxic goitres store almost twice as much as normal glands; those containing toxic goitres very much more. However elimination in the latter also proceeds very much more rapidly.

Estimates of Possible Radiation Dosage.—When the actual amount of isotope deposited per gram of any tissue can be determined, then, for a known half life of the substance, and a known energy of the radiation emitted, calculations can be made of the actual dosage delivered to that tissue, in terms of a unit which is comparable with the standard roentgen. Hence it can be determined whether the amount of radioelement which can be concentrated in the organ will deliver a radiation dose which might be expected to be of any value.

Therapy.—Radiophosphorus is the only radioactive element which has had extensive clinical use. The largest number of cases treated have been leucaemias of all types. In chronic myelogeneous and lymphatic leucaemia, good remissions are obtained, the results are not spectacularly better than those with X-ray therapy, however there is an impression that remissions are longer, and abnormal types of cells disappear more completely under phosphorus treatment, while, in general, it is better tolerated than X-ray irradiation. In acute and subacute cases, little improvement is noted; this is also true in X-ray therapy.

Lymphosarcoma has been treated with radiophosphorus. The same types of case which do well under X-ray therapy do well with phosphorus; the type which does badly with X-ray does little, if any, better with phosphorus. Most of the cases in this series are too recent to permit conclusions to be drawn.

Several cases of polycythaemia have been treated at the University of California, with success.

At the Memorial hospital a number of patients with osteogenic sarcoma have received radiophosphorus therapy in the hope that it will be absorbed in clinically nonevident metastases and prevent their growth. Evaluation of results in these cases cannot be made as yet.

Neutrons.—Direct neutron beam therapy has been carried out at the University of California for three years, on a total of more than 150 patients. In almost all the initial results were good. Since most of the first cases treated had advanced disease, the results are felt to be sufficiently encouraging to warrant continued neutron therapy.

Irradiation with slow neutrons has been suggested on the basis of experiments at the University of Illinois and the Memorial hospital. If compounds containing boron or lithium are irradiated with slow neutrons, alpha particles are released, producing very intense local effects. *In vitro* experiments with mammary carcinoma, lymphosarcoma and sarcoma show that such local ionization is sufficient to cause lethal effects. *In vivo* it would be necessary to introduce into the tumour tissue a suitable organoboron or organolithium compound which should be nontoxic and should either diffuse out of the tumour very slowly or be decomposed and deposit the boron or lithium in the tissues. The affected region, or even large parts of the body, could then be irradiated with slow neutrons; little effect would be produced except where the boron or lithium atoms were found, and here intense alpha ray irradiation would ensue. Efforts to localize these substances by attaching them to a dye, etc., have not proved successful, but the problem did not in 1941 appear hopeless.

Radium.

When the radium refinery at Oolen, Belgium, fell into German hands, the Belgian Congo ores were shifted to the United States, and receipts in 1940 amounted to 2,400,198 lb. of uranium-radium ore.

By the end of 1939 the capacity of the refinery at Port Hope, Ont., had been expanded to 8 grams of radium and 40 tons of uranium compounds monthly, but since the stocks on hand at the refinery were sufficient to keep the refinery working for three years or more, and since there was a sharp drop in the demand for both radium and uranium, operations at the mine at Great Bear lake were discontinued in June 1940. It was also reported that uranium concentrates had been received from the United States for treatment on a custom basis, but it was not known whether this represented domestic output or whether it was material imported from the Congo.

Nothing was known in 1941 of actual production or sales of radium during 1940, but it was understood that the agreement made several years before dividing the market between the Congo and Canada on a 60:40 basis remained in force, but that war conditions had severely restricted the market, the entire European continent having been eliminated for the time being.

World consumption was in 1941 estimated at 85% for medical use, 10% for luminous paints and 5% for other purposes, including the radiography of metal castings and forgings for inner flaws. Medical sales in the United States were estimated at 25 grams annually, and while radiographic applications were expanding, the nature of the use was such that only small amounts of radium were required. Use in luminous paints would probably expand considerably, especially in dials for aeroplanes, but since one gram of radium would be sufficient for several thousand planes, the demand would not be large. All indications seemed to point to a reduction of operations at the Port Hope

refinery, or the accumulation of a considerable amount of radium in surplus stocks during the remainder of the war. (*See* also URANIUM.) (G. A. Ro.)

Radziwill, Princess Catherine (MRS. CHARLES LOUIS KOLB-DANVIN), (1858–1941), U.S. writer and lecturer, was born March 30 in St. Petersburg. The daughter of a Czarist army officer of Polish birth, she was married at the age of 15 to Prince Adam Charles Radziwill, whose family was related to Frederick the Great. They resided in Berlin, where she met many of the great political and military leaders of the 19th century at Hohenzollern court functions. After the death of her first husband, she married Charles Louis Kolb-Danvin, an Alsatian business man. She went to the U.S. on a lecture tour, became a U.S. citizen and wrote a number of works on European politics and court life. Among them are *Germany Under Three Emperors* (1917); *Cecil Rhodes, Man and Empire Maker* (1918); *Intimate Life of the Last Tsarina* (1928); *The Taint of the Romanovs* (1931) and *It Really Happened* (1932). She died in New York city, May 11.

Railroad Retirement Act: *see* SOCIAL SECURITY.

Railroads. Fears, early in the year 1941, that the railroads of the United States would break down under the strain of national defense grew out of the facts that the railroads had emerged from the depression in a seriously weakened financial condition, that nearly one-third of their mileage was in receivership or in the hands of trustees, that the number of locomotives and cars had been materially reduced and were not fully maintained, and that the normal expenditures for additions and betterments had not been made since 1930. Notwithstanding these adverse factors, the railroads in 1941 produced more ton-miles than in any previous year and the service was performed without congestion, car shortage or unreasonable delay.

The revenue ton-miles in 1941 were approximately 470,000,000,000. The previous high record was in the predepression year of 1929 when the revenue ton-miles were 447,000,000,000. In 1941 freight cars (including privately owned cars) numbered about 1,890,000. The comparable figure for 1929 was 2,446,000. As to freight locomotives, the numbers in 1941 and 1929 were 21,754 and 29,248, respectively. Thus in 1941, with 23% fewer freight cars and 26% less locomotives, the ton-mile product was 5% greater than in 1929.

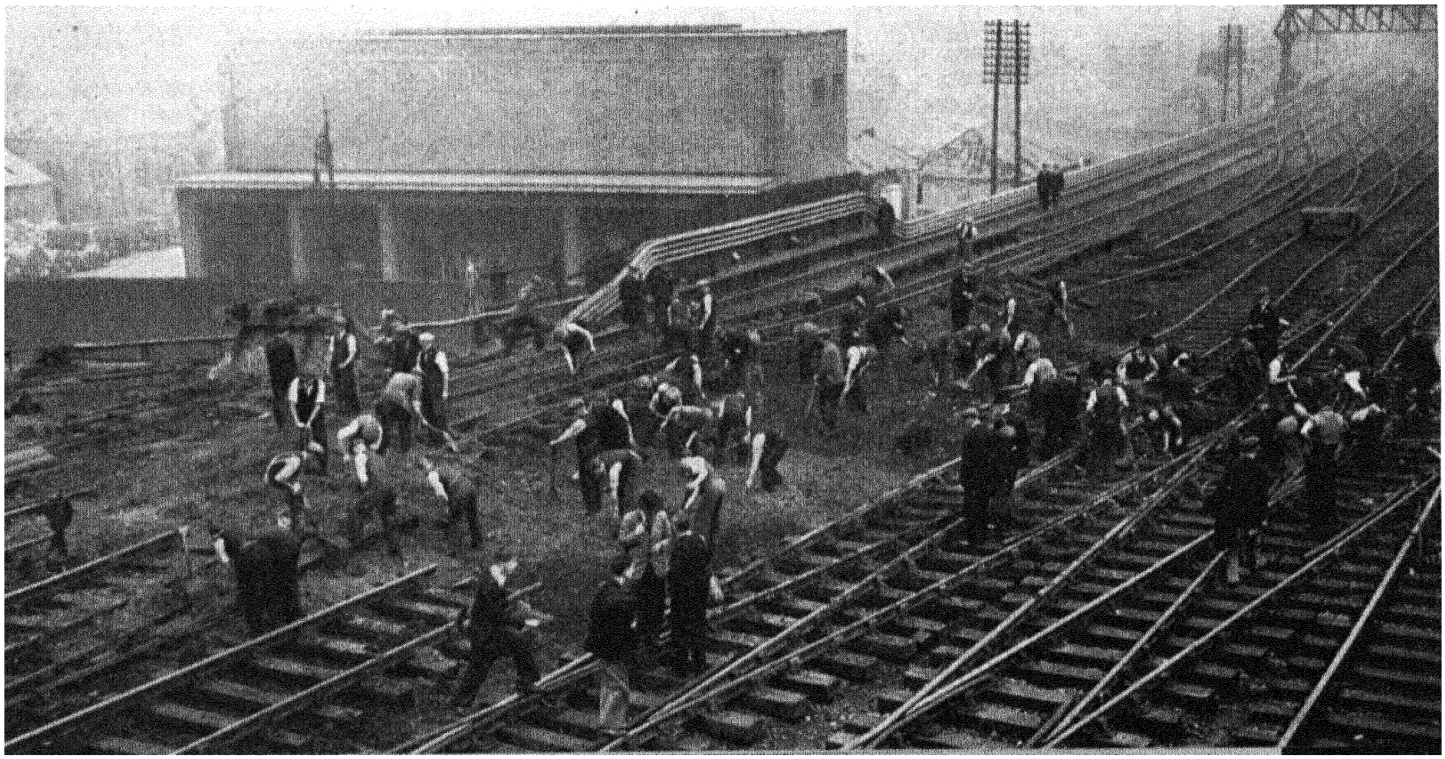
This creditable performance was due to three factors. Of greatest importance was the improvement in operating efficiency. The second and third factors were effective co-ordination among railroads and the several governmental agencies and cheerful co-operation of shippers. The improvement of freight-car performance is indicated in ton-miles per freight-car day. In the first nine months of 1941 the figure was 722. For the same period of 1929 it was 549. The freight-train load (first nine months) was 910 tons in 1941 and 808 tons in 1929. Co-ordination between the Association of American Railroads and the several governmental agencies was achieved and priority problems were avoided through a transportation commissioner of the council of national defense and by liaison officers of the railroads sitting in with the army and navy officers in charge of troop movements and the services of supply. The co-operation of shippers and receivers of freight, especially in the prompt loading and unloading of cars, was organized through the shippers' advisory boards.

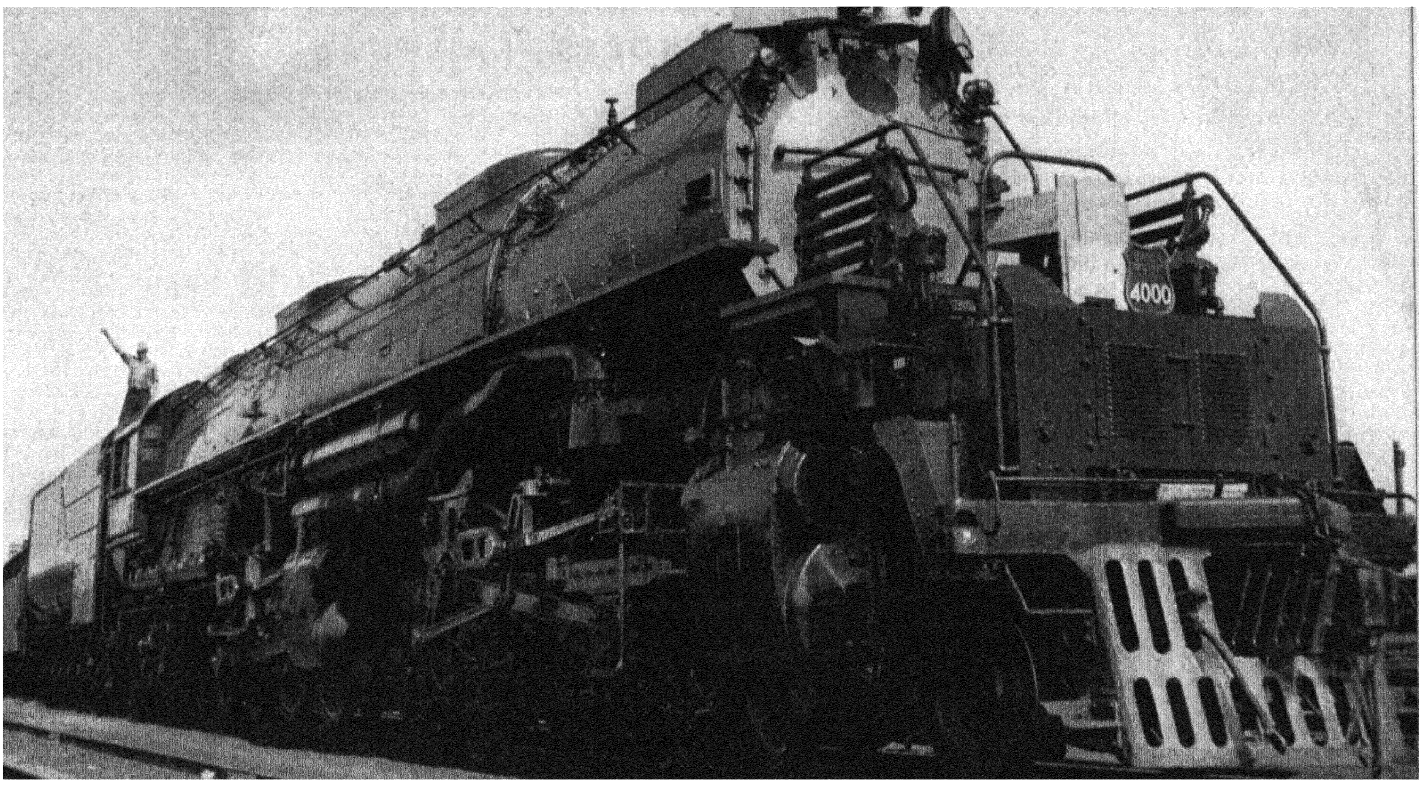
The volume of passenger traffic, including the movement of 3,000,000 troops, was greater than in any year since 1929.

Early in the summer the railroad labour unions took preliminary steps which led, early in December, to a substantial increase in the wages of practically all workmen and clerical forces and to the granting of vacations with pay to certain classes. These demands having been refused by the railroad managers, on the ground that the wage scales were as high as were justified by wages in other industries and as high as railroad earnings would permit, strike votes were taken and dates set for stoppage of work. Thereupon the president of the United States, acting under the authority of the Railroad Labor act, appointed a fact-finding board to investigate the dispute and make recommendations. The board, on Nov. 5, recommended temporary increases of 7½% for the train service brotherhoods and about 12½% with vacations for other employees.

These recommendations were not acceptable to the unions and the strike threat was renewed. At the suggestion of the president the controversy was again referred to the fact-finding board as

FOUR HOURS after a German bomb scored a direct hit on tracks of the London & North Eastern railway on the outskirts of the capital, early in 1941, full train service was resumed. A maintenance crew speedily filled the crater and laid new ties and rails





LOCOMOTIVE BUILT in 1941 for mountain hauling in the U.S. Rockies. The engine and tender weigh 596 tons; the locomotive was the largest in the world at the time of its completion

mediators. In that capacity, on Dec. 1, the board recommended and both sides agreed to permanent increases on a higher scale. The annual addition to the pay rolls by reason of these increases in wage rates and the granting of vacations would be about $332,000,000 on the basis of 1941 employment. To meet the higher costs of operation the railroads appealed to the interstate commerce commission for authority to increase freight and passenger rates about 10%, with certain exceptions. The hearings began in Jan. 1942.

Streamliners.—The policy of a few railroads of streamlining their passenger trains, reducing running time and adding to the comfort of passengers, was being adopted in 1941 on a larger scale and by more railroads. The number of new lightweight streamline trains placed in service from Sept. 1, 1940 to Nov. 1, 1941, was 34, and the number on order on the latter date was 26. Including the 34 trains mentioned above there were in 1941, 121 of these modern, lightweight, high-speed trains in operation, most of them powered with diesel engines. Generally speaking they were well patronized and were successful in increasing rail passenger traffic.

In the movement of freight the quality and adequacy of rail service was further improved and vigorous efforts were being made both by better service and by lower rates to regain a part of the merchandise and less-than-carload freight lost competitively to the trucks.

Income.—The income account of Class I railroads in 1941, 1940 and 1929 is given below in condensed form. The figures for 1941, partially estimated by the Bureau of Railway Economics, are taken from the *Railway Age* of Jan. 3, 1942.

Income Account of Class I Railroads, 1941, 1940 and 1929
(in millions)

	1941	1940	1929
Operating revenues	$5,325	$4,297	$6,280
Operating expenses	3,660	3,089	4,506
Tax accruals	550	396	397
Net Ry. operating income	980	682	1,252
Net income after fixed and contingent charges	485	189	807
Rate of return on property investment	3.72%	2.50%	4.81%

It may be noted that the increase in net railway operating income in 1941 over 1940, mainly attributable to the national defense traffic, was $298,000,000. That gain is $34,000,000 less than the estimated additional annual cost of the wage increases granted in December. If these wage rates had been in effect throughout the entire year 1941 they would have more than absorbed all of the net income from the gain of more than $1,000,000,000 in operating revenues. The outlook for the holder of railroad securities was not bright at the close of 1941.

The additional revenues from the greater volume of rail traffic in 1941 brought an improvement in the financial condition of the weak roads which had escaped bankruptcy in the depression years. The reorganization of two Class I railroads and four small properties (Class III) was completed and but one (of Class III) was added to the list of bankrupts. At the end of 1941, 97 railroads (including 35 in Class I) were in process of reorganization. Their mileage, 72,750, was approximately 30% of the total railroad mileage. Substantial progress was made in the procedural steps incident to reorganization.

Transportation Act.—The competitive effect on railroads of the broadened powers, in the 1940 Transportation act, of the interstate commerce commission over domestic water transportation was obscured by other factors incident to national defense. The demand for boats in other than domestic coastal service was so great as to induce several of the lines to sell many of their boats and cancel their former service. This gave the railroads additional business. The transfer of oil tankers to naval service threw a larger part of the oil tonnage to railroads.

Under the Transportation act of 1940 the president was directed to appoint a temporary board of investigation and research to make a study of the several modes of transportation and to report to congress on the relative fitness and economy of carriers by rail, highway and water, the extent to which each mode is subsidized and the extent to which each is taxed. There was delay in appointment by the president and in confirmation by the senate, and the board was not organized until late in the year. Its important tasks were no more than begun at the end of the year.

Office of Defense Transportation.—Late in December the president, by executive order, created the Office of Defense Trans-

portation and appointed Joseph B. Eastman (chairman, interstate commerce commission) as director, reporting to the president. The duties of the office are, among other things, to co-ordinate the transportation policies and activities of the several federal agencies and private transportation groups, to make estimates of transportation requirements and to co-ordinate domestic traffic movements. (*See* also BUSINESS REVIEW: *Industrial Groups.*) (W. J. C.)

Other Countries.—Instead of war imposing a halt to railway extension and development throughout the world, it resulted in a stimulus towards increasing railway capacity and brought about the construction of lines long projected and planned but hitherto regarded as economically unjustified. Progress and development have been so guided as to fulfill strategic needs and the changed flow of essential traffics. This was not only true of European conditions but applied to other continents in 1941.

Great Britain.—The main problems to be solved in 1941 were the continuance of operation under war conditions, with considerable interference from air raids during the first five months of the year, involving the rapid organization of repair work; the welding of the four railways and the London transport electric services into one even more cohesive operating entity; and, third, the completion of a new financial agreement between the railway companies and the government, necessitated by the latter's determination to alter the basis of payment for air-raid damage.

A progressive step of importance was the setting up of an Inter-company Freight Rolling Stock Control on March 1, 1941, thereby ensuring that the optimum use was made of the 1,240,230 wagons, 2,800 meat containers, over 400,000 sheets and 220,000 ropes. By this system many of the advantages of a single railway administration were obtained without eliminating the initiative derived from a four-company ownership of the main line railway network.

With many of the flows of traffic reversed or changed it became necessary to continue the reduction of many passenger services to ensure the essential movement of freight traffic; while detailed figures were not published it is known that the average length of haul of freight traffic increased, thus causing ton mileage to rise in greater proportion than tonnage loaded.

Under the new financial agreement, made public in Sept. 1941, there was a government guarantee to the four main line railways and the London Passenger Transport board of £43,000,000 annually; this may be regarded as net revenue in respect of a capital expenditure for the four railways of over £1,100,000,000, and for London transport of over £160,000,000; certain interest on investments is to be added to this £43,000,000, but air-raid damage is an unknown liability.

Technical Progress.—The Southern railway placed in service the first of its new streamlined "Pacific" locomotives of the "merchant navy" class. The London and North Eastern railway turned out the prototype of its new general utility locomotives, 2–6–2 "bantam cock" class, available for running over nearly all its main line mileage, and the S.R. and the L.N.E.R. both ran trials with their new main line electric locomotives. The Great Western railway provided certain of its classification yards with the electropneumatic route unit system of point control and added to its fleet of diesel railcars.

First class accommodation was withdrawn from all trains in the London area in October, primarily to simplify the handling of peak period traffic under war conditions. In view of blackout and other wartime difficulties, punctuality was well maintained, and dining cars and sleepers continued to run on the more important trains.

Railway Air Services were allocated the contract for carriage of mails to Northern Ireland.

Continental Europe.—With the exceptions of Switzerland, Spain, Portugal, Sweden and Russia, the railway working was virtually under German control, and all rolling stock was mobilized to serve the German war effort. Passenger services in France, Holland, Belgium and other countries were but a shadow of the prewar workings, and reconstruction of bridges and other war damage occupied thousands of military and labour corps men throughout western Europe. Many main lines in the Balkans were severed during the Greek and Yugoslav campaigns.

The Spanish railways, taken over by the government on Feb. 1, had still not overcome the ravages of the Civil War, and in eastern Europe, with the outbreak of the German-U.S.S.R. war, cases occurred where lines were converted twice in as many years from standard to Russian (5 ft.) gauge or vice versa. The entire railway equipment industry of continental Europe was harnessed to the German war machine, and the output of rolling stock to replace war losses was phenomenal, especially in respect of tank cars to handle Rumanian oil, owing to the diversion of this traffic from maritime routes.

Progress was made with many strategic lines, such as that between Shumen and Karnobat in Bulgaria, while improvements were carried out on a large number of arteries running east-west across continental Europe, chiefly in the Czechoslovak and Polish areas. Lack of fuel for highway vehicles placed an almost unbearable load on many European railway lines, and lack of railway fuel acted as a stimulant to railway electrification in France, Italy and Sweden. The Swiss and Swedish state railways obtained much added revenue from German-Italian and German-Finnish or Norwegian traffic respectively. Poor quality and shortage of fuel caused extensive railway delays, notably in Ireland (where peat was used as a substitute), France, Spain and the Balkans.

The steady progress achieved by the U.S.S.R. railways during recent years was necessarily checked by the German attack in June, but the ability to resist provided a good measurement of the vast improvement effected in the past decade. It is impossible to separate developments in European and Asiatic U.S.S.R., but figures show that automatic signalling was in use on over 3,200 route miles, and long mileages have been rock ballasted, greatly strengthening the track. There were over 55 classification yards in use on the 54,000 route miles of the system, and interesting trials had been made with condensing locomotives for working on Asian lines where water is not easily available; but for the war the "Red Arrow" express between Leningrad and Moscow would have been greatly accelerated. In Jan. 1941, the U.S.S.R. had 1,162 mi. electrified; recent conversions were the Zestafoni-Samtredi and Khashuri-Borzhom sections of the Transcaucasian; the Perm-Chesovekaya section was in course of conversion. Construction of new lines was proceeding apace early in 1941; among openings may be quoted the 260 mi. line from Neldy to Jezkazgan, a copper producing centre. The Trans-Siberian formed the only link between Japan and Manchuria and the countries of Europe under German-Italian control.

Asia.—The Iraq state railways came within the war zone for the first time and, after the completion of the Baghdad-Haydar Pasha through route, formed one of the chief supply routes for Turkey from Basra. To deal with the additional traffic several streamlined "Pacific" type locomotives were placed in service. On the neighbouring Iran state railways extension of branch lines from the chief Trans-Iranian main line continued; the most important was planned to link Tehran with the U.S.S.R. gauge line at Djulfa.

The Indian state railways received further standard type locomotives and converted several railway shops to war production purposes, while the Bombay, Baroda and Central India railway extended the use of air conditioned cars. Shortage of coastal shipping diverted much traffic to the railways. A surplus of about £11,000,000 was expected to result from the working during 1940–41; much of this was to be allocated to general government revenue. The Bengal-Dooars railway was the latest to be taken over by the Indian government; transfer took place at the end of 1940. Particularly successful financial results were achieved by the Nizam's state railway, where technical progress interlinked with initiative, such as the co-ordination with road and air services, greatly assisted the development of the state. The Ceylon government railways provided another example of additional motive power being urgently required, and some powerful locomotives of eight-coupled design were delivered, weighing in working order only 49 tons, a figure necessitated by the low axle load permissible. The Turkish state railways were hard put to it to carry the additional traffic offering, but new locomotives and wagons materially eased the position.

An event of considerable importance to the Japanese state railways was the completion in March 1941 of the pilot tunnel for the Moji-Shimonoseki railway tunnel, nearly four miles long.

Africa.—The most notable program of construction in Africa was the Vichy government's scheme to proceed with the Trans-Saharan railway, so long projected. Starting from Bou Arfar and built to the standard gauge it would eventually link Algiers to the Niger; the route adopted was understood to be via Timbuktu.

There was also construction work proceeding in Portuguese East Africa where a new line was completed from Manjacaze in October 1940, while in November the President Carmona bridge over the Komati was opened with ceremony, thus permitting through trains to work between Lourenço Marques and Guija.

The Kenya and Uganda railways, in view of their proximity to Abyssinia, were called upon to carry much war traffic, and their ability to deal with it was greatly assisted by the use of large Garratt type locomotives, some of which were added recently, and, of the 4–8–4 + 4–8–4 type, were believed to be the heaviest locomotives working on a metre gauge line; they operated a round trip of 1,106 mi. between Nairobi-Kampala-Nairobi, attaining mileages of 6,500 per month. Some diesel-engined railcars of articulated design were also placed in service in 1941. The Egyptian state railways were called upon to carry very heavy traffic and imported much additional equipment from Europe.

In the Union of South Africa the financial year 1940–41 concluded with another record in traffic receipts, reflecting a period of intense activity. In addition to the opening of a new line from Germiston to Jupiter at the end of 1940, heavy programs on deviation work to reduce grades and curvature on main lines were still in progress; a typical case was the line between Hercules and Koedoespoort which would relieve the main line to Pretoria of heavy traffic from the Eastern Transvaal and the Witbank coal area; when completed it would bring the mileage of the system up to 13,245. With a financial surplus of over £3,730,000 the system was in 1941 on a very sound basis.

Australia.—In Victoria the peak traffic problem of Melbourne suburban traffic became acute, with 1,000 passengers passing through the barriers at Flinders street every minute in the evening peak hour. By staggering office hours, it was hoped to ease the position.

The renowned "Spirit of Progress" express proved financially successful, over 250,000 passengers being carried in 1939–40. A new locomotive of remarkable design was placed in service on the Victorian railways, while the New South Wales government railways also introduced a new design of express locomotive.

Final figures for 1940–41 were likely to prove record ones in spite of 2,000 men having joined the armed forces. Improvements were effected at Darling Harbour, Sydney's freight station, which handles 1,300 wagons daily and collects a revenue of £3,000,000, being 15% of the railway's total. At gauge change stations, grab transporters were being installed to accelerate transhipment.

New Zealand.—The New Zealand government railways, on their extensive 3 ft. 6 in. gauge system were faced with considerable difficulty in designing powerful locomotives capable of operating safely over lines laid with only 50 lb. per yard rails, but a streamlined 4–8–2 "mountain" type was constructed, and was expected to fulfill all requirements. Forty of these were dispatched from Scotland.

South America.—In Chile, much railway construction was progressing, linking up isolated sections, while state ownership was being extended to the nitrate railways. Further use was being made of diesel trains and electrification in the Santiago area. In Argentina, the Buenos Aires Pacific developed the bulk movement of oil, wine and grain, but difficulties in regard to coal supply led to trials with a mixture of maize and coal for locomotive fuel. The financial situation of the Argentine lines showed little improvement, being partly due to problems of exchange; difficulties also arose with the financing of pension funds. Electrification plans continued in Brazil, where the policy of state ownership was being extended. An important resignalling scheme at Montevideo on the Central Uruguay

railway, making use of the relay interlocking method, and completed in 1940, marked the introduction of this system to South America.

Canada.—The two large Canadian systems were working at maximum pressure due to war traffic, and in 1941, the Canadian National railway was expected to earn due interest on its publicly owned capital. This system's Grand Trunk section borrowed locomotives from other American lines until its new motive power was received. Extensive improvements were made to the Montreal-Moncton-Halifax main line, greatly increasing its capacity, and further progress was recorded in the construction of the new Montreal passenger terminal. The C.N.R. continued to develop the Trans-Canada services, one new link operating between New York and Toronto. (*See* also DISASTERS: *Railroads;* UNITED STATES: *Transportation.*) (C. E. R. S.)

Rayon. The entry of Japan into the axis circle of fighting nations made rayon the textile fibre of greatest new interest in 1941. As far as the Allied nations were concerned, the final curtailment of silk supplies by the breaking off of commercial relations between the United States and Japan in July, began the trend of events that resulted in rayon being the first fibre to be allocated by the United States government for both military and civilian use. Former makers of silk hosiery and silk fabrics appealed to government agencies for a share of the rayon that was already on order by regular users of rayon. South American republics which had agreed to ship wanted metals and other war materials to the United States asked in exchange quantities of rayon yarn with which to make materials that would replace those previously imported from Japan, Germany and other countries no longer in a position to ship merchandise across the oceans. New uses for rayon and other synthetic fibres in war materials added their prior claim over all civilian needs. The shortage of rubber brought about through the Japanese aggression in Malaya resulted in increased use of a high tenacity rayon in tires, gasoline tanks for planes, etc. Demands for wool in government uniforms made a reduced civilian supply which in turn was to be appeased by the use of staple rayon fibre. Parachutes, whose original silk content gave rise to the name "Caterpillar Club" for aviators who had saved their lives by the use of the silken canopy provided by the silkworm or "caterpillar," were in the future to be made of nylon, the synthetic fibre that the hosiery industry had considered its own. Sailors' neckerchiefs and soldiers' ties of purest silk became fabrics of spun rayon and acetate filament rayon.

Even the official red tape ribbon affixed to official documents in Washington became rayon instead of silk. (*See* also SILK.)

The allocation was a precedent taken by the Office of Production Management in Washington immediately following the stoppage of silk supplies in July 1941. Ten percent of the monthly production of rayon yarn was ordered set aside for distribution to former silk users, of which 7% would go to hosiery mills and 3% to weavers. Shortly thereafter, the 3% was divided into 1½% for direct distribution to former silk weavers by the rayon producers and 1½% for distribution by the government upon special appeal to the director of priorities. The allotment was based on the former use of silk and the arbitrary equivalent adopted was three-fourths of a pound of rayon to one pound of silk. The basis was questioned by many manufacturers who claimed that due to the coarser size of rayon, the yards per lb. were reduced and that it therefore took a greater poundage to make a given number of yards of cloth.

Not only were rayon shipments controlled, but prices were also fixed by government edict. Prices were fixed not only for the yarn, by informal agreement with the producers, but for rayon fabrics of nineteen standard types, by formal ruling of the Office of Price Administration. Rayon was recognized as one of the basic commodities for civilian necessity, since official price schedules were set only on products in which there was a scarcity and for which there was such a wide public demand that rapidly rising prices would bring about inflation.

In Oct. 1941 came reports that the yarn supply would be further disrupted by an allotment to Latin America which needed the raw material for its newly active weaving mills. The development of the rayon industry in South America was the direct outgrowth of the cutting off of supplies from Japan and Germany principally. For some years, several ventures in weaving rayon, and even in production of rayon yarn, had been started in the Argentine, Chile and Brazil. Mexico also had some active looms. The product was mostly of a coarse type of cloth not made in the United States and more nearly approximating the inferior types produced in Japan for export. When countries in Latin American areas were thrown on their own resources for fabrics, the native mills developed rapidly. Some were under the management of American textile men (for example, the largest weaving plant in Chile), so that it was not surprising to find rayon yarn among the first things asked by South America and Mexico when Pan-American trade negotiations got under way. Because of the shortage of rayon yarn in the United States, due to the freezing of silk and use of wool for defense purposes, the percentage to be allotted to the other countries was subject to protracted discussion, not completed at the close of the year. It was estimated, however, that the final amount would be 4% for the first quarter of 1941. Based on 1941 average production, this would amount to about 5,000,000 lb. for three months. Whether the mills in Latin America were ready to absorb such an amount was questioned.

War conditions made it impossible to collect world statistics on rayon production for 1941. The United States, in 1940, produced over one-third of the world's supply, and it may be safely estimated that with conditions as they were in other producing countries, combined with the great increase in United States production, this proportion might be increased to one-half. For the United States, the 1941 annual production showed a total poundage of 573,230,000 compared with the 1940 record of 471,170,000. This increase of more than 20% included both filament and staple fibre. The major gains were made in staple fibre production—50%. The filament production was 16% greater than the 1940 output. The comparative figures for the years 1936 to 1941 are given in Table I.

Table I.—*United States Rayon Production in Millions of Pounds*

	1941	1940	1939	1938	1937	1936
Rayon filament yarn . .	451.2	390.1	328.6	257.6	321.7	277.6
Rayon staple fibre . . .	122.0	81.1	51.3	29.0	20.2	12.3

In relation to other textile fibres used in the United States over the same period, rayon's standing is shown in Table II.

Table II.—*Consumption in Millions of Pounds*

	1941	1940	1939	1938	1937	1936
Cotton	5,207.2	3,961.7	3,629.7	2,918.7	3,657.1	3,470.2
Silk	25.3*	35.8	47.3	51.7	53.6	57.8
Wool	644.9*	411.1	396.5	284.5	380.8	406.1
Rayon	452.4	388.7	359.7	274.1	267.1	297.8

*11 months actual, one month estimated.

The consumption of rayon by trades was marked chiefly by the increase shipped to the hosiery and knit goods mills. Nylon continued to be of principal interest to hosiery makers because of its superior elasticity and strength but their use of rayon yarn increased from 16,000,000 to 25,900,000 lb. in one year. Their share of rayon was principally in the viscose, cupra and nitro types. In 1941, they took 8% of the total production instead of 5% as in 1940.

Prices remained relatively stable. In Sept. 1941 producers, with one exception, issued a new price schedule in which a representative type, 150 denier viscose, was 55 cents a pound and acetate yarn, 150 denier, was also 55 cents a pound. Later, a manufacturer not included in the first group announced a price of 57 cents a pound for the acetate yarn. On Oct. 28, the Office of Price Administration approved a price schedule of 55 cents a pound for the viscose yarn and 56 cents for the acetate type. A comparison of rayon prices with those of other textile fibres, is shown in Table III.

Table III.—*Average Price for the Year, per Pound*

	1941	1940	1939	1938	1937	1936
Cotton	$0.139	$0.102	$0.093	$0.089	$0.118	$0.124
Wool	1.09	0.96	0.82	0.71	1.01	0.90
Silk	2.94	2.77	2.71	1.69	1.86	1.76
Rayon	0.54	0.53	0.52	0.52	0.62	0.57

Reconstruction Finance Corporation.

This is one of several agencies comprising the Federal Loan agency, under the supervision of the Federal Loan administrator, and may perform all functions it is authorized to perform under law to close of Jan. 22, 1947, or such earlier date as the president

Reconstruction Finance Corporation—Summary of Activities Feb. 2, 1932, through Dec. 31, 1941

	Authorizations	Disbursements	Repayments and Other Reductions
For benefit of agriculture	$ 2,604,071,430.83	$ 1,450,652,374.51	$1,448,940,848.88
To open banks to meet demands of depositors	1,334,805,161.08	1,138,251,619.27	1,082,584,822.41
For distribution to depositors in closed banks	1,391,474,104.19	1,035,530,126.44	1,003,087,205.58
For bank capital (including Export-Import banks $176,500,000, and Federal Home Loan banks $124,741,000)	1,645,205,689.00	1,469,712,331.56	744,230,583.71
For self-liquidating projects (including PWA municipal securities)	1,270,701,208.95	1,058,500,414.15	895,865,658.55
To business enterprises	587,650,930.18	271,978,915.25	162,329,107.20
For loans for national defense	5,338,512,873.16	980,346,623.21	173,152,054.89
For loan to Great Britain and Northern Ireland	425,000,000.00	350,000,000.00	4,844,381.30
For purchases of stock—national defense	120,100,000.00	20,100,000.00	
To drainage, levee and irrigation districts	147,747,818.64	98,210,980.63	25,397,370.03
To railroads (including PWA railroad securities)	1,531,530,885.54	1,027,450,714.70	554,448,632.08
For loans to and capital of mortgage loan companies (including $25,000,000 capital the RFC Mortgage company and $11,000,000 capital Federal National Mortgage association)	760,367,930.95	586,658,311.39	371,286,372.46
For loans to and capital of insurance companies	138,014,750.19	125,168,209.81	102,418,473.93
To building and loan associations (including receivers)	170,530,059.59	125,275,297.17	122,114,740.10
To public school authorities	25,674,050.00	23,242,170.85	22,303,900.00
Catastrophe rehabilitation loans	16,184,520.95	12,003,055.32	10,975,936.33
To state funds for insurance of deposits of public moneys	13,087,715.88	13,064,631.18	13,064,631.18
For mining, milling and smelting businesses	16,578,100.00	6,808,409.40	3,126,779.90
For loan to Export-Import bank	25,000,000.00	25,000,000,00	25,000,000.00
For other purposes	669,057.07	614,813.85	614,813.85
Total—By directors of the corporation	$17,563,806,385.20	$ 9,818,658,998.69	$6,765,876,312.38
Allocations and loans to other governmental agencies and for relief by direction of congress	3,484,649,945.66	3,199,696,363.30	2,852,014,066.63*
GRAND TOTAL	$21,048,456,330.86	$13,018,355,361.99	$9,617,890,379.01†

*Includes $2,738,724,131 of corporation's notes cancelled pursuant to act of congress, approved Feb. 24, 1938.
†Includes $42,508,118.06 credited on indebtedness for property taken over for debt.

may authorize. It was created by "an Act to provide emergency financing facilities for financial institutions, to aid in financing agriculture, commerce, and industry, and for other purposes," approved Jan. 22, 1932, which may be cited as the "Reconstruction Finance Corporation Act." The powers of the corporation were increased and the scope of its operations extended or otherwise affected by subsequent legislation. The corporation was organized and began operations on Feb. 2, 1932. Chairman, board of directors (1941), Charles B. Henderson. (C. B. H.)

Red Cross. The sufferings of war on two continents and the resulting dislocation in other parts of the world in 1941 precipitated one of the busiest years in the 77-year history of the Red Cross movement. The American Red Cross took a prominent role in the war relief operations of the International Red Cross. On June 30, 1940, American Red Cross foreign war relief reached $47,087,052—including large consignments of food, clothing and medicines; 4,000,000 individual garments, 336,158 layettes of 27 pieces each and more than 22,000,000 surgical dressings, all produced by chapter volunteers; more than 100,000 food boxes for Allied soldiers in German prison camps. Operations were made possible through a fund of $21,000,000 donated by the American public and through distribution of relief supplies purchased by the United States government.

For national defense, the American Red Cross was engaged domestically on two fronts—civilian and military defense. Red Cross services to the armed forces included: providing counsel and direct aid to soldiers and sailors through field directors in military and naval stations; chapter assistance to the families of men in uniform; the enrolment of nurses and medical technicians from which to draw personnel for military service; volunteer production of surgical dressings, sweaters and other articles of comfort; providing volunteer blood donors for the establishment of a 200,000-unit defense blood plasma bank; training service men as instructors in first-aid and water safety.

For the protection of the civil population the American Red Cross embarked on a project to train 100,000 nurses' aides, a corps of volunteers to assist nurses and alleviate the strain on current nursing facilities. Disaster relief preparedness was strengthened in chapters to be ready for mass feeding, housing and clothing of persons evacuated in time of wartime emergency. On the health front chapters were asked to gear their programs of teaching home nursing and nutrition. First-aid detachments were formed throughout the nation to protect life in factories, office buildings, schools and other locations where large numbers are concentrated. In these services the Red Cross worked in co-operation with the U.S. Office of Civilian Defense.

In 1941 the American Red Cross had 9,866 chapters and branches supported by 9,190,474 adult members and 9,749,053 junior members. Through this support the organization was able during 1941 to perform the following services:

Gave aid to more than 334,000 persons at the scene of 222 disasters at a cost of $896,000; trained 577,267 persons in first aid, 260,332 in water safety and distributed 9,000,000 accident prevention "check lists" to encourage removal of accident hazards in the home and on the farm; provided more than 4,500 registered nurses for military and naval service out of the first reserve of 20,000 nurses; maintained 639 nurses in 460 communities lacking other nursing facilities; 271 nutritionists and food experts taught classes in 121 chapters.

Red Cross field directors dealt with the problems of 126,515 men in the armed forces of the United States. Of these, 29,147 involved supplementary service by their home chapters. The chapters dealt with 127,098 cases of ex-service men and their families, of which 51,729 required supplementary service by the camp, hospital and liaison workers of the national staff. More than $1,000,000 worth of athletic equipment for army and navy field stations has been made available; an appropriation of $1,250,000 has been made for the erection of Red Cross headquarters buildings in army and navy stations, 62 of which have been completed. In addition the Red Cross began staffing and equipping 63 Red Cross recreation buildings erected by the army and navy at the sites of hospitals.

A total of 1,216,000 volunteers accomplished the following during 1941: For home and abroad, produced 14,523,773 garments; 20,502,900 surgical dressings for the army; 22,795,429 surgical dressings for foreign war relief; transcribed into Braille 473,365 pages and duplicated 371,138 pages for distribution among the blind; 1,408 chapters maintained emergency closets containing surgical dressings and clothing for disaster relief; canteen workers prepared and served meals to 104,557 persons; 6,576 members of the motor corps made 198,259 trips principally in behalf of disabled veterans and crippled children; Gray Ladies numbered 3,688 served in army and navy hospitals; home service workers made a total of 34,468 visits to assist field directors in handling cases of enlisted men and their families; staff assistants numbering 10,744 gave their time to perform general office work in chapters. (G. S. Br.)

The World.—World War II brought increased need for Red Cross activities throughout the world. National Red Cross societies and their international organizations, the International Red Cross committee and the League of Red Cross Societies, expanded and assumed new responsibilities.

In each of the major belligerent nations, with the exception of the Union of Soviet Socialist Republics, the International Red Cross committee, with headquarters at Geneva, Switz., maintained delegates to visit camps for war prisoners or civilian internees, saw that the provisions of the Geneva convention regarding prisoners of war were respected, arranged for the distribution of relief supplies, and facilitated the exchange of information regarding prisoners through the Central Agency for Prisoners of War established at Geneva by the International Red Cross committee. On the other hand, national Red Cross societies of belligerent governments, from their own resources or with government aid, secured and shipped through the International Red Cross committee supplies for their nationals held by the enemy.

The International Red Cross committee carried an increased burden in the exchange of messages between civilians in opposing countries. Brief personal messages on standard Red Cross forms collected in one belligerent nation, either by the national Red Cross society or the postal system, and sent to the International committee at Geneva were dispatched to civilians in enemy countries. It was estimated that 10,000,000 such messages were handled by the committee and its co-operating Red Cross societies during the year 1941.

The League of Red Cross Societies, the federal body of national societies, continued to promote through its Geneva headquarters Red Cross work for civilian populations. It reorganized its Pan-American bureau to strengthen the societies of the western hemisphere and prepare them to meet their wartime responsibilities. Together with the International Red Cross committee, the League of Red Cross Societies formed a joint commission to secure funds and supplies and extend relief to civilian populations especially in occupied European countries.

Red Cross committees representing countries occupied by axis powers were established in connection with their refugee governments in London, while at home the former Red Cross societies continued operations in most of the occupied nations although limited by military occupation. (P. E. R.)

Refugees. In 1941 the various refugee migrations continued the patterns of movement established in the years

immediately preceding. In China, war refugees estimated at 30,000,000 fled from the cities before the Japanese armies along railways and highways to the agricultural hinterlands. The two substantial movements were from central China and the southeast to the southwest, and from the northeast to the northwest. The refugees consisted chiefly of skilled labourers, industrial leaders, small merchants, government employees, students and intellectuals. Unskilled labourers and peasants, through inertia, lack of funds, or the need for continued cultivation of the land, moved shorter distances and were prone to return to their homes as soon as the Japanese stabilized the occupied areas or the Chinese armies recaptured them. Whatever the final outcome of the war, the cultural and industrial imprint on the previously sparsely settled western agricultural areas of China would remain.

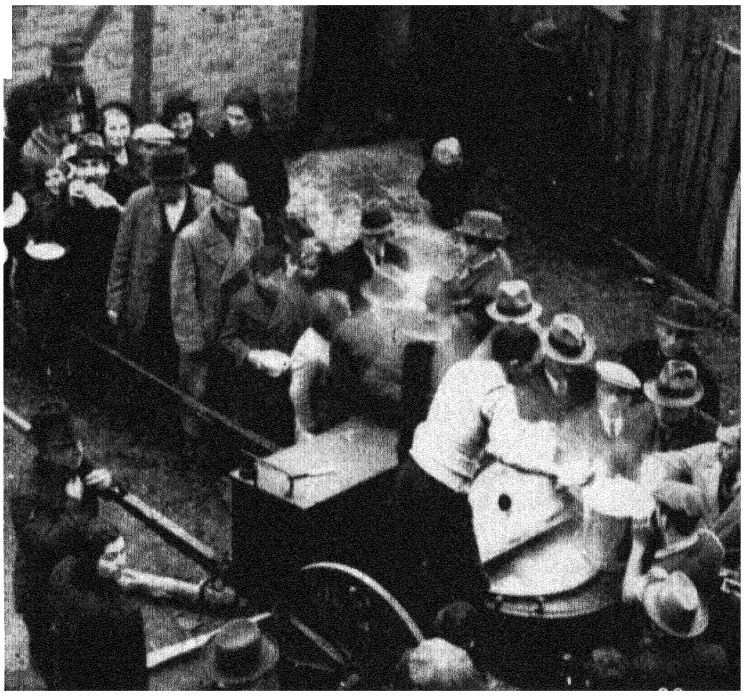
The movement of refugees from central Europe, Germany, Austria and Czechoslovakia, proceeded in greatly reduced volume compared with that of 1940, through the only remaining outlets, Lisbon and across Siberia through Vladivostok, Kobe and Yokohama to the western hemisphere. This movement, political in nature, had been precipitated in 1933 by the assumption of power in Germany of the nazi party and the introduction of the Nürnberg laws in 1934. The laws divided the German population into Aryans who remained as first-class citizens, and non-Aryans of Jewish blood, who were expelled. (*See* also ANTI-SEMITISM.)

At the beginning of 1941 substantial remnants of the various movements of peoples during 1940 were struggling desperately to get away from Europe through Portugal. The route across Siberia had not proved practical for substantial numbers and was virtually closed. Some 20,000 German and Austrian Jews were struggling to maintain life in Shanghai, China and approximately 2,000 had collected at Kobe in Japan. Many were still trapped in central Europe; 200,000 in Germany, 80,000 in Czechoslovakia, more than 1,000,000 in Hungary and Rumania and 1,000,000 to 2,000,000 in Poland.

The spread of the war to the Balkans in 1941 and the initial success of the German armies in the U.S.S.R. increased the fears of receiving countries overseas with respect to refugees. Popular belief, unsupported by fact, that "fifth columnists" were proceeding to the countries of immigration in the guise of refugees closed the gates of immigration ports tighter, and visas became increasingly difficult to secure. Spain refused passage to those of military age and Lisbon, concerned by the accretions to its refugee population, granted transit visas only to those possessing valid visas to countries of final immigration. Because of these restrictions, Casablanca in French Morocco became a new port of exit in 1941 as the refugees found or forced new routes of egress through Algiers or from Marseilles to Casablanca by boat.

Shipping from these ports was also increasingly restricted. French boats withdrew from the transatlantic service about midyear after one boat had been captured and after it became apparent that relief ships from America would not be passed through the British blockade. By the end of the year United States and Spanish boats had also withdrawn from the traffic, and only a few Portuguese boats remained in service.

In July 1941 the United States government concentrated its examination of visa applications in the state department at Washington, and the flow of refugees to the United States was reduced thereafter to a third of the volume of 1940. Immigration to South American countries during the year was reduced by the same proportions. The spread of the war to the eastern Mediterranean had also diminished both quota and nonquota immigration to Palestine. Earlier in the year there had been frequent reports of explosions and sinkings of overloaded refugee ships which dramatized vividly the desperate struggle of refugees to reach a haven of safety in the Jewish homeland in Palestine.



PORTABLE SOUP KITCHENS alleviated the food problem of Polish refugees only partially in 1941

In Nov. and Dec. 1941 the German government instituted a new drive to rid Germany of its non-Aryans. Sealed refugee trains again left centres like Vienna, Berlin and Prague for new ghettos in former Poland. The numbers transferred were estimated at 25,000 to 30,000. They included elderly people who previously had expected to live out their lives in their homes. Reports of conditions, particularly in the Warsaw ghetto, a centre of typhus infection, were distressing in the extreme. Simultaneously Germany refused exit westward to all those under 60 years of age.

Official bodies such as the League of Nations, the International Labour organization and the Intergovernmental committee were unable to act effectively during the year because international collaboration in other than the military sphere was precluded by the spread of the war to the far east and the western hemisphere. The settlement of refugees at Sosua in the Dominican Republic, an outgrowth of the work of the Intergovernmental committee organized at Evian, Fr., in 1938, continued hopefully with more than 500 refugees building a new life in agriculture as a demonstration of a pattern for refugee settlement on a larger scale after the war. By the end of 1941 refugees were no longer able to move in substantial numbers from their places of temporary abode either in the far east or from Europe to places of final settlement. Since 1933 the United States had accepted approximately 200,000 refugees from central Europe, South America 115,000 and Palestine 70,000. (*See* also CHILD WELFARE; JEWISH RELIGIOUS LIFE.)

Relief. Trends noted in 1940 in relief giving and in its organization due to World War II continued to change the pattern of public and private welfare in 1941. In Britain the functions of the Assistance board were broadened to include many functions performed by local poor-law officials.

In Canada, on the other hand, in May 1941, the dominion government discontinued unemployment relief contributions to the

provinces, which in turn withdrew these contributions from local authorities, thus throwing back upon the latter the responsibility for care of the unemployed, many of which were unwilling or unable to assume the burden. No important change in structure of public welfare occurred in the United States. The amendment to the Social Security act that state and local agencies receiving federal grants-in-aid should have an acceptable merit system for selection of employees went into effect on July 1, 1941.

Public assistance in the United States showed two distinct changes. The amount given and the number of persons aided declined sharply, from more than $200,000,000 in January to less than $162,000,000 in October, and from more than 15,000,000 persons to somewhat more than 10,000,000 persons in October, respectively, October being the last month for which figures were available. However, in special categories such as blind, old age and dependent children, there were slight increases both in assistance and in number of families aided, the increases varying between 3% and 10%, while in general relief as in Work Projects administration there were decreases varying from 40% to nearly 50% in both assistance and in persons aided. As the demands for workers in the defense industries increased, the rolls of Work Projects administration and of general relief were drained of available workers, leaving only those who were incapable of working or persons belonging to minority groups, such as Negroes, not drawn into industry. But the fact that there were more than 220,000 unemployed in England in July was evidence that under the most severe pressure for workers, all cannot find jobs. (*See* FEDERAL WORKS AGENCY.)

Gifts to private agencies engaged in peacetime services in Canada and the United States as indicated by collections made by community chests (*q.v.*) were greater in 1941 than in 1940, in spite of large additional contributions collected for wartime services and for the Red Cross (*q.v.*). In each country collections were about 15% greater than in 1940—$3,274,407 for 14 Canadian community chests, as compared with $3,095,010 in 1940. In the United States an incomplete report showed $55,402,133 for 1941 as compared with $49,384,284 for 1940 in about 300 cities.

These sums were collected in the face of two drives for war relief funds in each country. The Red Cross in Canada appealed for $5,000,000 and received more than $6,000,000; and the federated war charities for $5,500,000 more, and received more than $7,000,000. In the United States, the United Service organizations (*q.v.*), created to minister to the needs of enlisted men and their families in communities near military camps, asked for $10,765,000, and secured nearly $2,000,000 more than asked for. The American Red Cross in late December asked for $50,000,000, which would probably be oversubscribed, although (Jan. 1, 1942) returns were not all in. (*See* also WAR RELIEF CONTRIBUTIONS.)

While England had not known the problem of nonresident dependents in the volume experienced by Canada and the United States, yet dislocations of populations caused by bombing caused great shifts in population. Early in 1941 the minister of health ordered that the usual health and welfare services "be extended to all evacuated and homeless persons" and reimbursement to local authorities would be made by the central government. In the United States, through a decision by the United States supreme court, the nonresident dependent won the right to cross state boundaries, which for about a decade had been denied him by several states, and a special congressional body appointed to study the problem of transiency made this significant statement: "A body of stateless people is appearing, existing in the limbo of lost settlement rights and forced to migrate in search of elusive employment." That committee recommended a new category in the Social Security act for grants-in-aid to states for general relief, requiring the state to abolish residence as a qualification for relief.

Of the nations at war, all made special provisions for the support of dependents of enlisted men except the United States, which up to the end of 1941 had not adopted any such measure. In England and Canada as well as Australia such provisions were contingent upon the enlisted man's apportioning half his pay to his dependents. Upon such action, the government made its additional allowance, automatically to wife and children, but to other dependents, such as parents, brothers or others, only on the evidence of need. In Canada by the end of 1941 there were nearly 250,000 accounts open in dependent's allowances and assigned pay in the dominion, and the government was paying more than $6,250,000 into these accounts each month. In Australia, only the wife, children and widowed mother were eligible to allowance from the state. Maximum monthly allowances from the state varied from 28*s.* for warrant officers to 7*s.* for privates whose pay was less than 17*s.* 6*d.* The precise amount allowed to each family was then determined by the number and kinship of the dependents. In Canada it varied within substantially the same range of rank from $60 a month to $10. In Australia allowances were not dependent upon rank of the enlisted man, and they might be as high as £4 a month.

Special provision was made for exceptional situations, by which extra grants might be made upon certain conditions. Canada placed authority to determine allowances in the Dependents' Allowance board in the dominion department of defense, but decentralized investigation and supervision by the use of local agencies, which might be public welfare bodies or private organizations.

In addition to these benefits during service, Canada in common with other warring countries offered privileges to discharged soldiers, such as financial assistance to complete either academic or professional education; subsistence allowance for vocational training; financial aid during illness not contracted in service; underwriting small business projects; and insurance against unemployment at least equal to that which civilians enjoyed under the Unemployment Insurance act. Relief, War: *see* WAR RELIEF CONTRIBUTIONS.

Religion. Religion in 1941 presented an essentially unified picture by reason of its chastened and penitent mood and its focusing of attention upon the religious interpretation of history. The keynote editorial in the *Federal Council Bulletin* at the beginning of the year declared: "The most agonizing question of the day is whether we can discover any moral meaning in history." A statement of the bishops of the Church of England added that demonic and not merely human forces of evil were evidenced in the disorders of the age.

While maintaining a faith believed to derive from an Eternal Will above and beyond history, many religious people fell back upon the formula that men have to act under particular circumstances not of their own choosing in which often no morally pure choice is possible. A choice of the relatively good must consequently be made while at the same time religion asserts the final authority of absolute values. This doctrine of the paradoxical character of moral experience had wide vogue both in Europe and in America.

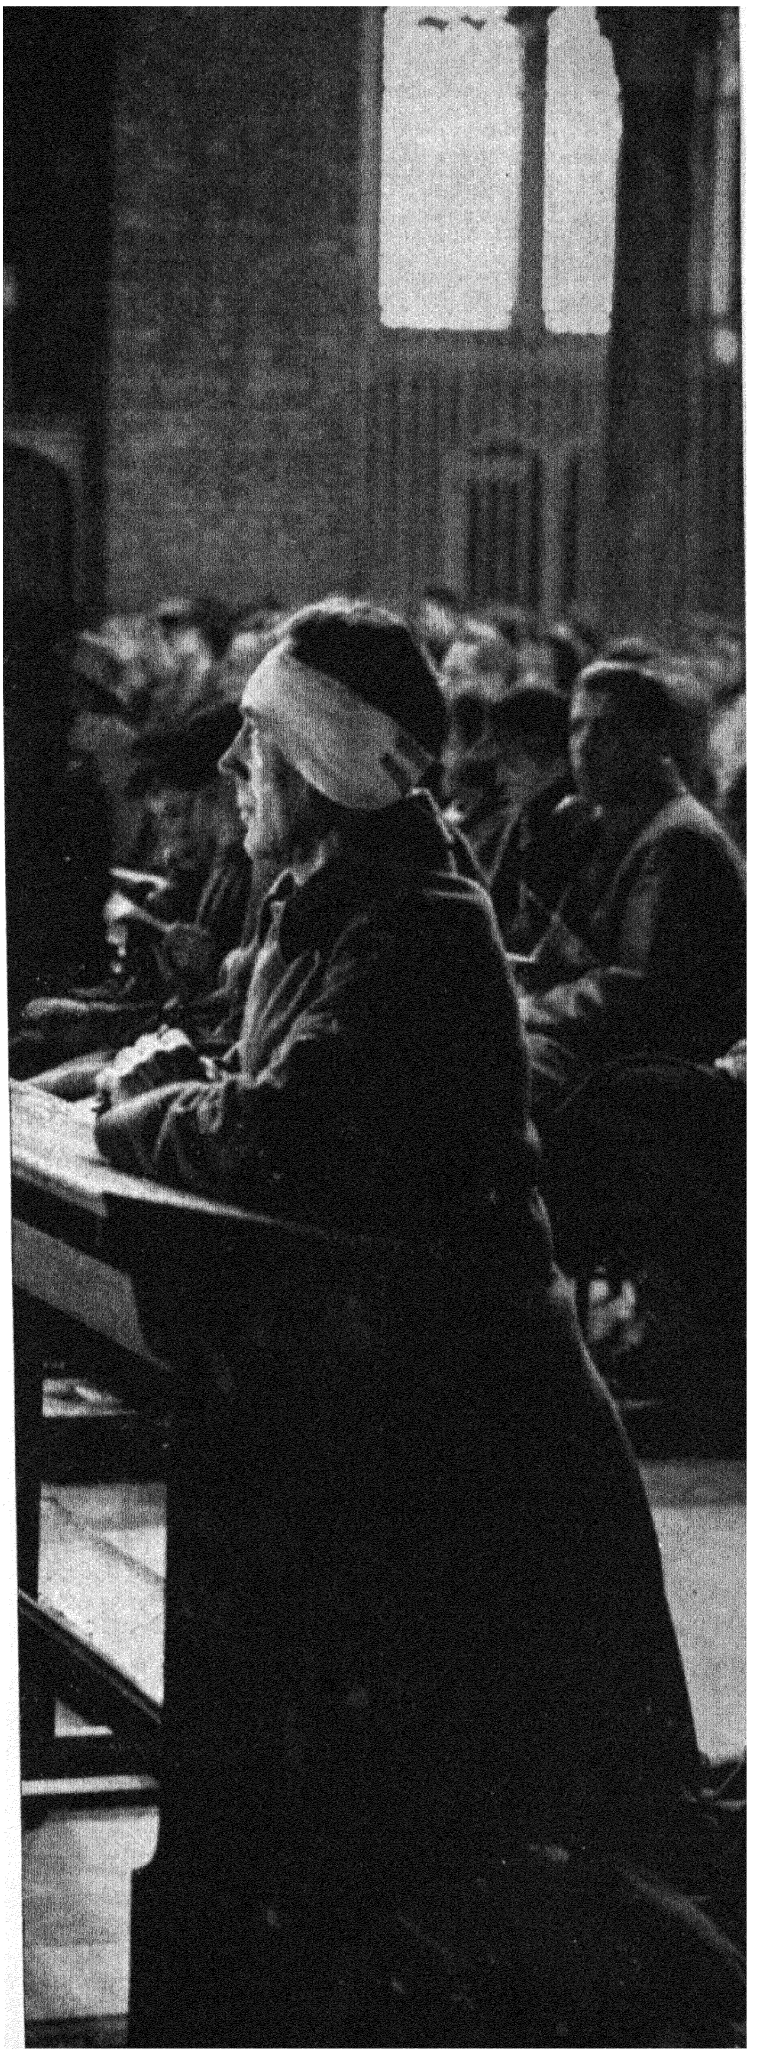
The more ultimate issue which confronted religion was that of the social revolution which many discerned behind and underneath the war and anticipated in full expression after it. The declaration of the archbishops of the English church, the Roman Cath-

olic cardinal primate of Britain and the moderator of the Free Church Federal council linked five demands—abolition of inequalities in wealth, equal opportunities in education for all, safeguarding of the family, the restoration of the sense of divine vocation to man's daily work and the use of the resources of the earth as God's gift to the whole human race—with the five conditions of international peace set forth by Pope Pius XII. The English Malvern conference convened under the auspices of the Anglican church, re-endorsed these ten points and elaborated their general viewpoint in a declaration which was widely influential in the United States and throughout the churches of the world.

The most immediate issue forced upon organized religion was that of the role of the church in a time of war. Virtually all Christian bodies engaged in prolonged discussions on this issue and scores issued pronouncements upon it. Almost universally the churches declined to identify the cause of God with that of any particular nation, their own or others. Hate was repudiated by representative churches even in the occupied countries. The oecumenical fellowship of the church was affirmed in spite of war by representatives of the churches in Japan and the United States. Patriotism in all countries nevertheless received strong reinforcement from religion, even in the case of nations like Russia, which had fostered anti-religious movements.

Because the state makes war, the issue of church-state relations was precipitated more pointedly than ever before in modern times. The churches universally asserted the prior allegiance of the religious man to God, and many of them accepted as a corollary the necessity of following conscience to the point of civil disobedience when conscience conflicted with the claims of the state. At the same time numerous accommodations of religion to the decisions of the state as the actual organ of the national will were to be noted. Russia exhibited new religious tolerance, while at the same time Christian bodies which had persistently denounced Russia for its godlessness modified their positions toward Russia as an ally in war. The inconsistency between these positions and those previously advocated was the basis, for example, of an attempt to line up churches in occupied countries on the axis side, on the plea of its anti-Bolshevist mission. Most militant pacifists, both in the United States and Britain, ceased active opposition to national policy; while the main body of Christians reluctantly acquiesced in the decisions of their nations in the matter of war.

Over much of the earth organized religion suffered persecution and acute hindrance in its work. A pastoral letter of 30 Catholic bishops in Germany asserted that the basic religious rights—those of carrying on religious and moral teaching, the free preaching of the Gospel and freedom of worship—were infringed upon there without any basis of military necessity. Churches in the occupied countries were oppressed in varying degrees by required oaths of allegiance, official control of services, pressure of party governments and anti-Semitic edicts. Great destruction by war, consequent vast migrations of population and multitudes of war refugees reduced many churches in central Europe virtually to the point of extinction. In belligerent lands great numbers of churches were bombed and religion everywhere was distracted by war demands and nationalistic pressure. These experiences served to draw the major religious communions closer to each other. Numerous communities which suffered war damage were holding united religious services for people of various communions. The "Sword of the Spirit" movement, originating in English Roman Catholic circles, drew as many Protestant followers as Catholic and associated the two religious groups to a point of intimacy.



WOUNDED R.A.F. MAN KNEELING In prayer at Westminster cathedral, London, on the fourth British national day of prayer, March 23, 1941

While the pressure of circumstances tended to increase the solidarity of religious movements and the sense of their common stake with science and philosophy in the maintenance of the democratic way of life, the choice which the times necessitated between religion and much that was going on in the world, tended to augment a sense of their distinctiveness in the minds of religious people. The slogan "Let the Church Be the Church," initiated by the Oxford World conference in 1937 had increased acceptance. This implied the belief that the Christian interpretation of life constituted the most profound creative process undergirding all constructive human effort. Religion was demonstrating anew the capacity of its inner life to survive any degree of human catastrophe. Christianity felt itself to constitute an actual world-wide society bound by ties which are deeper than its divisions and exemplifying both the structural principles and the spiritual force which ultimately hold the world together. (*See* also CHRISTIAN UNITY; also under separate churches.) (H. P. D.)

Religious Denominations: *see* CHURCH MEMBERSHIP.

Rennell, James Rennell Rodd, 1ST BARON, OF RODD (1858–1941), British diplomat, was born Nov. 9. Educated at Oxford, he entered the diplomatic service in 1883. In 1897 he headed a British mission to King Menelik of Abyssinia and paved the way for the establishment of a permanent British envoy to Addis Ababa. He was minister to Sweden, 1904–08, and ambassador to Italy, 1908–19. In 1920 he accompanied Lord Milner's mission to Egypt and was a delegate to the League of Nations in 1921 and 1923. After retiring from the diplomatic service, he was a member of the house of commons from the St. Marylebone district of London, 1928–32. He was created a peer in 1933. Lord Rennell died at Ardath, his home in Shamley Green, Surrey, July 27.

Representatives, House of: *see* CONGRESS, UNITED STATES.

Republican Party. When the 77th congress convened for its first session on Jan. 3, 1941, two months after the re-election of President Roosevelt for a third term, the Republicans held 28 senate and 162 house seats. Senator Charles L. McNary of Oregon, and Representative Joseph W. Martin, Jr., of Massachusetts continued, respectively, as Republican senate and house leaders. Representative J. William Ditter of Pennsylvania served as chairman of the Republican Congressional committee, and former Senator John G. Townsend, Jr., of Delaware headed the Republican Senatorial committee.

Throughout 1941, questions of foreign policy overshadowed domestic issues. Continuing its program of aid to Great Britain, and other countries resisting aggression, the Roosevelt administration took steps to make available to the nations aligned against the axis, in increasing measure, the material resources of the United States.

In their attitude toward the administration's foreign policies, the Republicans were sharply divided. Soon after its presentation to congress in January, Wendell L. Willkie, Republican candidate for president in 1940, announced his support of the administration's new lend-lease bill. Following a visit to England in the spring, he urged all-out aid for Great Britain.

Though Willkie, in his endorsement of the president's foreign policies, had the backing of many members of his party, other Republicans, including most of the party leaders in congress, sharply criticized the administration's international program, and warned that the president, in his anti-axis moves, was heading the country into war.

In congress, the trend of Republican sentiment was predominantly non-interventionist. With few exceptions, Republicans in both houses voted against the administration's proposal to amend the Neutrality act and authorize the arming of American merchant ships. Only 23 Republicans in the house voted for the new lend-lease authorization. Though approving measures to strengthen the army and navy, most Republicans opposed the bill to extend for 18 months the service of men called to the colours under the Selective Service law. Seven Republicans voted for draft extension in the senate and 21 in the house.

Representative Joseph W. Martin, Jr., of Massachusetts, who had served as the chairman of the Republican national committee since the 1940 party convention, submitted his resignation at a meeting of the committee in Washington, D.C., on March 21. The committee refused to accept his resignation and Martin agreed to continue at the helm of the national organization. Sinclair Weeks, also of Massachusetts, was named treasurer of the committee.

As national chairman, Martin travelled widely during the year, addressing state and local party organizations, and directing preparations for the 1942 congressional elections. Franklyn Waltman, director of publicity, and a former newspaperman, announced his resignation on Nov. 13. The Republicans gained several seats in the house in scattered elections held during 1941. Following the death of Senator Alva B. Adams, Democrat, of Colorado on Dec. 1, Governor Ralph L. Carr appointed a Republican, Eugene D. Millikin, to fill the vacancy.

With the entrance of the United States into World War II against the axis in December, the Republicans, previously sharply divided over the administration's foreign policies, closed ranks, and joined with the Democrats in securing quick passage of legislation to mobilize the full resources of the United States in men and materials in the war against Hitlerism.

Only one member of congress, Representative Jeannette Rankin, Republican, of Montana, voted against the Dec. 8th declaration of war against Japan. Both houses unanimously approved the war declarations against Germany and Italy on Dec. 11.

On Dec. 10, two days after the United States declared war against Japan, Representative Martin, and Edward J. Flynn, chairman of the Democratic national committee, in an exchange of letters, agreed to work in close collaboration to further the success of the U.S. war effort.

Because of the war, Chairman Martin, on Dec. 21, announced an indefinite postponement of a meeting of Republican state chairmen that had been arranged for Jan. 12, 1942. "Nothing must be allowed to interfere in the vigorous efficient prosecution of the battle to preserve American freedom," said Mr. Martin.

On the eve of the opening of the second session of the 77th congress, Martin gave a pledge of full Republican co-operation toward winning the war, promising, however, that the minority, as the opposition party, would call attention to "honest mistakes" made by the administration in prosecuting the war effort. On Jan. 4, 1942, Clarence Budington Kelland, author and magazine writer, was appointed executive and publicity director of the Republican national committee. (*See* also ELECTIONS; UNITED STATES.) Rhode Island. A north Atlantic state of the United States. in New England; one of the 13 original states; popularly known as "Little Rhody." Area, 1,214 sq.mi. (smallest

of the United States); pop. (1940) 713,346. The urban population was 653,383 (91.6%). Capital, Providence (253,504). Other cities include Pawtucket (75,797); Woonsocket (49,303); Cranston (47,085); Newport (30,532); Warwick (28,757); Central Falls (25,248).

History.—At the regular 1941 session of the legislation, leading measures passed were the following:

Amendments to the civil service law, giving the governor power to replace the commission; an act creating a four-member bipartisan board of elections; an act giving housing authorities the right to exercise power of eminent domain; an act creating a state council of defense and authorizing local and district councils; an act requiring state and municipalities and construction companies doing business by contract with state or municipalities to rehire persons drafted or inducted into the armed services; an act guaranteeing to persons entering the armed forces a maximum unemployment compensation of $16 weekly upon their discharge, as long as they are unemployed or as long as their wage credits last; amendments to the workmen's compensation law, increasing allowances for medical and hospital care and changing the base for computing compensation; an act extending the emergency period for state unemployment relief for one year and providing penalties for accepting relief fraudulently; an act creating a state labour relations board; and a new law of arrest.

The chief executive officers of the state elected in Nov. 1940 for 1941–42 were:

J. Howard McGrath, governor; Louis W. Cappelli, lieutenant governor; Armand H. Cote, secretary of state; John H. Nolan, attorney general; Russell H. Handy, general treasurer. Edmund W. Flynn was chief justice of the supreme court.

Education.—During 1940–41 there were in the public elementary schools 62,856 pupils and 2,186 teachers; in junior high schools 24,133 pupils and 1,006 teachers; in senior high schools (three years) 18,034 pupils and 817 teachers; in senior high schools (four years and vocational) 5,381 pupils and 222 teachers. The enrolment in the State college was 1,254 and the teaching staff numbered 94. Enrolment in the State College of Education was 498; the teaching staff numbered 33.

Public Welfare, Charities, Correction.—The total number of persons receiving relief in all categories (including a small amount of overlapping among categories) in Nov. 1941 was 21,385, or about 3% of the state's population. The total amounts paid out during the year Dec. 1, 1940–Nov. 30, 1941 were as follows: state unemployment relief, $1,622,494; soldiers' relief, $87,445; old-age assistance, $1,732,339; aid to dependent children, $708,353; aid to the blind, $20,128. In unemployment compensation, the gross amount of benefits paid during 1941 was $3,594,100.73 to 42,709 different individuals. The amount paid into the fund during 1941 was $13,321,229.24. WPA monthly average employment for the year ending June 30, 1941 was 9,768. Total expenditure for the fiscal year was $7,432,441.46.

There were 910 inmates in correctional institutions in Oct.–Nov. 1941, and 4,478 patients in charitable institutions and institutions for defectives.

Communication.—The total mileage of highways on Dec. 1, 1941 (excluding city streets) was 2,680.86. Expenditures (1941) for the 801.58 mi. of constructed state highway system totalled $3,431,000. The total mileage of railways was 138.21. Water-borne commerce of the state for 1940 was 7,389,110 tons. Airways totalled 120 mi.; there was one airport, two landing fields. In Jan. 1941 there were 125,796 telephones in service.

Banking and Finance.—There were 35 banking institutions in 1941. Resources of 23 banks under state supervision totalled $474,822,392.63 and of 12 banks under federal supervision, $149,724,519.81. Savings deposits (exclusive of club accounts) in savings banks and trust companies (the 23 state banks) amounted to $319,624,619.81 on June 30, 1941. In addition, six loan and investment companies had resources of $9,996,344.94; eight building and loan associations, $40,028,893.06; 18 credit unions, $4,235,208.18.

At the close of the fiscal year, June 30, 1941, total state receipts were $18,530,403.36; expenditures and encumbrances, $18,315,130.05; surplus from operation, $215,273.31. The state gross debt was $30,766,000; net debt, $25,302,823.92.

Agriculture.—The total value of agricultural production was $11,736,000 in 1941 and $10,944,000 in 1940. Total acreage harvested was 47,600 in 1941. Cash income from crops in 1941 was $4,300,000; from livestock, $7,200,000; from government payments, $100,000; making a total of $11,600,000.

Table I.—*Leading Agricultural Products of Rhode Island, 1941 and 1940*

Crop	1941	1940
Corn for grain, bu.	39,000	38,000
for silage, tons	57,000	54,000
Hay (tame), tons	40,000	46,000
Potatoes, bu.	920,000	916,000
Oats, bu.	144,000	136,000
Apples (commercial), bu.	278,000	267,000

Manufacturing.—The total estimated value of manufactures was $516,390,541 for 1939 and $517,196,193 for 1937. Total employment in 1939 was 106,269 wage earners and 12,005 salaried personnel. The number of establishments was 1,460. Wage earners received $105,406,950 and salaried personnel, $27,940,576.

Table II.—*Principal Industries of Rhode Island, 1939 and 1937*

Industry	Value of Products	
	1939	1937
Woollen and worsted	$128,542,594	$136,915,685
Dyeing and finishing	41,497,061	29,259,406
Cotton	35,622,185	38,959,390
Rayon	30,206,766	25,760,092
Machinery (including electrical)	26,909,680	20,113,660
Jewellery	19,497,109	28,734,064
Rubber	16,253,109	14,481,321

Mineral Production.—The value of mineral production in Rhode Island is small: $980,916 in 1939 and $911,599 in 1938. Stone ($558,944 in 1939) and sand and gravel ($265,631) are the principal products.

(M. C. ML.)

Rhodesia. The territory extending from the Transvaal border northward to the boundaries of the Belgian Congo and of Tanganyika Territory. It is bounded on the east by Portuguese East Africa, Nyasaland and the Tanganyika Territory, and on the west by Belgian Congo, Portuguese West Africa and Bechuanaland. Area 440,656 sq.mi.; comprises two territories of the British empire; viz., Southern Rhodesia and Northern Rhodesia. Southern Rhodesia is a self-governing member of the British commonwealth, but supervision over native rights is reserved to the imperial government.

Northern Rhodesia remains a dependency of the crown. Certain essential statistics are given in the table on p. 570. (*See* also BRITISH EMPIRE.)

History.—The governors of Northern and Southern Rhodesia and Nyasaland met in conference at Salisbury in 1941 to establish a standing secretariat for co-ordinating the war effort of the three territories. The headquarters of the Rand Native Labour association tropical areas administration was moved to Salisbury, though the Rand mines would not recruit from Southern Rhodesia, where the labour shortage was acute, but from Nyasaland and Barotseland.

To reach the latter country, some 600 mi. of road were constructed through the Kalahari desert. The tropical labour recruited for the Rand was at the rate of more than 20,000 men per annum in 1941.

Southern Rhodesia.—Southern Rhodesian airmen and other white troops took a prominent part in the East African campaign. An African regiment, the Rhodesian African Rifles, was raised in 1941. African chiefs from Matabeleland visited the camp and were much impressed by the effects of military discipline and training.

Increased mining activity and the demands for primary products improved general prosperity but intensified the shortage of African labour in 1941. Proposals put forward by employers for conscription of African labour were turned down by the prime minister. A land apportionment act emphasized the policy of territorial segregation, but at the same time more attention was paid to welfare services for Africans. From each of two districts Africans had contributed more than £1,100 to buy mobile canteens for bombed areas in Britain.

Northern Rhodesia.—The governor of Northern Rhodesia, Sir John Alexander Maybin, died in April 1941. He was succeeded by Sir Eubule John Waddington.

The need for base metals mined on the Copper Belt and elsewhere greatly increased production and there was a corresponding demand for more food crops.

Arrangements were made to buy maize from the Belgian Congo, where there was a surplus. The Beit trustees promised £6,000 toward a new pathological laboratory at Lusaka and the African hospital at Mazabuka. New premises for the Jeanes school were

opened at Chilambana, where village teachers are trained and courses are held for chiefs. Broadcasts were given from Lusaka in several African languages in 1941. The tuning-in signal was given by African drums. (M. RD.)

Ribbentrop, Joachim von (1893–), German statesman, was born April 30 at Wesel on the Rhine and was educated at the gymnasium at Metz. In 1910 he went to Canada as an independent merchant. At the outbreak of war in 1914 he returned to Germany, enlisted in a Hussar regiment, advanced to lieutenant colonel, and by the end of the war was attached to the war ministry. After the war he returned to private business as a wine merchant. He first became identified with the nazi party as a worker in 1930. At his home in Berlin-Dahlem were held the important meetings that preceded Hitler's appointment as chancellor of the reich, Jan. 30, 1933. In 1935 Ribbentrop was appointed ambassador-at-large, and from 1936 to 1938 he was ambassador to Great Britain. He became foreign minister Feb. 4, 1938, and played a prominent role in the diplomatic negotiations that preceded the war.

Ribbentrop was at Hitler's elbow during all the latter's more important conferences with representatives of other states in 1940 and 1941. He was also charged with releasing the official German apologias for the various invasions undertaken in those two years. On March 21, 1941, he asserted at Munich that "developments of 1941 will force our opponent to admit his defeat."

Ribeiro, Manoel (1879?–1941), Portuguese novelist and keeper of the National archives in Lisbon, was the author of *The Cathedral,* his first and most successful work. This book was followed by two other volumes to complete a trilogy, *The Resurrection* and *The Desert.* His last novel was *Evergreen Thorn.* Ribeiro died in Lisbon in November.

Rice. The western hemisphere, long dependent on the orient for a large part of its supply of rice, became 95% self-sufficient in rice production after the outbreak of World War II, the office of foreign agricultural relations of the U.S. department of agriculture reported Dec. 15, 1941. For the first ten months of 1941 Cuba, a large consumer of rice, imported 319,512,000 lb. Of this amount, 295,620,000 lb. was from the United States and 15,216,000 lb. from the orient; the remainder was from Ecuador and the Dominican Republic. In the same period in 1940 Cuba imported 227,649,000 lb. of rice from the United States, 118,731,000 lb. from the orient, 728,000 lb. from Egypt and none from Ecuador or the Dominican Republic. Rice production in the United States in 1941 was 54,028,000 bu.; slightly less than the 54,433,000 bu. of 1940; the ten-year (1930–39) average was 45,673,000 bu., all produced in four states, Louisiana, Texas, Arkansas and California. The United States area planted to rice in 1941 was 1,245,000 ac., compared to 1,069,000 ac. in 1940 and a ten-year average of 942,000 ac. The yield was 43.4 bu. per ac. in 1941; in 1940 it was 50.9 bu. per ac.; the ten-year average was 48.4 bu. per ac.

Burma, the world's largest rice-exporting country, reported a 1941 crop of 401,600,000 bu. Exports for the first ten months of 1941 were 6,580,596,000 lb., compared to 5,533,073,000 lb. in the same period of 1940. The Burmese government announced in Sept. 1941 that the government would take over exports of rice in order to protect the growers after the freezing of Japanese credits by the United States, Great Britain and the Netherlands in July. Japan, Burma's second largest customer, took 1,028,691,000 lb. of Burmese rice in the first ten months of 1941. India imported 2,372,648,000 lb. from Burma in that period. The Philippines also bought 17,000,000 lb. and the Dutch Indies bought 22,000,000 lb. of Burmese rice. Production of rice in British Malaya in 1941 was reported as approximately that of 1940 (27,776,000 bu.). Malayan imports of rice were greatly increased in 1941 in anticipation of war with Japan. Malaya ordinarily subordinates rice to rubber production and produces little more than a third of its requirements. Production of rice in other countries is shown in Table I.

Table I.—*Production of Rice in Certain Countries, 1941 and 1940*

000's omitted

Country	1941 bu.	1940 bu.	Country	1941 bu.	1940 bu.

A 1941 crop of 12,000,000 bu. in Brazil was reported greatly reduced by floods.

Table II.—*U. S. Production of Rice by States, 1941 and 1940*

State	1941 bu.	1940 bu.	State	1941 bu.	1940 bu.
Louisiana	19,906,000	18,760,000	Arkansas	11,342,000	9,588,000
Texas	13,600,000	16,645,000	California	9,180,000	9,440,000

(S. O. R.)

Rickert, Thomas A. (1876–1941), U.S. labour leader, was born April 24 in Chicago, Ill. Educated at public schools and at a business college, he went to work as a garment cutter and at 19 he took active part in union affairs. In 1904 he was elected president of the United Garment Workers of America (A.F. of L.), a post he held until his death. He was a member of the war labour board during World War I and was named to the industrial conference called by President Wilson in 1919. Although Rickert was appointed by President Roosevelt to several committees during the early New Deal days, he later became sharply critical of the administration's labour policies. Known as a conservative in labour ranks, he was an outspoken foe of concessions to the C.I.O. Rickert, who was a second vice-president of the A.F. of L., died in New York city, July 28.

Rickets: *see* MEDICINE.

Riddle, John Wallace (1864–1941), U.S. diplomat, was born July 12 in Philadelphia, Pa. He graduated from Harvard in 1887, attended Columbia university law school, 1888–91, and the École des Sciences Politiques, Paris, Fr., 1891–93. He was secretary in the U.S. legation in Turkey, 1893–1900, secretary in the U.S. embassy in Russia, 1901–03, diplomatic and consul general to Egypt, 1903–05, minister to

Rumania and Serbia, 1905–06, and ambassador to Russia, 1906–09. He served with the military intelligence division of the general staff at the Army War college, 1917–18. Riddle was ambassador to Argentina, 1921–25. He died in Farmington, Conn., Dec. 8.

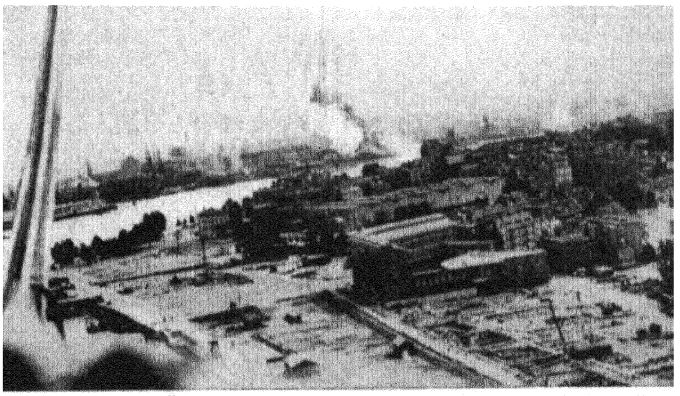
Ridge, Lola (Mrs. David Lawson) (1884–1941), U.S. poetess, was born in Dublin, Ire., and spent her childhood in Australia and New Zealand. She went to the United States in 1907, wrote fiction for popular magazines and edited an experimental poetry review. In 1929 she published *Firehead,* a 218-page narrative poem dealing with the Crucifixion. This work was inspired by the Sacco-Vanzetti case. In 1935 she received a Guggenheim fellowship and in both 1934 and 1935 she received the Shelley Memorial prize for poetry. Her poems were intensely class-conscious and displayed deep sympathy for the labouring man. Among her works are *The Ghetto and Other Poems* (1918); *Sun-Up and Other Poems* (1920); *Red Flag* (1927); and *Dance of Fire* (1935). She died in Brooklyn, N.Y., May 19.

Rio de la Plata Conference: *see* Uruguay.

Ripley, William Zebina (1867–1941), U.S. economist, was born Oct. 13 at Medford, Mass. He was graduated from the Massachusetts Institute of Technology in 1890 and received his Ph.D. degree from Columbia university in 1893. He joined the Harvard faculty in 1901 as professor of political economy, retiring in 1933. He was awarded the Huxley Memorial medal for his lectures in 1908 at the Royal Anthropological institute in London. During World War I, Ripley was administrator of labour standards in the war department, and from 1919 to 1920 he was chairman of the National Adjustment commission of the U.S. shipping board. A sharp critic of the corporate practices of big business, he urged the government in hearings before senate inquiry committees in 1931–32 to place rigid curbs on investment trusts and to probe the financial affairs of big corporations. He was employed by the interstate commerce commission as a consolidation expert, 1920–23, and drew up the Ripley plan to merge railroads into 19 regional groups; this plan formed the basis of a later I.C.C. consolidation formula. He was the author of *The Races of Europe* (1900); *Trusts, Pools and Corporations* (1905); *Railway Problems* (1907); *Railroads—Finance and Organization* (1914), and *Main Street and Wall Street* (1927). Professor Ripley died at his summer home in East Edgecomb, Me., Aug. 16.

Ritchie, Neil Methuen (1897–), British army officer, was born July 29, and was educated at the Royal Military college at Sandhurst. He entered the army at the age of 17 as 2nd lieutenant in the famous Black Watch regiment (42nd Highlanders). He served on the western front during World War I, went to Mesopotamia, 1915, and saw action in Egypt, 1918. He was wounded in action and won the distinguished service order and military cross. After the war, he passed through the Staff college, held war office and Indian appointments and served in northern India and Palestine. In Jan. 1938 he received command of the King's Royal regiment (Lancasters). In 1939 he became colonel, was an acting brigadier general within a year and acting major general by Oct. 1940. He had been deputy chief of the middle east general staff for some months, prior to his appointment on Nov. 26, 1941, as commander of the 8th army in Libya, succeeding Sir Alan Gordon Cunningham (*q.v.*).

Rivers and Harbours. Federal improvement of rivers, harbours and other waterways in continental United States, Puerto Rico, Alaska and the Hawaiian Islands for navigation and allied purposes is prosecuted by the corps of engineers, U.S. army, under the direction of the secretary of war and the supervision of the chief of engineers, in accordance with plans authorized by congress. The facilities provided by these works are vital to the commercial and general economic development of the United States in normal times and are essential to that country's need in times of war.



THE DOCKS OF ROTTERDAM were pounded with regularity by the R.A.F. in 1941 to destroy German shipping in the Netherlands port. This photograph was taken from one of the raiding British planes whose tail is visible at the left

Reports requested by congressional directives to ascertain the advisability of further improvements are also made by the corps of engineers.

Approximately 1,000 river and harbour projects were in force on June 30, 1941. The river and harbour act, approved Oct. 17, 1940, authorized additional waterway improvement at 22 localities in the interest of national defense. Improvements and maintenance operations in 1941 were underway on 377 separate projects, of which 20 projects were fully completed. Total expenditures for the fiscal year were $86,500,000, of which $45,900,000 were for new work. The total net water-borne commerce during 1940 over federally improved waterways and harbours of the United States, after eliminating all known duplications, was 607,900,000 short tons.

(*See* also Water-Borne Commerce of the U.S.)

The principal items of new work in progress during 1941 on rivers and harbours, exclusive of that covered under the title of Canals and Inland Waterways (*q.v.*), included dredging of the Delaware river channel from Philadelphia, Pa., to Delaware bay to a depth of 40 ft.; dredging to extend the harbour anchorage facilities south of the Craney island anchorage in Norfolk harbour, Va.; jetty construction at the mouth and dredging of the Calcasieu river from the Gulf of Mexico to the port of Lake Charles, La.; and completion of the upper reach of the 34-ft. Houston ship channel, Tex., including dredging of a turning basin at the head of the channel near Houston. At Buffalo harbour, N.Y., deepening a portion of the outer harbour to secure a depth of 23 ft. was in progress. Channel widening in the Cuyahoga river at Cleveland harbour, O., was substantially advanced by dredging at critical bends. Work was prosecuted under the program for a seaplane basin and enlargement of anchorage facilities for deep-draught vessels at San Diego harbour, Calif., to provide depths ranging from eight to 35 ft. Extension of the breakwater system at Los Angeles and Long Beach harbours, Calif., to provide an extensive anchorage area for deep-draught vessels was initiated. Construction operations for hydroelectric power development at Bonneville dam on the Columbia river, Wash., were vigorously prosecuted; units nos. 1–5 were completed and were in operation; unit no. 6 would shortly be put into service; and contracts were let for the construction of an equipment for units nos. 7–10, which would complete the full installation. At Fort

Peck dam, Mont., construction of the powerhouse substructure had been completed and work on the superstructure was scheduled to begin early in 1942 for the first two units of the ultimate three-unit installation. Dredging was in progress in various stretches of the Atlantic-Gulf Intracoastal waterway and authorized depths for the entire length of the waterway were essentially accomplished.

Important channel and harbour improvements were also effected at waterways and ports on the Atlantic, Gulf and Pacific coasts and on the Great Lakes, including improvement at New York and New Jersey channels; Boston harbour, Mass.; Providence river and harbour, R.I.; Fire Island Inlet, N.Y.; Raritan river, N.J.; waterway from Delaware bay to Chesapeake bay, Del. and Md.; Tampa harbour, Fla.; Southwest pass and South pass, Mississippi river, La.; Sabine-Neches waterway, Texas; Mississippi river between the Ohio river and Minneapolis, Minn.; Illinois waterway, Ill.; Missouri river between the mouth and Sioux City, Ia.; Ohio river; Keweenaw waterway, Mich.; Erie harbour, Pa.; Columbia river, Wash. and Ore.; San Juan harbour, P.R.; and Arecibo harbour, P.R. (*See* also AQUEDUCTS; CANALS AND INLAND WATERWAYS; DAMS; FLOODS AND FLOOD CONTROL.) (J. L. S.)

Great Britain.—It was not practicable at the end of 1941 to present an adequate review of the changes which had taken place in connection with docks and harbours during the year, mainly for reasons arising out of wartime restrictions. The suspension, cessation or retardation of port development and improvement programs in Great Britain, as in fact throughout the whole of Europe, continued in varying degree and the paralyzing effect of hostilities on constructional enterprise was enhanced by the havoc which was taking place incessantly in the various theatres of war. Each successive aerial bombing attack on the British and European coast line resulted in the destruction of port structures and equipment.

Apart from repairs, only minor works were feasible in Great Britain on account of the shortage of materials, and even where essential work was carried out, there were frequent delays. The most striking feature was the shift of shipping and cargoes from east coast ports to less vulnerable areas on the west coast, involving the transfer of a considerable quantity of plant and appliances.

The only regions (apart from the United States and, in some measure, Canada) in which port development schemes of importance were in progress and concerning which particulars can be given are to be found in South Africa and Australia.

South Africa.—The impressive program of harbour expansion, to cost more than £4,000,000, at Cape Town, made good progress in spite of hindrances due to the war. The original contract was for the formation of a new basin with an area of nearly 300 ac. and the provision of three deepwater berths, all to be completed by June 6, 1941. Unavoidable delays in obtaining materials and an increase in the scope of the contract were deferring completion. The three deepwater berths, however, each affording 1,000 linear ft. of quayage, were actually completed and in use. The fourth berth, subsequently decided upon, was well in hand. The new basin was to have a uniform depth of 40 ft., which would enable it to receive the largest ships in existence, including the "Queen Elizabeth." The old outer breakwater was demolished and liners of 20,000 tonnage can safely pass over the site. A new large graving dock was also contemplated, but for financial reasons was not started in 1941.

At Durban, where a new "T" jetty was in progress at an estimated cost (including certain ancillary works) of £2,500,000, the sinking of caissons for both the eastern and western walls was well advanced and more than 1,200 linear ft. of superstructure completed. The new accommodation would provide berthage for seven large ships, with berths for two others closely adjacent.

At East London, an expenditure of £500,000 was being made on the provision of a turning basin, a mail-boat quay and transit sheds.

Australia.—The new large graving dock, 1,050 ft. long by 137 ft. wide, projected for Sydney harbour at a cost of £3,000,000, was actually in hand and was well advanced in the preliminary stages. A cofferdam to enclose the site was almost, if not quite, completed. In order to facilitate constructional operations and at the same time to form the west bank of the entrance to the new dock, reclamation of 3½ ac. of water area in the harbour at Pott's Point was being undertaken and some of it was already showing above water level.

In Victoria, a series of improvements at the ports of Melbourne and Geelong, as well as changes in the administration, were the subject of a special report of the Parliamentary Public Works committee presented to the state cabinet in June. It was recommended that the entrance to Port Phillip bay should be deepened by blasting to a depth of 48 ft., the depth in 1941 being 43 ft. at low water. The report also urged that all channels leading to deepwater berths at the port should be deepened to enable them to be navigated at all tides by vessels drawing 35 ft. In 1941 the South channel had a depth of 37 ft. at low water and the Port Melbourne channel, a depth of 34 ft. It was also recommended that the Yarra river should be deepened and widened so as to be navigable by vessels drawing 31 ft. The sill formed by the Spotswood tunnel limited the depth to 27½ ft.

(B. Cu.)

Rivets, Explosive: *see* METALLURGY.

Roads and Highways. The spectacular efforts that made the Yunnan-Burma highway a life line to the Chinese armies were reported by press and radio. For a time press reports indicated the great importance of the modern Moscow-Smolensk highway in supplying a Russian sector resisting German invasion. Great Britain perfected a detailed organization of its commercial vehicles that was co-ordinated with rail transport in the rapid dispersion of food and other supplies away from ports, to lessen damage from bombing attacks.

The United States with a great network of main highways and nearly 70% of the world's motor vehicles found its highway transportation resources taxed to the limit. Conversion of labour and production facilities to defense activity required enormous movements of men, materials and supplies. All forms of transport were used in the building of camps and defense industries, in the movement of food, raw materials and supplies to these places after they were placed in operation and in the movement of products of the industries to the places of use. Without the great highway improvements made since World War I, it would have been impossible to supply the materials and feed the men being used in defense operations.

A curtain of military censorship undoubtedly hid many important highway events in the countries at war. Full facts concerning the military use of highway transport would not be known until detailed histories of the war were written but in the meantime fragments of information indicated that the existence or nonexistence of highways influence when and where battles are fought and who wins them.

Did Hitler rush the construction of a road or roads across southern Russia to support his advance on the Crimea and the Caucasus as suggested by some reports? Did the Russians use highway transport for movement of quantities of machinery for arms production away from the area expected to be invaded? Some observers reported seeing such a movement. Are the British building highways from the Persian gulf or Mediterranean toward the Caucasus to support a front against the advancing Germans? These are some of the questions of great interest to which an answer could not be given in 1941.

From the viewpoint of world-wide advance in highway improvement and use, the year 1941 was a disappointing one. Extension of highway networks and modernization of existing roads for commerce and promotion of general welfare was practically at a standstill in all of Europe, much of Africa and all of occupied China.

United States.—In the United States with 306,000 mi. of surfaced primary rural state highways, more than 1,000,000 mi. of surfaced feeder roads and 32,500,000 motor vehicles, highway use was greater than ever before. Total travel by vehicles probably exceeded 300,000,000,000 mi. during the year. The loads carried by trucks in 1941 were probably 24% greater than in 1939 and should reach a total of 72,000,000,000 ton-mi. on rural highways alone.

Improvement of highways went forward at a rapid rate. The mileage of surfaced rural roads was increased by about 37,000 mi. per year in 1939 and 1940 and approximately the same progress was made in 1941.

However, the most important work of the year was in the modernization of main routes of travel to make them suitable for the large volume of fast-moving traffic. Work of this kind to relieve congestion in and near cities was particularly important. Examples of such work were the improvement of the main thoroughfare through Palo Alto, Calif., Bulkley boulevard in Cleveland, O., and the belt line built around Minneapolis, Minn. Congestion and delay in small towns and cities was relieved by building alternate routes around them. Traffic between Chicago, Ill., and St. Louis, Mo., could skirt Normal and Bloomington, Ill., taking only 10 min.

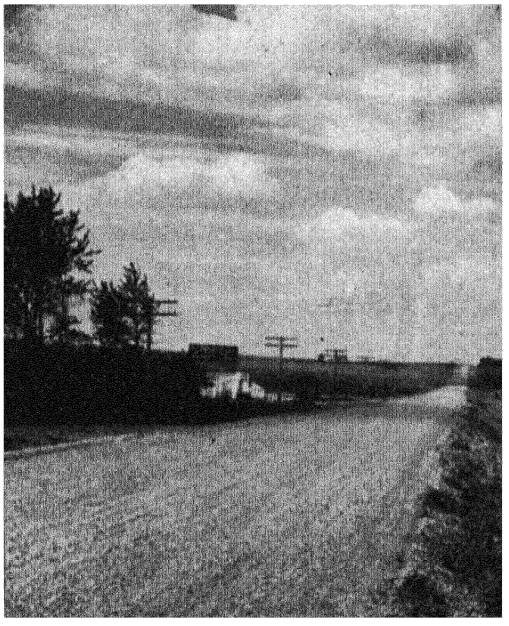
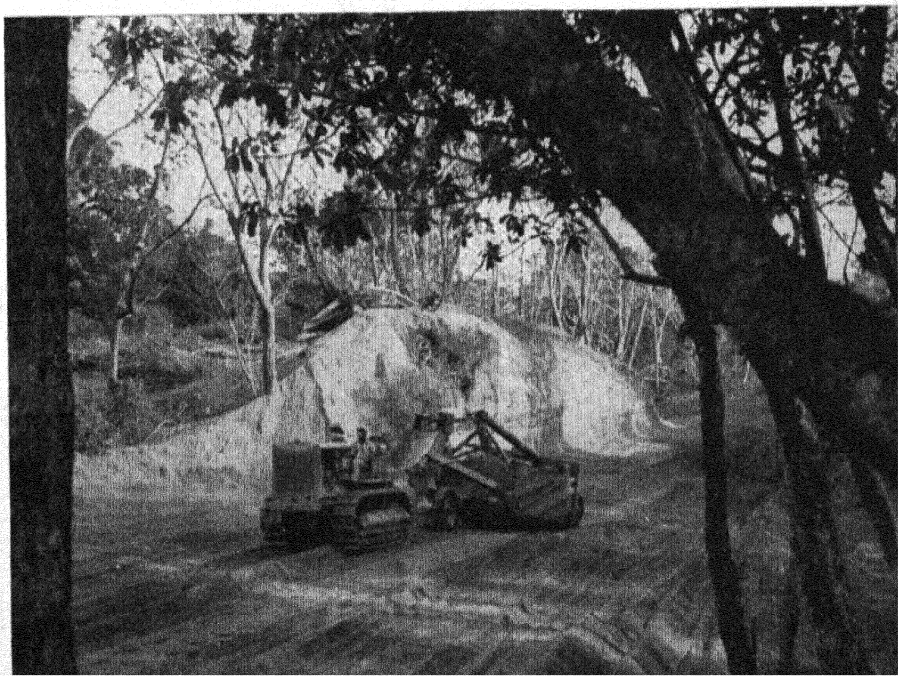
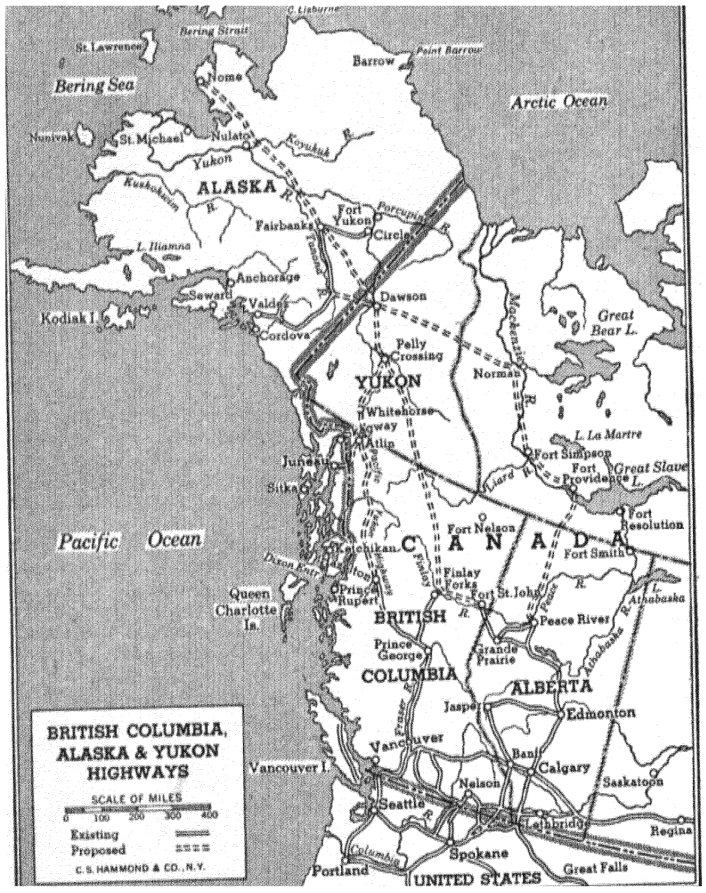
Below, left: SECTION OF THE GRAVEL HIGHWAY north of Edmonton, Alberta, Canada which was under consideration in 1941 as a link in the proposed highway between the United States and Alaska

Below, right: U.S. MACHINERY levelling a section of the Inter-American highway near Managua, Nicaragua in 1941







THREE PROPOSED HIGHWAYS (shown by dotted lines) connecting the U.S. with Alaska through Canada were considered in 1941 as measures to strengthen Alaskan defenses

where it formerly took 19 min.

In the federal-aid road program and other federal highway work administered by the Public Roads administration, nearly 13,000 mi. of highway were completed in the fiscal year ending June 30, 1941. Three hundred and twenty-one highway-railroad grade crossings were eliminated, 65 obsolete elimination structures were reconstructed and 941 were protected by signals or other devices. The total cost of the work was $317,000,000, of which $177,000,000 was paid with federal funds.

After the beginning of the defense program all available federal-aid highway funds were applied to roads of special defense significance as far as could be done under existing limitations of law. Nearly 5,000 mi. of defense highways, either on the 80,000-mi. strategic system approved by the war department or access roads to camps and defense establishments, were approved for construction with federal funds.

As the year closed, $150,000,000 was authorized for the construction of roads to relieve the badly congested conditions at training camps and defense industries. Plans were already prepared and work was to begin immediately.

An important step toward the planning of an interregional highway system for improvement after defense activity is over was taken when the president appointed a National Interregional Highway committee to make studies and report to him.

Highway to Alaska.—The commission, appointed by the president of the United States to investigate the feasibility of a highway to Alaska and to consult with Canadian officials, continued its work. Various proposed routes were under discussion. Two of the routes were identical from Vancouver to Prince George, B.C. One of these proposals was to build a highly scenic route parallel to the coast but about 100 mi. inland through Prince George to White Horse, Yukon Terr., and thence to Fairbanks, Alaska. Another route from Prince George would go east of the Stikine mountains to Fairbanks. Still another proposed route would proceed from North Dakota to Edmonton, Alta., and thence to Fairbanks by the route east of the Stikine mountains or a more easterly route.

The United States commission discussed the routes with Canadian officials and recommended construction of a highway. Up to the close of 1941, Canada had not agreed to improvement of the highway and funds for detailed surveys and construction had not been authorized.

Canada.—The first transcontinental highway across Canada from Halifax, N.S. to Vancouver, B.C., 2,800 mi. in length, was expected to be opened to travel throughout its length in 1941. Grading on the last gap, lying north of Lake Michigan, was expected to be completed. Continued rains beginning in August, however, delayed completion until 1942. Canada has been drawing an increasing number of tourists from the United States each year both in eastern Canada and in the Canadian Rockies.

Inter-American Highway.—Tourists from the United States visit Mexico in increasing numbers each year. They go to Mexico City and some distance beyond, but it would be three or four years before they could reach Guatemala. There were in 1941 many sections of improved road between Mexico and Panama but no long section of improved road. Work was being done in all intervening countries and was progressing rapidly in Nicaragua, Costa Rica and Panama with loans from the United States. Between the United States and Panama City there were 2,004 mi. of all-weather road in a total distance of 3,252 mi. Between Panama City and the Colombia border, a distance of about 225 mi., there were only 38 mi. of usable road. No vehicle had up to the close of the year made the trip by land.

The South American countries have made considerable progress in selecting and improving routes on the Inter-American highway system. The route from the Panama-Colombia border to Buenos Aires, Arg., follows the Pacific coast to Vitor, Peru, from which two branches lead on to Buenos Aires. One branch follows the coast to Valparaiso, Chile, then proceeds east to Buenos Aires; the other branch turns east to La Paz, Bol., and then proceeds southeast to Buenos Aires. From the Panama boundary to Buenos Aires via Valparaiso, Chile, the distance is 5,757 mi., of which some 4,030 mi. are all-weather road. Via La Paz, Bol., the distance to Buenos Aires is 5,433 mi., of which about 3,790 mi. are all-weather road. Of the all-weather road on these routes, roughly a third is paved.

Other important routes in South America include the Simon Bolivar highway from La Guaira, Venez., to Guayaquil, Ec., and the Rio de Janeiro-Montevideo-Buenos Aires highway. The Simon Bolivar highway is 2,295 mi. long, and of this length 2,018 mi. have all-weather surfaces. From Murillo, Colom., to San Juan, Ec., a distance of about 715 mi., this highway is coincident with the Inter-American highway to Buenos Aires.

The Rio de Janeiro-Montevideo-Buenos Aires highway is 1,922 mi. long. Of this length, 960 mi. are paved and an additional 61 mi. have an all-weather surfacing. An interesting feature of this route is a 31-mi. ferry, crossing the Rio de la Plata at Buenos Aires.

Three pioneers composing the Richardson expedition left Detroit, Mich. in Nov. 1940 and after travelling 15,000 mi. over good roads, mountain trails, hacking their way through jungles and transporting their car around impassable sections, arrived at the tip of South America in July 1941.

Great Britain and Europe.—Because of the war no official information on highways was made public in 1941.

Australia.—In Feb. 1941 a road of great strategic importance in supplying the garrison at Darwin on the north coast was opened to traffic. This road runs for 450 mi. across the so-called "dead heart" of Australia. Darwin has heretofore been isolated during the rainy season except by sea. The new road gives a year-round supply line and also opens huge tracts of cattle-raising and mineral-bearing land.

The commonwealth government was spending £250,000 ($1,000,000) in reconditioning the long route along the southern coast of Australia.

China.—Roads in eastern China were severely damaged in the fighting of 1937–39 and very little had been done to repair the damage up to the close of 1941. In several instances highways reopened to traffic were so damaged by the native population as to be unfit for use. Use of roads in occupied territory is controlled by the Japanese army. In April 1941 the North China Communications company, a Japanese firm, was operating 150 bus lines over an 8,000-mi. system. Four other companies were operating lines over 4,000 mi. of highway.

Offsetting destruction of roads in eastern China was the amazing construction of new roads in western China by the Chinese National government. Western China in 1941 had more road mileage than the whole of China had before the Japanese attack. The system, with Chungking as its hub, includes 65,000 mi.

Burma Road.—Most important highway in this system is the Burma road extending from Lashio near the Burma border across Yunnan province and on to Chungking. The 610-mi. Yunnan section was opened to traffic in 1939. After Oct. 1940 this was the only route open to the sea. Japanese seizure of Indo-China threw upon this route the added burden of supplies that formerly went to the Chinese through Indo-China.

In 1941 an intensive effort was made to increase the movement of supplies over the Burma road. Transportation experts went from the United States to assist the Chinese in reorganizing the management of the road. Road machinery was sent to improve the road and additional trucks were sent. Reports on operations in the fall of 1941 showed that the tonnage transported to interior China was moving constantly upward.

The first two modern highways in Sikang province, bordering Tibet, neared completion in 1941. One of these roads reaches an elevation of 9,200 ft. or more than 1,000 ft. above the highest point on the Burma road.

(T. H. MacD.)

Roberts, Elizabeth Madox (1886–1941), U.S. novelist, was born in the Pigeon river country near Springfield, Ky., where her ancestors had migrated in the 1770s. She spent much of her youth in Colorado and did not enter college until she was an adult, graduating from the University of Chicago at the age of 35. At the university, she was elected to Phi Beta Kappa and won the Fiske prize for poetry in 1921. Miss Roberts won immediate recognition as a top-rank writer with her first novel, *The Time of Man*, published in 1926. The

book, about Kentucky poor whites, was later regarded as her best work. Among her other publications are *Under the Tree* (1922), a book of children's poems; *My Heart and My Flesh* (1927); *Jingling in the Wind* (1928); *The Great Meadow* (1930), an historical novel of Kentucky pioneer days; *A Buried Treasure* (1931); *The Haunted Mirror* (1932), a collection of short stories; *He Sent Forth a Raven* (1935); *Black is My Truelove's Hair* (1938); *Song in the Meadow* (1940), her second book of verse; and *Not by Strange Gods* (1941), a collection of short stories published four days after her death. She died at Orlando, Fla., March 13.

Robinson, Frederick Bertrand (1883–1941), U.S. college president, was born Oct. 16 in Brooklyn, N.Y. He was graduated from the College of the City of New York in 1904 and received his Ph.D. degree from New York university in 1907. He was named president of the College of the City of New York in 1927, a post he held until his resignation in 1939. He died in New York city, Oct. 19.

Rockefeller Foundation was chartered in 1913 for the permanent purpose of "promoting the well-being of mankind throughout the world." Its program is concerned with certain definite problems in the medical, natural, and social sciences, the humanities, and public health. In the field of medicine its interest is centred mainly in nervous and mental diseases, and a large part of its contributions are made for the furtherance of research and teaching in psychiatry and allied subjects. Its program in the natural sciences is concerned with experimental biology. In the social sciences the emphasis is on projects contributing not only to the understanding of important social problems, but also to the development of personnel and methods. The program in the humanities centres around the techniques by which cultural levels of contemporary society are being influenced—such as museums, the radio, drama and libraries—and the promotion of better international understanding through cultural interchanges. The program in public health includes research on a number of selected diseases; demonstrations in the control of some of these diseases in their environments; co-operation with governments in services of central or local health departments; and the development of public-health education. During 1941 the foundation appropriated approximately $9,000,000 for work in its various fields of interest. The chairman of the board of trustees in 1941 was Walter W. Stewart; the president, Raymond B. Fosdick; and the secretary, Norma S. Thompson.

General Education Board was incorporated by an act of congress in 1903, with the stated object of "promoting education within the United States of America without distinction of race, sex, or creed." Its program is restricted largely to the support of education in the southern states. During 1941 appropriations approximating $900,000 were made by the board. The chairman of the board of trustees in 1941 was Ernest M. Hopkins; the president, Raymond B. Fosdick; and the secretary, William W. Brierley. (H. B. V. W.)

Roman Catholic Church. The pope, Pius XII is recognized as the supreme spiritual ruler. In his person reside plenary power, spiritual, legislative, executive and judicial, in all matters of faith and morals. To him, the Catholic faithful throughout the world owe spiritual allegiance, as they owe full civil allegiance to their respective governments.

Appointed by the pope are the cardinals, patriarchs, archbishops, bishops, vicars who govern the ecclesiastical jurisdictions throughout the world. The cardinals, traditionally numbering 70, are the electors of the pope. Some govern archdioceses in various countries; others are resident in the Vatican, as assistants to the pope in church government. Due to deaths, and the fact that Pius XII had made no appointments, the number was in 1941, 53. As in 1941, there were 14 patriarchates, 1,210 archbishoprics and bishoprics, 512 apostolic vicariates, prefectures, abbacies and mission prelacies. In addition there were some 779 titular archbishops and bishops without territorial jurisdiction. The number of Catholics throughout the world was estimated by the Vatican, in 1941, to be in excess of 385,000,000 reaching up to 400,000,000, about 19% of the world population.

English-Speaking Countries.—In the United States, Catholics, under the inspiration of the hierarchy, co-operated fully in the defense projects, and upon the declaration of war, pledged all-out support to the nation and the government. Archbishop Stritch, as chairman of the episcopal committee on the pope's peace plan, issued a statement on Dec. 17, declaring that "victory will be a benediction for all the world," and Archbishop Mooney, chairman of the administrative board, addressed President Roosevelt, pledging "whole-hearted co-operation." By the end of 1941, it was estimated that upwards of 31% of the armed forces were Catholic, though Catholics were only about 18% of the total population. Chaplains in the army and navy, as of Dec. 31, numbered 362.

The ninth National Eucharistic congress was held at St. Paul, Minn., June 24, with Dennis Cardinal Dougherty as the papal legate. Under the direction of the Confraternity of Christian Doctrine, a revised text of the New Testament was issued, and also a revision of the Baltimore catechism. Denver, Colo., was raised to the rank of an archdiocese; Pueblo, N.M., and Honolulu were erected into dioceses. The wide-spread activities of the church in the United States were directed by the National Catholic Welfare council.

The official figures of the Catholic population in the United States and its possessions were placed at 22,293,101, an increase of 889,965 since 1940. Bishop Noll, in November, estimated the total at 35,000,000. There were 116 archdioceses, dioceses and vicariates. The hierarchy consisted of 2 cardinal archbishops, 23 archbishops, 123 bishops. The parishes with resident clergy numbered 13,224; to these were attached 5,897 mission centres. The total of priests, diocesan and religious, increased to 35,839.

In Great Britain and the commonwealth, with the exception of Eire, which maintained neutrality, Catholics united in the total war against the axis powers. The Lenten pastorals of the English bishops dealt with the social and economic problems, during and after the war, and urged a peace based on papal principles. A movement initiated by Cardinal Hinsley, the Sword of the Spirit, sought to unite all Christians in the defense of Christianity against the aggressive paganism of the totalitarian ideologies. Though accepting a military and economic alliance with the soviets, the Catholic leaders urged that communism be opposed. Many churches and religious institutions were destroyed by the nazi bombers. Numerous conversions were reported. Catholic life was active in an extraordinary degree.

In England and Wales, the number of Catholics was estimated at 2,414,000, an increase of 7,583; in Scotland, at 614,469; in northern Ireland, 428,290; in Eire, at 3,013,701. Ecclesiastical jurisdictions were as follows: England and Wales, 4 archdioceses and 14 dioceses; Scotland, 2 archdioceses and 4 dioceses; Eire, 4 archdioceses and 25 dioceses.

Cardinal Villeneuve, in April, appealed for unity in the war effort of Canada, thus giving impetus to the Catholic contribution. The Knights of Columbus (*q.v.*) and the Catholic Women's

League collected for, and aided the men in service, and helped provide for more than 200 Catholic chaplains. Australian and New Zealand Catholics were heavily engaged in war efforts. In the former, the hierarchy planned a unifying agency such as the National Catholic Welfare conference in the United States.

The Catholic population of Canada was estimated to be 4,745,882, an increase of 121,200; the number of clergy was 8,850. The country was divided into 12 archdioceses and 36 dioceses and vicariates. Catholics in Australia and New Zealand totalled 1,723,802, living under the jurisdiction of 30 archbishops and bishops.

Hispanic America.—On the whole, Catholic authorities were agreeable to establishment of better relations with the U.S. In Mexico, Catholics were heartened by the Avila Camacho government to the extent that Archbishop Martinez, Mexico City, in November, could commend the president for having made "notably easier the situation of the Catholic Church in Mexico." In Santiago, Chile, was held a national Eucharistic congress that attested to the inherent Catholicism of the people. Notables from all of South America and from the United States were present. Argentine Catholics were most active in social, economic and moral programs. The hierarchy issued a joint pastoral urging justice toward the working classes. The Brazilian bishops published a joint pastoral asking prayers for the peace of Christ, seeking higher moral standards, condemning indecency in books, magazines and motion pictures. At Rio de Janeiro was opened the Catholic University of Brazil, authorized by the plenary council of 1939. In Colombia, progress was reported on the proposed concordat with the Vatican. In Venezuela, controversy over religious instruction in the state schools veered in favour of the Catholic viewpoint. A Catholic radio station was inaugurated. The Nicaraguan congress' legislation making civil marriage compulsory, giving preference over religious ceremonies, was protested by Catholic bishops.

Europe.—In Italy, a continued revival of spiritual values was manifest. There were no major conflicts between the government and the church. In the axis partner, Germany, however, the persecution and suppression of Catholicism was intensified. Several documents were issued, under alleged nazi influence, decreeing the practical extirpation of all Christian religion. A pastoral by the German bishops cited four major protests: suppression of Catholic publications; disbanding of religious institutes and convents; closing of Catholic schools and prohibition against religious teaching in those remaining open; nazi propaganda seeking Catholic apostasy. Bishop von Galen, of Muenster, in a series of sermons, denounced the methods of the gestapo against Catholics, as did Bishop Bornewasser, of Trier. Archbishop Groeber, of Freiburg, declared that the war had increased the persecution of the church in Germany.

In the countries under nazi domination, the church suffered the same ill treatment. In the Germanic countries, Catholic organizations were rendered impotent, even in spiritual affairs, schools and religious institutes were suppressed, religious properties and funds were seized, religious services were curtailed and priests arrested. In Holland, the bishops issued three strong pastoral letters: the first, warning against Catholic participation in nazi and communist movements; the second, denouncing nazi usurpation or suppression of Catholic organizations; the third, refusing the sacraments to members of nazi groups. In Belgium, protests against nazi methods and restrictions were likewise voiced. The church in Poland suffered excruciatingly, in its dismemberment by the soviets and the nazis, and then under complete nazi domination. Reports on the horror of executions, imprisonments and confiscations were made by Cardinal Hlond, primate of Poland, from the Vatican. Arrests of clergy and closures of institutions were likewise reported from Yugoslavia and the Balkans. Although not numerically strong in the Scandinavian nations, the church was hampered in its spiritual and moral mission.

In the U.S.S.R. because of the religious restrictions in the constitution, and the Marxist hostility to religion, Catholicism was almost nonexistent. The Vichy government of France, despite axis pressure, attempted the reconstruction of the free areas on Christian principles, thus abrogating much of the legislation of the Third Republic. Spain, also under nazi threat, struggled to mend the spiritual, economic and social ill effects of the civil war. Portugal, maintaining its independence, increased in Catholic activity. The statutes concerning the colonial missions, stemming from the 1940 agreement with the Vatican, were put in force.

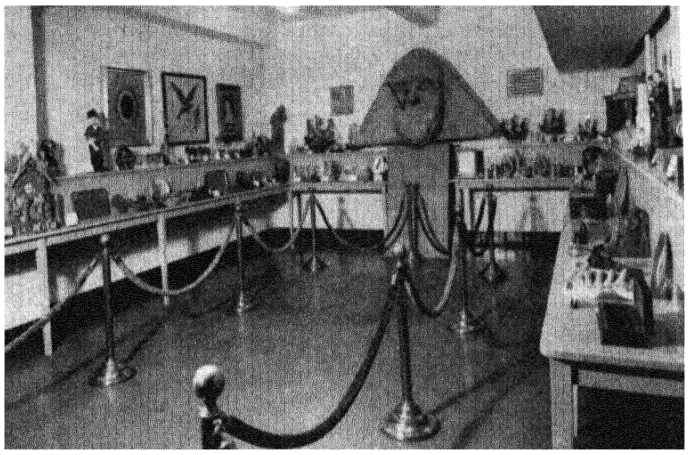
The Mission Countries.—The spread of the war in the Pacific rendered uncertain the future of the widespread mission activity. Japan recognized the legality of the church, and the Vatican adapted Catholic activities to the Japanese policy; all ecclesiastical jurisdictions were entrusted to native Japanese. In China, conversions continued; in the year ended August 1941, 103,900 were reported. Chinese seminarians numbered 7,028, an increase of 315. Progress was made in India, in the organization and increase of Catholicism. Favourable reports also indicated the spread of the church in Asia and throughout Africa. Since the support of the missionary establishment had been seriously cut, and since the missioners, belonging to so many varied nations, had been obstructed by governments, and since the Japanese domination was spreading, there were few bright hopes at the close of 1941 for the continuance or the expansion of missionary labours and successes. (*See* also PIUS XII; VATICAN CITY STATE.) (F. X. T.)

Rommel, Erwin (?–), German army officer, fought on the western front and the Italian front in World War I. He left the army after the war, but found the student life at Tuebingen university too dull. He joined the postwar Reichswehr and fought as a storm-troop leader in the nazi party. He advanced rapidly in the German army and his brilliant strategy and tactics in mechanized warfare won him early recognition. In the battle of France, Rommel's tank units smashed through the Maginot line at Sedan in May 1940 and swept to the coast at Abbeville, closing a ring around 1,000,000 Allied soldiers in northern France and Belgium. He was made commander of the German desert forces in 1940 to bolster the crumbling Italian armies in Libya. He launched a counterdrive in Cyrenaica in March 1941, hurling Allied forces back across the Egyptian border and holding a defense line near the Libya-Egypt border throughout the summer. The British struck again on Nov. 18, 1941, with a large mechanized army, and while Rommel slowed the attack in the early stages British superiority in arms and numbers and his own inadequate supplies caused his armies to fall back beyond Bengasi, which was taken on Christmas day, 1941.

Roosevelt, Franklin Delano (1882–). (See *Encyclopædia Britannica* for extended biography.)

On Jan. 6, 1941, in his annual message to congress, President Roosevelt emphasized the need for stronger national defense and greater material help for the nations resisting axis aggression, and called for a new world order based on the "four freedoms"—freedom of speech and worship, and freedom from want and fear.

On Jan. 8, 1941, the president submitted to congress a budget of $17,485,528,049 for the next fiscal year, of which $10,811,000,000 would be used for defense purposes. To pay part of the costs of armament expansion and lend-lease aid he proposed additional taxes. The budget message estimated at $9,000,000,000 the deficit for the next fiscal year, and suggested a cut of 15% in the non-



THE ODDITIES ROOM of the Roosevelt library at Hyde Park, N.Y., opened June 30, 1941, houses items received or collected by the president. A favourite is the pulp caricature which dominates one end of the room

defense and nonfixed expenditures of the federal government.

Throughout 1941, Mr. Roosevelt devoted much time to the grave international problems that confronted the country.

The president was inaugurated for a third term on Jan. 20. Chief Justice Hughes administered the oath. In keeping with the times, the armed forces provided most of the units taking part in the traditional inaugural parade.

To assure an uninterrupted flow of munitions and other materials to Great Britain, China and other countries fighting aggression, the president asked congress for a new lend-lease authorization. This request was approved by the house on Feb. 8 by a vote of 260 to 165, and by the senate on March 8, by 60 to 31. Passage of the lend-lease bill over strong Republican and noninterventionist opposition represented a major victory for the president.

With the approach of spring, the war in Europe took a turn increasingly unfavourable to Great Britain and her allies. In April, the Germans launched a blitzkrieg invasion of Yugoslavia and Greece, and the British evacuated Crete. The nazi gains in Europe led to increasing discussion in the United States of the need for navy convoys to assure deliveries of lend-lease supplies overseas, and they resulted also in a demand for a speed-up in production of munitions. On April 20, the president announced an agreement between Canada and the United States for cooperation in the production of war materials for Great Britain.

On June 12, the president sent to the senate the nomination of Associate Justice Harlan F. Stone (*q.v.*) as chief justice of the supreme court of the United States, to succeed Charles Evans Hughes, who had retired after presiding over the court for 11 years. The president made two appointments to the Supreme court in 1941—Senator James Francis Byrnes (*q.v.*) of South Carolina, nominated on June 12, and Attorney-General Robert H. Jackson, named on June 19. On Sept. 5, the president nominated Solicitor General Francis Biddle (*q.v.*) to succeed Mr. Jackson as attorney-general.

On June 9, the president ordered the army to take over the strike-bound North American Aviation company's plant in California. The same day, it was announced that the American freighter "Robin Moor" had been torpedoed by a German submarine about 1,000 miles off the coast of Brazil. Five days later, Mr. Roosevelt ordered the immediate freezing of the assets in the United States of Germany, Italy and all invaded and occupied countries. In a special message to congress on June 20, he denounced Germany as "an international outlaw" and warned that the U.S. would insist that Germany make full reparation for the sinking of the "Robin Moor."

Without a declaration of war, Germany, on June 22, invaded soviet Russia. Two days later, the president pledged all possible material assistance to Russia. On July 7, United States forces landed in Iceland, and on July 10, the president asked congress for funds to equip an army of 1,200,000 men. On July 30, the president requested congress for price control legislation. The federal government needed authority to control prices, he pointed out, not only to strengthen national defense, but to protect the United States against the evils of inflation. Although the house passed a price control bill, the senate took no action in 1941, with the result that enactment of this important legislation was postponed until 1942.

After several days of rumour, lacking official confirmation, it was announced on Aug. 14, that President Roosevelt and Prime Minister Winston Churchill, with high-ranking political, military and naval aides, had conferred at sea. At this meeting, the two leaders drew up the Atlantic charter, which contained an eight-point declaration of peace aims. For Atlantic charter, *see* DEFENSE, NATIONAL (U.S.).

Relations between the United States and Germany became increasingly strained in September. The United States destroyer "Greer" was attacked by a German submarine on Sept. 4, while on patrol duty off Iceland. Three days later, the U.S. freighter "Steel Seafarer" was sunk in the Red sea by a German submarine. In a radio address on Sept. 11, the president announced that the navy had been ordered to "destroy on sight any German or Italian submarines entering waters, the protection of which is necessary for American defense." On Sept. 18, he requested congress to appropriate an additional $5,985,000,000 for lend-lease aid.

On Oct. 9, the president asked congress to amend the Neutrality act, to permit the arming of U.S. merchant ships and to authorize their entry into combat zones.

Labour troubles continued to cloud the domestic horizon. On Oct. 25, John L. Lewis, president of the United Mine Workers of America, called a strike in the captive coal mines of the seven largest steel companies. The principal issue was the union demand for complete unionization of the workers in the mines. Following three requests by the president, Mr. Lewis, on Oct. 30, agreed to call off the strike until Nov. 15, pending an investigation of the merits of the controversy by the National Defense Mediation board. By a vote of 9 to 2, the board, on Nov. 10, rejected the demands of the union for a closed shop. Six days later, union officials ordered 53,000 men in the captive mines to go on strike and threatened to call out 400,000 more workers in the bituminous coal mines. On Nov. 22, Mr. Lewis accepted the proposal of the president for arbitration of the closed shop issue and called off the strike. The president appointed three arbitrators —Benjamin Fairless, chairman of the board of the United States Steel corporation; John L. Lewis, and John R. Steelman, director of the United States Conciliation service. Reversing the findings of the Defense Mediation board, the arbitrators, on Dec. 7, granted the union the closed shop.

To formulate a program to prevent work stoppage during the emergency, the president called a meeting of labour and industrial leaders in Washington, D.C., under the chairmanship of William H. Davis, head of the Defense Mediation board. On Dec. 23, the president accepted the report of this group. This included an agreement by labour not to call strikes during the war and to settle industrial disputes by peaceful means. It was also proposed to set up a war labour board. A threatened nation-wide railway strike was averted on Dec. 1, by an agreement to increase the wages of rail workers by $300,000,000.

On Dec. 7, while discussions were still in progress between Secretary Hull and the "peace" envoys of the Mikado, Japan de-

clared war on the United States after a surprise attack on Pearl Harbor and other United States outposts in the Pacific. Following a special message by the president, congress the next day declared war on Japan. Acknowledging the seriousness of the losses at Pearl Harbor, the president on Dec. 9 called upon the American people to prepare for a long and hard war. He named a special board, headed by Associate Justice Owen J. Roberts of the supreme court to investigate the Pearl Harbor attack, and determine whether or not there had been negligence on the part of the U.S. naval and military commanders in Hawaii. (*See* also UNITED STATES; JAPAN.)

On Dec. 22, Prime Minister Churchill, accompanied by Lord Beaverbrook and British air, military and naval chiefs, arrived in Washington. Mr. Churchill had Christmas dinner with the president at the White House and joined with him in a Christmas message to the American people. On the following day Mr. Churchill addressed congress. In the closing days of 1941, the president, with leaders of Great Britain and those of other nations fighting the axis, canvassed the problems of grand strategy in the conflict that had now become a global war.

In conference with members of congress and administration officials, Mr. Roosevelt also mapped out a program designed to secure, as quickly as possible, the full mobilization of the economic and military resources of the United States. (O. McK.)

Roosevelt, Gracie Hall (1891–1941), U.S. electrical engineer and brother of Mrs. Franklin Delano Roosevelt, was born June 28 in Neuilly, France. A graduate of Groton, he studied electrical engineering at Harvard, where he received his degree in 1914. After working at his profession in the Yukon, he returned to the United States, where he joined the General Electric company. During World War I he was a flying instructor in the army air corps. After the armistice he rejoined the General Electric company. He was executive vice-president of the Detroit United railways and vice-president of the American State bank in Detroit, 1929–30. From 1932 to 1938 he worked as a consulting engineer in Chicago, Detroit and New York city. He died in Washington, D.C., Sept. 25.

Roosevelt, Sara Delano (1854–1941), mother of Franklin Delano Roosevelt, was born Sept. 21. Sara Delano was one of five daughters of Warren Delano 2nd, whose father owned a fleet of whaling vessels and engaged in the Chinese clipper trade. She was descended from an old French Huguenot family whose first member, Philippe de la Noye (he later changed his name to Delano), settled in the Pilgrim colony in 1621. Sara Delano was educated by private tutors and studied in Paris and Berlin. In 1880 she married James Roosevelt, a noted sportsman and railroad lawyer. They went to live on his estate at Hyde Park, N.Y., where their only child, Franklin Delano Roosevelt, was born two years later. She was the first woman since Mary Washington to see her son chosen president. Mrs. Roosevelt was a frequent visitor to Europe, entertained the president's renowned guests at her home in Hyde Park with informal ease and talked proudly of "my boy Franklin," though she carefully avoided political subjects. Her book *My Boy Franklin*, written in collaboration with two other authors, was published in 1933. Mrs. Roosevelt died at her Hyde Park home, Sept. 7.

Rosenwald Fund, The Julius. The Rosenwald fund differs from other large U.S. foundations in that the trustees not only are permitted to spend capital as well as income at any time but are compelled to expend all its funds within 25 years of the death of its founder, that is, before Jan. 6, 1957. During the 24 years since its establishment in 1917 by Julius Rosenwald, this fund has expended approximately $17,000,000, being all of its income from year to year and about four-fifths of its principal fund. At the close of the fiscal year June 30, 1941, the assets of the fund (held chiefly in capital stock of Sears, Roebuck and Co. of Chicago) had a value of approximately $4,000,000.

The chief program of the fund during its early years was aid in the building of rural public schools for Negroes. The main programs in 1941 were (1) improving the content and quality of rural education in both white and Negro schools in the south; (2) aid in building up four important centres of higher education for Negroes: Howard university in Washington, D.C., Atlanta university in Atlanta, Ga., Fisk university in Nashville, Tenn. and Dillard university in New Orleans, La.; (3) efforts in behalf of Negro health; and (4) a series of fellowships for Negroes and for white southerners.

During the year 1940–41 the fund expended $770,000 upon these and related programs.

Rotary International. During the year 1941, Rotary's loss of clubs and members in subjugated countries was offset by expansion, particularly in the western hemisphere. On Dec. 31, 1941, there were approximately 5,100 Rotary clubs with a membership in excess of 211,000 in more than 50 geographical regions of the world. General officers for the fiscal year 1941–42 (term ending June 30, 1942) were: president, Tom J. Davis, Butte, Mont., U.S.A.; vice-presidents, T. A. Warren, Wolverhampton, England; Joaquin Serratosa Cibils, Montevideo, Uruguay; A. S. FitzGerald, Windsor, Canada; secretary, Chesley R. Perry, Chicago, Ill., U.S.A.; treasurer, Rufus F. Chapin, Chicago, Ill., U.S.A. During 1941, an international convention was held in Denver, Colo., U.S.A.; 200 "Institutes of International Understanding" were presented by U.S. Rotary clubs in community forums and in high schools; in addition to their usual service activities, Rotary clubs throughout the world engaged in activities for the alleviation of war suffering and in intensified national service activities in their respective countries; a series of 14 weekly international radio broadcasts called "The Americas Speak" was presented by Rotary International as a contribution to friendship and understanding among the countries of the Americas. Rotary International publishes *The Rotarian* in English and *Revista Rotaria* in Spanish. In addition there were, in 1941, 15 regional Rotary magazines published throughout the world in 12 languages. (C. R. P.)

Rottenstone: *see* ABRASIVES.

Rourke, Constance Mayfield (1885–1941), U.S. writer, was born on Nov. 14 in Cleveland, Ohio. After teaching English for five years at Vassar, she left that institution in 1915 to devote herself to writing. Miss Rourke specialized in gathering material from firsthand sources and in the course of her travels in the U.S. she interviewed Americans in all strata of society. Her "living research" yielded fruitful material on American ballads, songs and folk tales, on which she based many of her books. Among her works are *Trumpets of Jubilee* (1927); *Troupers of the Gold Coast, or the Rise of Lotta Crabtree* (1928); *American Humor—A Study of the National Character* (1931); *Davy Crockett* (1934); *Audubon* (1936); and *Charles Sheeler: Artist in the American Tradition* (1938). She died in Grand Rapids, Mich., March 23.

Rowell, Newton Wesley (1867–1941), Canadian politician and jurist, was born

Nov. 1 in Middlesex county, Ontario. A leader of the Liberal party, he served in the Ontario legislature and also served in the federal government. He was chief justice of Ontario, 1936–38. Justice Rowell died in Toronto, Ont., Nov. 22. (See *Encyclopædia Britannica.*)

Rowing. The University of Washington and Harvard university took the major honours in American intercollegiate rowing during the 1941 season. The eight-oared varsity crews representing these two schools were the only college crews to finish an undefeated season.

The University of Washington, rowing the fastest three-mile race that had ever been rowed on the west coast, won the Pacific coast championship. They won the varsity race at Poughkeepsie, N.Y., defeating California a second time and finishing far ahead of the eastern crews. This crew was one of Washington's greatest crews and was considered by many experts to have been the fastest U.S. crew to take the water during 1941.

Harvard's fine crew was on a par with the Washington boat. They opened their season against Massachusetts Institute of Technology and Boston university with an easy victory and then went on to win the sprint championship of the east with victories over Princeton, U.S. Naval academy, University of Pennsylvania, Cornell and Syracuse. They finished their season with an impressive victory over Yale at New London, Conn. This Harvard crew took its place in rowing history as one of Harvard's fastest crews.

Following is a brief summary of the major college races of the year:

April 19, Washington *v.* California. Three miles on the Oakland estuary, California. Washington led from the start and won by three lengths. Their time of 14:28 was a new Pacific coast record for three miles.

Princeton *v.* Navy. One and three-quarter miles at Annapolis, Md. This was a close race all the way, Princeton pulling ahead in the last half to win by a length. Time 9:36.

Columbia *v.* Rutgers. One and one-half miles on the Harlem river, N.Y. Rutgers took a slight lead in the early part of the race, Columbia winning by a quarter length. Time 6:53.6.

April 26, Columbia *v.* Navy. One and three-quarter miles at New York city. Very close race all the way, Columbia winning by two feet. Time 7:24.4.

Yale *v.* Syracuse. Two miles at Derby, Conn. Syracuse led over most of the distance, Yale sprinting to a third-of-a-length win. Time 10:36.

Rutgers *v.* Pennsylvania. Henley distance (1 5/16 mi.) at Philadelphia, Pa. Close race all the way, Rutgers winning by a scant length. Time 6:30.2.

April 29, Harvard, M.I.T., Boston university (Rowe cup). Henley distance at Cambridge, Mass. Easy two-length victory for Harvard, M.I.T. second. Time 6:56.2.

May 3, Navy *v.* Cornell. One and three-quarter miles at Annapolis, Md. Close race from the start. Navy won by a third of a length. Time 9:09.

Columbia, Pennsylvania, Yale (Blackwell cup). Henley distance at Philadelphia, Pa. Close race with Columbia winning in the sprint, a deck-length ahead of Penn. Time 6:24.

Harvard, Princeton, M.I.T. (Compton cup). One and three-quarter miles at Cambridge, Mass. Harvard took the lead shortly after the start to win by open water over Princeton. Time 9:22.4.

May 10, Princeton, Columbia, M.I.T., Pennsylvania (Childs cup). One and three-quarter miles at Princeton, N.J. Princeton overcame a slight Columbia lead to finish better than a length ahead of Columbia, M.I.T. third. Time 9:35.4.

Syracuse *v.* Cornell. Two miles at Syracuse, N.Y. Syracuse won by a fifth of a second in a race that saw the lead change several times. Time 11:25.2.

May 17, Syracuse *v.* M.I.T. Two miles at Syracuse, N.Y. Syracuse again won a close hard-fought race by only a tenth of a second. Time 11:38.

Harvard, Navy, Penn (Adams cup). One and three-quarter miles at Annapolis, Md. Harvard trailed at the start with Navy leading. Harvard took the lead entering the last half mile and won by a half-length with Navy in second place. Harvard's winning time of 8:24.4 established a new cup record and also a new course record.

Cornell, Princeton, Yale (Carnegie cup). Scheduled for two miles at Ithaca, N.Y. The race was cancelled on account of rough water.

Dad Vail regatta. Henley distance at Marietta, Ohio. Won by Rutgers with Marietta second. Time 6:36.

Joe Wright cup for lightweight crews. Henley distance at Cambridge, Mass. Won by Harvard, Princeton second. Time 6:40 (new course record).

May 24, Harvard, Princeton, Cornell, Syracuse. One and three-quarter miles at Cambridge, Mass. Harvard led after the first quarter winning by two lengths, Princeton second, with Cornell third. Time 9:23.

June 13, Harvard *v.* Yale. Four-mile downstream at New London, Conn. Harvard took the lead at the start and gradually increased it to about three lengths at the halfway mark. There was very little change in the relative position of the two crews in the last two miles. Time, Harvard 20:40, Yale 20:53.4.

June 25, Poughkeepsie regatta. Four miles on the Hudson river at Poughkeepsie, N.Y. Washington and California had open water on the eastern crews within the first mile. They then went on to fight it out for first place during the next two miles. Washington was definitely in the lead just before entering the last mile and went out to win, two and one-half lengths ahead of California. The other crews in the race finished in the following order: Cornell, Syracuse, Princeton, Wisconsin, Rutgers, M.I.T., Columbia. Time, Washington 18:53.3, California 19:02.2. California won the junior varsity race and Cornell the freshman race. (E. O. Le.)

THE CREW OF REED COLLEGE, Portland, Ore., was distinguished in 1941 as having the only girl coxswain in collegiate rowing

Rubber and Rubber Manufacture. During 1941 the national defense program directed development efforts of all rubber manufacturers toward supplying the armed forces with necessary equipment on land, on the sea and in the air. Even before the declaration of war against the axis powers, certain secrecy orders were issued banning publicity concerning inventions in fields deemed of vital concern to national defense; and, after the opening of the war, these restrictions were extended further and made more rigid.

Certain achievements may, however, be indicated. One of the most important was the general conservation of supplies of crude rubber from the far east by the entire industry. This was done in several ways: by increased use of rubber from American (guayule) sources (*see* below); by increased use of synthetic rubbers; by greater use of reclaimed rubber; by eliminating white sidewalls on tires and by simplification through discontinuance of special varieties of hose, belting and other goods. At the same time the government's efforts to increase the reserves of crude rubber in the United States were successful in giving the country, at the beginning of 1942, a stock pile aggregating as much rubber as had been utilized in any year for a decade preceding 1940. Furthermore, though specific figures may not be cited, plans were revised for the production of synthetic rubber of the non-oil-resistant type suitable for tires, belting and other products, in order to provide as quickly as possible increased amounts for all rubber manufacturers. Consideration was also given, both by governmental and private agencies, to plans for obtaining additional rubber from plants grown on the American continents. None of the plantation schemes proposed were expected to supply any considerable quantity in 1942. The rubber industry also made needed economies in the use of zinc oxide and of vegetable oils and the fatty acids derived from them. The urgent need of defense materials effectively precluded the invention of new products for civilian use.

During 1942 restriction of the greater part of available rubber

to war needs would require drastic changes in production and selling activities. Many types of goods would probably be rationed and regulations devised for prolonging the serviceable life of articles previously in use. Retreading of tires, regulating the speed at which automobiles might be operated, repairing of articles hitherto discarded without any attempt at repair, and other methods might be necessary to conserve the United States' supply of rubber, natural and synthetic. It is possible that public disclosure of developments in the rubber industry might not be permitted for the duration of the war. During that period, however, new materials and processes would be developed and new knowledge acquired which would enable the industry better to serve peacetime needs when the struggle ceased.

Guayule Rubber.—In view of impending curtailment of supplies of rubber from the far east, it was urged during 1941 that guayule rubber be produced within the United States. It is obtained from a shrub, *parthenium argentatum*, growing wild in semiarid sections of Mexico and southwestern United States. It is not a new product. It has been available commercially for more than 30 years whenever the price of other grades has been sufficiently high to permit its profitable production in Mexico.

The rubber is obtained by masticating in water entire plants pulled from the ground. The woody portions become waterlogged and sink, whereas the rubber, which forms short cylindrical "worms," floats and is readily separated. Guayule rubber, thus produced, contains 20% to 25% of soft, resinous material in contrast with a resin content of hevea grades of from 1% to 3%; and it is not the equivalent of plantation rubber either in processing properties or in the quality of vulcanized compositions in which it is substituted directly for other grades. It is therefore used in small percentages with other rubber, either crude or reclaimed. Passenger car tires made entirely of compositions of guayule rubber tested some years ago yielded about 60% of the mileage of the same-sized tires then marketed. In high speed or heavy duty service the ratio might well be considerably less. Between 1907 and 1910 when the difference in cost of guayule and of other grades of rubber was 35 cents to 50 cents a pound, rubber goods manufacturers found it profitable to produce for their own use partially deresinated guayule rubber and most of that used during those years was thus prepared. Later, the costs of crude rubber were too low to permit profitable production of low-resin guayule rubber. If the resin content were reduced to 5% or less, it is probable that products of high quality could be made of this material.

Excellent experimental work was done at Salinas, Calif., in breeding high-yielding varieties of the shrub and in determining the most economical cycle of production. Four-year-old plants were recommended. This would involve a five-year cycle, inasmuch as the land lies fallow one year between harvesting and replanting. The yield indicated by W. B. McCallum, who carried out the botanical studies, was 330 lb. per acre per year. It was proposed to grow guayule in certain sections of California where soil and sparse rainfall are favourable. Irrigation increased the size of the shrub but greatly decreased the rubber content.

This project was but one phase of a comprehensive program to obtain sufficient rubber to supply American needs. Establishing plantations of hevea trees in Central and South America was another phase and the production of synthetic rubber in the United States was a third. In the emergency facing the United States all should be started promptly even though one or more might prove uneconomical in time of peace. (*See* also CHEMURGY.)

Table I.—*Imports of Rubber to the U.S.** (In long tons)

	1941 (9 mo.)	1940	1939	1938
Gross imports	739,678	780,820	469,803	397,620
Re-exported	4,177	7,060	13,125	5,652

November	.....	408,507	219,249
December	.....	434,814	216,895

After the attack on Pearl Harbor, the statement was made that the United States had 540,000 tons on hand and 110,000 tons afloat. The interesting fact is that at the end of 1941 there was as much crude rubber available in the United States as was used in any one year, excepting 1940 and 1941. (*See* also BUSINESS REVIEW.) (J. W. Sc.)

Rubens, Horatio Seymour (1869–1941), U.S. lawyer, was born June 6 in New York city. After finishing his law studies, Rubens clerked in the office of Elihu Root. Interested in Spanish-American affairs, he became general counsel for the Cuban junta, formed in New York in 1895 to press for Cuban independence from Spain. He described his role in the ensuing struggle in his book, *Liberty, the Story of Cuba* (1932). He was appointed a colonel in the army of Cuba and in later years headed several railroad companies there. He died in New York city, April 3.

Rumania. A kingdom in southeastern Europe. Area on Jan. 1, 1941 *c.* 74,000 sq. mi.; pop. *c.* 16,000,000. Capital, Bucharest. Principal cities: Bucharest (648,162); Yassy (104,471); Galatz (102,232); Timisoara (89,872). Religion, mostly Greek Orthodox. King: Michael; prime minister, Gen. Ion Antonescu (*q.v.*).

History.—Rumania had suffered violent upheavals and dismemberment of her territory during 1940. In the year 1941 the upheavals continued for some time, but later on the country found itself involved in a war with the soviet union which brought great territorial gains to Rumania, though by the end of the year the new acquisitions were not yet clearly defined, while the discontent of the people continued and the country was far from having entered a period of order or normality within the "new order" which had been imposed upon her. By the end of Jan. 1941 a serious revolt broke out, led by the native fascist legion, the Iron Guard, the followers of the executed leader Corneliu Zelea Codreanu. The revolt was under the leadership of some foremost members of the government itself, among them vice-premier Horea Sima. Also Corneliu's father, Ion Codreanu, played a prominent part. The minister of the interior, Gen. Constantin Petrovicescu, was also involved; he had been replaced immediately before the outbreak by the military commander of Bucharest, Gen. Demeter Popescu.

The Antonescu dictatorship was accused by the Iron Guard, which embraced most of Rumania's youth, younger officers and many priests, of having sold out the country to the Germans. The fighting between the heavily armed Iron Guardists and loyal troops lasted for several days. It was accompanied by ferocious pogroms against the Jews, of whom many hundreds were killed. After three days of fighting Bucharest was again in the hands of the government, but rebel units held out for a short while at Brasov, Ploesti, Arad and Constanza.

While Horea Sima succeeded in escaping, Antonescu, with the help of the Germans, threatened the insurgents with death and tightened his grip on the country. The real rule in the country passed to the German minister, Baron Manfred von Killinger. In a manifesto of Jan. 25, Antonescu declared to the nation that "in these days of greatest sadness I have behind me the loyal shadow of the great fuehrer and the honour of German might which guaranteed our borders." He accused the chiefs of the Iron Guard, with whom he had established the fascist regime in Rumania by the coup d'état of Sept. 6, 1940, of ingratitude and of unspeakable atrocities. On Jan. 27, Antonescu formed a new government consisting mainly of high ranking army officers and close personal friends, and announced his intention to develop a closer community of spirit between the axis and Rumania. All important private industries were brought under military

TO WIDOWS of Rumanian troops killed during the uprisings of Jan. 21–23, 1941, Premier Ion Antonescu personally distributed rewards at a ceremony in Bucharest

control. The German government insisted that in view of the international situation all internal conflicts in Rumania be firmly suppressed. Many high-ranking officials, officers and diplomats who had been members of the Iron Guard were dismissed and imprisoned. On Feb. 6 Antonescu established the most drastic criminal code in threatening death penalties for most infringements of internal order. Writing antigovernment articles or singing political songs became punishable by death; from one to five years' imprisonment was provided for parents whose children were convicted of crimes. Thus the native fascist movement with its Rumanian aspirations was fiercely suppressed in the interests of Germany, which during February made the country the base from which to start its Balkan war activities.

On Feb. 10 Great Britain severed diplomatic relations with Rumania in view of the occupation of the country by large German forces; at the beginning of March these forces crossed the Danube into Bulgaria, and on April 6 attacked Yugoslavia and Greece. On March 12 Premier Antonescu held a nation-wide plebiscite. All persons over 21, except Jews, were obliged to vote, no speeches or propaganda were allowed, the vote was to be a vote of approval or disapproval of Antonescu's conduct. Needless to say that an unbelievably unanimous vote was cast. On March 5 Antonescu had seen Chancellor Hitler and had given Germany full control over Rumania's economic life and foreign policy. Meanwhile the Rumanians complained of the shortage of food in this rich agricultural country as a result of German operations, and the feeling of the people was reported to be so strongly anti-German that there were definite rumours of dissatisfaction on the part of the Germans with Antonescu's regime. But all efforts of finding other elements to lead the country failed. Antonescu himself reported on April 15 a plot by the Iron Guard to assassinate him during Easter services. Much of the Rumanian dissatisfaction could also be explained by the continued tension with Germany's other friend, Hungary, over Transylvania, whose loss had never been accepted by the Rumanians. How seriously Rumania had been hit by the "new order" could be seen in the fact that while the country had exported, in the first three months of 1940, 412,600 tons of cereals, the exports had sunk in the same period of 1941 to 96,900 tons. By the month of June a monster trial against the leading Iron Guardists brought heavy punishment to some of the former best known rightist statesmen of Rumania.

All internal problems, however, receded into the background for a while when Rumania on June 22 entered the war against the soviet union on the side of Germany to reconquer the provinces ceded to the soviet union in 1940. By the middle of July the formerly Rumanian parts of Bukovina and Bessarabia were reconquered. But the Rumanian army did not halt at the old frontiers. It had to bear the brunt of the war against the soviet union in southwestern Ukraine, across the Dniester river, and in the siege of Odessa; and the losses of the Rumanian army were so great that the discontent silenced for a short while by the military successes grew again and assumed alarming proportions. The war effort strained the disrupted Rumanian economy so much that war weariness became general and a demand for an end of military operations was heard even in high army circles. The persecution of the Jews in Rumania reached a new height. The territory lying between the Dniester and the Bug rivers, outside the former boundaries of Rumania, was put under Rumanian administration as Transnistria, with the capital in Tiraspol. Antonescu was named marshal on August 23, in recognition of the Rumanian army conquests.

In September the chief of staff of the Rumanian army, Gen. Michael Jonescu, was killed on the eastern front. The administrator for Bessarabia and Moldavia, George Alexianu, had to promise radical agrarian reforms to appease the angry peasantry of the newly conquered or reconquered territories. On Oct. 22 it was announced that Rumania had denounced the Vienna pact, according to which she had ceded part of Transylvania to Hungary. A new plebiscite in Rumania was held on Nov. 9 in which again every citizen had to vote on Rumania's foreign and home policies and had to declare before the vote whether he was going to vote yes or no—whereupon he was handed the corresponding ticket. The German news agency declared beforehand that no one in Rumania doubted that the plebiscite would be an overwhelming demonstration of confidence in Antonescu and his work. But in spite of tremendously rising prices, the value of Rumanian exports had fallen in the first half of 1941 to 15,000,000,000 lei as against 20,000,000,000 for the corresponding period of the preceding year, and the imports from 15,000,000,000 to 9,000,000,000. Thus Rumania, in spite of victories and conquests, offered by the end of 1941 a picture of seething discontent and disorganization. The picture was not brightened by Rumania's declaration of war against the U.S. in Dec. 1941. (*See* also WORLD WAR II.)(H. KO.)

Rumbold, Sir Horace George Montagu (1869–1941), British diplomat, was born Feb. 5, the eldest son of Sir Horace Rumbold, also a diplomat. He was educated at Eton and entered the diplomatic service as an honorary attaché at The Hague. After holding a series of posts in Europe, the near east and Asia, he became chargé d'affaires at Berlin in July 1914, but left Germany at the declaration of war a month later. He served as minister to Sweden in 1916–19; minister to Poland, 1919–20; British high commissioner and ambassador to Turkey, 1920–24; and ambassador to Germany from 1928 to 1933, when he retired. He was considered one of Britain's leading experts in Asiatic and near eastern affairs. Sir Horace was the author of *The War Crisis in Berlin, July-August 1914* (1940). He died at Tisbury, Wiltshire, Eng., May 24.

Rundstedt, Karl Rudolf Gerd von (1875–), German army officer, was born Dec. 12 at Aschersleben, descendant of a noble family of Brandenburg. At the start of war in 1914 he commanded a company in Alsace, then after a period of service with the general staff saw action on the eastern front in Galicia and northern Poland. It was in the latter regions that he acquired military fame in 1939 during the Polish campaign. He was in command

at the fall of Cracow, Lodz and Przemysl. The battles of the river San and the bend of the Vistula, and the entry into Warsaw were further milestones in Gen. Rundstedt's career. For these accomplishments and for his successes during the invasion of the Low Countries and France in 1940 he was created marshal of the reich July 19, 1940. Rundstedt was in command of the southern group of German armies in the Russian campaign of 1941, and it was against his forces that the Russians first began their counter-offensive, at Rostov late in November. The Germans' rout from that city was their first major defeat of World War II. Dispatches from Berne in December reported that Rundstedt had resigned his command, but these rumours lacked confirmation at the end of the year.

Rural Electrification. The electrification of rural areas in the United States which received its impetus in 1935 with the establishment of the Rural Electrification administration, continued during the year 1941, the estimated number of farms with central station service exceeding 2,250,000 as of Dec. 31 in comparison with approximately 2,000,000 at the end of 1940.

In terms of the percentage of farms with central-station electric service the increase was from 32.6% to an estimated 37.0% at the end of 1941.

The approximate number and percentage of electrified farms at the end of previous years were as follows: 1934, 744,000 farms, 10.9%; 1935, 789,000 farms, 11.6%; 1936, 1,043,000 farms, 15.4%; 1937, 1,242,000 farms, 18.2%; 1938, 1,407,000 farms, 20.5%; 1939, 1,786,000 farms, 27.8%. Prior to 1935 substantially all electrified farms received power from private utility companies; after 1935, rural electric service was furnished by both private companies and co-operatives, nonprofit enterprises. Over 90% of the federal rural electrification loans had been made to the latter type of enterprise, essentially community-owned and operated businesses.

In response to the continuing demand of rural populations for electric service, congress authorized $100,000,000 for rural electrification loans during fiscal 1942. This authorization increased to $474,000,000 the total funds available for rural electrification through the Rural Electrification administration. By Dec. 31, 1941, it was estimated that the Rural Electrification administration would have allotted a total of more than $400,000,000 to 850 systems to finance on a self-liquidating basis the construction of rural electric systems comprising about 380,000 mi. of line to serve more than 1,250,000 rural consumers. At the close of the year 1941 approximately 350,000 mi. of line were in operation serving some 875,000 consumers in contrast to 267,846 mi. serving 674,495 consumers at the end of 1940. About 80% of all consumers were farm families; the balance consisted of schools, churches, commercial establishments and many types of rural industries.

National Defense.—As a result of World War II and the national defense program of the United States, rural electrification was assuming, perhaps unexpectedly, an important new role in furnishing power for decentralized defense industries and military establishments. A study by a national defense commission revealed that in both England and Germany quantities of war matériel were being produced in small rural workshops and shipped to assembly points. In the United States rural electric systems were serving army camps, aeroplane beacons, communication systems and many small industrial plants whose facilities were becoming increasingly important to the national defense program.

Farms.—In addition to wider availability of electric power in rural areas in 1941, farm consumption of power in the United States continued to increase and there was some further reduction in rates. Wider application of electric power to farm operations received an increasing amount of attention from agricultural colleges and research agencies of the department of agriculture. An appliance survey made by REA-financed systems during the spring of 1940 showed the percentage of relatively new farm consumers of electricity who acquired various appliances and equipment, among which were: radios, 89.7%; irons, 85.3%; washing machines, 55.0%; refrigerators, 41.8%; vacuum cleaners, 21.0%; water pumps, 18.4%; separate motors, 16.5%; hot plates, 15.2%; poultry lights, 10.5% and cream separators, 8.2%.

In order to serve areas of low income and low density on an economical basis, a limited number of self-help projects were financed by the Rural Electrification administration during 1941. Under the self-help plan the farmer members of the co-operative performed the common labour required in constructing the system; such as digging pole holes, clearing right of way and trimming trees, for which they received credits.

These were applied against the cost of wiring their houses or the purchase of appliances and equipment. Group purchase plans for obtaining electrical appliances and equipment at quantity discounts were developed and used more extensively by farm members of rural electric co-operatives during 1941. (R. B. C.)

Russell, Lady Mary Annette (pseudonym ELIZABETH) (1866–1941), British novelist, was the author of the 1940 best seller, *Mr. Skeffington*. Her first book, an autobiographical novel, *Elizabeth and Her German Garden* (1898), was written in Pomerania, where she lived for 19 years. Following the death of her first husband, a Prussian nobleman, she returned to England. Her other works include *The Adventures of Elizabeth in Ruegen* (1929); *In the Mountains* (1929); *The Enchanted April* (1932); *The Jasmine Farm* (1934) and *All the Dogs of My Life* (1936). Lady Russell went to the United States in 1939 to make her home. She died in Beaufort, S.C., Feb. 9.

Russell Sage Foundation. This foundation was created by Mrs. Russell Sage in 1907 as a memorial to her husband. Its purpose is "the improvement of social and living conditions in the United States of America." Its general aim is the study of the causes of adverse social conditions and the dissemination of information which will be of assistance to citizens and organizations seeking to ameliorate, remedy or prevent such conditions.

Printed reports of such studies are made available at moderate prices. Among its publications are *Consumer Credit and Economic Stability*, by Rolf Nugent; *The American Miners' Association*, by Edward A. Wieck; and *Social Work Year Book 1941*.

The original gift by Mrs. Sage was $10,000,000, to which she added $5,000,000 in her will. The income of the foundation in 1941 was approximately $570,000.

The offices of the foundation are at 130 East 22nd street, New York city. (S. M. HA.)

Russia: *see* UNION OF SOVIET SOCIALIST REPUBLICS.

Russian Literature. The swing-over of soviet foreign policy in Aug. 1939 deprived soviet Russian literature for the time of one of its staple themes, anti-fascism, but the soviet-German rapprochement did not find any positive reflection in literature. Nor was soviet literature greatly affected by World War II. Perhaps its most notable product was Erenburg's journalistic novel *Padenie Parizha* (*The Fall of Paris*), a communist picture of France on the eve of collapse.

Nikolay Shpanov's *Pervy Udar* (*The First Blow*), published a few months before the outbreak of war between Great Britain and Germany, is worth mentioning. Although hardly a work of literary distinction, it gave a graphic description of the first 24 hr. in the "future" aerial war between the U.S.S.R. and Germany. At the end of 1939 four annual "Stalin prizes," of 100,000 roubles each, were instituted for the best work of the year in fiction, poetry, drama and literary criticism. The first prizes were awarded at the end of 1940, the prize for fiction going to Sholokhov for the last instalment of his *Tikhy Don* (*Quiet Don*). Other works of note published during 1939–41 include Fedin's short novel, *Sanatoriy Arktur* (*Sanatorium "Arcturus"*), which, in theme and treatment recalls somewhat Mann's *Zauberberg;* Kaverin's *Dva Kapitana* (*Two Captains*), Vsevolod Ivanov's *Parkhomenko.* An unusual and charming book was Prishvin's *Neodetaya Vesna* (*Unclothed Spring*), a record of a hunter's communion with nature. In drama the years 1939–41 yielded new plays by Leonov, Katayev, Vsevolod Ivanov, Afinogenov, Svetlov and Korniychuk (another Stalin prize-winner). Most of these plays deal with contemporary subjects; but there were also a number of plays on Russian historical themes. The 500th anniversary of the Kalmuck national epic *Dzhangar* was celebrated in 1940, and the centenary of Lermontov's death was commemorated in July 1941. In poetry the publication of a new book of verse by Anna Akhmatova, *Iva* (*The Willow Tree*), to which was added a selection from her earlier books, was something of an event. It was her first since 1921. In the field of translations there was a new version of *Hamlet* by Boris Pasternak. The war between the U.S.S.R. and Germany led to a fresh outburst of patriotism among soviet writers and an increasing interest in Russia's past, accompanied by the continued rehabilitation of a number of Russian national heroes.

Russian émigré literature suffered badly because of the war and in its centre, Paris, was almost brought to a standstill. Among the works published in 1939, Bunin's *Lika* (a sequel to his great work *Arsenyev's Life*) and Merezhkovsky's two volumes on Dante stood out. New poems by Vyacheslav Ivanov, one of the founders of Russian symbolism, attracted well deserved attention.

(G. St.)

Russian S.F.S.R.: *see* UNION OF SOVIET SOCIALIST REPUBLICS.

Ruthenia. Also known as the Carpathian Ukraine, Ruthenia was formerly the easternmost part of the Czechoslovak republic. It was occupied in March 1939 by Hungary and incorporated into the latter state. It has an area of 4,690 sq.mi. with a population of 671,962. The people are in the great majority of Slavonic descent, closely related to the Ukrainians who live beyond the Carpathian mountains in eastern Galicia. The large majority of the population were engaged in agriculture and forestry in 1941; the most important product of the country is timber. The Ruthenian language enjoyed the status of a second official language in the province, which was represented by seven deputies in the Hungarian lower chamber. But the population was subject to a process of fast and progressive Magyarization, which grew in intensity after Hungary entered Germany's war against the soviet union as Germany's ally. For some time it had been thought that Ruthenia would become the nucleus for a national Ukrainian movement which, in the service of German expansion, would unite the Ukrainians in Poland, and especially those in the soviet union, into a German vassal state. After the conquest of the Polish and soviet Ukraine, however, the German government abandoned entirely the idea of any autonomy or national rights for the Ukrainians, who were put under direct German domination. Under these conditions the Ukrainian Ruthenia lost much of the political interest which had attached to it and was now openly subject to Magyarization. Some of the Ruthenian leaders continued to hope for participation in a Ukrainian national state, while others turned their attention to the possibility of a restoration of the democratic Czechoslovak republic of which they had been a part for 20 years, during which time the backward and neglected country had made great progress, both in its economic structure and in its educational level. (H. Ko.)

Rye. The rye crop in the U.S. in 1941 was 45,191,000 bu. from 3,498,000 ac. The 1940 crop was 41,149,000 bu. from 3,210,000 ac. and the ten-year (1930–39) average was 38,472,000 bu. from 3,320,000 ac. The U.S. record production of rye was 100,896,000 bu. in 1922.

U.S. Production of Rye by Leading States, 1941 and 1940

State	1941 bu.	1940 bu.	State	1941 bu.	1940 bu.
North Dakota	13,516,000	10,127,000	Kansas	979,000	672,000
South Dakota	7,510,000	6,060,000	Colorado	803,000	344,000
Nebraska	4,278,000	2,736,000	Pennsylvania	798,000	900,000
Minnesota	3,540,000	5,627,000	Michigan	783,000	1,160,000
Indiana	1,953,000	1,860,000	Illinois	728,000	856,000
Wisconsin	1,633,000	2,548,000	Oregon	638,000	608,000
Ohio	1,332,000	1,296,000	Montana	540,000	484,000
Oklahoma	1,224,000	969,000			

The acreage seeded to rye in the fall of 1940 was 6,182,000, and included areas seeded for pasture, soil improvement, etc., as well as the acreage seeded for harvest as grain. The acreage seeded in the fall of 1941 was 2% larger—6,289,000 ac. (*See* also CEREALS.)

(S. O. R.)

Sabatier, Paul (1854–1941), French chemist, was born Nov. 5 in Carcassonne, France. He began research as an assistant to Marcellin Berthelot, famous French chemist, was chemistry professor at the University of Toulouse after 1882 and was named dean of the university's science faculty in 1905. In 1912 he won the Nobel prize in chemistry and a year later he was named a member of the Institute of France and the Academy of Sciences.

He was also a member of the academies of Madrid, Amsterdam and Prague and was a fellow of the London Royal society. In 1926 Professor Sabatier received a special award from the American Chemical society, and in 1933 he received *in absentia* the Franklin medal, highest award of the Franklin Institute of Philadelphia, which cited his contributions to organic chemistry and his discovery of the catalytic activity of finely divided common metals.

Among his publications are *Travaux de Chimie, Leçons de Chimie Agricole, La Catalyse en Chimie Organique* and *Recherches sur les Sulfures et les Métaux Nitrés.* He died in Toulouse, France, Aug. 14.

Sabotage: *see* FEDERAL BUREAU OF INVESTIGATION.

Sackett, Frederic Moseley (1868–1941), U.S. ambassador and senator, was born Dec. 17 in Providence, R.I. After completing his studies at Harvard law school in 1893, Sackett took up practice in Columbus, Ohio. In 1898 he went to Louisville, where he was active in business and politics. In 1917 he was appointed federal food administrator for Kentucky. In 1924 he was elected senator from Kentucky, but resigned his seat in Dec. 1929 to accept the ambassadorship to Germany, a post he held until 1933. Sackett died in Baltimore, Md., May 18.

St. Louis. Eighth largest city of the United States, St. Louis, Mo., had a population of 816,048 by the federal census of 1940. An additional 541,567 persons live within the greater metropolitan district. Mayor (Jan. 1, 1942): William Dee Becker (Rep.).

By late 1941 from 40,000 to 60,000 had been added to the census figure of 1940, a consequence of the mushroom growth of war industries. Central location, minimum vulnerability to enemy attack and access to labour, fuel and raw materials have made St. Louis a focal point of such production. During the year the city was awarded $750,000,000 in defense contracts and an estimated $250,000,000 in subcontracts. New construction included a $106,000,000 small-arms ammunition plant, largest in the world in 1941.

In the winter of 1940–41, St. Louis won national attention through smoke elimination. In Sept. 1941 its citizens voted a charter amendment instituting civil service. Another amendment was voted requiring election of aldermen by residents of the respective wards they represent. Previously they were elected by the voters at large. By a count of 183,073 to 147,336 on April 2, 1941, Republican William Dee Becker, former St. Louis appellate judge, was elected mayor over his opponent, former Mayor Bernard F. Dickmann, Democrat, who had headed the city for two terms. Dickmann was elected in 1933 after 24 years of uninterrupted Republican rule.

When President Roosevelt late in 1941 transferred 12 federal agencies from overcrowded Washington, he moved to St. Louis the Rural Electrification administration and the Farm Security administration.

At the beginning of the 1941–42 fiscal year (April, 1941) the city deficit was $1,362,247 (a $320,482 decrease in a year); indebtedness, $72,245,500; assessed valuation of all property, $1,066,729,087; and the tax rate (including state and school), $2.74. (E. L. R.)

Sakatani, Yoshiro, VISCOUNT (1863–1941). Japanese statesman and financier, was born January 16 in Okayama-ken. After graduating from Tokyo Imperial university in 1884, he entered the department of finance. Sakatani, who was finance minister from 1906 to 1908, had been a fiscal adviser to the emperor. He was mayor of Tokyo, 1912–15, director of a number of corporations and president of Senshu university.

A few days before his death in Tokyo, Nov. 14, he was made a viscount by Emperor Hirohito.

Sales, Retail and Wholesale: *see* BUSINESS REVIEW: *Retail and Wholesale Trade.*

Salt. The United States is the leading salt producer of the world, with 28% of a total estimated at some 35,000,000 metric tons annually, followed by the soviet union with 14%, Germany 11%, United Kingdom 10%, China 9%, France 7%, India 5%, and Italy 5%.

For 1940, data were available only from the United States, where the output increased 8% over 1939, to 10,003,448 short tons, while consumption increased 7% to 9,866,800 tons. Both imports and exports were small, the former 30,000 tons and the latter 147,000 tons in 1940. (G. A. Ro.)

Salvador, El. The smallest of the Central American republics, located on the Pacific coast. Area: 13,172 sq.mi.; pop. (Dec. 31, 1940, official est.): 1,787,930, of which 37.4% was rural. Capital: San Salvador (104,000). Religion: Roman Catholic; language: Spanish. President in 1941: Gen. Maximiliano Hernández Martínez.

History.—El Salvador was politically quiet during 1941, the eleventh year of Gen. Martínez's presidency. The dominant factors of the year's political history were direct outgrowths of World War II. The Martínez government continued its policy of maintaining cordial relations with the United States and of repressing totalitarian propaganda. In May strict instructions were issued to teachers "to explain democratic doctrines and their significance" and to exclude from teaching any discussion of anti-democratic doctrines.

Moral support for Great Britain was repeatedly expressed in the press. On Sept. 8 a presidential decree ordered the closing of the last Salvadorean consulates in Germany. Japan's attack upon the United States was answered within 48 hours by a formal and unanimous declaration of war on Japan (Dec. 8). Declarations against Germany and Italy followed on Dec. 12.

Meanwhile the government froze all axis funds, and on Dec. 16 formally tendered emergency fuel and other facilities for use by any Allied ships and planes.

Education.—There were about 1,300 primary schools in 1941 (enrolment 90,000), 44 secondary and normal schools and one university.

Finance.—The monetary unit is the colón (value: 40 cents U.S. in 1941).

Trade.—In 1940 exports totalled $12,227,955, a 4% decline, with coffee comprising 76.5% (1939: 83.6%), gold and silver 8.8% (2.8%), minerals 6.2% (2.3%), sugar 1.7% (1.8%), balsam 1.1% (0.8%). The United States took 75.2% of all exports (1939: 59.9%), Norway 8.4% (7.2%), Honduras 4.2% (4.1%), Sweden 3.1% (4.3%). Imports (foodstuffs, textiles, machinery and miscellaneous manufactures) were valued at $8,108,044 (8.4%), supplied mainly by the United States 67.4% (53.0%), Great Britain 7.6% (6.9%), Italy 4.0% (4.3%), Honduras 3.4% (2.8%), France 2.6% (3.6%), Canada 2.3% (0.8%), Peru 2.2% (2.0%), Yugoslavia 1.3% (0.3%), Germany 1.3% (17.5%). Exports to Latin-American countries aggregated 6.9% (1939: 8.4%), imports from them 8.5% (6.7%).

Communication.—External communication is principally by sea and Pan American Airways, supplemented by the Inter-American highway and by railways. Railways totalled 602 km. in 1941. The national highway system (nearly 4,000 km.), already the best in Central America, was being rapidly expanded. The Inter-American highway, 183 mi. through El Salvador (cost to 1941: $4,000,000), was roughly two-thirds complete in 1941.

Agriculture.—Coffee is the dominant money crop (1940 export: 942,490 bags). The United States, Norway, Sweden and Italy are normally the heaviest consumers. Sugar is mainly for domestic consumption, cotton (1939–40: 9,000 bales) entirely so. (L. W. BE.)

Salvation Army. In the United States, war service of the Salvation Army was organized into four principal channels:

1. Operation of clubhouses for service men, as designated through the United Service organizations (*q.v.*).
2. Collection and salvage of waste paper, scrap metals, clothing and other discarded materials of value for defense.
3. Evacuation and emergency housing of civilians.
4. Operation of mobile canteens at defense installations.

In the United Service organizations' program the Salvation Army participated with five other national welfare agencies in the raising of a fund of $14,625,000 for the first year's operation of a chain of service clubs at camp and base communities, and for other leisure-time and recreational work among soldiers and sailors. By Dec. 31, 45 of these clubs, located from Maine to Hawaii, had been assigned to the Salvation Army for operation. A staff of more than 200 Salvationists and others was detailed for their direction and supervision. The first to come under enemy

THE SALVATION ARMY demonstrated its role in providing for the U.S. armed forces at a United Service Organizations rally May 20, 1941 in New York city

fire was the U.S.O. club operated by Major and Mrs. Alva M. Holbrook at Schofield barracks, Honolulu, raided from the air by the Japanese Dec. 7.

A national military and naval department with four regional supervisors stationed in New York city, Atlanta, Chicago and San Francisco was created for the co-ordination and execution of the war-welfare program. Administration of the Salvation Army's regular program is conducted from the same cities, where officers' training colleges are situated and the *War Cry*, the official gazette, is issued, under the four territorial commanders: (Eastern) Commissioner Ernest I. Pugmire, 120 West 14th st., New York city; (Central) Lt.-Commissioner John J. Allan, 713 North State st., Chicago; (Southern) Commissioner William C. Arnold, 54 Ellis st., Atlanta; and (Western) Lt.-Commissioner Donald McMillan, 115 Valencia st., San Francisco. Commissioner Edward J. Parker, national commander, with headquarters at 120 West 14th st., New York city, co-ordinates the administration of national policies.

The war—with its attendant family separations, transfer of technicians, and large-scale movements of peoples for safety and defense purposes—brought hundreds of unusual inquiries to the organization's missing persons bureau, which successfully traced 722 individuals with whom relatives or friends had lost contact.

In other lands, the war procedures established in 1939 at the instruction of General George L. Carpenter, international commander at London, were continued and expanded. In North Africa motorized canteens accompanied the British forces across the deserts in their westward offensive; at Icelandic and other North Atlantic bases the Canadian War Service supplied comfort to the continent's defenders; in China, Malaya, the Dutch East Indies and the Philippines women and children in military target areas were evacuated to Salvationist institutions for care.

Meanwhile, some 27,500 men and women officers—stationed at 17,900 corps and outposts and at 1,700 hospitals, homes, shelters and other Salvationist institutions in almost 100 countries, territories and colonies—proceeded with their established evangelistic, health and welfare schedule unless obliged to halt because of actual combatant conditions. (E. J. PA.)

Samara: *see* KUIBYSHEV.

Samoa, American. A possession of the United States of America. It lies about 2,700 mi. east of the northern tip of Australia and 2,200 mi. south of the Hawaiian islands; comprises the island of Tutuila and all other islands of the Samoan group E. of longitude 171° W., including Rose island, Tau, Olosega, Ofu, Aunuu and Swains. The principal island is Tutuila, area about 40 sq.mi. Pago Pago, the capital, population 934, has the safest and best harbour in the South Seas. Total population by census of April 1, 1940, 12,908, including 11,919 natives of Samoa (Polynesians); the remainder are foreign born and personnel of the U.S. naval establishment.

Public schools had an average enrolment of 3,000 during 1940–1941. Health and sanitary conditions were excellent. All medical attention is given by naval medical officers who treat the natives free of charge.

The only bank is the Bank of American Samoa, conducting a commercial banking business as a division of the treasury of the naval government of American Samoa, which owns the capital stock. Copra is the chief export; 862 tons, returning $23,557, were exported during the copra crop year ending Jan. 31, 1941; 325 tons of mats, rugs and native curios, returning $69,582, were exported during the fiscal year ending June 30, 1941. Imports: from U.S. $112,998; from New Zealand-Australia $131,984; other $18,721. The island has no indebtedness and receives no financial aid from the U.S. government. (G. L. WF.)

American Samoa was not subjected to attack in 1941 after the outbreak of war in the Pacific Dec. 7.

Samoa, Western: *see* MANDATES; PACIFIC ISLANDS, MANDATED.

Sanborn, John Pitts (1879–1941), U.S. newspaperman and music critic for the *New York World-Telegram*, was born in Port Huron, Mich. After graduating from Harvard, Sanborn was music editor for the *New York Globe*, 1905–23. During the summer months from 1912 to 1923 he served as correspondent in Europe for New York newspapers, and in 1924 he joined the *New York Evening Mail* staff, writing musical reviews. He remained at this post when the paper merged with the *Telegram* and later with the *Evening World*. For his achievements in musical criticism he was decorated by the governments of Italy and France. His years in France inspired him to write a volume of poetry, *Vie de Bordeaux* (1917).

He also wrote *Prima Donna*, a novel of the opera (1929); *Greek Night*, a novel (1933); and the *Metropolitan Book of the Opera* (1937). He also served as music commentator on the radio. He died in New York city, March 7.

Sand and Gravel. The United States production of sand in 1940 was 78,674,000 short tons, and of gravel 159,634,000 tons, a total of 238,308,000 tons, as compared with 72,542,000 tons of sand, 153,466,000 tons of gravel

and a total of 226,008,000 tons in 1939. In 1940 building construction took 44% of the sand output and road paving took 39%; among the less important uses, foundries used 6% as moulding sand, and glass manufacture took 3%; of the gravel output, 21% was used in building construction, 70% in road paving and 7% in railroad ballast. (G. A. Ro.)

Sand Island: *see* MIDWAY ISLANDS.
Sandstone: *see* STONE.

San Francisco. Twelfth largest city of the United States, San Francisco, Calif., had a population of 634,536 by the federal census of 1940. On July 1, 1941, officials of California estimated the city's population at 675,000. Mayor (Jan. 1, 1942): Angelo J. Rossi.

Residential building permits issued during the decade 1931–41 totalled nearly $100,000,000, with 1941 permits accounting for about one-fourth of the 10-year total.

Defense industries dominated San Francisco bay area activities during 1941 and contributed greatly to pay rolls and employment. Defense contract awards to bay area establishments at the close of 1941 amounted to more than $1,400,000,000, compared with about $750,000,000 at the beginning of the year. Of the former amount, shipbuilding awards totalled $911,000,000; construction awards, $380,000,000; supplies and equipment, $109,000,000. Shipbuilding employed about 55,000 workers at the end of the year. There were 181 public schools in San Francisco in 1941, also many private, parochial, nonsectarian and technical schools. The University of San Francisco and San Francisco State Teachers college are located in the city, and near by are the University of California at Berkeley, the California School of Fine Arts and Stanford university.

After the outbreak of war between Japan and the United States in Dec. 1941, rigid blackouts were enforced upon the city. Air-raid alarms were sounded on several occasions, but no actual aerial attacks had occurred by the end of the year.

Santo Domingo: *see* DOMINICAN REPUBLIC.
São Tomé: *see* PORTUGUESE COLONIAL EMPIRE.
Sarawak: *see* BORNEO.

Saskatchewan. The middle of the three prairie provinces of Canada, Saskatchewan was created a province by the dominion parliament Sept. 1, 1905. Area, 251,700 sq.mi.; pop. 887,747 (dominion bureau of statistics, 1941). Seat of government, Regina (56,520). The province as of 1941 sent 21 members to the house of commons, Ottawa, Ont., and 6 senators to the senate. The principal cities with populations (1941 census) are: Saskatoon (42,269), Moose Jaw (20,496), Prince Albert (12,290), Weyburn (6,119).

The Liberal party, elected June 8, 1938, continued in power in 1941 under the premiership of William Patterson. There were no political or other happenings of special significance during the year.

Education.—The province has autonomous control over formal education. In 1939 the daily average school attendance was 163,356; teachers numbered 7,415; government grants and tax revenue amounted to $9,559,875.

Communication.—In 1940 there were 4,315 mi. of surfaced roads and 147,503 mi. of improved earth roads. Total expenditures on roads for 1939 were $3,401,679.

Finance.—Saskatchewan through 1941 had never defaulted on its bond maturities. Ordinary revenue in 1940 was $24,958,420; ordinary expenditure was $25,258,324.

Agriculture.—The following figures, as reported by the dominion bureau of statistics, show the value of the field crops for 1941: wheat, $69,360,000; oats, $27,200,000; barley, $10,640,000; rye, $2,583,000; flaxseed, $4,464,000; potatoes, $2,197,000; hay, clover, $3,396,000; alfalfa, $672,000; fodder corn, $223,000.

The total value of crops in 1941 was $120,781,000. In 1940 it was $178,887,000. (J. T. C.)

Saudi Arabia: *see* ARABIA.

Savings Banks, Mutual. The year 1941 was eventful in the history of mutual savings banks in the United States, for two banks, those first established in the country, the Provident Institution for Savings, Boston, Mass., and the Philadelphia Savings Fund society, Philadelphia, Pa., completed 125 years of service. From two banks in 1816 the system had expanded to 538 savings banks as of July 1, 1941, with total assets of $11,938,000,000, an increase during the year of $23,400,000 as compared with an increase of $173,600,000 for the year ending July 1, 1940. Deposits credited to 15,906,157 accounts totalled $10,606,000,000 on July 1, 1941, the highest amount on record. The combined surplus was $1,284,000,000, or 12·11% of deposits. Dividends averaged 1·9% in 1941, a decline from 2·04% in 1940 and 2·17% in 1939. Two savings banks were absorbed by merger during the year, reducing the total number of banks to 538.

Defense Bonds.—The major development in the savings banks during 1941 was the qualification of these banks as agents for the sale of U.S. defense bonds. Early in the year the rising cost of the defense program made it imperative for the U.S. treasury to raise huge sums of money. The amount of funds to be raised exceeded the possible return from increased taxes, and the treasury department decided to increase the sale of government bonds to the individual investor, thus avoiding the sale of too many bonds to commercial banks. Three new series of U.S. bonds, called defense bonds, went on sale May 1. The bonds designed for the small investor are called U.S. defense bonds series E and are almost identical with the "baby bonds" that have been on sale since early 1935. They are discount bonds issued at 75% of face value and grow in redemption value every six months after the first year to full face value at the end of ten years. If held to maturity they yield the purchaser the equivalent of 2.9% interest compounded semiannually. The bonds are issued in denominations of $25, $50, $100, $500 and $1,000, and purchases are limited to $5,000 face value a year to any one person.

They are nonnegotiable and redeemable at the option of the holder not less than 60 days from the date of issue.

Series F and G bonds are designed for corporations, other than commercial banks, trustees, pension funds and large individual investors. Series F bonds are discount bonds issued at 74% of face value and mature in 12 years with a yield equivalent to 2.53%, compounded semiannually. Series G bonds are income bonds, issued at par, with a maturity of 12 years, bearing interest on par value at 2½%, paid semiannually by treasury cheque. Both series F and G bonds are nonnegotiable and redeemable, only after one month's notice in writing, on the first day of any month not less than six months from date of issue, at fixed redemption values specified on their face. To discourage cashing in of series G bonds before maturity the redemption values are fixed below par on a scale that provides the purchaser with approximately the same yield as he would receive from a series F bond held for the same period of time. Series F and G bonds may be purchased to a total of $50,000 cost price in any one year.

Savings banks may qualify as issuing agents for series E bonds and may take orders for series F and G bonds. They may also sell defense savings stamps, which are available in denominations of $.10, $.25, $.50, $1.00 and $5.00. When enough stamps have been accumulated they may be turned in for a defense savings bond. Of the 538 mutual savings banks, 506 had qualified as issuing banks on Nov. 1, 1941.

In the seven months period to Dec. 1, 1941, mutual savings banks distributed $119,056,650 par value of defense bonds and stamps.

Life Insurance.—During the year, a third state, Connecticut, legalized the sale of savings bank life insurance. The Connecticut plan follows the New York law more closely than it does the Massachusetts law. It allows policies up to $1,000 and the number of policies to three for one individual or maximum insurance of $3,000. There is a Savings Bank Life Insurance fund to which the issuing banks subscribe. This fund is controlled by a board of seven trustees, appointed by the governor, and these trustees provide the general machinery under which the policies are issued. A special committee, including the governor and the commissioners of banking and insurance, is responsible for putting the law into operation.

On Oct. 31, 1941, the end of the third fiscal year of operation of insurance departments in the savings banks of New York state, there were 22 issuing banks and 17 agency banks, an increase of 14 issuing and seven agency banks during the year. This substantial growth in the number of banks selling savings bank life insurance may be attributed to the changes made in the New York law in 1940.* On Oct. 31, 1941, there were $17,800,000 of insurance in force, representing 21,900 policies, an increase of $6,700,000 in insurance in force and of 8,200 policies since Oct. 31, 1940. In the state of Massachusetts there were 29 issuing banks and 108 agency banks on Oct. 31, 1941, an increase of two agency banks during the year. In that state there were $209,600,000 of insurance in force, representing 232,200 policies, an increase of $17,600,000 in insurance in force and of 20,200 policies since Oct. 31, 1940.

*After one year of operation, several changes were made in the statute governing savings bank life insurance, to conform with the views of savings banks. The changes were made to encourage more banks to enter the business. They were designed to place more responsibility on savings-insurance banks for the administration of the system than the original laws permitted, without diminishing the supervisory functions of the state insurance and state banking departments, to which all the administration duties were at first also assigned. The amendment provided that contributions to the insurance guaranty funds could be made from the savings banks; whereas originally these funds were required to be subscribed by individuals.

Great Britain and Europe.—No reports on the activities of the savings banks on the European continent during 1941 were available. The reports from Great Britain, however, were that the trustee savings banks had been a great help in raising funds for war purposes since all deposits in "ordinary accounts" were turned over to the National Debt commissioners for investment in government securities and deposits in "special investment accounts" had been invested entirely in government bonds since the outbreak of the war.

Balances in trustee savings banks were £360,489,000 on Aug. 31, 1941, an increase of £52,542,000 for the year ending that date as compared with a gain of £22,467,000 for 1940. This unusual gain was believed to be due to the work of the savings groups, to War Weapons Weeks and to the deposit of hoarded money. At the end of August there were 225,000 savings groups in England, Wales and Scotland, with a total membership exceeding 13,000,000 savers. These groups collect regular weekly savings from their members and deposit a substantial part of these funds in the trustee savings banks. The balance is deposited in the Post Office Savings bank or used to purchase national savings certificates and defense bonds.

A War Weapons Week is a special campaign managed by an individual city or village to raise a definite sum of money for a specific purpose. The first War Weapons Week was held in the Yorkshire city of Leeds in June 1940. The citizens of Leeds decided that they would like to provide Great Britain with 100 bombing planes, at a cost of about £2,000,000. They could not afford to give the money, but by lending it at low rates in interest, they could help equally as well. A seven-day campaign was staged. Posters, processions, speeches and loud-speakers urged citizens to roll up to the banks, post offices and other centres and invest in war bonds and certificates. At the end of this first War Weapons Week a total of more than £3,500,000 had been brought in. Since then, every town of any consequence has held its own Week with equally satisfying results.

Schizophrenia: *see* PSYCHIATRY.

Schobert, Eugen Ritter von

(1883?–1941), German general, commander of a German army on the Russian front at the time of his death, was born in Wuerzburg, Germany. Steeped in the military tradition of his family, long noted for its officers, he entered the First Bavarian infantry regiment at 19. He won the iron cross and other decorations for his services in World War I. He served in the war ministry and as inspector of infantry in 1933. In 1936 he commanded one of the divisions which occupied the Rhineland and in July 1940, in recognition of his manoeuvre which led to the penetration of French lines north of Verdun, he was made a colonel general by Hitler.

In Aug. 1941 he was put in command of the German-Rumanian army thrusting northeast to join the German forces coming down from Galicia. A German high command communiqué disclosed that he was killed in action, Sept. 12.

Schroeder, Ludwig von

(1884–1941), German general, was born Sept. 12. He organized Germany's civil air-raid protection league, of which he was president, and enrolled an estimated 13,000,000 reich nationals into this nation-wide air defense corps. Hitler, on the occasion of his 50th birthday in 1939, promoted von Schroeder to the rank of general of anti-aircraft. After the fall of Yugoslavia, he was made military commander of Serbia. He died at Hohenlychen, Brandenburg, July 29, from injuries he received in an aeroplane crash in Belgrade earlier in the month.

Schulte, Karl Josef

(1871–1941), German cardinal, archbishop of Cologne, was born Sept. 14 in Westphalia, the son of a farmer. In 1931 the cardinal protested against nazi "misconceptions of Christian teachings." Two years later, however, he tried to come to terms with the Hitler regime. Then acting for the Fulda conference of German bishops, he formally revoked the church ban on the nazi movement, explaining that the reasons for the ban were no longer existent. This apparent understanding was short lived. Clerical protests against nazi persecution of churchmen mounted, and in both 1935 and 1938 Cardinal Schulte signed pastoral letters issued by the German bishops containing charges that the nazis violated church rights and listing grievances against the regime. He died in Cologne, March 11.

Schuman, William Howard

(1910–), U.S. composer and music teacher, was born in New York city. A pupil of Persin, Haubiel and Roy Harris, he also studied at the Salzburg Mozarteum. His compositions prior to 1941 included *Choreographic Poem* (1934), *Symphony No. 1* (1935), *String Quartet No. 1* (1936), *Prelude and Fugue, Symphony No. 2, Pioneers and String Quartet No. 2* (1937). His *Quartet No. 3* was given its first public performance by the Coolidge string quartet in Town hall, New York city, Feb. 1940. A cantata, *This Is Our Time*, which was given its premiere in New York city, July 1940, is unusual in that it is a choral work written for nonreaders of music; originally composed for the People's Philharmonic Choral society, a workers' amateur group.

His *Symphony No. 3*, played for the first time by the Boston Symphony orchestra at Boston, Mass., in Oct. 1941, received wide critical acclaim.

Science and World Order, British Association Conference on.

The most important event in the history of that division of the British association devoted to the study of the social implications of advances in science was the conference on Science and World Order held at the Royal Institution, London, on Sept. 26, 27 and 28, 1941. The conference was truly international in character, for distinguished speakers representing science in Britain, the empire, the United States of America, the U.S.S.R. and other countries, indicated the lines on which science could assist in planning a world order and in serving national needs. The six sessions of the conference were devoted to discussions on science in government, science and human needs, science and world planning, science and technological advance, science and postwar relief and science and the world mind. Sir Richard Gregory, president of the British association, delivered the inaugural address and presided at the first session. The chairmen of the remaining sessions, in the order just named, were the American ambassador, J. G. Winant, the Soviet ambassador, M. Maisky, the president of Czechoslovakia, Dr. Beneš, the Chinese ambassador, Dr. Wellington Koo and H. G. Wells.

At the end of the sixth session, Sir Richard Gregory announced that committees would be appointed to prepare reports dealing with important points which had been raised during the sessions and presented a charter of scientific fellowship which had been drawn up by a committee of the division.

It is difficult to summarize in brief compass the results of a three-day discussion which ranged over so many fields of thought and action; perhaps the most hopeful method is to group those proposals which call for international action and planning and those which call for similar efforts within national boundaries; and it must be emphasized that in every instance objective scientific study was demanded, the results of which were presented to governments for appropriate political action.

Thus in the international sphere it was clearly brought out that there existed an urgent need for more accurate and detailed knowledge of the extent of the material resources of the world, particularly of the sources of energy and of food. The joint use of heat and power calls for regional planning on a large scale; the use of raw materials for the common benefit of mankind is indispensable to any successful scheme of world order and to the development of backward areas; international planning in agriculture is necessary to avoid the extremes of waste in one area and want in another. A problem raised by the war was that due to Russia's scorched-earth policy and it was proposed that research stations in Canada should multiply grain bred for its suitability to the conditions prevailing in those agricultural regions in Russia which were devastated and that a similar policy should be followed in respect of fruit trees. International co-operation was demanded in the fields of epidemiology and in the systematic use of the natural curative resources of Europe. It was concluded that international organizations are a prerequisite for any successful postwar food policy and for implementing efficiently measures against malnutrition.

Among topics of national interest, the relations between science and government were discussed at considerable length; existing contacts in Great Britain were described and directions were indicated in which these contacts might be extended. The work of the Tennessee Valley authority was described and discussed and examples were reviewed from British colonial history of successful co-operation between science and government. Town and country planning, diet, education, housing, public health, public heat supply, the easing of housework—these are examples of topics concerning which constructive criticisms and outline plans were made in many of the sessions.

The seven points of the charter of scientific fellowship are being given *in extenso*. They followed a preamble which asserted that World War II

involved an age-old conflict of ideas and that complete freedom of thought and interchange of knowledge and opinion were supreme necessities. These seven points were termed a Declaration of Scientific Principles:

(1) Liberty to learn, opportunity to teach and power to understand are necessary for the extension of knowledge, and we, as men of science, maintain that they cannot be sacrificed without degradation to human life.

(2) Communities depend for their existence, their survival and advancement, on knowledge of themselves and of the properties of things in the world around them.

(3) All nations and all classes of society have contributed to the knowledge and utilization of natural resources, and to the understanding of the influence they exercise on human development.

(4) The service of science requires independence combined with cooperation, and its structure is influenced by the progressive needs of humanity.

(5) Men of science are among the trustees of each generation's inheritance of natural knowledge. They are bound, therefore, to foster and increase that heritage by faithful guardianship and service to high ideals.

(6) All groups of scientific workers are united in the fellowship of the commonwealth of science, which has the world for its province and the discovery of truth as its highest aim.

(7) The pursuit of scientific inquiry demands complete intellectual freedom and unrestricted international exchange of knowledge; and it can only flourish through the unfettered development of civilized life. (A. FN.)

Scientific Research and Development, Office of.

The Office of Scientific Research and Development (OSRD) was created in the Office for Emergency Management (*q.v.*) by executive order 8807 of June 28, 1941. Dr. Vannevar Bush (*q.v.*) of the Carnegie institution of Washington was appointed director. The functions of the office were:

(a) Advise the president with regard to the status of scientific and medical research relating to national defense and the measures necessary to assure continued and increasing progress in this field.

(b) Serve as the centre for the mobilization of U.S. scientific personnel and resources in order to assure maximum utilization of such personnel and resources in developing and applying the results of scientific research to defense purposes.

(c) Co-ordinate, aid and, where desirable, supplement the experimental and other scientific and medical research activities relating to national defense carried on by the departments of war and navy and other departments and agencies of the federal government.

(d) Develop broad and co-ordinated plans for the conduct of scientific research in the defense program, in collaboration with representatives of the war and navy departments; review existing scientific research programs formulated by the departments of war and navy and other agencies of the government, and advise them with respect to the relationship of their proposed activities to the total research program.

(e) Initiate and support scientific research on the mechanisms and devices of warfare with the objective of creating, developing and improving instrumentalities, methods and materials required for national defense.

(f) Initiate and support scientific research on medical problems affecting national defense.

(g) Initiate and support such scientific and medical research as may be requested by the government of any country whose defense the president deems vital to the defense of the United States under the terms of the act of March 11, 1941, entitled "An Act to Promote the Defense of the United States"; and serve as the central liaison office for the conduct of such scientific and medical research for such countries.

(h) Perform such other duties relating to scientifit and medical research and development as the president may from time to time assign or delegate to it.

Within the OSRD are the National Defense Research committee (NDRC) and the Committee on Medical Research (CMR). The former assists the director of the OSRD in the mobilization of the scientific personnel and resources of the U.S., while the latter advises and assists with special reference to the medical personnel and resources of the U.S. The NDRC operated as a committee of the Council of National Defense from June 27, 1940 until June 28, 1941, during which time it entered into a number of contracts which were assumed by the OSRD.

The OSRD operates through contracts with scientific laboratories in academic and industrial establishments. As of Dec. 31, 1941, the OSRD had concluded 424 contracts, while work was actively under way under approximately 264 additional letters of intention for which covering contracts were in the process of negotiation. These contracts and authorizations were with a total of 73 academic and 55 industrial establishments. Most of the work of the OSRD was started at the direct request of the armed services. Practically all of it is of a confidential nature which makes it impossible to reveal details. However, results of the OSRD efforts had already been shown at the end of 1941 in orders placed by the armed services for equipment. Between June 27, 1940 and Dec. 31, 1941 the OSRD and its predecessor NDRC had received a total of $25,702,536 to be used in carrying out its objectives. (I. ST.)

Sculpture.

Stimulating sculpture exhibitions were held by representative groups, new acquisitions were made by leading museums and several important public projects, as well as various lesser ones, were brought to completion during 1941. The democratization of art, assiduously cultivated for a number of years through government art channels, including competitions and exhibitions, was continued throughout the United States with further evidence of popular interest and appreciation.

Serious problems, however, were presented to sculptors, who in the years preceding had seen the promise of rich opportunities for the development of sculpture. Far-reaching readjustments became necessary. While many were put back on their own resources as a result of the tapering off of the federal art projects, numerous young sculptors were called to national service in the armed forces and in defense preparation. While these conditions necessarily affected the volume of sculpture production and other activity, much work of vitality was produced. In the contemporary field both conservatives and moderns held their ground, the latter showing as before much vigorous experimentation with methods and materials.

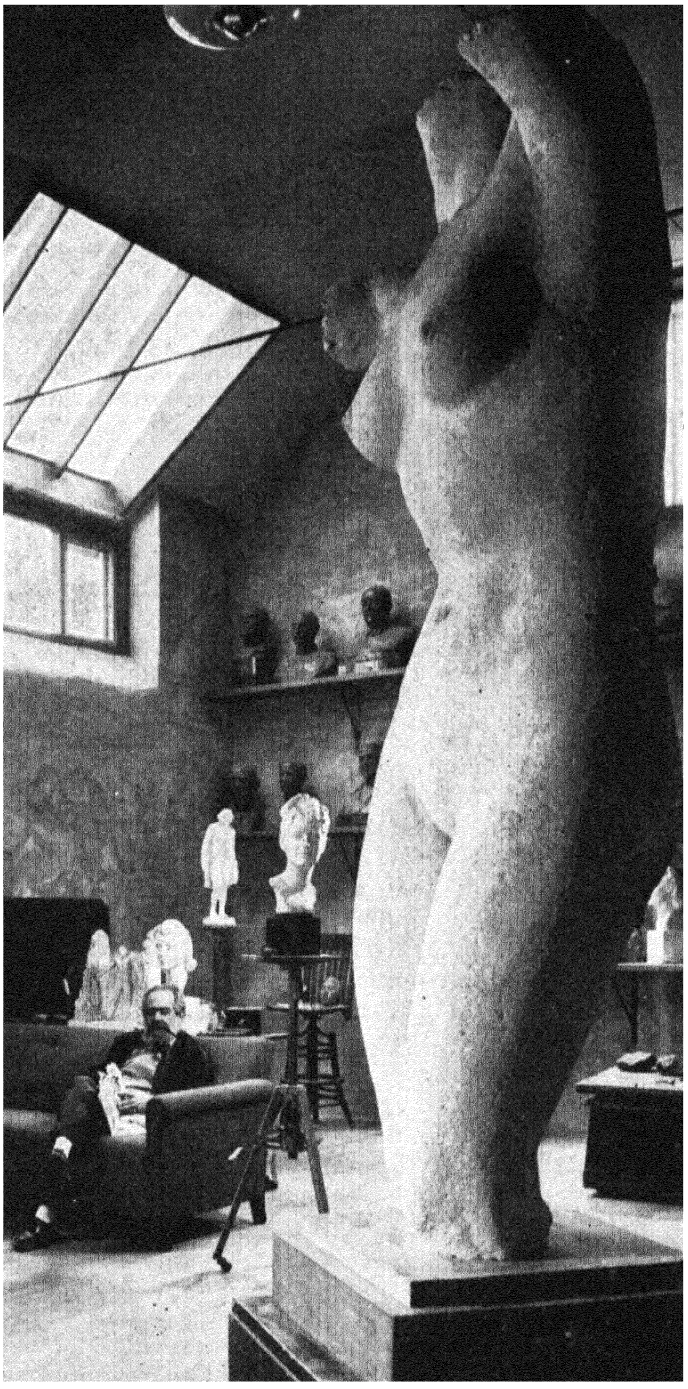
National Gallery of Art.—The major event of 1941 fell in the field of historical sculpture with the installation at the National Gallery of Art in Washington, D.C., of the famous Renaissance sculptures from the Mellon and Kress collections. This group of some 70 pieces, showing the efflorescence of the Florentine school led by Donatello, became at once one of the most important collections in the United States, impressively illustrating the work of Verrocchio, Mino da Fiesole, Rossellino, Pollaiuolo, the Della Robbias and other Italian and French artists of the period. Recognition of the rich opportunities for study and appreciation of these splendid old world treasures was one of the high lights of the opening of the National gallery in March.

Shows.—In the contemporary field recognized groups were active, including the youthful Sculptors' Guild which again served to bring together representative work by younger sculptors. Showing air raids, refugees and traditional American figures with folk art implications, the artists who exhibited in a landscaped open lot in New York city, gave perhaps the best illustration of the vigorous realistic and experimental trends being followed at the present time. The work represented in particular a new-developing cross-section of New York and nearby talents, many of them products of the federal art projects. The conservative National Sculpture society limited itself in 1941, on the other hand, to two small shows, one of which was devoted to work in relief, with special emphasis on medallic sculpture.

Government Sponsored Work.—Most conspicuous vitality was shown perhaps in the public works completed under national and civic sponsorship, including decorative sculpture for post offices and courthouses. Striking examples were the eight granite reliefs for the façades of the Philadelphia courthouse, completed under the auspices of the Section of Fine Arts of the Public Buildings administration. Edmond Amateis did the four large reliefs on the subject of "Mail Delivery," and Donald De Lue the four on "Law and Justice" which were set in place in August, both groups showing maturity of accomplishment and decorative force in style. Although a number of other similar works were produced as the result of competitions among sculptors, the Philadelphia groups constituted the latest major project completed. The section, however, continued its awards, giving first prize in a competition conducted in 13 states to two figures executed by Sahl Swarz, a New York sculptor, on subjects of Freedom. The figures were to be completed in bronze for the Statesville, N.C., courthouse and post office.

Memorials.—Work on sculptured memorials also occupied the public's interest in 1941. The year saw the essential completion of the huge Mt. Rushmore memorial by the late Gutzon Borglum, which was pronounced ready for dedication. Showing the gigantic heads of Washington, Jefferson, Lincoln and Theodore Roosevelt on the crest of a granite peak in the Black Hills of South Dakota, the monument required 14 years to complete and is one of the most ambitious projects realized by a modern sculptor. New York university, whose sculptural hall of fame contains the busts of famous Americans, made an addition to the group by authorizing a bust of Stephen Collins Foster, the American composer of folk music. The work was assigned to Walker Hancock and was unveiled in May. Another monument to a historic figure was a statue of Peter Stuyvesant, the Dutch governor of New Amsterdam, which was unveiled in Stuyvesant park, New York, on ground originally part of Stuyvesant's farm. The seven-foot bronze by Gertrude V. Whitney was presented to the city by the Netherlands America foundation.

Perhaps the most important sculptural assignment during the year was the award to Rudulph Evans of the $35,000 contract for a statue of



JO DAVIDSON in his Lahaska, Pa., studio, completed in 1941. The nude in the foreground is called "Torso"

Thomas Jefferson for the Jefferson memorial in Washington, D.C. Evans' four-foot model of the third president won a national competition sponsored by the Jefferson Memorial commission in which 100 sculptors took part. The statue when completed will be a bronze of heroic proportions standing 18 feet high on a seven-foot pedestal in the main hall of the memorial.

Museums.—As usual museums made prominent additions to their sculpture collections through purchases and gifts. A 15th century north German bronze font bearing the signature of Goteke Klinghe and the date 1483, acquired by the Museum of Fine Arts, Boston, Mass., and a bronze bust of Dolores Ibarruri, called "La Pasionaria," one of the leaders of the loyalist forces in the Spanish civil war, by Jo Davidson, which was obtained by the Museum of Modern Art, New York city, were among the most prominent. Seven pieces by contemporary sculptors, including Malvina Hoffman, William Zorach, A. A. Weinman and Gaetano Cecere, also went to augment the growing collections of the new Norton Gallery and School of Art in West Palm Beach, Fla.

Europe.—Sculptural achievement in Europe was again greatly limited by the war, and the production of few works of prominence was recorded during 1941. Great Britain continued its efforts to preserve normal productivity, and was among the most successful in promoting the careers of sculptors. Many of France's well known artists scattered before and after the fall of France and sculptural activity had been virtually at a standstill there since the German invasion. Secondary Metals.

Practically no data on the recovery of secondary metals are collected outside the United States. In the United States the recovery is mainly from two different classes of material: first, new scrap, that is scrap made in the fabrication of new metal, plus any new products that have been discarded because of faulty construction or material; and second, old scrap, which is made up of worn-out products discarded from the pool of metal in use and collected as "junk."

*Ratio of secondary recovery to consumption of new metal; where a second figure appears, this is the percentage of the total secondary metal recovered from *old* materials, the remainder having come from the reworking of new plant scrap.
†Includes some in chemical compounds. ‡Other platinum group metals.

In addition to the nonferrous metals listed in the table there was consumed in the United States in 1940 a total of 44,530,000 short tons of ferrous scrap of all types, as compared with 36,327,000 tons in 1939. The 1940 total included 25,048,000 tons made in the consumers' own plants (mainly new scrap) and 19,482,000 tons of purchased scrap (mainly old scrap). In addition, exports of scrap in 1940 were 3,142,000 tons, against 4,015,000 tons in 1939, making the total ferrous scrap supply 47,672,000 tons in 1940 and 40,341,000 tons in 1939. These tonnages of scrap were considerably greater than the tonnages of pig iron produced (41,254,000 tons in 1940 and 31,076,000 tons in 1939), and compared with 59,806,000 tons of steel made in 1940 and 47,142,000 tons in 1939. (G. A. Ro.)

Second World War: *see* WORLD WAR II.

Secret Service, U. S.

The United States secret service is a division of the treasury department and is one of the oldest federal law-enforcement agencies, having been established during the Civil War. Its major duties include the protection of the person of the president of the United States, the members of his immediate family and the president-elect; the policing of the White House and its grounds; the suppression of the counterfeiting and alteration of all government obligations; the protection of treasury buildings, money and securities, and the enforcement of other laws relating to the treasury department. The successful performance of the protective duties of the secret service in time of war is of vital importance to the United States, and such duties represent a grave and serious responsibility.

During the period 1932 to 1936, victims of passers of counterfeit money in the United States lost an average of $771,000 a year. In 1937, secret service chief Frank J. Wilson began an experiment designed to reduce counterfeiting losses by teaching Americans to know the difference between good and bad money. At the close of the fiscal year of 1937, counterfeiters' victims had lost only $519,000. The educational work was broadened, and in 1940, under the slogan, "Know Your Money," the secret service exhibited instructive motion-picture films and delivered enlightening talks to nearly 5,000,000 people. Beginning with the 1941 fall semester, the secret service succeeded in having its 32-page "Know Your Money" booklet introduced as a part of the regular curricula of junior and senior high schools throughout the United States.

The value of the secret service program of crime prevention through education, as opposed to the suppression of crime by the age-old methods of investigation, prosecution and imprisonment is indicated by the fact that for the fiscal year 1941, victims of counterfeit notes lost only $91,000, a startling drop of 88% from the 1936 average.

During the fiscal year 1941, the secret service made a total of 2,949 arrests, representing the following violations: 198 for making or passing counterfeit notes; 554 for making or passing bogus coins; 64 for making or passing altered currency; 1,859 for forging government checks; 25 for violation of the Gold Reserve act; 10 in counterfeit or altered stamp cases; 7 for violating the Federal Farm Loan act; 8 for making false claims against the government; and 224 for miscellaneous cases.

A total of 2,876 cases were disposed of, and in the cases brought to trial there were 2,572 convictions and 76 acquittals. In the other cases disposed of, 228 persons were dismissed, not indicted or died before the trial. Convictions were obtained in 97.1% of the cases brought to trial, and it is interesting to note that this percentage was exactly the same as for the fiscal year 1940. Secret service agents investigated 18,095 criminal cases and 3,534 noncriminal cases during the fiscal year 1941.

With the ever-increasing use of coin-operated merchandise vending machines, this form of American business has suffered stupendous monetary losses through the use of worthless coin slugs in place of genuine coins. Telephone and traction companies, cigarette vendors and others have suffered yearly losses of $5,000,000 as a result of this widespread fraud. During the fiscal year 1941, the secret service succeeded in obtaining an interpretation of the counterfeiting laws which permits federal prosecution of coin-slug manufacturers and dealers. Arrests were made in many parts of the nation, and convictions were obtained. A decided drop occurred in the use of slugs, and it was expected that the prompt action of the secret service would end this nation-wide and pernicious fraud.

It was not expected that the involvement of the United States in war would necessitate the cancellation of the long-range program of the secret service to prevent crime by education. (F. J. W.)

Securities: *see* LAW: *Securities;* BUSINESS REVIEW: *Securities and Banking;* STOCKS AND BONDS.

Securities and Exchange Commission.

Securities effectively registered with the Securities and Exchange commission under the Securities act of 1933 during the fiscal year ended June 30, 1941, aggregated $2,611,000,000, compared with $1,787,000,000 for the preceding fiscal year, and $2,579,000,000 for the year ended June 30, 1939. Securities proposed for sale by issuers amounted to $2,081,000,000 in the 1941 fiscal year as against $1,433,000,000 in the preceding year and $2,020,000,000 in the 1939 fiscal year. Of the indicated net proceeds from the sale of securities effectively registered during the 1941 period, repayment of indebtedness was highest with 73.6%, new money uses took 14.2% and the purchase of securities accounted for 11.9%. (*See* also STOCKS AND BONDS.)

The SEC had nine regional offices in 1941: at Fort Worth, Tex.; New York, N.Y.; Atlanta, Ga.; San Francisco, Calif.; Seattle, Wash.; Chicago, Ill.; Denver, Colo.; Cleveland, O., and Boston, Mass.

At the beginning of the fiscal year 1941, the enforcement section had pending 696 investigations of alleged violations of statutes which the commission administers. During the year, 484 additional investigations were initiated. Of this total of 1,180 cases, 548 were disposed of, leaving 632 cases pending on June 30, 1941. The commission instituted 34 civil proceedings during 1941, including 28 injunctive actions brought against 82 persons to restrict them from fraudulent and otherwise illegal practices in the sale of securities.

Up to July 1, 1941, the commission had referred 329 criminal cases to the department of justice, including 52 cases which were referred during the fiscal year 1941. Since the organization of the commission in 1934, a total of 1,852 defendants had been indicted in 260 cases, including 27 cases which had been referred to the post office department. Convictions had been obtained against 739 defendants in 200 cases, representing 93% of the 213 cases which had been disposed of as to principal defendants.

Investment advisers registered with the commission under the Investment Advisers act (also administered by the SEC) on June 30, 1941, numbered 753, approximately 85% of which had commenced their investment advisory activities after 1930.

Holding Companies.—On June 30, 1941 there were 147 public utility holding companies registered under the Holding Company act of 1935, which is also administered by the SEC. The consolidated assets of these companies exceeded $15,000,000,000. The 147 registered holding companies constituted 53 public utility holding company systems, which included 1,457 holding, subholding and operating companies. During the fiscal year 1941, applications covering more than $1,065,000,000 of new securities became effective under the Holding Company act, bringing the total of new securities issued since the effective date of the act, Dec. 1, 1935, to more than $3,951,000,000. (*See* also PUBLIC UTILITIES.)

Bankruptcy Reorganizations.—The commission actively participated during the 1941 fiscal year in 145 reorganization proceedings under chapter X of the National Bankruptcy act. These proceedings involved the reorganization of 177 companies and were scattered among federal district courts in 28 states. The aggregate stated assets of the 177 companies totalled around $2,214,653,000, while the aggregate indebtedness was about $1,354,374,000.

The chairman of the commission in 1941 was Edward C. Eicher, of Iowa. Other members were: Robert E. Healy, of Vermont; Sumner T. Pike, of Maine; Ganson Purcell, of New York; and Edmund Burke, Jr., of New York.

Seeing Eye.

This organization, which teaches dogs to guide blind people, began in 1928 when Morris Frank brought his German shepherd, Buddy I, from Switzerland and proved that the heaviest New York street traffic could be negotiated safely. Buddy I was bred and trained by Mrs. Harrison Eustis and Elliott S. Humphrey. In 1941, 630 educated dogs, graduates of the Seeing Eye at Morristown, N.J., were acting as the liberators of some 500 men and 130 women. In almost every state in the union, and also in Canada, these dogs with their blind masters were engaged in such professions and businesses as law, the ministry, music, beekeeping, storekeeping, poultry raising, pharmacy, undertaking, journalism, electrical and radio engineering. Dogs and their self-reliant blind owners were attending colleges and keeping house; one pair was a professor of physics, one a mayor, one a judge, one an alderman. Moreover, the Seeing Eye had committees in New York, N.Y.; Philadelphia, Pa.; Boston, Mass.; Cleveland, O.; Detroit, Mich.; Chicago, Ill., and Los Angeles, Calif., to explain its work to a sympathetic public. Three years are required to train a man to train a dog, three months to train a dog, and a month to teach the blind person how to handle his trained dog. Not every blind man or woman is physically and mentally strong and alert enough to use a Seeing Eye dog; but every person who finally gets one discovers literally the difference between night and day. (B. TA.)

Seismology.

In spite of the tendency to discontinue scientific activity not directly related to war-making effort, the scarcity of materials and the adverse conditions in formerly active countries, there was in 1941 a surprising amount of continuity of effort. The activity of international seismological organizations was curtailed but not entirely stopped.

The only major earthquake, that of Nov. 25, 1941, was beneath the sea about 600 mi. westward from Lisbon, Portugal. It caused no important damage. There were no highly destructive earthquakes, but in ten there was an appreciable loss of life and property. There were moderately destructive shocks in California on Oct. 21 and Nov. 14.

Strong-motion records continued to be obtained and that of the earthquake off Santa Barbara on June 30, 1941, and further analysis of the Imperial valley earthquake of May 18, 1940, gave additional information for the design of earthquake-proof structures. Analysis of strong-motion records showed that the earth's motion at the start of an earthquake can be accurately measured.

Among the developments of 1941 were a new seismograph for recording vertical motion and an appraisal of the seismicity of the earth, based on instrumentally located earthquakes.

No progress was made toward accurate earthquake prediction, but the determination of crustal movement by geodetic measurements continued. Such movements may indicate a state of strain which may ultimately be relieved by earthquake. The possible effect of loading due to a large artificial lake in producing earthquakes was studied. Application of tectonics, especially the simulation in the laboratory of the pressure of the earth's crust, was investigated.

Selective Service. During the year 1941 approximately 1,000,000 men were inducted into the U.S. army by Selective Service. The figures by months are as follows:

January	73,000	July	58,200
February	90,200	August	53,000
March	153,200	September	41,500
April	123,200	October	86,900
May	56,900	November	51,200
June	114,200	December	29,000

These men were inducted after being found available and physically fit for service by their local boards and classified in I-A. Altogether, a total of 14,928,600 men were classified, 495,000 being deferred for occupational reasons and placed in II-A and II-B, and 9,536,000 deferred for dependency and placed in Class III. About 1,448,000 men were deferred for miscellaneous reasons and placed in Class IV.

Concluding six months' service as director of Selective Service, C. A. Dykstra resigned on April 1 to accept appointment by President Roosevelt as chairman of the National Defense Mediation board.

Brigadier General Lewis B. Hershey, who had been executive officer of the joint army and navy Selective Service committee since 1936 and was largely responsible for planning the operations and organization of Selective Service, became acting director in his capacity of deputy director of Selective Service, a post he had held under Dykstra since the creation of the Selective Service system.

President Roosevelt proclaimed July 1, 1941, as registration day for those men who had reached the age of 21 between Oct. 16, 1940, the first registration day, and July 1, 1941, the second registration day.

Approximately 752,500 men were registered. Indicative of the keen public interest in the second registration and the wide public desire to be of service were the countless proffers from organizations and individuals who offered their services voluntarily to assist in the registration.

On July 17 the second national lottery was held in the Departmental auditorium in Washington, D.C., where the first lottery was held on Oct. 29, 1940. This lottery was held in exactly the same manner as the first lottery, except that 800 numbers were drawn instead of the 9,000 used in the first lottery. These 800 numbers were placed in opaque capsules and on the day of the lottery were stirred into the historical fish bowl which had been brought from Independence hall in Philadelphia, Pa. It was the same bowl used in the World War I draft lottery and in the first Selective Service lottery in 1940.

Secretary of the Navy Knox, who was to have drawn the first number, declined by announcing to the crowded auditorium that he wanted that honour to go to one of the group of 50 conscripted men who had been brought to Washington from neighbouring army camps to participate in the drawing. Staff Sergeant Robert W. Shackleton of Fort Dix, six months before an actor on Broadway, reached into the goldfish bowl and drew forth the first number—196. Secretary of the Navy Knox drew the second number. The lottery lasted from 7 P.M. until 9.27 P.M. As a result of the lottery, those men who had registered on July 1 were integrated into the list of men that had registered in the first registration and had received their order numbers in the first lottery.

Men who had been accepted for service by the local board were notified to report for induction. After winding up their personal affairs, which in some cases involved the sale of personal property, such as automobiles and furniture, and the severance of certain civilian ties, many of these men upon examination by the army examiners at the induction station were declared unfit and were returned to their home communities and placed in Class I-B, as fit only for limited military service, or in IV-F, as unfit for any military service.

Immediate steps were taken to minimize the hardship to the registrants and expense to the government thus incurred. A system of preinduction examination was inaugurated.

Under new plans each state was divided into districts, with the army physicians conducting examinations of drafted men in each of the districts. In the more congested areas an examination station functioned at all times; while in the sparsely settled districts the tests were given at periodic intervals.

Classification Status of Selective Service Registrants by State as of Sept. 30, 1941—Class 1-A to Class 1-BO

State	Registered (All ages) Number	Classified (All ages) Number	Classified % of Total Registered	Class 1-A and 1-AO Total Projected (All ages) Number	Class 1-B & 1-BO Number	Class 1-B & 1-BO % of Registered (21–27)
U. S. (Continental)	17,370,355	14,680,650	84.6	1,674,275	488,502	6.1

Class 1-A. Available for general military service when found acceptable to the land or naval forces.

Class 1-AO. Available for noncombatant general military service when found acceptable to the land or naval forces; conscientious objector.

Class 1-B. Available for limited military service when found acceptable to the land or naval forces.

Class 1-BO. Available for noncombatant limited military service when found acceptable to the land or naval forces; conscientious objector.

Table I.—*Estimated Number of Registrants Found to be Unqualified for General Military Service Because of Physical and Mental Reasons, by Availability for Military Service and by Defect or Disease*

Major defect or disease	Unqualified for general military service by selective service*			Unqualified for general military service by the army†	Total unqualified for general military service	Percentage of estimated total unqualified for general military service
	Qualified for limited military service	Disqualified for any military service	Total			
Teeth	100,000	53,000	153,000	35,000	188,000	20.9
Eyes	72,000	28,000	100,000	23,000	123,000	13.7
Cardiovascular system	17,000	67,000	84,000	12,000	96,000	10.6
Musculo-skeletal	27,000	25,000	52,000	9,000	61,000	6.8
Venereal	35,000	14,000	49,000	8,000	57,000	6.3
Mental and nervous	8,000	30,000	38,000	19,000	57,000	6.3
Hernia	35,000	11,000	46,000	10,000	56,000	6.2
Ears	7,000	18,000	25,000	16,000	41,000	4.6
Feet	21,000	9,000	30,000	6,000	36,000	4.0
Lungs ‡	6,000	11,000	17,000	9,000	26,000	2.0
Miscellaneous	72,000	54,000	126,000	33,000	159,000	17.7
Total	400,000	320,000	720,000	180,000	900,000	100.0

*These estimates are based on classification reports from local boards as to the number qualified for limited military service, the number disqualified for any military service, and the rate of rejections by groups of defects or diseases by availability for military service as revealed in an analysis of 19,923 reports of physical examination. The major defect or disease for each registrant was determined by the principal cause of rejection.

†These estimates are based on the classification reports from local boards as to the total number found unqualified for general military service at the army induction station, and the rate of rejections by groups of defects or diseases as revealed in an analysis of 123,000 reports of physical examination at the army induction station as released by the war department. The major defect or disease for each registrant was determined by the principal cause of rejection.

No data were available to permit a breakdown by cause of rejection and availability for military service for registrants rejected by the army. Classification reports from local boards indicate that only 70,000 of the 180,000 found to be unqualified for general military service by the army induction stations are classed as available for limited military service. Based on limited observations, it is believed that the ratio of the number acceptable for limited military service to the total number unqualified for general military service by the army is much greater than the data indicate.

‡Including tuberculosis.

The period between the time of examination and the time of induction gave registrants ample opportunity to make final arrangements concerning their financial and other personal affairs. Whenever possible, registrants were permitted to return to their homes on the same day they were examined by army physicians. In certain areas, however, Selective Service doctors conducted "screening examinations" to eliminate men obviously unfit for military training.

Commanders of the army corps areas started working with the state Selective Service directors in the early autumn of 1941 to make the program effective as rapidly as possible. However, aside from these considerations, one staggering and shocking fact emerged from the physical examining of large numbers of U.S. young men. More than half of the 21- to 36-year-old men examined for induction were found to be physically or mentally unfit for general military service.

Physical Condition of Registrants.—In 1941 the Selective Service system was making an analysis of the reports of physical examination for each registrant examined, in accordance with the provisions of the Selective Training and Service Act of 1940. Pending the complete analysis of these reports, a survey was made of 19,923 reports to provide an indication as to the physical fitness of American youth between the ages of 21 and 36 for military service. This sample was stratified by states for representativeness and included a cross-section of registrants examined.

Summary reports from local boards, and a sample analysis of reports of physical examination by Selective Service local boards and army induction stations, indicated that about 50% of the approximately 2,000,000 registrants who were examined were found to be unqualified for general military service because of physical, mental and educational reasons. Of the approximately 1,000,000 registrants who were not qualified for general military service, 900,000 were so classified because of physical and mental defects and 100,000 because of the lack of educational qualifications.[1] Of the 900,000 rejected for physical and mental reasons, 470,000, or 23% of those examined, were qualified for limited military service, and 430,000, or 22% of those examined, were disqualified for military service.

Based on the physical standards, only about 1,000,000 men, of the approximately 2,000,000 examined, were qualified for any type of military service in the army immediately, and at least 500,000, or 25%, were available for the performance of military duties in a slightly limited capacity. Thus, out of the approximately 2,000,000 examined, at most, 25% were not qualified for any type of military service.[2]

Based on the major defect or principal cause of rejection, dental defects accounted for an estimated 188,000, or 20.9% of the 900,000 registrants not qualified for general military service by Selective Service local boards and army induction stations; defects of the eyes, 123,000, or 13.7%; defects or diseases of the cardiovascular system, 96,000, or 10.6%; musculoskeletal defects, 61,000, or 6.8%; venereal diseases, 57,000, or 6.3%; mental and nervous diseases, 57,000, or 6.3%; hernias, 56,000, or 6.2%; defects of ears, 41,000, or 4.6%; defective feet, 36,000, or 4.0%; defects of lungs, including tuberculosis, 26,000, or 2.9%; and miscellaneous defects, 159,000, or 17.7%. Included in the miscellaneous group were defects and diseases of the mouth and gums, nose, throat, kidneys and urinary system, abdomen, genitalia, skin, haemorrhoids, varicose veins, tumours, and infectious and parasitic diseases.

Table II.—*Incidence of Defects Found in 19,923 Registrants Examined by Selective Service Local Boards, by Broad Classifications*

Disease or defect	Number of defects found	Rate of defects per 1,000 examined
Eyes	2,305	115.7
Ears	887	44.5
Teeth	2,795	140.3
Mouth and gums	1,273	63.9
Nose	1,372	68.9
Throat	1,321	66.3
Lungs	327	16.4
Tuberculosis	114	5.7
Cardiovascular system	2,000	100.4
Blood and blood-forming organs	19	1.0
Hernia	1,287	64.6
Kidneys and urinary system	279	14.0
Abdominal viscera	244	12.2
Genitalia	1,175	59.0
Venereal	695	34.9
Skin	2,308	115.8
Haemorrhoids and rectal defects	610	30.6
Varicose veins	531	26.7
Mental and educational deficiency and illiteracy	239	12.0
Mental disorders	362	18.2
Neurological	454	22.8
Musculo-skeletal	2,018	101.3
Feet	2,888	145.0
Endocrine disturbances	319	16.0
Tumours	228	11.3
Infectious, parasitic and epidemic diseases	7	0.4
Other diseases and defects	974	48.9

[1]The minimum educational requirement for a registrant to be inducted into the army is the ability to read and write the English language as well as a student who has satisfactorily completed the fourth grade in an American grammar school.

[2]There seems to be little doubt but that most of the registrants being classed as available for limited military service, and a substantial portion of the registrants being classed as disqualified for any military service in the United States army, possess health conditions which would be acceptable for military duty in any army in continental Europe. United States army regulations, in setting forth the physical standards, prescribe health conditions that must be attained at the time of physical examination by Selective Service registrants for induction into the army. Such regulations provide only minor differences in standards between registrants qualified for general military service and registrants qualified for limited military service. These regulations are predicated upon the assumption that registrants qualified for general military service should be physically, mentally and educationally capable of performing any service that a soldier of the army may be called upon to do, while the registrants qualified for limited military service should be physically, mentally and educationally capable of performing such of the routine chores of the army as the limitations of the soldier permit. Registrants being classed as available for limited military service were not being accepted by the army in 1941.

Table III.—*Age of Registrants by Availability for Military Service*

Age*	Number examined	Percentage of total examined	Qualified for general military service		Qualified for limited military service		Disqualified for military service

*Age at last birthday at time of physical examination.

†Nonregistrants who have volunteered for one year of military service with the army. The Selective Training and Service Act of 1940 provides that nonregistrants between the ages of 18 and 20, inclusive, shall be afforded an opportunity to volunteer for training and service into the land and naval forces of the United States.

SGT. R. W. SHACKLETON, trainee of Ft. Dix, N.J., drew the first capsule—number 196—at the second national selective service lottery July 17, 1941 in Washington, D.C.

Selective Service local boards classed approximately 41% of all registrants physically examined as available for limited military service or disqualified for any military service. Of the 59% examined by local boards and classed as available for general military service, approximately 15% (or 9% of the total number examined by the local boards) were rejected at the army induction stations for borderline physical or mental conditions, diseases and defects obtained since the time of the local board examination, educational deficiencies, and other miscellaneous reasons.

The president charged the Selective Service system with the administration of a program for the physical rehabilitation of rejected men who could be completely and permanently rehabilitated at a reasonable cost in a reasonably short period of time, and made available for general military service in the armed forces. Of the 900,000 who were classed as available for limited military service or disqualified for military service, an estimated 200,000 could be completely physically rehabilitated for the performance of general military service. Perhaps one-half of those who had remediable defects, or 100,000, had dental defects that could be successfully corrected.

There is presented in Table I the estimated number of registrants classed as unavailable for general military service, because of physical and mental reasons, in the first 2,000,000 registrants examined by Selective Service local boards and army induction stations, by availability for general military service and by major defects or diseases.

Age Distribution.—Two-thirds of the registrants physically examined by local boards were between the ages of 21 and 27, inclusive. Registrants between the ages of 28 and 36, inclusive, accounted for 31.3% of the total number examined. The number of nonregistrants who volunteered for one year of military service with the army accounted for 2.1% of the total registrants examined.

The rate of rejections for registrants between the ages of 31 and 36, inclusive, was nearly twice as great as that for registrants between the ages of 21 and 25, inclusive. Of the registrants between the ages of 31 and 36, 61% were unacceptable for general military service, as compared with 45% between the ages of 26 and 30, and 34% between the ages of 21 and 25. The average age of registrants called up for physical examination by local boards was 25.8 years. The percentage who were qualified for general military service varied from 70.5% for registrants 21 years old to 29.9% for registrants who were 36 years old at the time of physical examination. The striking relationship that existed between age and availability for general military service is shown in Table III.

Race, Urban-Rural Residence and Place of Birth.—The ratio of Negro registrants to the total number examined was approximately the same as the ratio of Negroes to the total population. Registrants of other races, which accounted for less than 1% of the total number examined, were mainly Chinese, Japanese and Indians.

Two-thirds of the registrants examined were from urban communities. The rate of acceptance for general military service was 61.9% for registrants from rural areas compared with 57.6% for registrants from urban areas.

Of all registrants examined, 97.3% were born in the United States or its territories. The place of birth of registrants of other nativity was Canada, British Isles and Europe, in the order of importance given.

The number of registrants examined, according to availability for military service by race, urban-rural community and place of birth, is shown in Table IV.

Height, Weight and Chest Measurement.—The average height of the registrants examined was 67.5 in., the average weight 150 lb., and the average chest measurement at expiration was 33.9 in. Registrants who were classed by local boards as available for general military service averaged 68.1 in. in height and weighed 152 lb.

The height of registrants examined varied from 54 in. to 88 in.; 98.3%, however, were between 60 in. and 78 in., which is the minimum and maximum height, respectively, for admittance into the army. Registrants varied in weight from 85 lb. to 385 lb., and 93% were between 100 lb. and 190 lb. The minimum weight for admittance into the army for a registrant 60 in. tall is 105 lb. and the standard weight for a registrant 78 in. tall is 184 lb.

Discretion and judgment is used, however, in determining the availability for military service of registrants with slight variations in the ratio of weight to height.

While many obvious reasons make direct comparisons with data compiled in previous emergencies impossible, it is interesting to note that the average height of recruits examined during World War I was 67.5 in., the average weight was 142 lb., and the average chest measurement at expiration was 33.2 in. It is estimated that the average height for men examined for military service in the federal forces during the Civil War was 67.5 in., the average weight was 136 lb., and the average chest measurement at expiration was 33.5 in.

Vision and Hearing.—Of the registrants tested for vision without correction, 71% could see as well as, or better than, normal (20/20) and 91% had vision equivalent to, or better than, the minimum requirements for acceptance into the army (20/40 or better). Of the registrants, 6% had a vision of between 20/40 and 20/100 without correction, 2% had a vision of 20/200 without correction, and only 1% had a vision of 20/400, or worse, without correction.

Fewer registrants had as severe impairment of hearing as of vision. Of the registrants who had their hearing tested, 95% possessed normal hearing, or better, and 99% could hear as well as was necessary for entrance into the army.

Occupation.—Of the registrants physically examined, about 14% were unemployed. The largest group of employed registrants physically examined was operatives and kindred workers, which comprised about one-fifth of all registrants examined. The most numerous types of operatives and kindred workers were chauffeurs, truck drivers and deliverymen, and operatives in metal, textile and mining industries, such as weavers, knitters, spinners, assemblers, operators of lathes, drill presses and other machines.

Farmers and farm labourers were the second largest employed group, accounting for 14% of the total number examined. Labourers, except on farms and in mines, accounted for 11% of all registrants examined.

The next largest group was craftsmen and foremen, which comprised more than 8% of all registrants physically examined. The most numerous occupations in this group were carpenters, cabinet makers, pattern makers, mechanics, repairmen, machinists, millwrights, toolmakers, painters, paper hangers, printers and foremen.

Clerical and kindred workers made up nearly 8% of those examined, with domestic, protective and other service workers accounting for better than 5% of those examined. The remaining registrants who were employed at the time of physical examination included professional workers, semi-professional workers, salesmen and emergency workers. Approximately 1% of all registrants examined was students.

Prehabilitation and Rehabilitation.—In May 1941, in an effort to cut down the appalling rate of 50% rejections for physical disabilities, Selective Service inaugurated a physical prehabilitation program for registrants. It was entirely voluntary and essentially an educational project.

Physicians, dentists and registrants alike co-operated and the program met with some success; however, stronger and more positive measures were required. In Oct. 1941 President Roosevelt announced a rehabilitation program which called for the correction of minor defects of 200,000 men who had been placed in Class I-B as "fit only for limited military service."

Soon after the president's announcement, Brigadier General Hershey called a conference of representatives of all interested agencies, both governmental and civilian; medical, dental and lay. On the basis of past studies and these conferences, it was determined to begin the Selective Service Rehabilitation program for treatment of registrants having correctable defects.

Re-Employment Program.—The demobilization of nearly 5,000,000 men after World War I presented a re-employment problem of great magnitude.

Table IV.—*Race, Urban-Rural Residence and Place of Birth of Registrants by Availability for Military Service*

*Urban areas were those communities of 2,500 population or over and rural areas were those of less than 2,500 population.

The veteran camps of the Civilian Conservation Corps bore mute witness to the size of this problem and the difficulties encountered in restoring ex-soldiers to civil life, for at one time there were as many as 30,000 such men in the CCC camps. That a total of 213,000 individual World War I veterans had been enrolled in these civilian camps during the 23 years after the end of the war was proof of the need of a comprehensive re-employment program. The figure might have been larger except for the fact that the veteran enrolments were limited by law to not more than 10%.

To guard against a repetition of this experience, the congress provided, in section 8 of the Selective Training and Service Act of 1940, for the director of Selective Service to establish a personnel division with adequate facilities to render aid in the replacement of inductees in their former positions and in securing positions for inductees. Legislation made the re-employment benefits available to all members of the military and naval forces of the United States who entered the service subsequent to May 1, 1940.

Great Britain had recognized the re-employment problem which follows demobilization. The National Service (Armed Forces) Act, 1939, 283 Geo. 6 ch. 81, imposed the duty, except certain legal defenses, upon each employer of a man called for military or naval service to reinstate the man in employment under conditions not less favourable to the man than if he had remained in continuous employment. Violations subjected the employers to a fine of not more than £50 and the court could compel the employer to pay the employee an amount equal to 12 weeks' wages.

In the United States no provisions were made for handling re-employment in the studies prepared by the joint army and navy Selective Service committee, although the importance of the problem was fully realized. It was anticipated that this work would in all probability be entrusted to some other agency.

Within a week of the passage of the Selective Service Act of 1940, the Selective Service system started studies looking to the establishment of an adequate "personnel section," as called for in section 8 of the Selective Service act.

The Re-employment Program in Operation.—The entire re-employment procedure of Selective Service system was highly decentralized. General principles and policies were formulated in the national headquarters. These were then transmitted to the state headquarters of Selective Service, which adapted them to their own use. The plans were then transmitted to the local boards within the respective states. For the United States at large there were 6,443 local boards and with each one there was associated at least one re-employment committeeman, who was responsible for seeing that men returning from the armed forces were reabsorbed into gainful employment. In carrying out this plan, the re-employment committeeman was responsible for seeing that the returning person be reinstated in his old position, if he had one and desired to return to it, or that new jobs were found for the men who were not employed at the time they entered the service or who, for one reason or another, desired to seek new positions.

Due to the changes in the Selective Service act authorizing the discharge, between Sept. 1 and Dec. 10, of certain men who had attained age 28, the war department directed that some 200,000 men be transferred from active service to the reserve, and that this be accomplished not later than Dec. 10, 1941. This group of men had largely been transferred to the reserve at the time the United States declared war on Japan on Dec. 8, 1941.

In handling the re-employment problems of the men who were released from active service between Sept. 1 and the time the U.S. entered the war, there was an excellent opportunity to try out the plans which had been formulated by the national headquarters of Selective Service, and which had been adapted in the several states to meet their respective needs.

A co-ordinated program was developed in conjunction with the National Selective Service system, the United States Employment service, the State Employment service, the state headquarters of Selective Service and the local boards. Certain staff members in the state headquarters of the employment service, and also in the branch offices, were designated as specialists to handle the re-employment problems of men returning from the service. In addition, and at the invitation of the war department, the state employment service established emergency referral offices in the army posts which contained 8,000 or more soldiers, and an itinerant service was arranged for the smaller posts. Through the emergency referral offices and by the visitation service thus established, interviews were held with men about to be released, if it appeared that they would meet the standards required for certain defense activities—referred to as the "critical labour supply." In many instances it was found that men about to be discharged possessed the necessary qualifications to render great service in the defense activities, and in such instances if the man was willing, he was interviewed by the employer and put to work at once.

For those men who did not meet the requirements for the "critical labour supply" or for one reason or another preferred to return to their homes, re-employment assistance was given, if they desired it, when and as they asked for it. The law required, however, that in order for a man to be entitled to the re-employment assistance, he must apply for his old job within 40 days after his release from the armed forces. It also provided that after he had been reinstated, he could not be released, without due cause, for a period of at least one year.

From the experience obtained, it appeared that employers, generally, co-operated wholeheartedly in the reinstatement of their employees to positions which they had held at the time they entered the armed forces.

Legislative Changes in 1941.—During the year 1941, the 77th congress passed five direct amendments to Public Law 783, passed by the 76th congress, which set up the Selective Service system.

Public Law 87 (H.R. 4125) was approved by the president on May 29, 1941. This law extended the exemption of liability to training and service to men who have completed three consecutive years of satisfactory service in the army, navy, marine corps or coast guard. It also clarified the exemption extended to the national guard.

Public Law 206 (S. 1524) was approved by the president on Aug. 16, 1941. This law in the main provided deferment for registrants above 28 years of age, and for the release of such men already inducted. It provided for the publication of the names and classifications of men classified by local boards. It also reduced to two years and six months the service period required for men who had been discharged for the convenience of the government in order to obtain exemption from training and service.

Public Law 213 (S.J. Res. 95) was approved by the president on Aug. 18, 1941. The principal provision of this law was to extend the period of training and service to 30 months. It also provided certain rights for National Service Life Insurance, and it provided for release from service of certain men having dependents and provided for an increase of pay of $10 per month after one year of service.

Public Law 338 (S.J. Res. 117) was approved by the president on Dec. 13, 1941. This law removed any territorial restrictions on the use of selectees and extended the period of training and service for the duration and for six months after any war in which the U.S. might be engaged.

Public Law 360 (H.R. 6125) was approved by the president on Dec. 20, 1941. The main provisions of this law were: (1) provision for the registration of the man power of the United States between the ages of 18 and 65, and (2) provision for liability to service of those between 20 and 45.

Besides these direct amendments, the following three laws affected in some manner the administration of Selective Service:

Public Law 47 (S. 1524), approved May 5, 1941, removed the liability of criminal code sections 109 and 113 from lawyers holding Selective Service appointments.

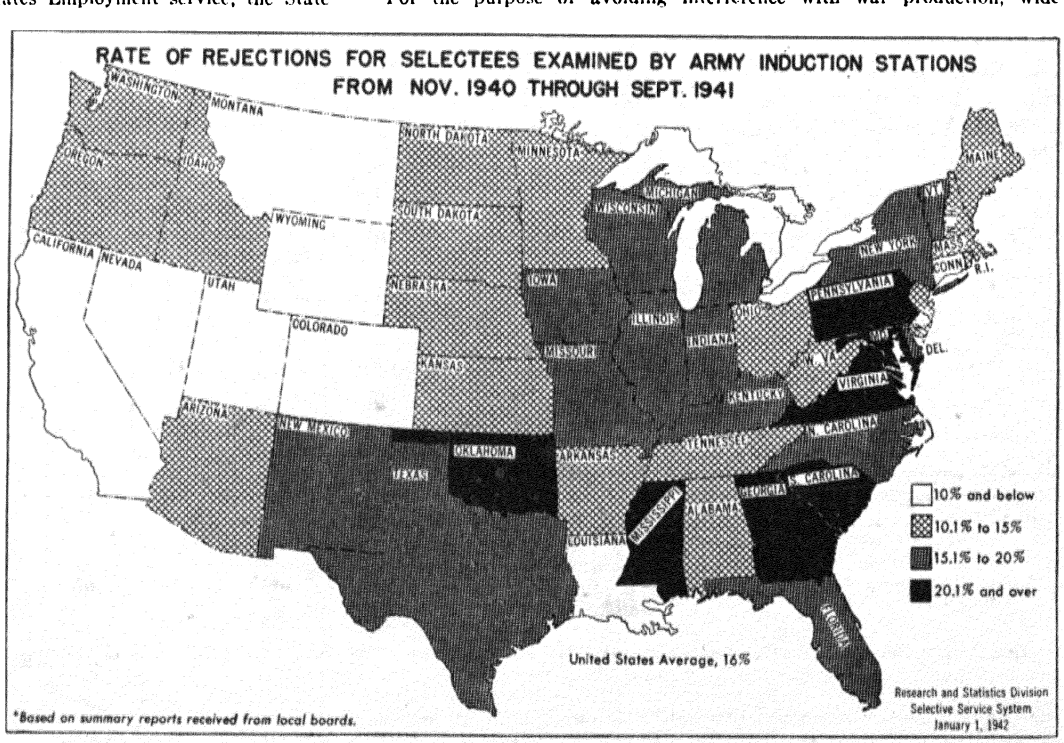
Public Law 163 (H.R. 2475), approved July 11, 1941, provided for the protection of morals around army and navy camps and stations.

Public Law 376 (S. 2082), approved Dec. 26, 1941, amended Public Law 47 and extended relief from sections 109 and 113 of the criminal code to state directors of Selective Service.

Selective Service in Total War.—Following the Japanese attacks on Hawaii and the Philippines and the subsequent declaration of war between the United States and Japan, Germany and Italy, the two additional amendments cited above (Dec. 13 and Dec. 20) were passed to enable recruitment of man power on a wartime basis.

These were followed by the issuance, on Jan. 5, 1942, of the president's proclamation requiring the registration on Feb. 16, 1942, of "every male citizen of the United States, and every other male person residing in the continental United States or in the territory of Alaska or in the territory of Hawaii or in Puerto Rico," with a few specific exceptions prescribed by the original act, who is between 20 and 45 years old and has not previously registered.

For the purpose of avoiding interference with war production, wide



latitude was allowed the director of each state and territory to conduct the Feb. 16 registration in his individual area in conformity with local conditions. In many places, therefore, this registration was to be started several days before Feb. 16, and in industrial centres registration was to be conducted in shops and factories.

The requirement for the Feb. 16 registration was that all men between 20 and 45 years old who had not registered before that date must do so then between 7 A.M. and 9 P.M. Specifically, the president's proclamation designated those required to register, as every man not previously registered who "on December 31, 1941, had attained the twentieth anniversary of the day of his birth and on February 16, 1942, had not attained the forty-fifth anniversary of the day of his birth."

This third registration also was to be followed by a national lottery to determine the order in which these 20- to 45-year-old men would be called for possible military service.

Subsequent registrations, to be called by the president, would enrol the man power that was not within the 20- to 45-year-old military age bracket—those 18 to 20 years old and those between 45 and 65 years of age.

With these registrations completed, a total of more than 41,000,000 would have registered. (*See* also DEFENSE, NATIONAL [U.S.]; HEART AND HEART DISEASES; INDIANS, AMERICAN.) (E. M. CN.)

Selenium. Although recovered as a by-product in copper refining in several countries, production statistics were in 1941 available only from the United States, where production amounted to 328,731 lb., sales to 368,709 lb., and imports to 134,429 lb. in 1940, all sharp increases over 1939. Canadian production had for several years been greater than that of the United States, and probably increased still more in 1940, following the heavy demand for copper. (G. A. RO.)

Serrano Suñer, Ramón (1901–), Spanish statesman, was born in Saragossa. While studying law in the University of Bologna, Italy, he became interested in left-wing political theories. On his return to Spain he practised law in Saragossa, and in 1933 he became a member of the cortes as a deputy of the Catholic party. Two years after the outbreak of the Spanish civil war in 1936, he was appointed minister for press and propaganda in the cabinet of the insurgents by his brother-in-law, Generalissimo Francisco Franco (*q.v.*). This position gave him complete control over press and radio. In 1937 he made a good-will visit to Germany, where he attended the Nürnberg nazi congress and met von Ribbentrop, Hitler and other ranking nazis. As a result of these visits and his talks with Mussolini and Ciano in Italy he succeeded in getting more axis war materials for the insurgent armies. On Oct. 18, 1940 he was made foreign minister of Spain. Serrano Suñer tied Spain to the coat tails of the axis in foreign policy, but dependence on Britain for food prevented a rupture with the Allies during 1940 and 1941. On Dec. 19, 1941, both he and Franco signed a decree announcing Spain's "non-belligerent" status in the Pacific war. (*See* also SPAIN.)

Serum Therapy. Biological products which are employed for the diagnosis, prophylaxis, modification and treatment of disease are commonly spoken of as serums and vaccines. The former include immune globulin, normal human plasma and serum, antitoxins, antibacterial and antiviral serums; the latter include toxins, antibacterial and antiviral vaccines, bacterial toxins, toxin-antitoxin mixtures and toxoids. One example will suffice to illustrate the various uses of such products. Determination of susceptibility to and diagnosis of scarlet fever involves the use of toxin; permanent and temporary immunity is developed by the use of toxin-antitoxin and convalescent serum; treatment by the use of antitoxin and convalescent serum.

The greatest usefulness of such preparations is in the prevention of disease. Success has been reported in the prevention of plague, cholera, diphtheria, gas gangrene, leishmaniasis, measles, whooping cough, rabies, smallpox, tetanus, scarlet fever, undulant fever, typhoid, paratyphoid, yellow and Rocky Mountain spotted fever in individuals susceptible to the disease. Such susceptibility can be determined by the use of suitable preparations for chancroid, diphtheria, leishmaniasis, tuberculosis, pneumococcic pneumonia, scarlet fever, typhoid, paratyphoid, typhus and undulant fever and trichinosis. Experimental work has been done on the diagnosis of meningitis and whooping cough and on the prevention of influenza, erysipelas, epidemics of cerebrospinal meningitis, pneumococcic pneumonia and chancroid, but the work was, up to Jan. 1, 1942, not conclusive and satisfactory procedures had yet to be established. Some of these preparations may be used to confirm the diagnosis when some of these diseases are suspected.

Occasionally it is desirable to confer a temporary immunity or modify the severity of a disease in susceptible persons as in the case of an infant or a debilitated child living in a family in which an infectious disease such as measles is rampant. Some diseases may be successfully treated or modified with serums or vaccines: acne caused by acne bacillus, anthrax, bacillary dysentery, botulism, diphtheria, erysipelas, gas gangrene, measles, meningococcic meningitis, plague, pneumococcic infections, tetanus, tularemia, undulant fever, catarrhal stages of whooping cough, rabies, snake bite (North American—rattlesnake, copperhead, water moccasin; South American—tropical rattler, fer de lance and other Bothrops; British Indian—cobra and viperine), spider bite (Black Widow spider) and scorpion bite. Serum or vaccine treatment of a number of these conditions requires extensive study before the evaluation is complete.

Serums for most of the various types of pneumococcic pneumonia were in 1941 available either as horse serums or rabbit serums (claimed to produce fewer reactions).

Serums and vaccines may be administered intradermally, subcutaneously, intramuscularly, intravenously or intrathecally according to the nature of the preparation, the disease and the necessity for prompt action. The value of oral vaccines was not established in 1941; intranasal application of vaccines was under extensive investigation but its value could not be determined. There were in 1941 no established immunizing agents for the treatment or prevention of the common cold, influenza, gonorrhoea and poliomyelitis. (P. C. B.)

Shaposhnikov, Boris Mikhailovich (1882–), Russian army officer, was born in Zlatoust, Russia. He won a scholarship to the imperial academy of the general staff, was graduated in 1910 at the top of his class and was commissioned an officer in the Czarist army. In May 1918 he offered his services to the red army and was appointed an assistant commissar by Lenin and Trotsky. In 1921 he was awarded the order of the red banner. He served in the red army for 13 years before joining the communist party. In 1928 he was chief of staff of the red army, and in 1931 commander of troops in the Volga military district. In 1937 he became chief of the general staff and a member of the powerful central executive committee of the U.S.S.R. His plans were followed in the invasion of Poland in the fall of 1939, and he became generally recognized as the chief strategist of the red army when he succeeded in breaking Finnish resistance in the winter of 1940. In recognition of his achievements in the Finnish campaign, Stalin conferred on him the rank of marshal in

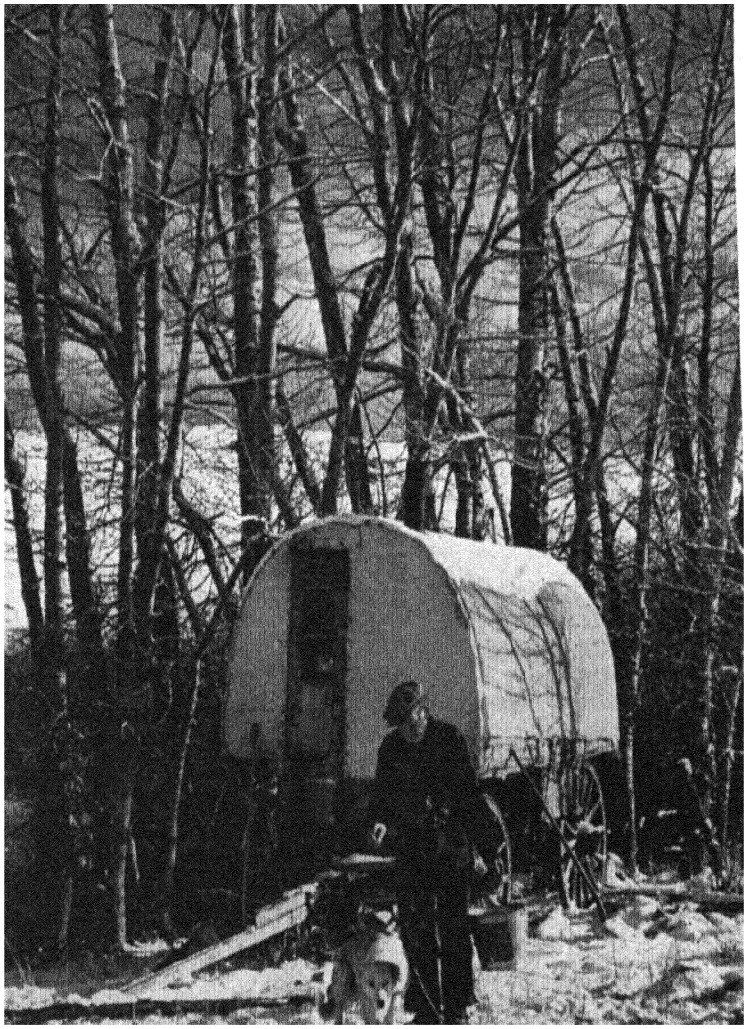
May 1940. He was said to have been the author of the three-front plan of defense against Hitler's armies in the German-Russian war, and on Oct. 31, 1941 he was recalled as soviet chief of staff.

Sharpening Stones: *see* ABRASIVES.

Sheep. Sheep raising in the United States entered 1942 with two new records, the largest lamb crop in the country's history and a larger number of sheep and lambs on feed Jan. 1, 1942 than on any previous Jan. 1. The 1941 record lamb crop was 34,549,000 head, compared with 32,885,000 in 1940. The number of sheep and lambs on feed Jan. 1, 1942 was 6,775,000, an increase of about 5% over a year earlier. The United States department of agriculture did not ask for an increase in sheep numbers in its national defense food program for 1942, but it requested that slaughter of sheep and lambs be increased by 2% in 1942 over 1941. Slaughter of sheep and lambs in 1941 at federal-inspected plants amounted to 18,124,531 head, compared with 17,351,157 in 1940 and a five-year (1936–40) average of 17,427,656. The increase of 1,664,000 head in the lamb crop in 1941 was attributed to the addition of 500,000 breeding ewes to flocks and to the fact that three more lambs per 100 ewes were saved. More than two-thirds of the increase in the lamb crop was in the western states, and 15% of the increase was in Texas, where sheep raising had increased sharply. South Dakota, Montana and Wyoming also registered large increases. Flocks in western states Dec. 1, 1941 were reported in better condition than at any time on that date since 1928. Supplies of feed and water on winter ranges were reported good. The level of prices for sheep and lambs in 1941 was higher than in 1940. Good to choice-grade slaughter lambs sold in mid-December, 1941 in Chicago, Ill., at $2.75 higher than in Dec. 1940. Lamb prices in the summer and fall of 1941 were about $1.50 higher than in the similar period of 1940. (*See* also LIVESTOCK; MEAT; WOOL.)

(S. O. R.)

SHEEPHERDER'S WAGON on a Montana ranch



Sheppard, Morris (1875–1941), U.S. senator, was born May 28 in Wheatville, Morris county, Texas. He graduated from the Yale law school at the age of 23 and four years later, in 1902, he was elected to the 57th congress to fill the unexpired term of his father, John L. Sheppard, in the house. In 1913 he became a senator, filling another unexpired term. Sheppard was one of the authors of the 18th amendment and he fought a losing battle against its repeal in 1933. But on the anniversary of that repeal he would regularly address the senate on the evils of liquor. He was a member of many important senate committees. Chairman of the Military Affairs committee, he long advocated armed preparedness for the United States and played an important role in the passage of the Selective Service act in 1940. He died in Washington, D.C., April 9.

Shipbuilding. As of Dec. 1, 1941 there were approximately 9,800,000 dead-weight tons of seagoing merchant vessels under construction in the United States, and about 2,138,590 displacement tons of naval vessels, including those under construction in navy yards. As of the above date, 972,000 dead-weight tons of merchant vessels had been delivered in 1941 and 557,668 tons of naval tonnage commissioned. Employment figures indicated that nearly 400,000 workers were engaged in shipbuilding in private and public shipyards.

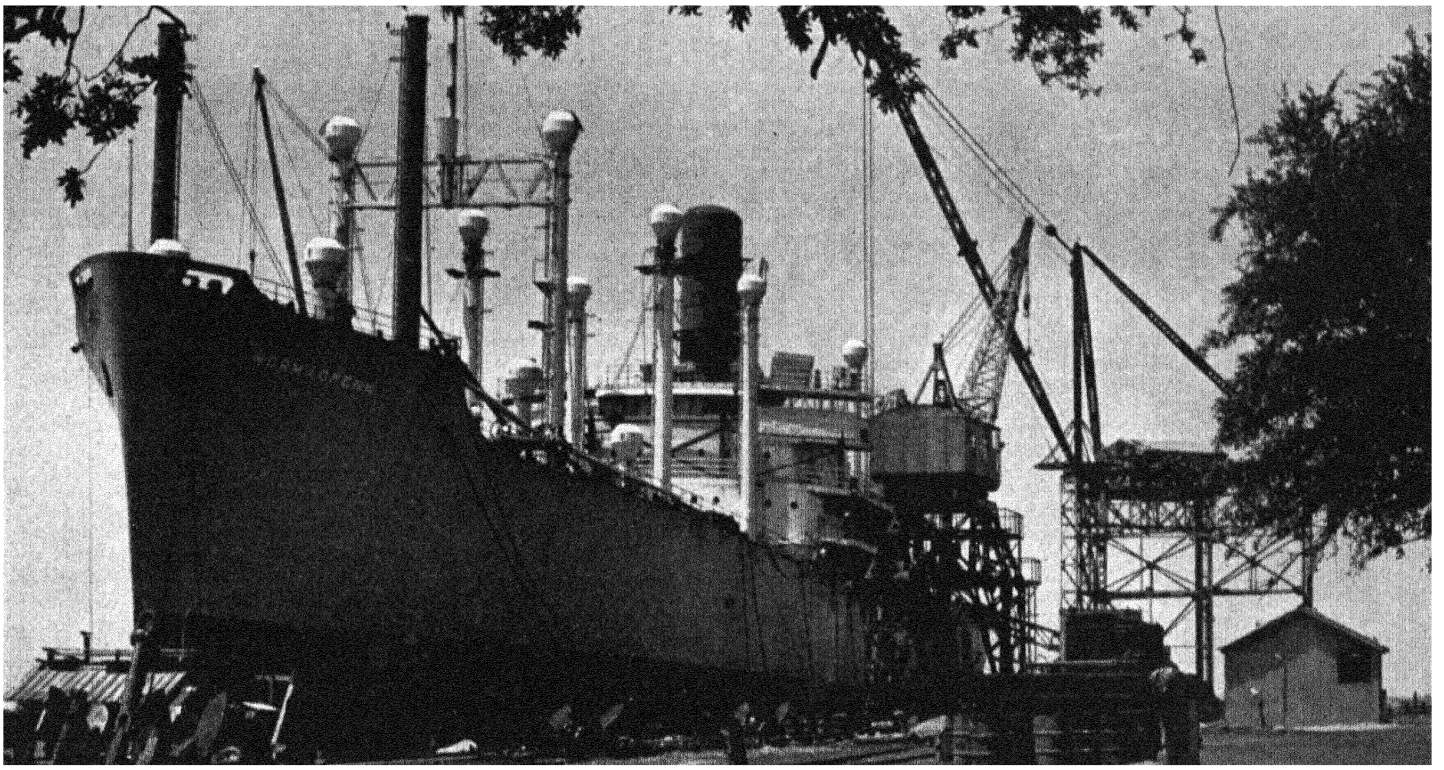
The launchings of merchant vessels reached the approximate rate of one ship a day, and deliveries were expected to reach this rate early in 1942, with two ships a day later in that year. During the first 11 months of 1941 the navy commissioned 27 combatant ships, launched another 41 and laid the keels for 128.

Liberty Ships.—Outstanding events of the year affecting the shipbuilding industry were the enactment of legislation providing funds for the construction of 200 merchant vessels of the so-called "liberty cargo vessels type," the lend-lease program providing for the construction of 112 additional "liberty ships" and 115 of other types and the so-called "all out program" provided for in the Supplementary Deficiency act passed in August, calling for 566 vessels of various types. There were 123 vessels of the "liberty" type to be built on the east coast, 134 on the west coast and 95 on the Gulf coast. In order not to compete with the requirements for labour, material and equipment involved in the Maritime commission's regular program of construction and the expansion of the United States navy, the liberty ships were designed along simple lines adaptable to easy and rapid construction and equipped with reciprocating engines. The 60 ships constructed for British account were coal burners with Scotch boilers, and the 352 for domestic account were oil burners with water-tube boilers.

The principal characteristics of the liberty ships were: length, 441 ft., 6 in.; beam, 56 ft., 10¾ in.; dead-weight tonnage, 10,500; gross tonnage, 7,100. (*See* also SHIPPING, MERCHANT MARINE.)

Navy Department.—Measures taken by the navy department to expedite the completion of combatant vessels and seagoing auxiliary vessels under construction in navy yards and privately owned shipyards commenced to bear fruit during the year 1941. As of Nov. 1, 1941 more than 550,000 tons of naval vessels, exclusive of small craft, were launched. The contract building times on these vessels were reduced from 12 months to 6 months according to the type of ship.

The program of the navy department for the alteration and



THE SLEEPY SOUTHERN TOWN of Pasc[illegible]liss., hummed with activity in 1941 as the first U.S. merchant ships built there took final form. Gulf coast shipbuilding expanded rapidly during the year to meet the demands of national defense and aid to Britain

conversion of commercial vessels and yachts into transports and other naval auxiliaries progressed rapidly, taxing the ship and yacht-repair facilities of the United States. The navy took over 222 commercial vessels, including trawlers and 87 yachts for conversion to navy use.

During the year, the facilities of navy yards and private yards were made available for the repair of damaged British men-of-war. Excellent records for speed were made in connection with this vitally important work. (H. G. S.)

British Empire.—Shipbuilding in 1941 had to be directed solely to fighting the enemy attack on commerce, either by replacements or the construction of men-of-war. The supply of steel, although naturally difficult, proceeded remarkably smoothly. Private contracts continued to be very scarce and practically the whole output was to the order of the British or dominion governments. This made an exact estimate of the increased price of private orders difficult.

In Britain the control continued in the hands of the admiralty as the only party able to balance conflicting demands for labour and material. It was the target of criticism and there were various suggestions of change, from handing the control back to the ministry of war transport to the establishment of an entirely new ministry of merchant ship production. Generally speaking, the difficult work of administration received approval.

The question of reopening the shipyards, closed under the rationalization scheme during the slump, was argued continually, but the authorities refused to lay down a definite policy, considering each case on its merits. Most of these yards, it was pointed out, had been entirely cleared and required new machinery, while there was not enough skilled labour to supply the needs of the establishments at work. Some of the sites appeared to be suitable for fabricating ships from component parts built at a distance.

The fabricated system was arranged on a considerable scale between the shipyards and steelworks on the northeast coast of England as a means of accelerating production. Ferroconcrete shipbuilding was also revived. On a new system, one motorship of about 2,000 tons was built in dry dock on the Mersey and a large number of dumb barges of about 200 tons dead weight were constructed for the admiralty. Welding was being used more and more for minor parts and repairs, but in spite of its advantages in time and weight its use was handicapped by the layout of most existing yards, efficient welding requiring at least 33% more space alongside the slipways.

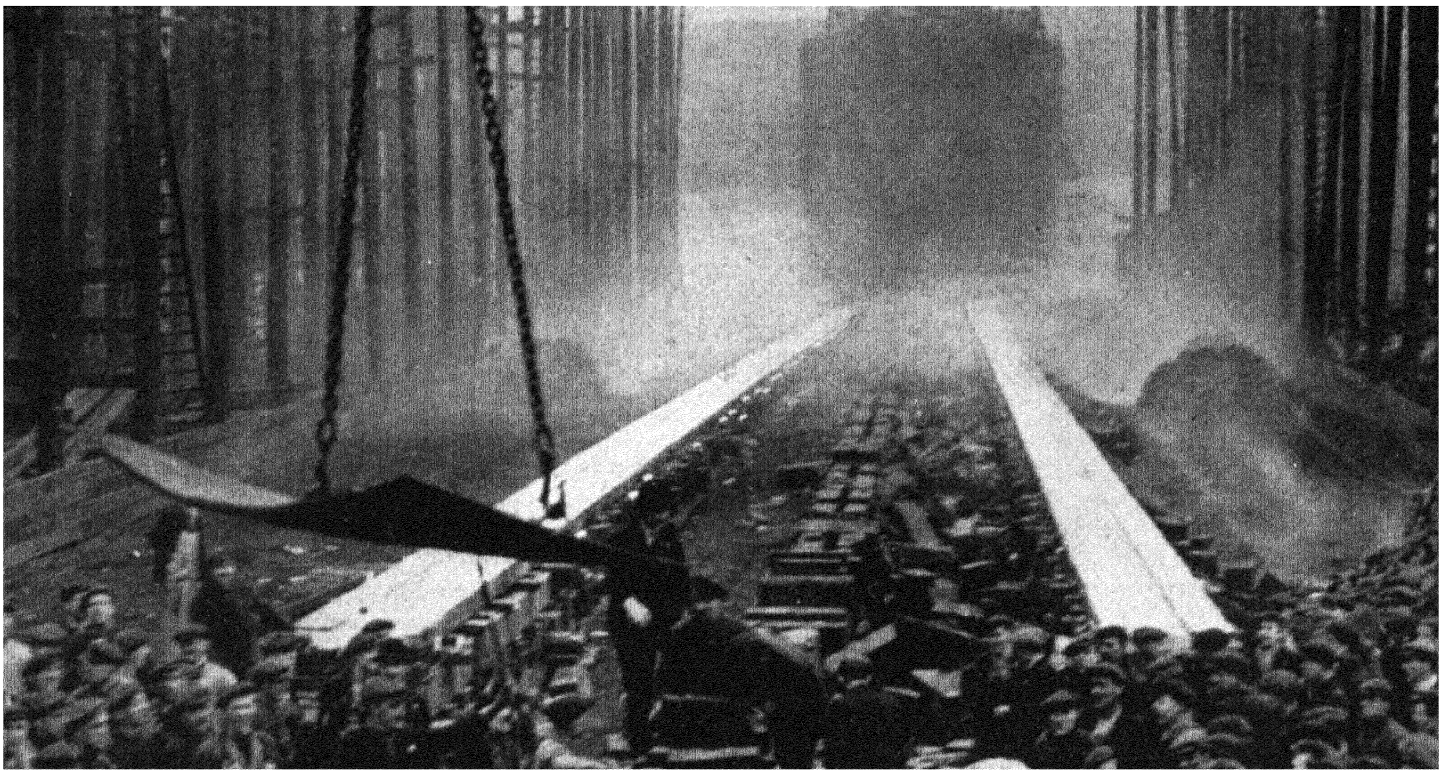
An elaborate plan for saving time by the adoption of the assembly line system was put forward. The ships were to be laid down in dry dock and as soon as the hulls were high enough to float they were to be passed into a canal to be finished in successive berths. The authorities considered that proposal but decided against it.

Although exact details of new merchant ships were withheld, the majority were known to be slow vessels of the tramp type. As more and more ships were lost in slow convoys, a big agitation developed for the construction of faster ships and this continued both inside and outside parliament for the greater part of the year. A number of arguments were put forward for increased speed, irrefutable as an ideal, but there was a significant silence on the part of those accustomed to the operation or production of tramp tonnage.

After so many years of depression the labour problem in Britain naturally continued to be serious, but the general standard was very high and the loyalty of the workers was given high praise. Certain cases of undue zeal by union officials for the retention of peacetime rules attracted attention, but they were exceptional, as was the bad timekeeping in some areas. In the first half of 1941 there were 124 shipbuilding and engineering strikes—the shipbuilding figures were not published separately by the authorities—involving 57,400 workers and wasting 311,000 working days, against 64 strikes involving 16,900 workers and 67,000 days for the same period in 1940. Against this was a very general sacrifice of holidays, etc., by the workers, with a growing conviction that excessive hours were slowing down production through fatigue rather than improving it.

In March the authorities ordered compulsory registration by ex-shipyard workers who had been employed in the industry within 15 years, but most of those who returned had deteriorated greatly in their skill and nerve, and many jobs, especially at a height, were beyond them.

The organization of repair work was greatly improved during



SYMBOLIC OF BRITISH DETERMINATION to maintain their merchant marine was this launching of a freighter in 1941. Before the freighter reached the water, the first plate for a new ship was lowered into place

1941 and the work increased. In addition to numerous cases of direct damage there was a great deal of re-riveting necessary for loosening, owing to near misses by bombs, mines or depth charges. Several examples were related of half ships being salved by the admiralty organization and new bows or sterns built on to them. Only necessary work was undertaken and all owners had orders to get their repairs done abroad whenever possible, the government contributing toward the higher cost. Deferred repairs became a serious matter for both the owners and the underwriters.

On the naval side secrecy was naturally maintained, but much was done to make up for the shortage of small mine sweeping and submarine hunting vessels caused by the French surrender, and the new ships officially mentioned showed that the output of all classes was steady. There were also the alterations and repair jobs inevitable in wartime.

Shipbuilding in the British dominions made very large strides; Australia and Canada showed the most striking results. India made good progress, and the latest suggestion was that South Africa, hitherto interested almost exclusively in repair work, should engage in new construction. In most cases work was started on small craft, principally naval, while facilities for big merchant ships were being built up and it was announced in Sept. 1941 that Australia aimed at the completion of 50 warships, including destroyers, before the end of 1942.

Axis Powers.—The axis powers made the most of the shipbuilding facilities in occupied territories and Vichy France, in spite of the disadvantages of forced labour and the risk of sabotage, but practically no material was allowed for other work. There were many doubtful rumours and propaganda stories of axis activity, but the details were naturally secret. Germany was obviously concentrating on warships and hampered by the bombing of yards, while Italy held up the construction of two badly-needed new battleships for lack of material. In spite of the careful veil of secrecy, it appeared that Japan was greatly hampered by lack of steel and the withdrawal of skilled labour by the services. It was taking twice as long to build an ocean-going ship as it did before the start of the Chinese war, in spite of standardization.

Neutral Countries.—Several neutral countries, which previously imported their tonnage, attempted to establish shipbuilding industries, but it generally proved very difficult on account of the shortage of machinery and labour. Sweden with her own ore supplies was working to capacity with big orders in hand, and Spain made big plans, but progress was slow. (F. C. Bo.)

Shipping, Merchant Marine.

Because of defense requirements, it was difficult in 1941 to make a detailed examination of routing and ship assignments of the United States merchant marine. Repeal of Neutrality act provisions permitted American merchant ships to resume service on combat zone routes, provided for protective arming and allowed the use of U.S. navy escorts.

In 1940 the commission was engaged in its long-range construction program of 500 ships in 10 years (a ship a week). During 1941 its shipbuilding program reached enormous proportions. Superimposed upon the original long-term program of 500 ships in 10 years came an accelerated program to hasten the delivery of those ships, then an emergency program calling for 200 EC-2 or "liberty ships," then the lend-lease program of 227 ships and finally the all-out program provided for in the supplementary deficiency bill of Aug. 1941, calling for an additional 566 vessels of all types. In addition the commission authorized the construction of well over a hundred smaller vessels such as ocean-going and harbour tugs, coastal tankers, coastal cargo vessels, barges, etc. (*See* also SHIPBUILDING.)

These combined programs contemplated a total construction cost in excess of $3,000,000,000 and were expected to bring into service, by the end of 1943, more than 1,200 new cargo ships aggregating over 13,000,000 dead-weight tons. The commission added 993 large vessels to its regular program between Feb. and Sept. 1941. Instead of placing the emergency ship program behind the long-range program, the lend-lease program behind that, and the 566 ships authorized in Aug. 1941 behind the lend-lease, each new expansion was superimposed to some extent upon the others. The combined programs were expected to produce 90 vessels of 1,000,000 dead-weight tons in the first three months of 1942, 146 vessels of 1,400,000 dead-weight tons in the second three months of 1942, 154 vessels of approximately 1,646,000 dead-weight tons in the third quarter and 184 vessels of close to 2,000,000 dead-weight tons in the fourth quarter. In the first quarter of 1943,

220 ships aggregating 2,270,000 dead-weight tons should be placed in operation. The speed of production was set up so as to allow the launching of a ship a day by Dec. 1941 and by July 1942, and thereafter, the completion of two ships a day.

Since the beginning of the Maritime commission's building program in the fall of 1937, and due mainly to wartime defense needs, shipbuilding facilities had grown from ten yards with 46 building ways, capable of handling 400-ft. ships or larger, and engaged in both naval and merchant work, to 40 yards with 275 ways capable of doing the same type of work, of which 29 yards with 202 ways were devoted to the construction of ocean-going merchant vessels.

Because of the rapidity with which new tonnage was placed in commission, 151 ships of approximately 1,300,000 gross tons were turned over to the army and navy. Since 1940, and under the direction of the president, the Maritime commission made available for Great Britain and the other embattled democracies a shipping pool of more than 2,000,000 tons. Another million gross tons of shipping was sold, mostly to the British or for foreign operation.

The Maritime commission used its original 500-ship program to speed up production and thus had a number of modern vessels available when crises developed and defense needs arose. Vessels designed for use as army troop ships and navy transports and supply vessels, as well as others designed for navy aircraft carriers and destroyer tenders, were provided for in the shipbuilding program. In addition to the vessels turned over to the armed forces, other merchant ships were used, as required, to assist in carrying supplies to bases located in the Caribbean sea and in the Atlantic and Pacific oceans.

Preservation of existing oversea trade routes was considered of great importance both as a means of augmenting stock piles of essential raw materials necessary for defense needs and for maintaining the domestic economy of the democratic nations, particularly of the western hemisphere. While routes to continental European and Mediterranean areas were closed for months because of Neutrality act provisions, and transpacific trades somewhat dislocated, others were in full operation, many of them on a greatly expanded basis. For instance, on Jan. 1, 1941, there were 141 ships totalling 832,673 gross tons in service to both coasts of South America, Central America and Mexico, and the West Indies while on Sept. 1, 1941, in the same services there were 209 ships totalling 1,105,284 gross tons.

In order to cope with unexpected emergencies, the Division of Emergency Shipping maintained a "backlog fleet." These were Maritime commission-owned ships, or ships taken over from Denmark in the spring and summer of 1941. This fleet was employed on quick runs to pick up extra defense cargoes whenever ships carrying vital commodities were running behind schedule. For example, a number of these ships were sent down to Chile to bring back copper and nitrates.

The shipping pool ordered by President Roosevelt to relieve the British was augmented by the seizure or purchase of axis-owned and Danish vessels which released 70 ships; American vessels placed on Australian-New Zealand runs released 13 ships and as of Oct. 2, 1941, 79 vessels were placed on runs to the Red sea, releasing an equal number of British ships in that trade. A number of vessels were assigned to carry lend-lease materials to Rangoon, Burma, for transport over the Burma road to the interior of China, and another fleet carried supplies to Russia. Under the "aid to Britain program," prior to Neutrality act repeal, were 40 Norwegian tankers and 23 tankers owned by American oil companies but under Panaman registry.

To facilitate the importation of critical and strategic materials, commercial goods listed as nonessential to the national defense program were moved homeward when, as and if space was available above requirements for essential materials. This procedure enabled American ships to transfer to American soil much of the great backlog of stock piles of strategic raw materials necessary to the defense industry. There was no priority system on outward cargoes and outbound movement of lend-lease materials was controlled largely by the needs of governments to be aided.

Co-operative organization of port facilities in the interest of efficient cargo handling under Maritime commission guidance, resulted in large savings in time and cost of merchant vessels. Quicker turn around sometimes permitted the employment of fewer ships in certain routes. Abroad, in principal ports, the commission maintained expediters and trouble shooters whose duty it was to obtain the best possible service for American ships.

Under lend-lease legislation the commission handled repairs, conversions and defense installations on British and other foreign vessels. Under the Ship Warrants Act of 1941, the commission exercised comprehensive control over emergency shipping activities of both United States and foreign flag vessels trading with the U.S. The commission had authority to supervise rate structures under the Shipping Act of 1916, and also was authorized to provide war risk insurance and reinsurance under certain conditions.

In 1941 about 10,000 licensed officers and 40,000 seamen manned the ships of the American Merchant marine. By 1943 an additional 10,000 officers and 40,000 seamen were expected to be available as new ships were completed. Officers could be obtained from (1) licensed men, either retired or on shore duty, (2) seamen of at least three years' experience qualified to take examinations for licence as junior officers and (3) graduates of the Maritime Commission Cadet Training system or of four state maritime academies. The Maritime commission offered unlicensed seamen a four months' training course to help qualify them to sit for examination. Cadets were required to possess educational and physical qualifications equal to those required to enter the U.S. Naval academy as they become members of the Merchant Marine reserve of the U.S. Naval reserve. They spend three years in training. Four ships owned by the commission were, in 1941, assigned to state maritime academies in California, New York, Massachusetts, and Pennsylvania.

Facilities were available for enrolling 1,000 apprentice seamen monthly for Maritime commission training. Enrollees spend two months ashore and four months at sea in either deck, engine, steward or radio departments. The commission had four shore schools and a training fleet of nine vessels. (*See* also WATERBORNE COMMERCE OF THE UNITED STATES.) (E. S. L.)

Great Britain.—For the year 1941 the major interest in world shipping was the German campaign, the losses which it caused and their replacement. Early in the year it was officially disclosed that the satisfactory situation maintained for the greater part of 1940 no longer existed; losses were exceeding British and American output combined. The weekly British admiralty return was changed to a monthly one in April, partly because of the information that it was giving to the enemy and partly because delayed news and other reasons would often make the figures misleading. After June it was suspended altogether, although it was later officially announced that the losses for July and August had been lighter than for a long time previously.

The situation was eased somewhat by the increased number of Allied merchantmen put on the supply services by the transfer to Britain of more ships built by the U.S. Shipping board during and immediately after World War I, by the transfer of American tankers and other ships under the lend-lease act and by the transfer of a large number of ships from distant services to the

war routes, these ships often being replaced by American vessels.

British owners were very seriously concerned because they were not allowed to replace their war losses by purchasing government-owned ships out of the insurance money that they had drawn. These sales were not to be permitted until after the war, but constant efforts were made to secure a reversal of the policy.

The extent of the help rendered by the merchant ships of Allied flags was shown by the official figures published for July. Down to the end of June, 335 Allied ships of about 1,500,000 tons gross had been sunk by the enemy, but there remained on service 1,617 ships of about 7,250,000 tons gross. The list was headed by Norway with 719 ships of 3,250,000 tons. These consisted very largely of fast motor cargo liners and tankers; only a short time previously it had been stated that a quarter of the goods and half of the oil reaching Britain were carried under the Norwegian flag. Holland supplied 480 ships of 2,250,000 tons, ranging from large passenger liners, some of which were serving as hospital ships and transports, down to the little motor coasters which had reached Britain with thousands of Dutch refugees at the time of the German invasion. The 240 Greek ships, aggregating 1,000,000 tons, were mostly of the tramp type and varied greatly both in age and quality. The Free French contingent numbered 92 ships of 400,000 tons and included a number sailing under the British flag. Belgium supplied 54 ships of 200,000 tons and Poland 32 of 100,000. There were also a number of Yugoslav ships operated in the Allied interest by their national authorities in the United States as well as useful Danish tonnage.

The manning problem, with the large number of casualties and men disabled for long or short periods, was as great as that of material. Various training ships and establishments, evacuated from the most dangerous areas, carried on their work in hulks or premises on shore and there was no lack of keen youngsters volunteering. Under the Military Service act men were given the choice of serving on land, at sea or in the air and the number who chose the sea was greatly in excess of the vacancies in the navy. Arrangements were therefore made to give intensive training for mercantile service in special establishments under the control of royal naval reserve officers with naval petty officers and instructors.

The result was eminently satisfactory; a fine type of man came forward and proved most satisfactory.

The problem with regard to marine engineers and certificated officers was more difficult. Large numbers of trained engineers went back to the sea from shore service, and there was some relaxation in the regulations for sea time in the qualification for officers' certificates, which was found quite possible without any loss of efficiency. In certain instances, officers were permitted to ship in one rank above the certificate which they held (for instance the holder of a first mate's certificate could take command) and this also proved to be safe.

In May the merchant navy pool was instituted from which officers and seamen could be drawn as required in order to prevent delaying the sailing of vessels through local shortage. Under the scheme they sacrificed their choice of ship, which had always been a highly prized privilege, but in return they obtained continuity of employment, longer leave on pay between voyages, pay while they were awaiting appointment and proper relief. All men ashore who had served at sea since Jan. 1, 1936, were required to register in this pool, and after a few initial mistakes which naturally attracted criticism the system settled down to work in a satisfactory manner.

The general standard of the behaviour of the men, both British and Allied, was high and in the majority of cases the greatest gallantry and coolness were shown under fire. There were, however, intensive fifth columnist operations which had some effect among a small minority of seamen who gave trouble with desertion, absence without leave and disobeying instructions. These offences came under the defense regulations which provided more severe punishment than the merchant shipping acts.

Allied countries were given temporary legal powers in British territory under the Allied Powers (Maritime Courts) act passed in May.

Public appreciation of the seamen's services undoubtedly had a great influence on their morale. Suggestions to effect permanent improvements in the lot of the seamen, and to remove acknowledged hardships, were not always happy on account of their advocates' lack of intimate knowledge concerning the conditions and difficulties of the merchant navy, and the constant fear that they were to be used as a steppingstone to nationalization. The most conspicuous of these was in September, when Lords Marchwood and Chatfield in the house of lords, and A. P. Herbert in the house of commons, moved for the appointment of a royal commission to enquire into the employment and conditions of merchant seamen. The suggestion aroused great opposition from practically all parties in the industry, and it was rejected by the government on the ground that the National Maritime board already had full power to arrange the discussion of such matters between the representatives of all parties and that the commission would undermine the work of the board, which was contriving excellent results.

The suggestion of a uniform was also strongly opposed by the unions.

All safety regulations were periodically overhauled and tightened up during 1941. Great attention was paid to life rafts and their launching gear, reducing the chance of their being fouled as they floated off and affording greater support and protection. A number of new patterns were evolved, the Chipchase reversible life raft with sail, etc., being one of the most ingenious and popular. The life boat regulations were improved, providing a better minimum of fittings and a better chance of attracting the attention of rescuers by lamps, scarlet canvas covers, etc. All British ships were made to carry at least one motor life boat, and motor car firms were engaged in the mass production of suitable engines. Further measures for the protection of personnel included the provision of asbestos clothing for the crews of tankers which were particularly liable to fire and the order, in September, for 100,000 "exposure suits" made of strong waterproof material with foot covering and hood, which packed into a small package weighing 2¾ lb. and could be carried by the seamen when at work.

These suits, which were to be provided for every British seaman, greatly reduced the hardships of cold and exposure.

During 1941 there were certain relaxations in the British load line regulations, permitting deeper loading in many cases, but they were very strictly limited by considerations of safety and were not nearly so liberal as the concessions which were made in World War I. Carrying capacity was also increased by closing the tonnage openings of a number of shelter-deck ships, reducing the freeboard demanded for safety, but, unlike the practice of World War I, this did not increase the rates paid by the government.

These rates of hire for requisitioned ships, which had been accepted under protest in the first place, were constantly discussed. A particular point was that requisitioning rates based on the average cost of groups of ships hit the owners of the best and newest tonnage very hard and did not cover interest and depreciation, without reckoning any return on capital. In the coasting tramp trade, which had been under licence and not requisition, there were a number of amendments and concessions by the authorities. Of these the most important was announced

in June, when the government took over the whole liability for war risk insurance premiums on unrequisitioned ships. The controlled rates of freight were reduced accordingly so that there was no direct financial benefit to the owners, but it greatly improved their position for obtaining business in competition with rail and road transport.

In May it was announced that the ministry of shipping and ministry of transport were to be amalgamated under the title of ministry of war transport on account of the many occasions on which the land and sea sides overlapped. F. J. Leathers, well known in the London coal transport trade, was appointed the first minister.

British shipping was further drained by the large scale military operations in the near east, demanding an immense tonnage, and the convoying of practically all merchant shipping with inadequate naval material, which led to increased delays. The speed of convoys was further reduced by deferred repairs and dry docking, while voyages which were prolonged to find the safer routes caused additional delay.

Axis Shipping.—Axis shipping, and the shipping which had fallen into axis hands when various countries were occupied, was employed almost entirely on the coastal supply services, particularly as a result of the congestion of the railways. This shipping suffered very heavily from Allied naval and air attack and, especially in Norway, the strongest measures had to be adopted to force native seamen to handle the ships. Allied shipping losses were so heavy that there was a tendency for many people to lose sight of the fact that the enemy had lost a large number also; in September a conservative estimate was published that Germany had lost 526 ships of more than 2,320,000 tons and Italy 319 ships of more than 1,530,000 tons. Ex-neutral ships lost in axis employ numbered 73 of about 153,000 tons, while 54 refugee ships from occupied countries, totalling about 324,000 tons, had been taken into protective custody.

Neutral Shipping.—In the few remaining neutral countries the prosperity of shipping depended largely on its willingness to enter the danger zone with supplies, and the possibilities of doing so, although the freights on the comparatively safe "cross trades" were high at one time. Proof that a large proportion of the cargoes of Vichy ships, allowed to maintain the supply services, was going through to Germany led to the withdrawal of navicerts in May. Several countries attempted to build up or to conserve merchant shipping for their own purposes; Argentina was allowed to purchase refugee Italian ships under conditions, principally that Italy should not receive the money until after the war; while Brazil barred her ships from entering the danger zone in September, this zone including the east coast of South America below Bahia Blanca, which caused considerable comment. The greater part of Swedish shipping in home waters was placed on the German supply services, but the rates of hire were unsatisfactory until the middle of the year. Eire and Switzerland purchased a number of neutral ships for the essential supply services, but they had to pay very high prices for them. Japanese shipping was greatly handicapped by the colossal requirements of the services for the campaign in China, the rigid control imposed by the government and difficulties of exchange; trade opportunities were further reduced by the boycotts imposed by the Allies and the United States after the occupation of Indo-China. Running expenses rose rapidly all over the world, and in most countries opportunities for profit were restricted by government control. (F. C. Bo.)

Shock Treatment: *see* PSYCHIATRY; MEDICINE.

Shoe Industry. Leather was in 1941 listed as no. 7 in war essentials. Its world-wide status was important as a needed supply, limited to the production of meat, of which it is a by-product. The shoe industry of the United States went on a war footing in 1941. It had to depend upon itself for 80% of its leather for footwear and other uses. Most

*Preliminary.
†Includes shoes for defense.

sea lanes were closed to European and Asiatic hide and skin resources. Sharply curtailed civilian production throughout Europe, Canada and Australia and "war spots" throughout the world made necessary the conservation of war leathers and some restraint on their use in the civilian economy. No limitation was placed upon civilian footwear or leather use in the United States in 1941.

U.S. Shoemaking.—U.S. shoemaking increased in 1941 to an all-high total of 500,000,000 pairs (not including rubber footwear). U.S. soldier footwear, manufactured to the total of 16,000,000 pairs in 1941, was expected to be doubled in 1942. Additional demands for Allied nations' war needs were expected to increase war shoemaking to 50,000,000 pairs. Russian war shoe orders were in production. A complete withdrawal of war leather in the weights, substances and standards needed by the army and navy was expected.

Utilization of a wide diversity of skins and hides in the lighter weights continued to maintain civilian production in the United States at a high total. Feminine footwear the world over had to adapt itself to national supply in each land and reached the point in Europe, Africa and Asia where wooden soles, remnants of automobile tires, etc., replaced both leather and rubber.

Styling did not materially decrease because colour, design and pattern play a part in "lifting the spirits" of civilians.

The rise in price of shoes was retarded in all lands by either price ceilings or coupon rationing; and in the United States by voluntary restraint on the part of manufacturers and dealers. Shoes were classified as the "poor man's index" because they are in common use by men, women and children and subject to public price opinion.

World Export.—Foreign export was in a confusing situation. Trade intercourse between the United States and South America was of a two-way character—leather supplies and finished shoes in free distribution, with practically no sea lane interference. England maintained her quality shoe export. The impounded nations in Europe had to trade within themselves in shoes and leather. Lend-lease exports of shoes for war and civilian use were almost negative in 1941 but were expected to expand greatly in 1942 between the United States and Allied nations.

U.S. government licences and ceilings operated successfully on the major intake of hides and skins and the domestic sale and supply of finished leathers.

Rubber Footwear.—The highest record of rubber footwear production prevailed in the United States in 1941. Because of the shortage of aluminum moulds and vulcanizing equipment for the making of men's heavy boots and galoshes, the rubber industry went on 24-hour production schedules—the major output of which was restricted to army use. Civilian sandals, galoshes and rubber novelties continued at a high rate of production until the outbreak of the U.S.-Japanese war, when all rubber was impounded, subject to government allocation. There was no expectation of a release of any great quantity of rubber and latex in 1942. Women's fashion footwear, to the extent of one-third the total production, was made with rubber backing cloth to give elasticity and flexibility. This market was severely curtailed at the end of 1941 because of the lack of liquid latex for yarn making.

The civilian rubberized footwear industry continued to distribute its finished product at retail from inventory in plant and stores and there was no expectation of improvement in the making and supply of civilian rubber footwear unless conditions improved in the far east.

Rubber was the first war victim in the shoe industry's casualty list. (*See* also LEATHER.) (A. D. AN.)

Short, Walter Campbell (1880–), U.S. army officer, was born March 30 in Fillmore, Ill. A graduate of the University of Illinois, he entered the army in 1902 as an infantry lieutenant and saw service in the Philippines, 1908, and in the Mexican punitive expedition, 1916. During World War I he was attached to the 1st division general staff and was assistant chief of staff of the 3rd army. He was made a brigadier general in 1936, and was given command of the 1st division, Fort Hamilton, N.Y., 1939. In 1940 he was appointed major general and commanded successively the 4th and 1st army corps. He was made commanding general of the Hawaiian department Feb. 8, 1941, but was relieved of this post Dec. 17, 1941, in the army shakeup that followed the Japanese blitz on Pearl Harbor.

Shows. Horses.—The American Horse Shows association's rule book for 1941 listed 171 horse shows held that year under auspices of the association. Of these, 133 were sponsored by member organizations, and 38 were nonmember shows licensed by the association. The list did not, however, include hundreds of shows held in smaller communities or in connection with hundreds of county fairs. The only apparent effect of war on horse shows was that British, Canadian, Mexican and other army teams were absent from the picturesque National Horse show which held its 58th annual exhibition in Madison Square Garden, New York city, Oct. 5 to 12, 1941. United States, Cuban and Peruvian army teams participated in the New York show. The U.S. team won the International Military Special Perpetual Challenge trophy. United States army teams also appeared in a number of army and civilian horse shows throughout that country. Sensation, owned by Mrs. Reed Albee, Larchmont, N.Y., attracted outstanding attention at both the New York show and at the International Livestock Exposition and Horse show, Chicago, Ill., Nov. 29 to Dec. 6, 1941, taking first honours in the world's champion five-gaited $2,500 stake at Chicago and in the five-gaited class in New York city. In both shows E. F. Luckenbach's Lucky Jacqueline gave strong competition. Man of Destiny, owned by J. T. Russell and undefeated stallion champion of the year, won the $500 stallion stake in the Chicago show. Judy Dare, owned by Herbert Herff of Memphis, Tenn., was one of the leading favourites with spectators at the New York and Chicago shows, and also at the annual American Royal show in Kansas City, which had a record in both attendance and in the number of entries. The novel event of 1941, however, was the show held in San Francisco's huge new arena called the "Cow Palace," where the attendance was 142,000

MY OWN BRUCIE, a black cocker spaniel, was selected champion of 2,547 entries of all breeds in the Westminster Kennel club show in New York city Feb. 12, 1941, for the second successive year

although the show had only six weeks' previous notice. Most of the larger shows had unusually large classes in all divisions, and there was a prevalent tendency to increase the number of events open to women and juniors. (S. O. R.)

Dogs.—In 1941, 91,000 dogs, owned by 30,000 exhibitors, presented themselves for judging according to breed standard (physical type) at 232 all-breed and 115 one-breed shows. These figures were the largest since the first dog show was held in America in 1874. An orange-belton English setter Ch. Maro of Maridor won most best-in-shows, fourteen.

The cocker spaniel led in number of show entries (also stud book registrations). Obedience training classes and children's handling classes became increasingly popular as phases of dog show activities.

Morris and Essex Kennel club again held the world's largest dog show, at Madison, N.J. with judging in the open (3,883 dogs entered), 58 rings being used simultaneously, a one-day show. The Los Angeles Kennel club in November held the largest Pacific coast show, 1,002 dogs entered. Largest southern show, Birmingham, Ala., 530 dogs. Largest midwest show, Chicago, Ill., 1,227 dogs. (W. Ju.)

Livestock.—Annually beginning the calendar year of livestock shows and fairs in the U.S. is the National Western Stock show at Denver, Colo., which was held in its 35th renewal Jan. 11 to 18, 1941.

The Denver show is noted for its huge exhibits of range-bred feeder cattle and of purebred beef bulls and is a famous source of supply for quality bulls needed for range service and for choice young beef cattle for Corn Belt feedlots.

March 7 to 16 marked the 45th anniversary of the Southwestern exposition and Fat Stock show at Fort Worth, Tex. This show is the leading livestock exposition of the southwest and is the oldest livestock show in the country.

No important livestock shows or fairs occur in the United States from spring until the late summer. Beginning in August, these state shows are staged weekly through October, arranged by circuits in various sections of the country, to enable exhibitors to travel to a series of fairs over a period of a month to six weeks.

Most important of the nation's state fairs in 1941, in terms of livestock and allied agricultural exhibits, were those of Illinois, Indiana, Iowa and Ohio, all of which were held in August. The Ohio state fair at Columbus, Aug. 23 to 29, was distinguished by the largest exhibition of sheep at any show in the country during 1941.

The National Percheron Draft Horse show was held coincident with the Minnesota state fair at St. Paul, Aug. 23 to Sept. 1; and the Waterloo Dairy Cattle congress at Waterloo, Ia., Sept. 29 to Oct. 5, combined the year's major showing of the dairy breeds with the National Belgian Draft Horse show.

Important fairs, with emphasis on exhibitions of dairy cattle, were the Wisconsin state fair at Milwaukee, Aug. 16 to 24; the New York state fair at Syracuse, Aug. 24 to Sept. 1; and the Illinois state fair, Springfield, Aug. 9 to 17, the latter also ranking as one of the country's largest shows of beef cattle, horses, sheep and swine.

The National Dairy show, founded in Chicago, Ill., in 1906 and itinerant after 1920 was staged in Memphis, Tenn., Oct. 11 to 18, 1941 in connection with the Mid-South fair.

Ranking first among eastern sectional shows was the annual Eastern States exposition, which was held Sept. 14 to 20 in Springfield, Mass. This show emphasizes exhibitions of both dairy and beef breeds from eastern herds. A similar exposition of equal importance on the west coast is the Pacific International Livestock exposition at Portland, Ore., which took place Oct. 4 to 11, 1941. The Eastern States show has been held annually since 1917, the Pacific International since 1911.

The Ak-Sar-Ben Stock show in Omaha, Neb., Oct. 5 to 11, and the American Royal Livestock show in Kansas City, Mo., Oct. 18 to 25, were sectional shows of national importance, with special emphasis on exhibition of the beef cattle breeds. The American Royal Horse show is one of the country's best and largest.

In its perennial calendar position at the close of the year's agricultural expositions and fairs, the International Livestock exposition, held annually in Chicago since the turn of the century

during the first week of December, has, since its inception, been the country's largest and most important annual livestock and agricultural show.

Under world conditions in 1941, the 42nd International show at Chicago, Nov. 29 to Dec. 6, was not only the largest show of its kind in the United States, with an entry of 13,149 farm animals, but it also took world precedence in this respect. Every state in the union and five Canadian provinces were represented by participants. The world's largest farm crops show, the International Grain and Hay show, was staged in its 23rd year as a department of this exposition.

Canada.—Canadian war activities curtailed somewhat the dominion agricultural shows. However, the three famous summer shows of Canada, the Calgary exhibition, the Edmonton exhibition, and the Canadian National exhibition all took place in 1941. The largest, the Canadian National, founded in 1879, was held in Toronto, Ont., Aug. 22 to Sept. 6.

Great Britain.—After 108 years of continuous progress, the famous Highland Agricultural show of Scotland has not been held since 1939, due to the war; and the Royal Agricultural show of England, after 98 years, was discontinued in 1940 and 1941 for the same reason.

South America.—The chief South American agricultural show, the Palermo, was renewed in Buenos Aires on Aug. 15, 1941. A ten-day show, the first four days were devoted to judging, while the general public was excluded. During the remaining week, the public was admitted to view the prize-winning livestock displays. The Palermo has the world's largest annual showing of Shorthorn cattle and is noted for large exhibitions of Aberdeen Angus and Hereford cattle, as well as sheep. Although they are included, less emphasis is placed on the exhibition of Holstein-Friesians and Guernseys, the major dairy breeds of the Argentine.

(W. E. O.)

Siam: *see* THAILAND.

Siemens, Carl Friedrich von (1872–1941), German industrialist and munitions maker, was born Sept. 5 in Charlottenburg, Germany, the youngest of four brothers all prominent in British and German industry. His father, Werner Siemens, founded the vast Siemens works, which produced electrical machinery and armaments. Educated at the University of Strassburg, Carl Friedrich joined the family firm in 1899 and managed a London subsidiary from 1902 to 1908. He then returned to Berlin to become chairman of the Siemens Schuckertwerke. In 1919 he became chairman of the supervisory board of Siemens & Halske, an offshoot of the parent firm and the Siemens Schuckertwerke. In the postwar years the plant expanded enormously, and the Siemensstadt area in Greater Berlin was a target for R.A.F. bombers in World War II. He was a member of the reichstag, 1920–24. A Berlin dispatch of July 10 reported his death.

Sierra Leone: *see* BRITISH WEST AFRICA.

Silicosis is the most important chronic pulmonary condition due to inhaled dust. Years of exposure to high concentrations of fine, free silica dust (quartz) in mines, potteries, etc., produce small nodules of scar tissue throughout the lungs. In the absence of infection their uniformity of size and distribution produces diagnostically significant shadow patterns on an X-ray film. The cardinal symptom is exertion dyspnoea, often too slight to interfere with customary work. A specific susceptibility to tuberculosis is created which in healed or active phases increases disability. Toxic symptoms and tubercle bacilli in the sputum may not appear for years.

Silica irritation is chemical and not abrasive, so that emery and carborundum, for example, are not injurious. Quartz particles can be neutralized by coating them with insoluble substances, either mechanically by prolonged grinding with soft iron or gypsum or chemically with compounds of aluminum.

Attempts were being made in 1941 in Ontario and the U.S. to prevent silicosis by mixing metallic aluminum with the quartz in the air. Control of the dust at its source remained the best prophylaxis.

Asbestosis.—Most silicates are harmless but the fibrous varieties known as asbestos produce another dust disease called *asbestosis*. Diffuse fibrosis, associated chronic pleurisy and emphysema cause marked disability. Tuberculous complications are less frequent and tend to heal but produce excessive scar formation with increased dyspnoea. Very short asbestos fibres are less irritating to animals' lungs, suggesting a mechanical injury. In animals asbestosis retrogresses on cessation of exposure. Certain forms of talc have come under suspicion as a cause of disabling pneumoconiosis.

Silk. At the end of 1941, a silk dress, silk hosiery or any other article of silk, so far as the United States and other allied countries were concerned, had become a rarity to be treasured. The shifts of international dissension terminated the slowly dwindling use of silk that had been developing since 1932. When relationships that were strained by July 1941 became totally broken off on Dec. 7, Japan, as the chief supplier of the world's raw silk and as the conqueror of the eastern coast of China, the second largest supplier, made silk enemy material to the millions of Americans who had accepted silk as an everyday textile fibre.

On July 26, 1941 the United States government issued an order that no processing of silk would be permitted except for government use. One of the immediate effects of the order was the dislocation of the vast silk hosiery industry in the United States which at the time was supplying hosiery for that part of the world still in free trade.

Exports of hosiery to South America had been assuming large proportions when the makers found themselves deprived overnight of their raw material. All silk in the manufacturing plants or in warehouses was confiscated by the government for use in parachutes primarily, although so-called powder-bag cloth, for holding the charges of powder put into big gun shells, also demanded pure silk. This was waste silk, however, and not the type of silk (raw silk) used by hosiery mills. The government bought the silk from private owners at a stipulated price, as fixed by the Office of Price Administration, and resold it to mills making defense materials. The base price was $3.08 a pound for 78% Japan 13/15 white.

Previous to the action of the Price Administration early in August, the price had risen from $3.00 in June to $3.18 in July. There was no defense material that would employ the knitting machinery for making women's full-fashioned hosiery so that the actual effect of the ruling was to force every hosiery manufacturer to deliver his holdings to the government for use of the

Monthly Deliveries of Raw Silk to U. S. Mills, 1941

Month	Lb.	Month	Lb.
January	24,630	July	27,325
February	26,040	August	1,956
March	24,187	September	4,490

May	21,650	November	5,676
June	23,686	December	Not known

weavers of silk defense fabrics.

A picture of what happened to the industry is seen in the accompanying table of monthly deliveries of raw silk to United States mills during 1941.

The large shipments in July reflect the sudden effort of mills to gain possession of silk that was on order or held in warehouses for their account before the threatened import stoppage. The subsequent shipments of silk were to mills holding government contracts. The amount of silk on hand Aug. 1, from an inventory of warehouses of importers and of mills, was not divulged because it was considered confidential military information.

Many of the uses of silk that had continued despite the great use of rayon in dress fabrics were disclosed with this situation. Silk coverings for insulating wires, silk for cloth used by millers to sift flour, called bolting cloth, silk for shower curtains, umbrellas, raincoats, etc., silk for making the screens used in screen printing of textiles, silk for making fine cutout embroideries, where the design was stitched with cotton thread on a pure silk foundation and the effect of cutout embroidery given by dissolving the silk with an acid that did not affect the cotton—all these and many more were thrown into confusion with the sudden development. Some turned to rayon threads satisfactorily. The flour millers had a sufficient stock of bolting cloth on hand to last for some months and expected to use the stronger synthetic fibres such as nylon, vinyon, etc., when their stock of bolting cloth was gone. Others were conducting experiments to determine what they might use. (*See* also RAYON.)

The year closed with silk, in the Allied countries, a defense material, and in most of the other countries of the world an already forgotten product. But in the United States representations were being made to the government, through the department of agriculture, to investigate the possibilities of producing raw silk commercially in the western hemisphere. The fascination of sericulture had resulted in many attempts for 300 years to make silk a profitable crop in the U.S. or in Central or South America. Mulberry trees had flourished and the finest cocoons had been produced, but the movements met defeat in producing sufficient quantities of the reeled threads from the cocoons to make the venture successful in the commercial market. This was more true as the synthetic fibres were developed. (*See* also TEXTILE INDUSTRY.) (I. L. BL.)

Silver. World production of silver increased by 6% in 1940, to a total estimated at 273,700,000 oz. The trend of output is shown in the accompanying graph, and distribution of output in the accompanying table.

World Production of Silver
(In millions of fine ounces)

	1929	1937	1938	1939	1940
Canada	23.1	23.0	22.2	23.1	23.8
United States	60.3	69.3	58.7	57.8	67.0
Mexico	108.7	84.7	81.0	75.9	82.6
Other N. America	2.8	5.1	5.9	6.0	6.0
Peru	21.5	17.2	20.5	18.8	19.0

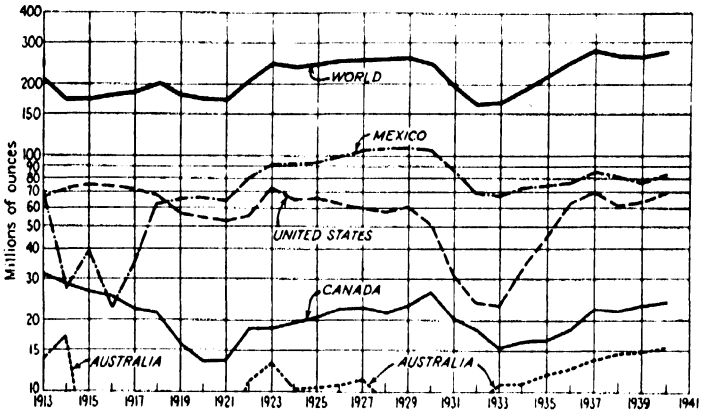
Oceania	9.9	14.8	15.1	15.5	15.6
Total	261.5	275.1	264.1	258.8	273.7

Production in the United States amounted to 67,013,000 oz. in 1940. The output during the first ten months of 1941 was 58,836,000 oz., an average rate equivalent to 70,600,000 oz. for the year. The total for the first seven months in Mexico was 48,591,000 oz., as compared with 47,768,000 oz. in the same period of 1940. In Canada operations for the first three-quarters of 1941 gave a total of 16,940,012 oz., against 19,273,224 oz. in the same period of 1940. No 1941 data were received from other sources.



SILVER PRODUCTION: world total and output of the major producing countries, as compiled by *The Mineral Industry*

The first change in the price of foreign silver on the New York market in more than a year was made on Nov. 28, 1941, when the quotation was raised from 34·75 cents per ounce to 35·125 cents. On Nov. 19 the government of the United States concluded an agreement with that of Mexico, covering the buying of Mexican silver at 35 cents, as against the current open market price of 34·75 cents. This resulted in so much of the silver going to the government that there was an insufficient supply in the open market until the price was raised. The government buying price for newly mined domestic silver was unchanged throughout the year at 71·11 cents. The London market opened at 23¼*d.*, and closed at 23½*d.*, with only minor changes during the year. (*See* also MINERAL AND METAL PRICES AND PRODUCTION.)

(G. A. RO.)

Simovitch, Dushan (1882–), Yugoslav statesman, was born in Kragujevac, Serbia. In 1900 he graduated as an honour student from the military academy at Belgrade with the rank of artillery lieutenant. During World War I he was a major on the general staff. After the war he was successively delegate in the national council at Zagreb, adjutant to the commander of the 4th army and adjutant to the king. From 1919 to 1927 he was chief of staff of the 3rd and 4th armies. In 1930 he served as commandant of the military district for Bosnia, then was transferred to take charge of the army mechanized instruction schools in Sarajevo. In 1938 he was appointed commanding general of the Yugoslav air force. On March 27, 1941 he engineered the coup d'état which led to the overthrow of Premier Cvetkovitch's government, under Regent Prince Paul, three days after it had signed a pact with the German-Italian axis. The new government repudiated the axis pact and proclaimed young Peter II as king, with Simovitch as premier. Upon Yugoslavia's speedy defeat by German arms (April 6–18, 1941) Simovitch fled with Peter II to Jerusalem. In June the two arrived in London to set up their government in exile. (*See* also YUGOSLAVIA.)

Singapore. Capital of the Straits Settlements (*q.v.*) and the main port of southeastern Asia, located at the intersection of the trade routes to Australia and to India and Europe, Singapore is on an island of the same name, 27 mi. long and 14 mi. broad, off the southern tip of the Malay peninsula. It is situated at 1° 20′ N. The population of Singapore Island (1940) was 750,805. Chinese, Hindus and Malays are the principal elements in a very mixed cosmopolitan population.

Singapore was chosen as the site of the largest British naval base east of Suez and was built over a period of years at a cost of about £7,700,000 sterling, not including the expenditures on the land and air forces stationed there. Conspicuous features of the base, which is located on the northern shore of the island, on the Strait of Johore (a causeway connects the island with the mainland), were the huge dry and floating docks, which could service the largest types of warship. There were also extensive naval repair shops and oil storage facilities. The British forces in Singapore were several times reinforced by Australian and other troops as tension with Japan became marked during 1941. The great base was the main objective of the Japanese overland drive down the Malay peninsula in Dec. 1941. (*See* also JAPAN; WORLD WAR II.) (W. H. CH.)

Sin Kiang (CHINESE TURKESTAN). Bounded on the north and west by the soviet union, by Mongolia on the north, on the south by India and Tibet and on the east by China, Sin Kiang is one of the largest, most remote, isolated and little known regions of China. The name means New Dominion, and it is not an integral part of China, from which it is separated by mountain ranges and deserts, although there is a seat of Chinese administration at Urumtsi. Area, 705,769 sq.mi.; pop. (est. by Chinese ministry of the interior, 1936) 4,360,020. Especially in the southern part of the territory, the population consists largely of Turki tribes, mostly of the Moslem faith, who have carried on sporadic rebellion against the Chinese authorities in Urumtsi. The largest towns are Urumtsi (50,000) in the north, and Kashgar (80,000) and Yarkand (75,000) in the south. Much of Sin Kiang is desert country; but cereals, fruits and vegetables are cultivated in the valleys of the Yarkand and Kashgar rivers, and irrigation has been known in this part of the world since ancient times. Cotton, wool and silk are other products. The trade of Sin Kiang tends to gravitate to the soviet union, especially since the opening in 1930 of the Turkestan-Siberia railway, which passes close to the border in several places. There is substantial soviet political influence in the region, and foreign travellers enter the territory at some risk if they do not possess soviet permission. The degree of domination by the soviet representatives is less than in Outer Mongolia, but it takes the form of giving military and technical advice. Soviet trucks, proceeding over an old caravan trail from Urumtsi, have transported considerable quantities of munitions and supplies to China. The air route from Chungking to Moscow also lies across Sin Kiang, with stops at Urumtsi and at Hami on the eastern border of Chinese Turkestan. There is an old inn at Hami where the famous mediaeval traveller, Marco Polo, once stopped. (W. H. CH.)

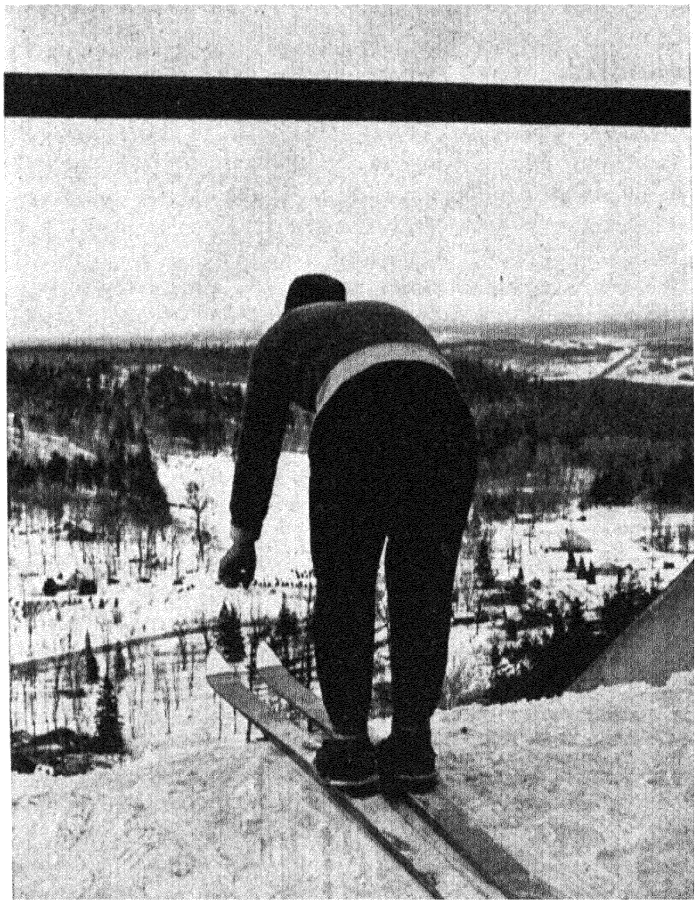
Skating: *see* ICE SKATING.

Skiing. As general enthusiasm for skiing developed in 1941, hundreds of ski clubs were established in cities and towns in all parts of Canada and in the states along the northern boundary of the United States. The Toronto Ski club had in 1941 a membership of more than 5,000 men and women. There are excellent ski runs near all the large cities and in the national parks, in settings of superb scenic beauty, from Quebec to the steep slopes of Washington.

Millions of skiers and skiing enthusiasts shared in the daring exploits of several sensational young men, led by Torger Tokle, the young Norwegian who thrilled thousands of spectators on



TORGER TOKLE, U.S. champion ski-jumper, preparing to take off at a meet in Duluth, Minn.

Olympian hill, near Seattle, Wash., when he soared 288 feet to top the national record of 273 feet he had set a short time before at Leavenworth, Wash. He also broke distance ski marks on ski runs at Lake Placid, Bear mountain, Duluth and Laconia-Gilford. Besides taking the national and central titles, he won the eastern crown for three successive years. Alf Engen, of Salt Lake City, dethroned by Tokle, leaped 267 feet off the huge Pine mountain slide and won the national classic combined in Michigan. Toni Matt, professional, won the national downhill and combined downhill-slalom in the open divisions, defeating the defending champion, Dick Durrance, the famous Dartmouth alumnus, who in turn took the national open slalom. Young Bill Redlin, of the University of Washington, won the amateur laurels in the downhill, slalom and combined events at Aspen, Colo. George Gustavson, of Auburn, Calif., returned as the national cross-country ruler. Dartmouth retained the collegiate Ski union title, but lost the 31st annual Dartmouth carnival to the University of New Hampshire team.

Among women skiers Mrs. Gretchen Fraser of the Sun Valley Ski club dominated the championships. In the open class she won the national downhill and combined downhill-slalom. Miss Nancy Reynolds, of Montclair, N.J., won two amateur titles, the national downhill and combined national championships. Miss Marilyn Shaw won both the open and amateur slalom titles with fine form. (J. B. P.)

Skin Diseases: *see* DERMATOLOGY.

Slate. The United States, United Kingdom, France and Germany accounted for about 90% of the world's slate production, and the soviet union, India, Belgium, Sweden, Australia and Canada for most of the remainder. The only 1940 data available were those of the United States, where production was 473,450 short tons, a decline of nearly 10% from 1939. (G. A. RO.)

Slovakia. A nominally independent republic in Central Europe, formerly a part of Czechoslovakia. Area 14,848 sq.mi.; pop. 2,800,000, of whom the great majority are Slovaks, a Slav people closely akin racially and linguistically to the Czechs. The majority are Roman Catholics, but there is a considerable Protestant minority. Capital, Bratislava; chief cities: Bratislava (123,852); Trnava (23,971); Nitra (21,259). President, Msgr. Joseph Tiso; premier, Dr. Bela Tuka.

Slovakia came into existence in March 1939 through German help. It signed a treaty with Germany according to which armed forces received the right to occupy Slovakia at any time and to erect military plants there. Slovakia pledged herself to conduct her foreign policy and to organize her army in agreement with Germany. All her economic life was strictly co-ordinated with national socialist economy. On Nov. 24, 1940, Slovakia adhered officially to the Rome-Berlin-Tokyo military alliance. As a result of that pact, Slovakia participated in Germany's war against the soviet union after June 22, 1941, and declared herself to be in a state of war with the United States after Germany's similar declaration of war Dec. 11, 1941. But Slovakia's relations with her axis partner Hungary remained extremely strained in view of the fact that Hungary had annexed much Slovakian territory and was believed to covet all of Slovakia, which before 1918 had formed part of Hungary.

Many of the leading Slovaks, dissatisfied with the German vassalage, with the fascist trend and with the anti-Slav stand taken by the Slovak government, worked for the re-establishment of the Czechoslovak republic. A number of Slovaks participated in the Czechoslovak government which resided in England under Dr. Eduard Beneš as president.

Industry and Trade.—Slovakia is a country rich in timber, wheat, ore and sugar beet and has developed industries working these raw materials. The exports amounted in 1940 to 3,175,000,000 Slovak crowns, the imports to 2,872,000,000. Germany participated in the exports with 69·7%, in the imports with 76·5%, Italy occupying second place, with 5·9% of the exports and 4·5% of the imports. Among Slovakian exports timber and wood ranked first followed by matches, iron and paper. Among the imports, textiles were followed by metal and metal goods, food and tobacco and machines and tools. Small Business: *see* BUSINESS REVIEW: *Industrial Groups.*

Smith College. A college for women located at Northampton, Mass. Hallie Flanagan Davis, professor of drama at Vassar college and former director of the federal theatre project, was appointed dean of Smith college and professor of drama in 1941 to succeed Marjorie Hope Nicolson, who joined the faculty of the graduate school of Columbia university. To compensate in some small degree for the cancelled "junior year abroad," one of the dormitories was redecorated and refurnished in the French style to house some 30 students who wished to become proficient in speaking French. Enrolment at the college for the academic year 1941–42 was 2,084 students; the faculty numbered 254; the number of volumes in the library was increased to 285,132. The endowment in 1941 was $6,431,828.69. (M. B. M.)

Smith, Preserved (1880–1941), U.S. historian and professor, was born July 22 in Cincinnati, Ohio. He began his academic career as an instructor in political science at Williams college, 1904–06, and from 1907 to 1914 he was a fellow in history at Amherst. He became lecturer in history at Harvard in 1919, and in 1922 he was appointed professor of history at Cornell. Dr. Smith wrote extensively on history; among his works are *The Life and Letters of Martin Luther* (1911); *The Age of Reformation* (1920); *Erasmus—A Study of His Life, Ideals and Place in History* (1923); *A Key to the Colloquies of Erasmus* (1927), and *A History of Modern Culture*, which appeared in two volumes, vol. 1, *The Great Renewal 1543–1687* (1930), and vol. 2, *The Enlightenment, 1687–1776* (1934). He died in Louisville, Ky., May 15.

Smithsonian Institution. The institution was founded in 1846 by bequest of James Smithson of England, "for the increase and diffusion of knowledge among men." The governing body is a board of regents. Executive officer, Dr. Charles Greeley Abbot, secretary. The institution directs six government bureaus; also the Freer Gallery of Art and the Division of Radiation and Organisms.

Activities in 1941.—*Smithsonian:* Engaged in several national defense projects; installed new index exhibit in Smithsonian building; completed fifth year of weekly educational radio broadcasts, "The World Is Yours," in co-operation with U.S. Office of Education and National Broadcasting company; publications issued (Smithsonian and all its branches), 78; distributed, 125,837 copies.

National Museum: Specimens added to collection, 326,686; numerous scientific expeditions in the field; 14 special exhibitions held; visitors, 2,500,302; publications issued, 25; distributed, 52,170 copies.

National Gallery of Art: Gallery established by joint resolution of congress. Art works and building to contain them were a gift to the nation by the late Andrew W. Mellon. The gallery is designated as a bureau of the institution but is administered by a board of nine trustees; David K. E. Bruce, president; David E. Finley, director. The building was completed at a cost of $15,035,597, and was opened to the public March 18, 1941. The building also houses the Samuel H. Kress collection of Italian paintings and sculpture, a gift of Samuel H. Kress and the Samuel H. Kress foundation to the gallery.

National Collection of Fine Arts: This name designates art collections administered by the Smithsonian Institution. Eight special exhibitions were held; the 20th annual meeting of the Smithsonian Art commission (formerly National Gallery of Art commission) was held Dec. 3, 1940.

Freer Gallery of Art: Added to its collections Chinese bronze and jade, Chinese and Persian porcelain and pottery; Arabic manuscripts; and Indian and Persian painting. Visitors, 111,784.

Bureau of American Ethnology: M. W. Stirling, chief, directed an expedition, in co-operation with the National Geographic society, to Mexico, where 20 stone monuments were unearthed and photographed, two initial-series dates were deciphered, and stratigraphic work was extended at Cerro de Mesa and a large number of stelae were excavated at Izapa. Other field work on American Indians was conducted by the following members of the scientific staff: Dr. J. R. Swanton, Dr. F. H. H. Roberts, Jr., Dr. J. H. Steward, Dr. William N. Fenton; linguistic studies were conducted by Dr. J. P. Harrington; Dr. Henry B. Collins, Jr. continued work on prehistoric Eskimo material excavated in 1936 around Bering strait; Miss Frances Densmore, collaborator of the bureau, continued her study of Indian music; publications issued, 3; distributed, 11,882 copies.

International Exchange Service: Official agency for the United States for interchange with other countries of governmental and scientific documents; packages of such material handled during year numbered 576,282; weight, 388,649 lb.

National Zoological Park: Dr. William M. Mann, director, returned from the Smithsonian-Firestone expedition to Liberia and brought back 200 animals for the collections; new restaurant building built under an allotment from PWA was completed; total number of animals in collection, 2,380; visitors, 2,430,300.

Astrophysical Observatory: The observatory maintained solar stations at Mt. Montezuma, Chile, Table mountain, Calif. and Tyrone, N. Mex., and continued work on a complete revision of all solar-constant values since 1923.

Division of Radiation and Organisms: Carried on investigations in the field of radiation in relation to plant growth, especially photosynthesis, respiration and chlorophyll formation, the influence of light in early growth of grass seedlings and the influence of cultural conditions on the growth of algae. The division published six papers. (C. G. A.)

Smoot, Reed (1862–1941), U.S. senator and Mormon leader, was born Jan. 10 in Salt Lake City, Utah. An expert on tariff, taxation and public finance, he fought against tax-exempt bonds in 1918 and proposed a sales tax in 1920 to pay the soldiers' bonus. As an advocate of economy, conservative Republicanism and a high tariff, he helped frame the Payne-Aldrich bill and the Fordney-McCumber tariff and was co-author of the Smoot-Hawley tariff act of 1930. Smoot served as a senator from Utah from 1903 to 1933, and after his defeat in the 1932 senatorial race he retired from politics. He continued, however, to take an active role in the Mormon church. He died in St

Petersburg, Fla., on Feb. 9. (See *Encyclopædia Britannica.*)

Soap, Perfumery and Cosmetics. The expansion of sales volume, which began with the outbreak of war in Sept. 1939 and continued through 1940, continued through 1941 in all three of these industries, stimulated not only by vastly increasing industrial employment and pay rolls, but also by the steady decline of foreign competition. With one or two exceptions there were, for example, no genuine French perfumes left on the U.S. market by the end of 1941.

Government restrictions on the uses of materials for purposes other than defense resulted in many new manufacturing problems. The enormous government demand for alcohol stimulated the importation of large quantities of Brazilian and Puerto Rican alcohols which can be used in these trades only with considerable difficulty. The new problems were not confined alone to those raised by the alcohol and chemicals position. Packaging, always a major factor in these industries, was complicated by shortages of paper, cardboard, foils, plastics, cellophane, and so forth. In general it may be said the situation was well met. The chief sufferers were new products and new contenders for a share of the profits of the industries.

In the early fall a notable and far-reaching change occurred in the industries' relationship to government when the burden of the miscalled "excise" tax was shifted from the producers to the ultimate consumer. The change should result in greatly increased revenue to the government. The net increase in cost to the consumer is trivial. The relief to the industry, not only from the burden of the tax itself but also from the costly nuisance of recording and collecting, was expected to be very great.

Value of Production of Soap, Perfumery and Cosmetics, 1939 and 1937
(Source: U. S. Bureau of Census)

	1939	1937
Soap and Glycerine	$302,634,474	$301,201,547
Perfumes, Cosmetics and Toilet Preparations	147,465,585	132,330,481

Note the difference in increase of soap and glycerine which is a pretty staple industry as compared with that in a luxury industry (perfumes and cosmetics) from 1937, a bad year, to 1939.

Developments of the war during 1941 definitely altered the export trade of these industries, with what net effect on sales volume it was by Jan. 1, 1942, still too soon to say, although it would probably be downward. The closing of the South African market —always a large and lucrative one to United States producers— ostensibly to conserve shipping space for necessities, but more probably in the interests of currency control—would inevitably divert a considerable volume of United States export trade to manufacturers in Great Britain; it had, indeed, by the end of 1941, already begun to have that effect. No one could say whether this shift was temporary or permanent; but with respect to those British manufactories which were U.S. owned or controlled—and they were an important part of the British whole—it would probably be temporary.

However, the fact that Great Britain should be using for the exportation of luxuries material of which it was in scant supply had a certain significance; for example, as previously noted, paper and cardboard were important materials of these industries. Great Britain's supply was short. A lot of the paper and cardboard it produced was made from pulp which it imported from the United States under the Lend-Lease act. However insignificant the part of Great Britain's global production of these commodities that went into exported luxuries might be, it was bound to achieve a certain amount of political importance—less perhaps than it might otherwise have been had the United States stayed out of the war. (H. T.)

Soccer. In March of 1941 the prominent Botafogo Football club of Rio de Janeiro visited New York city for an exhibition game, following a tour of Mexico. A selected team representing the American Soccer league beat the Brazilians in a hotly contested event. In September the Puentes Grandes club of Havana played six exceptionally fast games in the east, winning two, losing three and tying one. A National Soccer league team visited Haiti and with gallant sportsmanship lost three, won one and tied one.

Seventy-one clubs took part in the open classic under the auspices of the U.S. Football association. The honours went to the Pawtucket (R.I.) Football club, which beat the Chrysler Football club of Detroit, Mich., in home-and-home games. Twenty-nine teams competed in the national amateur event, which simmered down to a dramatic final between Fall River and Chrysler, at Fall River, Mass., won by Fall River.

In the American Soccer league (amateur) the Scots-Americans of Kearny (N.J.) and the Philadelphia Germans fought a keen contest for supremacy. The Scots gained the verdict for the fifth year in succession, nosing out their rivals by one point.

(J. B. P.)

Socialism. In the United States the Socialist party until the Japanese attack on Hawaii, Dec. 7, 1941, continued its active opposition to American participation in the war and to the steps leading thereto. The party, which continually made plain its opposition to Hitlerism, nevertheless urged that the country could better advance democracy, and in the long run serve mankind, by keeping out of war. After the United States was completely involved in war, the national executive committee of the party sought to concentrate socialist thought and action on the preservation of civil liberty; establishment of democratic controls over war and postwar collectivism; preservation and improvement of the standard of living for low income groups despite the war; taxation according to ability to pay; and, in general, the achievement of a democratic socialism as against any more or less totalitarian form of state capitalism. It demanded the earliest possible achievement of an enduring and desirable peace which, it argued, should be anti-imperialist and find its support in the co-operation of peoples and not in the police power of an Anglo-American military alliance. The party's statements were strongly critical of the charter of the Atlantic as a basis of a just, democratic and enduring peace.

In the spring of 1941 many Socialists, not in sympathy with the antiwar position of the party, played a leading part in the formation of the Union for Democratic Action, strongly interventionist in outlook but concerned for the preservation and increase of democracy at home and the winning of a democratic peace. This did not absorb the older prowar Social Democratic federation which continued its educational activities.

The year 1941 was an off year in American political campaigns. Jaspar McLevy, leader of the Connecticut Socialist party, disaffiliated with the Socialist party of the United States of America was easily re-elected mayor of Bridgeport, Conn.

In the municipal elections of New York city the Socialist party felt compelled by its position to nominate its own city-wide ticket. The American Labor party went along with fusion but nominated many of its own councilmanic candidates unopposed by Socialists. The A.L.P. refused its endorsement to Harry W. Laidler, who had previously been elected to the council under its banner, with the endorsement of the Socialist party and other groups. Dr. Laidler was endorsed again by the Socialist party, the City Fusion party and by other civic groups but was defeated for re-election under the system of proportional rep-

resentation. Two members of the Social Democratic federation were, however, elected to the council under A.L.P. designation.

The city-wide ticket nominated by the Socialist party was headed by Prof. George Hartmann, Teachers college, Columbia university as candidate for mayor. The ticket received about 25,000 votes, doubling the very small vote of the party in the presidential election. The headquarters of the party and of its official organ, the *Call,* remained at 303 Fourth avenue, New York city.

War conditions prevented any effective effort for the reconstitution of the Socialist—as distinct from the Communist—International. The Communist International, completely controlled by Moscow, continued its dependence upon Stalin's will, and the Communist party in the United States at once switched from vehement anti-interventionism to equally vehement interventionism after Hitler's attack on Stalin. World-wide Socialist forces in 1941 had more stability of democratic conviction but found it impossible to go beyond the stage of hopeful thinking and very little planning for the reconstruction of their international movement.

In the year 1941, European Socialists were able to function openly in Socialist and Labour parties in their own countries only in Great Britain, Eire, Sweden, Switzerland and Finland.

Great Britain.—In Great Britain, members of the British Labour party during 1941 occupied 36 ministerial positions in the government and nine top empire posts. The Annual Labour Party conference reaffirmed the party's support of the government. The delegates at the June conference again expressed their belief in international economic planning and declared that "no peace which does not aim at a Socialist reconstruction of international society can be accepted by the Labour party as adequate to the sacrifices involved in the defeat of nazi and fascist aggression." In the summer the party set up a Central Committee on Reconstruction under the chairmanship of Emanuel Shinwell, M.P., and the secretaryship of Harold J. Laski.

On July 31, 1941, the party again refused to be associated in any way with the Communist party, declaring that the latter's policy had "never been determined by democratic methods, nor by reference to the needs and purposes of the British people."

James Walker, Labour M.P., on Oct. 8, 1941, presented before parliament labour's case for the public ownership and control of industry as the one means of securing 100% utilization of the national resources. The leaders of the party, in December, however, refused to support an amendment to the conscription bill which declared that, as a means to the "full utilization of the natural resources in the war effort," "essential industries vital to successful prosecution of the war, especially transport coal mining and the manufacture of munitions, should be brought under public ownership and control and that necessary legislation should be brought in as soon as possible." Ernest Bevin (*q.v.*), opposing the amendment, declared that property was already at the government's disposal and promised that questions of further requisition would continue to be judged on their merits. He added, "neither interest, property, persons nor prejudices can interfere with the goal of winning the war."

The small Independent Labour party surprised the British public and press by winning 20% of the vote for its secretary, Fenner Brockway, who was its candidate in a parliamentary by-election. The I.L.P. was vigorously pushing immediate socialization. It advocated peace by action of the workers of the belligerent countries. Formally it professed not only opposition to the national government under Winston Churchill (*q.v.*), but also to the war conducted by that government. Meanwhile its conduct and treatment of the war to most outsiders would seem to have been adequately described as one of highly critical support.

Sweden.—In Sweden, the Social Democratic government, headed by Per Albin Hansson, continued in office throughout 1941. The government sought during the year to keep from being drawn into war, while retaining its independence and freedom of action. It continued to strengthen its defenses against possible invasion. The Danish coalition government, headed by Premier Stauning, remained in office, but practically all power was usurped by the nazis.

Finland.—As the year advanced, Finnish Socialists, who were likewise represented in the government, began to bring increasing pressure on the government to consider ways and means of ending the war with Russia before the country found itself committed to a policy of territorial aggrandizement.

Norway.—The Norwegian Labour government in exile, with headquarters in London, continued to manage the large Norwegian merchant marine. All the belligerent governments in exile with headquarters in London contained Labour and Socialist members.

France.—In France, Leon Blum and other prominent Socialists continued under arrest on the charge of being responsible for plunging France into war. Many Socialists were in concentration camps. Many were executed. Marx Dormoy (*q.v.*), former Socialist minister of interior, was assassinated.

Germany.—In Germany, Dr. Rudolf Hilferding, former Social Democratic minister of finance, was found hanged in his prison cell. In France, Norway, Denmark, Belgium, Holland, Czechoslovakia and other countries under nazi control, Socialists were active in the underground movements.

British Dominions.—Socialist and labour political movements were influential in 1941 in the various British dominions. In Australia, after refusing to join other parties in forming an All-Party government, the Australian Labour party, on the resignation of the Fadden (*q.v.*) government in early October, formed a Labour government with John Curtin (*q.v.*) as prime minister.

POLITICAL OPPOSITES were thrown together for the first time in 1941 by their common views on U.S. nonintervention in the war. Hamilton Fish, Republican, and Norman Thomas, Socialist, united in voicing their opposition to the lend-lease bill

In New Zealand, the Labour government under the premiership of Peter Fraser, inaugurated during the year a system of national free medical care. In the May municipal elections, the party suffered several reverses.

In Canada, the Canadian Commonwealth federation, in the elections in British Columbia in October, returned 14 of its members to parliament out of a total of 48, as compared with 7 in the previous election.

South America.—In South America, the Socialists in 1941 showed chief activity in Chile. In this country several Socialists were members in the early part of 1941 in the Popular Front cabinet. They resigned prior to the March elections in protest against the inclusion of Communists in the Popular Front, but Pres. Pedro Aguirre Cerda (*q.v.*) refused to accept their resignation. In the March elections, in which they ran independently, they elected 15 deputies and 5 senators and later formed a pact of cooperation with the Radical party which opened up the way to the continuance of the Popular Front government. Following the death of the president, the Socialist party nominated as his successor Oscar Schnake for whom a campaign was in progress at the end of the year. Socialist parties were also legal, well organized and active in Argentina and Uruguay. In Ecuador, under its very imperfect democracy the party had a semilegal existence and in some other countries there were leftist groups. (*See* also COMMUNISM; LABOUR PARTY.) (H. W. L.; N. T.)

Socialist Soviet Republics: *see* UNION OF SOVIET SOCIALIST REPUBLICS.

Socialized Medicine: *see* MEDICINE.

Social Security. In 1941 no new national developments were recorded in the social security program until Dec. 19, when the president nationalized the federal-state employment services.

At the beginning of 1942 the social security program of the United States embraced the following major programs:

A Federal Plan of Old Age and Survivors Insurance.—Under this program "primary" benefits, computed at 40% of the first $50 of the average monthly wage earned after 1936, plus 10% of the balance up to $250 monthly, are paid to persons reaching age 65. For each year of minimum earnings after 1936, 1% of the primary benefit is added. Thus a worker who averaged $100 a month in the preceding five years was entitled, upon retirement in Jan. 1942, to $26.25 monthly for the rest of his life. In addition, his wife past 65 years of age is entitled to 50% of her husband's primary benefit. A similar benefit is paid to a dependent child of a retired or deceased worker under the age of 16, or 18 if regularly attending school. The benefit is raised to 75% of the deceased husband's monthly primary benefit for widows who are either aged 65 and over or have dependent children under the ages specified above. Parents who are wholly dependent upon a worker who leaves no other eligible survivors

are each entitled to 50% of the primary benefit. When no eligible dependent survives, a lump sum up to six times the primary annuity is paid. Retired beneficiaries may earn up to $14.99 per month from work covered by the program and any amount from work not covered by the program.

By the end of Nov. 1941 a total of 465,663 monthly awards were in force. As a result mainly of the war boom, 48,979 of these awards were at that time in the "deferred" or "conditional" payment status, *i.e.*, no payments were made to them currently or were to be made for an indefinite period. Of the total number of awards in force, 224,178 were for primary beneficiaries, 61,725 were for wives of beneficiaries, 117,699 were for children, 14,134 were for widows past the age of 65, 46,059 were for younger widows with dependent children and 1,868 grants were given for aged parents.

The amount of payments in force as of November was $8,476,025. But in view of the "deferred" and "conditional" payment status of many awards, there was spent only $7,522,865 that month. At the end of September the monthly primary benefits then in force averaged $22.69. With an average wife's benefit of $12.09, this gave aged couples a national average of $34.78 monthly. The average aged widow's benefit amounted to $20.26 while a child's benefit averaged $12.17, a younger widow's $19.49 and a parent's $12.94.

In addition to the large number of awards held up, the war also had the following effects on this system: In 1941 about 2,400,000 employers were estimated to have been reporting taxable wages on about 40,000,000 employees. This was in contrast with 1,740,000 employers on 23,000,000 employees in the first quarter of 1938. Moreover, whereas in the first quarter of 1941 a total of 74,567 awards were made, only 65,593 awards were made in the third quarter of that year. The greatest reduction was in primary benefit awards, which fell more than 11,000 from the third quarter of 1940.

From 1937 to Oct. 1, 1941, a total of $2,742,065,000 was collected in federal old age insurance taxes. The total benefits through Sept. 1941 amounted to $122,900,000. The old age insurance trust fund, including interest, totalled $2,575,417,000 at the beginning of October.

Railroad Retirement Act.—Under the second largest national system of old age protection, the Railroad Retirement act, 154,847 pensions and annuities of various types were in force on Sept. 30, 1941. The monthly amount in force was $9,862,086. The total receipts available to this program up to Oct. 1, 1941, were $647,877,000. Benefit payments up to that time amounted to $450,926,000. Assets of this fund totalled $196,951,000 (Sept. 30, 1941).

Unemployment Insurance.—The 51 states and territories administering unemployment insurance paid a total of $519,945,914 in benefits during 1940, approximately $90,000,000 more than in 1939. In June 1940, some 28,000,000 workers were covered by the unemployment insurance systems. As against 3,613,012 total beneficiaries in 34 jurisdictions in 1939, 5,051,766 workers received their first benefit cheque in 49 jurisdictions during 1940. The systems provided an average of $100.15 per worker in 1940, in contrast to an average of $84.24 for 1939. The average benefit for a week of total unemployment was less than $10 in 30 jurisdictions and below $7 in seven of them. The average duration of benefits in 25 systems ranged from 5.36 weeks to 11.97 weeks. The proportion of beneficiaries who exhausted their benefits while still unemployed in the same 25 jurisdictions ranged from 30.2 to 78.7. Benefit expenditures in 1940 represented 60.8 cents of every contribution dollar collected during the year as compared with 54.4 cents in 1939.

In 1941 most of the states amended their laws. The changes consisted mainly in boosting the benefit rates and their duration. In September there were 2,170,455 compensable unemployment compensation claims throughout the U.S. for which a total of $22,941,874 was paid in benefits. The total represented a decline of 13.4% from August and of 37.3% from Sept. 1940. In September an average of 493,423 workers received weekly unemployment compensation benefits. The total collections in taxes since these laws came into operation amounted to $3,883,249,000 by the end of September. The total benefits paid out amounted to $1,618,853,000 by the same date. The ratio of total benefits to total collections since benefits first became payable amounted to 56.7. Between Jan.-Sept. 1941 this ratio was only 37.8. The Unemployment Trust fund amounted to $2,289,500,000 by the end of September.

On Sept. 30, 1941, 4,355,860 job seekers were registered with the employment services throughout the U.S. During the month of September 545,676 persons were placed in jobs, an increase of 7.1% from the previous month. In December the president nationalized all the federal-state employment services. (*See* also UNEMPLOYMENT.)

Railroad Unemployment Insurance.—The railroad unemployment insurance system paid in September a total of $561,828 in 25,659 benefit payments. This contrasted with $991,712 in 66,336 claims in Sept. 1940. Since the beginning of this system a total of $33,786,000 was paid out in benefits.

Public Assistance.—The year 1941 marked some significant strides in public assistance legislation. In Sept. 1941 the recipients of public assistance throughout the United States were as follows: 2,204,189 old-age assistance beneficiaries received a total of $46,174,595; 383,796 families with 926,149 children received aid-to-dependent-children amounting to $12,562,222; 74,892 blind persons received aid-to-the-blind amounting to $1,909,998. The average old age assistance payment in September was $20.95 for the nation as a whole but ranged from $7.63 in Arkansas to $36.45 in California. The average payment under aid-to-dependent-children amounted to $32.73 per family in September, ranging from $13.38 in Arkansas to $55.51 in Massachusetts. The average monthly aid-to-the-blind pension amounted to $25.50 for the United States as a whole, with $8.99 in Arkansas and $46.65 in California. During the same month 817,000 cases received $18,547,000, an average of $22.70, in general relief throughout the U.S. (*See* also CHILD WELFARE; LAW: *Social Security;* RELIEF.) (A. EP.)

Great Britain.—Social questions were the subject of much study in Great Britain during 1941, largely with reference to postwar settlement. A social reconstruction survey was undertaken by the authorities of Nuffield college, Oxford, with G. D. H. Cole as chairman and with a government grant of £5,000; a committee was set up under Sir William Beveridge to inquire into existing schemes of insurance, industrial superannuation, workmen's compensation, unemployment assistance, etc.

Unemployment Insurance.—The prime minister's promise at the end of 1940 to replace the household means test for unemployment and supplementary old age pensions by a test of personal need based on the applicant's circumstances was implemented in 1941 by the Determination of Needs act. Under this: in the case of an applicant who is a householder and has wage earners as members of his household (relatives or not), it is assumed that each of such persons earning 55*s.* per week or over contributes 7*s.* weekly to the household expenses, 5*s.* if the wage is between 30*s.* and 55*s.*, 2*s.* 6*d.* if over 20*s.* and under 30*s.*, and nil if not exceeding 20*s.* If the applicant is not a householder and lives with a near relation (not by marriage), and the householder's income (exclusive of overtime, Sunday pay, etc.) exceeds a certain figure, it is assumed that the applicant does not pay for board and lodging and therefore these items are ignored in assessing need. This figure is £6 per week in the case of a householder with one dependent, with another 15*s.* for each additional dependent. Thus, a married couple with two children has to receive £7. 10*s.* per week before it is assumed that they provide a needy relative with free meals and quarters. In such a case the applicant's unemployment allowance is 5*s.* per week and he is not eligible for a supplementary pension. An applicant not affected by this rule (the majority) is granted in addition to the ordinary allowance a sum equal to his share of the rent, but limited to 5*s.*; thus, if he is one of a household of four and the rent is 12*s.*, the addition to his pension—subject to the assistance board's power of adjustment to meet special needs—will be 3*s.* The act also provides that the first £375 of new money invested in war savings shall be disregarded in assessing means.

The 1939-40 income of the unemployment fund was £66,992,668, and expenditure (excluding the £37,000,000 debt repayment) £46,345,472; the former was an increase of over £800,500 and the latter a decrease of over £18,420,000 on the final figures of the previous year. Expenditure on benefit fell from £54,222,033 to £36,644,912, and administration expenses from £6,035,662 to £5,335,385, these results being due to the general reduction in the unemployment level and the decrease in the percentage of unemployed qualifying for benefit. There was a balance from the previous year of £40,500,000, and the balance carried forward at the end of the year, after deducting the £37,000,000 repayment, was £24,155,841. The balance on the agricultural account rose from £2,746,648 at the opening to £3,253,770 at the close of the year, notwithstanding the increased benefits announced in 1940.

The total number of persons registered as wholly unemployed in Sept. 1941 was 230,621 as compared with 613,671 in Sept. 1940.

National Health Insurance.—In the autumn an interim act was passed to deal with immediate necessities pending the issue of the Beveridge committee's report. This raised, as from Jan. 1, 1942, the weekly rates of sickness and disablement benefits by 3*s.* for men and women alike, and raised the income limit of nonmanual workers from £250 to £420 per annum (bringing in some 500,000 persons) and that for workmen's compensation from £350 to £420 per annum. Contributions were increased by 2*d.* per week, shared equally between employers and workers, and the annual additional charge of the exchequer was estimated at £1,300,000.

(L. H. D.)

Social Service. Important changes in social service in 1941 reflected the improvement in large areas due to the better employment and higher wages resulting from the impact of the defense program. Relief had been a less serious problem both for public and private agencies although in areas without defense industries there still were inadequate relief, or no relief, and resulting distress. There was renewed interest in the provision for migratory labourers who became destitute. This problem was made more apparent by the large influx of workers

into the new industrial areas in search of jobs.

Congressman Tolan's important house committee, which was, in 1940, the Select Committee to Investigate the Interstate Migration of Destitute Citizens, became in 1941 the Committee Investigating National Defense Migration. This committee held public hearings from coast to coast, but legislation to help the situation was delayed.

The rising cost of living brought hardships to the people who were clients of social agencies, but the expansion of the food stamp plan was of great assistance.

The private agencies organized in community chests in 314 different cities raised $55,865,065 (not including funds raised for defense and war social service needs) in 1941 to carry on during 1942 as compared with $55,602,133 raised in 1940. That is, the effect of the special "drives" did not affect appreciably the usual funds raised by private contributions for social work.

A 1941 report showed that in 34 urban areas reporting to the United States children's bureau, expenditures for health and welfare activities amounted to $548,000,000, or approximately 5% of the income of the residents of those areas, excluding payments by recipients for services, an important item in the health field. Many cities showed a decrease in their combined total welfare bill as a result of the decrease in the expenditures for various kinds of relief. (*See* RELIEF.)

Of the $31.79 per capita expenditures reported by all agencies, $28.23 in the 34 areas was expended by public agencies. In the field of relief and family welfare services, per capita expenditures were $24.10 for public agencies and $0.99 for private agencies.

Various statutory changes in welfare provisions came from the 43 different state legislatures that met in regular or special session in 1941. Many of these changes in state laws affected the state programs under the Social Security act. (*See* SOCIAL SECURITY.) There were some changes in state welfare organization and administration and marked improvement toward better welfare personnel came as a result of the merit system provisions in the 1939 amendments to the Social Security act which had been slowly implemented by the state welfare authorities. The attempt to protect welfare personnel from political interference made great progress in 1941 as in 1940 but the progress was particularly noticeable in state personnel administering public assistance and other Social Security provisions and there was still great opportunity for improvement if the patronage system was to be divorced from the public social services. (E. AB.)

Societies and Associations: *see* under specific name.

Sociology. With the coming of World War II, social scientists of every variety were expelled from the totalitarian countries and many of them found final refuge in Britain, Latin America and the United States. Among these social scientists the sociologists were perhaps the most prominent for they would not have chosen their particular academic specialty had they not been men who were temperamentally innovators. The traits which led them to break with academic orthodoxy were largely the same as those which kept them from identification with "old foes with new faces"; namely, the rising totalitarianisms. In Germany, for example, the few sociologists who remained were either men whose age and silence kept them from being disseminators of "dangerous thoughts," or they were young nazis whose glib talk about the "folk-community" and the "mission of leadership" endeared them to the powers that be. In France the shift from "liberty, equality, fraternity" to "family, country, work" had been paralleled by totalitarian trends in the universities. The important Durkheim school, which counted among its numbers the majority of French sociologists, suffered the triple disadvantage of a Jewish founder, sponsorship of secular education (and hence of anticlericalism) and devotion to the Third republic. The great sociological tradition of France probably was not dead, but it was quiescent. Few French sociologists were able to make their way to other countries—but perhaps they were willing to share the fate of their fellows, incredible as that might seem.

In Britain the influence of the émigré sociologists, most of them German, was salutary; Karl Mannheim, Adolf Löwe and a host of others did much to reinforce the forlorn heirs of the Hobhouse school, and sociology of knowledge, sociology of religion, and several other branches of the science were introduced. The Le Play tradition represented in the *Sociological Review* and Le Play house was likewise rejuvenated and in considerable measure divested of its sectarian character.

These were not the only influences at work in Britain. The success of the Gallup polls in the United States led to a British variant of them in the late '30s. Even before this, however, some left-wingers had started the Mass Observation movement. Tom Harrisson, one of the founders, was initially trained as an anthropologist; another, Charles Madge, had extensive experience as a journalist specializing in the human-interest story. This combination was in many respects a valuable one, but its strength lay at the observational and descriptive levels rather than at the analytic.

In 1941 Mass Observation work was much concentrated on problems of morale, and many important studies were made in towns that had suffered most heavily under the German assault. Other subjects of 1941 investigation were saving habits, attitudes toward joining the women's service, clothes rationing, housing and neighbourhood attitudes. Along with the professional field work, the national panel of voluntary observers contributed important material on a wide range of subjects, from religious attitudes to personal fears. Not the least important of Mass Observation's wartime activities was its war library, which collected ephemeral documents such as local newspapers, circulars, menus and house journals. These were not systematically collected by any other organization, essential as they are for the sociological analyses of wartime Britain that might later be written. Some of Mass Observation's collection was in 1941 available in duplicate at the University of Chicago, although of course much had to remain in Britain.

Latin America had long had its own distinctive varieties of sociological thought. The strongest influences from abroad, some flowing in the ordinary channels and some issuing from émigrés, were German and French —indeed, it is quite safe to say that sociologists such as Scheler, Alfred Weber, Bouglé and Richard were better known south of the Rio Grande than in the United States and Canada.

German influence seemed to be strongest in Argentina; Brazil had a considerable admixture of French along with the German—perhaps because of the fact that French rather than Spanish is the chief language of scholarship in this Portuguese-speaking nation. In Chile during 1941 North American sociology had one of its first representatives, Professor W. Rex Crawford of the University of Pennsylvania; another North American, Professor Donald Pierson, had for some time been identified with the Escuela Libre de Sociologia y Politica of São Paulo, Brazil.

In Mexico there was a flourishing institute of social investigation in conjunction with the Universidad Nacional Autónoma de Mexico at Mexico City. The institute of social investigation sponsored by the University of Mexico issued an excellent sociological review, the *Revista Mexicana de Sociologia*.

Implied in the reference just made is a fact worth noting; namely, that throughout all of Latin America there was little or no distinction between anthropology and sociology. This probably is as it should be, for in the United States during 1941 the *rapprochement* of social anthropology and sociology was one of the most striking developments. This mutual incorporation of new points of view and new techniques was possible without disrupting the present scientific division of labour, although here and there the ultraspecialized were heard to complain. Perhaps the most important factor in making sociological and anthropological co-operation possible was the increasing awareness, on the part of both lay and academic publics, that sociology is not synonymous with the study of "social problems," social work, social planning or socialism, and that anthropology has not exhausted its repertory when it has dealt with "the lesser breeds without the law." Ralph Linton and Bronislaw Malinowski, both social anthropologists, addressed the American Sociological society at its December meetings in 1941, and the works of Arensberg, Redfield and Warner, likewise anthropologists, dealt with topics and peoples hitherto handled by sociologists exclusively.

Perhaps the most well marked 1941 trend in the field of sociology per se was in "sociometry." This specialty, christened by the émigré psychiatrist-sociologist, J. L. Moreno, oscillates between a kind of sociotherapy of mental ills, called the psychodrama, and a "quantitative"-graphic method of describing social processes and social structures. The journal of the movement, *Sociometry*, in 1941 came under the editorship of Professor George A. Lundberg of Bennington college, who gathered about him an imposing array of sponsors and contributing editors. Undeniably there was much faddishness in the sociometric movement; the mixture of a method of healing mental ills by acting out thwarted im-

pulses combines appealingly, for most Americans, with the graphing and "measuring" of social conduct. In spite of uncritical enthusiasm, however, there is a sound sociological core in sociometry, for some aspects of it go back to the work of Simmel, Wiese, Tarde, Cooley and Mead, as Moreno freely acknowledges.

This sociologist or, more strictly speaking, sociometrist cannot properly be classed among the recent émigrés for he came to the United States from Vienna in the late 1920s. Later arrivals from many parts of Europe were legion, but among the most prominent might be named: Paul Honigsheim, interrelations of anthropology and sociology, sociology of religion and several other fields; Godfrey Salomon, sociological training of administrators; Georges Gurvitch and N. S. Timasheff, sociology of law; Eugen Kulischer and Rudolf Heberle, sociological aspects of migration; Henry Jordan, Sigmund Neumann and Hans Speier, interrelations of sociology and political science; H. H. Gerth and Paul Lazarsfeld, public opinion studies and other varieties of psycho-sociology; Hans von Hentig, criminology and penology; Werner Landecker, Heinrich Infeld, Erich Franzen, Alfred Salomon and N. C. Leites, systematic sociology; Kurt Wolff and Ernst Manheim, sociology of knowledge. Most of these men were on the staffs of universities, research institutes or specially created schools such as the University in Exile, but several of them had not found posts in 1941. In general it can be said that the émigrés did not exert much influence. The reasons are numerous: first, slowness of assimilation to North American modes of thought and instruction; second, reserve or lack of appreciation on the part of native sociologists, many of whom literally did not know what the émigrés were talking about; third, ultra-conservative editorial policies in the learned journals; fourth, the textbook pattern of publishing in the United States—treatises with small sales prospects had to be subsidized; fifth, occasional manifestations of arrogance by émigrés who overvalue their European training in the changed situation; sixth, jealousy and fear among those native sociologists who feel insecure against "outside" competition; seventh, strong émigré aversion to the quantification so beloved in the United States; etc.

S. C. Dodd spoke before the Committee on Conceptual Integration and the Sociological Research association in Dec. 1941 and won a respectful hearing (because of his obvious sincerity and dispassionateness) from those who on methodological grounds might be most opposed.

In some respects related to the quantifying trend, but in others independent thereof, was the interest in sociological prediction manifested in 1941.

Almost diametrically opposed to the varieties of North American sociology thus far noted is the *Social and Cultural Dynamics* (4th and final volume, 1941) of P. A. Sorokin. This is a grandiose attempt, Spengler-like in its sweep, to chart the future of civilization. Although much of the research was done by a staff of assistants, Sorokin's categories of "ideational-idealistic-sensate" dominate the whole, and seem to make the entire treatise a projection of his strong personal preference for a peasant society controlled by religious sanctions akin to those of Graeco-Russian Orthodoxy or Roman Catholicism. Sorokin's proclamations of the decadence of western civilization were sharply challenged by such eminent sociologists as R. M. MacIver of Columbia—in fact, the Harvard prophet had only a small cultlike following. Likewise with only a few adherents but of far greater scientific probity was F. J. Teggart, the republication of whose *Theory and Processes of History* (1941) should do much to counteract emotionalism and loose generalization in the sociologist's approach to world history.

Analytic or systematic sociology markedly contrasting with the all-inclusive speculations of Sorokin was represented in 1941 by the publication of Leopold von Wiese's *Sociology*, translated by Franz Mueller (1941). In 1941, Vilfredo Pareto provided the conceptual tools for one of the most significant studies of rural life yet to appear in the United States, George C. Homans' *English Villagers of the Thirteenth Century* (Cambridge: Harvard University Press, 1941). If all adherents of Pareto wrote books like this, the curse of the faulty conceptual scheme centring about "residues" and "derivatives" would be lifted. Moreover, Homans provided a splendid source of enlightenment for the rural sociologist; instead of cherishing the pathetic hope that the Hopi or the Navaho will give the clue, the analyst of rural life may decide to examine the immediate antecedents of the social patterns within which he lives and works. Homans' approach would have vastly improved studies such as the sociological portion of the department of agriculture's publication, *Farmers in a Changing World* (1941), edited by Gove Hambidge and M. J. Drown. The election of Dwight Sanderson of Cornell, one of the most analytically minded of rural sociologists, to the presidency of the American Sociological society for 1942 might help to further research along the lines indicated by Homans.

The *American Sociological Review* continued in 1941 as the official publication of the American Sociological society, but in the summer of 1942 would have a change in editorship; Read Bain of Miami university was to be succeeded by J. K. Folsom of Vassar college. The *American Journal of Sociology*, an organ of the University of Chicago, continued its aggressive editorial policy, already exemplified in timely special issues such as that dealing with war in Jan. 1941, and the one on national morale in Nov. 1941. The *Journal of Social Philosophy*, sponsored primarily by members of Columbia and the College of the City of New York faculties, continued as one of the most stimulating periodicals, although it perhaps cannot be classified as sociological in the narrower sense. The *Annals of the American Academy of Political and Social Science* from time to time publishes issues of sociological import; J. H. S. Bossard and J. P. Shalloo were special editors during 1941 of child welfare and of criminological numbers respectively that have some relevance to sociology as currently taught in the United States. *Social Forces*, published at the University of North Carolina, retained its regional emphasis. Clearly among the better sociological journals, it is primarily southern in orientation. Similarly regional is *Sociology and Social Research*, published by the University of Southern California. *Social Research*, a quite different journal, is published by the University in Exile, and affords a vehicle for some of the best émigré work. Sociology may be said to have ample publication facilities in the United States where shorter articles are concerned; the major lack seems to be an organ for longer presentations that are still too brief for book format.

In the United States the utilization of sociologists in the armed forces, in spite of totalitarian pioneering, was not practised. The appointment of Mark McCloskey, a former social worker, was a step in the right direction, but social work is not sociology. In the governmental bureaus there was a somewhat better situation. Reporting to the American Sociological society in Dec. 1941, George A. Lundberg showed that Washington takes considerable advantage of the offerings of sociologists. Although these sociologists were placed primarily in the bureau of the census and the department of agriculture, and although they sometimes were brought in under the protective cloak of "economist" or "statistician," there was ground for a good deal of optimism. This arose from the fact that the sociologists in the various bureaus acquitted themselves so well that there was a steadily increasing demand for their services as sociologists.

Sodium: *see* METALLURGY.

Sodium Carbonate. Production in the United States gradually increased after 1930, and reached 130,034 short tons from natural sources in 1940, mostly from the natural brines at Searles and Owens lakes in California. Canada had a small output in British Columbia, but this amounted to only 220 short tons in 1940, against imports of crude soda that have ranged from 1,500 to 5,000 tons. Kenya produces about 40,000 tons annually at Magadi lake, and small amounts are recovered in Egypt and South Africa. (G. A. RO.)

Sodium Sulphate. Production from natural brines in the United States increased heavily since imports of salt cake were restricted by war conditions, receipts having been cut by more than half in 1940. Production of natural sulphate was 187,233 short tons in 1940, having increased by 37% over 1939 and 133% over 1938. Canadian production increased by 40% in 1940, to 94,260 short tons, and Chile recovered amounts almost as large as a by-product of the nitrate industry.

(G. A. RO.)

Softball. Even surpassing baseball, in 1941 softball counted 2,750,000 players among young men and women, comprising 115,000 teams. The amateur Softball Association of America is the governing body of the sport. The 1941 championships, held in Detroit, Mich., provided plenty of excitement as well as new champions in both the men's and women's divisions. The Bendix Brakes from South Bend, Ind., emerged victorious in the men's section, succeeding Rochester, N.Y., the 1940 victors. The girls' Midgets team from Tulsa, Okla., won the crown from the Phoenix Ramblers of Arizona. Teams of women were becoming more numerous, and they played with as much speed and skill as the men. Games are played both day and night, and players are often arrayed in bright coloured uniforms of distinctive patterns. (J. B. P.)

Soil Erosion and Soil Conservation. With the entire world engaged in war at the end of 1941, the science of soil conservation became increasingly important. Those nations were most apt to survive which made the most intelligent use of their resources, and not the least of these resources were soil and water.

The war, with its increased demands for food and other products of the soil, forced even more intensive cultivation of soil than was normally practised. This was particularly true since some of the nations which formerly supplied a considerable amount of foodstuffs to the axis nations were at war with these countries.

Erosion conditions and conservation activities, if any, within most of the occupied territories of Europe were matters for conjecture only, although before the war began erosion by both sand and water was known to have reached serious proportions in some of the countries which in 1941 were under domination of invading forces. The chances are that the soil resources of these occupied territories likewise were being exploited by the conquerors, probably without much effort to protect them.

When the federal government in the United States undertook to build up its own defenses and increase the size of its armed forces it meant more food would be needed. When it undertook to supply foodstuffs to its warring allies and build up reserves for the future it became apparent at once that a considerable increase in farm production in certain lines was imperative. Added to the increased production necessitated by the lend-lease purchases and to the increased consumption because of army and navy expansion was an inevitable increase in consumption by the civilian population because of an improved employment situation.

Soil conservation districts, local units of government organized by farmers, under various state enabling laws, to enable them to carry out their conservation projects co-operatively, constituted one of the important channels through which the national conservation program essential to protection of soil and water resources was being carried out concurrently with the increased war production.

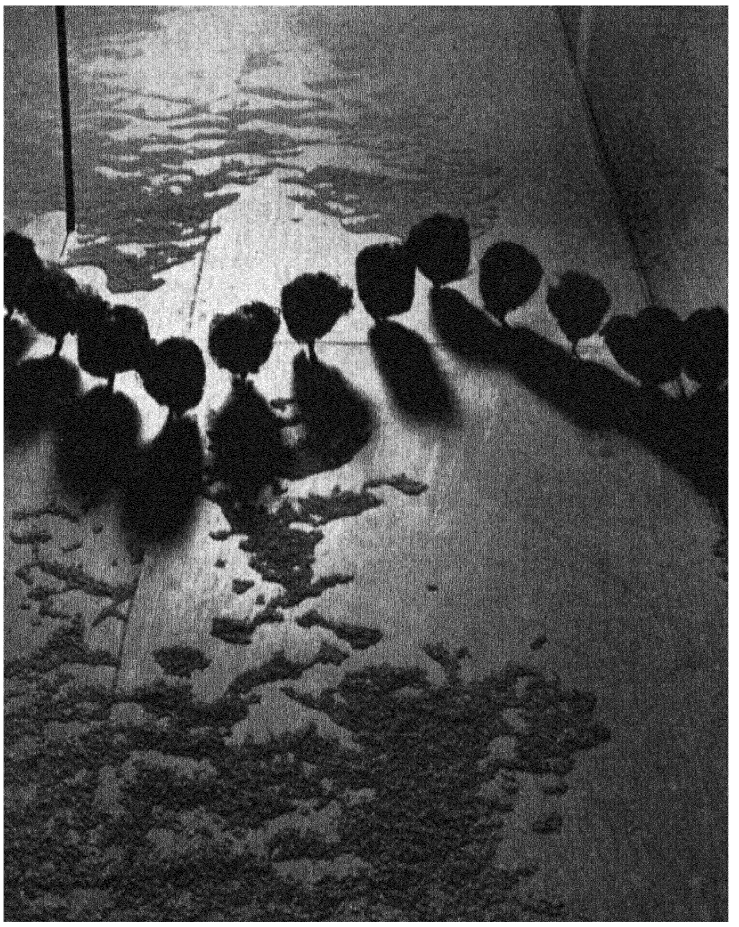
These districts which are initiated by, made up of and operated by farmers were at work throughout the United States. All except six of the 48 states adopted legislation authorizing farmers to set up soil conservation districts, and 1941 drew to a close with 642 districts established throughout the 42 states, representing a farm area of more than 378,000,000 acres or approximately one-fifth of the total land area of the United States. One state—Alabama—was within the boundaries of soil conservation districts.

Soil conservation districts are authorized by law to seek and accept aid in conservation work from the soil conservation service and other agencies of government, state and local as well as federal. Throughout 1941 the soil conservation service assisted the districts in carrying their own local conservation programs by furnishing trained technicians as well as equipment and materials where practicable.

One of the most significant developments in soil conservation work in the United States during 1941 was the increased utilization of subsurface tillage, for erosion control and moisture conservation. Experiments had been carried on before 1941, but during that year for the first time, it was put into use over large areas with encouraging results. In some parts of the country it was found that subsurface tillage cut down erosion and runoff even more effectively than basin listing. In subsurface tillage, crop residues are not turned under; rather the soil is cultivated by an implement that runs slightly beneath the surface and loosens the soil without turning under the vegetable matter, such as stalks, that help to hold the soil in place. Farm machinery manufacturers and farmers co-operated with soil conservation technicians in developing equipment for this work.

Control of irrigated land was improved during 1941 by substituting wide flat-bottomed furrows for the usual V-shaped furrows, and this change in method of cultivation likewise necessitated some changes in the farm machinery used. Improved methods of distributing irrigation water helped dry-land farmers by reducing operation costs and saving soil and water during 1941.

Various soil conservation practices had been put into effect on 31,500,000 acres of land in the United States under supervision of department of agriculture technicians. More than 2,260,900 acres of land unsuited for crop production had been retired from improper uses. The practices included contour cultivation, strip cropping, terracing, reforestation, range development, gully control and similar measures. The land retired under the land utilization program was developed as pasture, range, forest, and wild-life refuges according to its capabilities and included 138 projects in 44 states. There were at the close of 1941, 4,000 demonstration farms in 46 states and Hawaii and 182 demonstration projects in 46 states. The demonstration projects averaged 25,000 acres in size, and each included a number of farms. These involved a total of 36,083,000 acres, 2,168,000 in individual farms and 33,315,000 in project areas.



MODEL LAYOUT OF TREES in a wind tunnel at the California Institute of Technology, Pasadena, Calif., used to determine what patterns afford the greatest protection against wind erosion

The use of cover crops to conserve and improve soil was greater in 1941 than in any previous year. Perennial legumes such as kudzu and lespedeza sericea were used in many parts of the country and particularly in the southeast. In other parts of the country, particularly in the northern great plains, southern great plains and the Pacific southwest, various types of native and imported grasses were being used. Up to Jan. 1, 1942, more than 100 native plants never before used had been tested by the soil conservation service in co-operation with the bureau of plant industry and state experiment stations to determine their value in soil holding, soil building or for range improvement. More than 215,000 acres of kudzu had been planted in the southeastern states at the end of 1941. Seeds of many native and imported grasses also were harvested to furnish supplies for use in the conservation program.

More than 150,000,000 trees and other plants were furnished during 1941 by 30 soil conservation nurseries for the use of districts and other co-operators in erosion control plantings. These included among the trees: juniper, oak, black locust, ash, tulip poplar, hackberry, cottonwood, willow and five varieties of pine; among the shrubs: wild plum, viburnum, dogwood, Siberian pea and privet, mostly plants adopted to wild-life conservation. The herbaceous plants were mostly perennial legumes and grasses. In the meantime, research to discover other plants that would help control erosion and that might also add to the farmer's income was continued.

Dry-Land Farming Areas.—The soil conservation service has done considerable work in the dry-land farming areas of the United States for a number of years. The use of strips of crested wheatgrass, which provides hay and at the same time helps to hold the soil in place, is one of the important factors in control of wind erosion in the northern great plains region. Kikuyu grass, an import from Uganda, has been used to help prevent gullying in the Pacific southwest.

There had been few dust storms since the disastrous years of the middle '30s and none of tragic proportions. Blowing continued locally in various parts of the country but the use of contour cultivation and stripping, and other conservation practices had done much to counteract this.

In the southern great plains area sorghum, broom corn, kafir corn, cowpeas, small grains and annual legumes are used for soil improvement and to combat wind erosion.

Europe.—Since most of Europe was in the theatre of war it was im-

possible to get much authentic information concerning conservation work in the European countries. In general, the soils of northwestern Europe are in remarkably good condition, and erosion is negligible. Nevertheless, it had been the practice of the German government to take every possible precaution to protect its soil resources. Under the press of war Germany had to do more than that and was at work in 1941 on a project to improve approximately 123,500 acres of unproductive land in the Rhine valley north of Karlsruhe. Drainage and flood control are important phases of work on this project which was expected to be completed before the end of 1944. It is a small area, but in the face of the pressing food problems which Germany faced as a result of the war, it was extremely important.

Land reclamation is not a new thing in Europe. One of the largest reclamation projects ever undertaken is the drainage of the Zuider Zee in the Netherlands. In the reclaimed areas, conservation measures were established and farmers to whom the land was leased are required to maintain these measures.

Italy likewise has done a considerable amount of land reclamation both in the Pontine area near Rome, in the Veneto in the northeastern region, and near Genoa.

Erosion has been serious throughout the Mediterranean countries due probably more to deforestation and overgrazing than to cultivation, although primitive farming methods used in growing most crops have taken their toll.

Wind erosion and shifting sand dunes affect parts of Europe, the former in certain regions of Hungary and the latter in areas around the Baltic sea. The U.S.S.R. also had its erosion problems. Sheet and gully erosion were severe in the Ukraine and in central Russia. In the steppe country there was severe wind erosion and an expanding area of drifting sand in south central Asia. The expansion of mechanized co-operative farming in the drier sections increased the wind erosion problem, and control measures included shelter belts and the development of grasses resistant to drought and adapted to the plains country.

In the British Isles there is relatively little erosion and strenuous control measures are not required because of a grassland type of agriculture. However, as a result of increased cultivation due to war needs, the problems might become more serious.

South Africa.—There is considerable erosion in the various South African states, and the governments were taking steps to combat these conditions. Excellent conservation work has been done in the Transvaal and the Orange Free State. During 1941 the senate and the house of assembly of the Union of South Africa adopted an act designed to amend and consolidate the Union's laws on protection, management, utilization and tenure of forests, regulate the burning-over of the veld lands and make better provision for veld soil and water conservation. During the year the legislative assembly of Rhodesia enacted the Natural Resources law to set up machinery for combatting the considerable erosion damage already done, particularly in the Mazoe valley. This bill empowers the Natural Resources board to maintain general supervision of natural resources, and, on the recommendation of the board, the minister of agriculture and lands may construct and maintain works for the protection of the sources, course or feeders of a public stream, the disposal or control of storm water, the mitigation or prevention of soil erosion and the conservation of water. In addition, the board may order any landowner to undertake any measures considered desirable for conservation of natural resources. These may relate to methods of cultivation, use of land for pastures, control of water and retirement of land from cultivation.

Australia.—Erosion conditions in Australia are severe. There is widespread sheet erosion in Tasmania and severe erosion by water in the Queensland cotton-growing regions. The bush country and semiarid pastoral belt suffer from wind erosion, and there is considerable drifting of light sandy soils in South Australia, Western Australia, Victoria and New South Wales. Efforts were being made by the various state governments to correct these conditions. Legislation was passed in Queensland establishing the "Burdekin River Benefitted Area," in the Burdekin river valley, in which erosion control measures were to be carried out by the Queensland government. A soil conservation research station was established at Cowra in New South Wales to study soil and water losses and carry out research in erosion control and soil and water conservation. The government of Victoria made careful studies of erosion and conservation projects in that state, and the parliament adopted a soil conservation bill designed to conserve all natural resources within the state.

New Zealand.—During the latter part of 1941 a soil conservation and rivers control act was adopted by the New Zealand government. It was designed to set up a council to administer the act and provided for the establishment of soil conservation districts. The council is empowered to study erosion and its control, work on flood control projects, supervise or control the use of lands, establish soil conservation reserve areas and acquire private land for public work.

India.—India has a severe erosion problem and suffers from water shortages at certain seasons. Much of this has been caused by denudation of the soil and other kinds of mismanagement. Terracing, cover crops and hedges are used in some parts of India to stop or lessen the severity of erosion. In certain regions, including the Punjab, "antierosion circles" were being established by the government to combat this danger to the country's agricultural resources. Reclamation societies were set up for the purpose of reclaiming the large sandy beds of streams in the Siwalik hills. Co-operative societies of farmers were also being urged to push the work forward around the rural villages and considerable educational work was being undertaken to prepare the farmers of the villages for this work. Efforts were likewise being made in Ceylon, through legislation and governmental committees and boards, to deal with the erosion problem in that island.

Burma.—There is a wide difference in the types of erosion found in different regions of Burma, ranging from moderate sheet erosion to serious gully erosion on deep-soiled lands where cover has been removed and unscientific cultivation methods used. A considerable portion of Burmese soil, including the red lands of the Myelat, is particularly liable to gullying. A great deal of the low-lying land in lake basins and valleys had been almost ruined by siltation. This is not erosion properly speaking, but the results are similar since a considerable portion of the silt is useless and covers good topsoil. The problem in Burma is considered by the government to be urgent and a number of studies have been made to determine the best means of controlling and preventing erosion. Some of the principal means used in 1941 were reforestation of woodlands, restoration and improvement of grazing areas and improved methods of drainage and cultivation, in addition to the physical measures for control of gullying. Up to Jan. 1, 1942, this work had been carried out only on a small scale in local areas under supervision of the Burmese government, but a report issued by the deputy conservator of forests at Rangoon indicated that a great deal remained to be done. What effect the war, carried to the orient, would have on conservation work in Burma remained to be seen.

China.—The orient in general contains some of the worst examples of erosion in the world, as well as some of the oldest and best examples of erosion prevention. Additional efforts were being made in 1941 to combat the menace of erosion and to conserve the soil and water resources. Likewise, in that part of China under control of the Japanese government and known as Manchoukuo, work was being done in Pinkiang province. This program covered both flood protection work and land development work. It included construction of dikes, drainage gates, waterways, dams, flumes, development and protection of crop lands in low areas and the improvement of considerable uncleared land as farms, pastures and paddy fields. The work in Pinkiang province is a ten-year project and covers an area of slightly more than 864,000 acres, principally along the Sungari river and its tributaries.

Canada.—Erosion problems in the prairie provinces are similar to those in the northern great plains states which include wind erosion over large areas, as well as erosion by water. The parliaments of a number of these provinces have adopted conservation legislation, and farmers have been helped in developing water facilities for livestock and domestic use, and in establishing shelter belts of drought-resistant trees and planting suitable grasses.

Mexico.—There is considerable erosion in Mexico where farming on the steep slopes, which predominate over a great deal of the country, has caused severe gullying. Cultivation of the slopes is resorted to because Mexico does not have an abundant amount of good farming land. Overgrazing, particularly around Saltillo and Monterrey, caused considerable erosion and frequent floods resulted. In certain areas primitive control has been established where the natives were cultivating steep slopes on which they have built stone walls. Soil washed down against these walls gradually forms deep bench terraces which are effective for certain types of agricultural operations.

West Indies.—The close relationship between protection of forests and conservation of the soil was well recognized in the Dominican Republic, where a new variety of acacia tree was being used for reforestation purposes with excellent results.

Reforestation likewise was being carried out on an extensive scale in Puerto Rico. Nearly 90,000 acres of land under government control had been put in trees but more than 400,000 acres remained to be replanted. This was necessitated by severe deforestation which preceded the extension of commercial agriculture. By 1935, 75% of the topsoil had been washed off, 42% of the total land area of the island. Studies of the relationship of crops to land were being carried out at the experiment stations in Puerto Rico.

In Jamaica the Jamaica Agricultural society established an erosion control plot near Annotto bay. This was simply an erosion control experiment station on a small scale and adapted to the peculiar local conditions that obtain in Jamaica. Farmers were being urged to try on their own land the practices tried out on the erosion control plot. Khus-khus grass was being used as a soil binder and other crops such as peas, corn, bananas and plantains have been interplanted with the grass strips. Terracing was tried to some extent but without complete success, although according to the report of the supervisors, terraces contributed to some extent to the success of the work on the experimental control plot.

South America.—South America has some of the first notable erosion control structures in the world, which were designed and built by the Incas to provide irrigation and to prevent erosion. In various sections of the continent erosion by both wind and water had reached dangerous proportions, and many of the South American nations were taking steps to save the damaged land and to prevent extension of the damage.

In the central zone of the state of Minas Geraes, Brazil, erosion is a serious problem since increased agriculture development has begun to denude the land of its forests, and reforestation is not generally being practised. It was anticipated that the vast virgin agricultural areas in the west and north sections of the province would be opened up before soil conservation on a large scale was put into effect. However, experimental and demonstration work was being carried on. In the São Paulo province, where agriculture was mechanized more than in most other regions of the country, slight to severe erosion occurred on about 50% of the land, an area of more than 30,000,000 acres.

Chile suffers considerably from erosion and its concomitants of drought and flood. Absence of forests in the valleys of northern Chile results in tremendous floods, and the eroded topsoil carried away has caused serious sedimentation in many reservoirs. One dam, the Pangal dam, in Cochapoal, was completely covered by silt in about nine months. There is a great deal of erosion in other sections of Chile also. The principal measures for erosion control have been the planting of trees in marginal farmlands; changes in agricultural methods, especially in arid areas; and the increase of cattle production in the humid zones. Development of tree plantings and soil building is somewhat difficult in the drier regions due to frequent droughts throughout the summer.

Colombia, starting with fundamentals, established a "protected forest zone" where timber operations might be done only under government supervision. This zone was created by presidential decree under an act passed in 1939. The decree also provided for establishment of state nurseries to aid in reforestation of denuded areas.

Peru has a conservation problem peculiar to itself. There is little rain to cause erosion, there is little forest land to be preserved, and there is no

range problem. Conservation in Peru means largely conservation of water since this is one of the world's most arid regions. Water for irrigation was being obtained in 1941 by pumping it from a depth of 50 to 200 feet under the floors of the major river valleys. Also flood flows were being diverted from the rivers to suitable adjacent lands for irrigation purposes. It was believed, if these projects proved effective under actual trial, that agricultural production might be increased as much as one-third on areas under irrigation and that production on desert lands might be developed.

Venezuela, like most other South American nations, suffers from soil erosion, wind erosion being particularly bad in the eastern part of the country, while in the mountain regions of Venezuela there is severe sheet erosion and gullying. The Venezuelan government, however, was making an intensive study of the problem and its solution.

Toward the end of 1941, at the request of the government of Venezuela, the government of the United States sent a party of soil conservation experts from the department of agriculture to Venezuela to study their problems and advise them.

The Argentine has a serious erosion problem, including wind erosion in the semiarid middle west of that country, in the eastern section of La Pampa, southeast of Córdoba and west of Buenos Aires. Serious erosion by water is found in areas of abundant and intensive rains, particularly where there is too intense cultivation or grazing on steep slopes. A bill was introduced in the Argentine national congress during 1941 to establish a soil conservation program for the country. (*See* also AQUEDUCTS; DAMS; DROUGHT; IRRIGATION.)

Sombart, Werner (1863–1941), German economist, was born at Ermsleben in the Harz mountains on Jan. 19. An economist of world-wide fame, Dr. Sombart was best known for his work *Der Moderne Kapitalismus*, begun in 1902 and completed in 1926. He was one of the leaders in Germany of a movement to "isolate" economics and sociology from the conflict of politics. In a Stockholm lecture in 1922 he pronounced "dead" the cultures represented by the United States, France and Great Britain and urged the Germanic countries to turn to the east and to extend their culture in that direction. His works include *Die drei Nationalökonomien* (1930); *Die Zukunft des Kapitalismus* (1932); *Deutscher Sozialismus* (1934), and *Vom Menschen: Versuch einer Geistwissenschaftlichen Anthropologie* (1938). Dr. Sombart died May 19, according to a Berlin announcement; but the place of his death was not divulged. (See *Encyclopædia Britannica.*)

South Africa, The Union of. A self-governing dominion of the British commonwealth of nations. The four provinces of which it consists, the Cape of Good Hope, Natal, the Transvaal and the Orange Free State, extend from the southernmost point of the African continent to the Limpopo in the north. The former German colony of South-West Africa is administered under mandate as an integral part of the union, but this territory has not been incorporated as a province. Area 472,550 sq.mi. (incl. Walvis bay, 430 sq.mi.); pop. (est. June 30, 1940), 10,341,200 (Europeans, 2,152,700; native 7,124,100; Negro 829,600; Asiatic 234,800). Chief towns (pop. census 1936): Cape Town (seat of legislature, 344,223); Johannesburg (519,384); Durban (259,606); Pretoria (seat of government, 128,621); Port Elizabeth (109,841). Governor general: Rt. Hon. Sir Patrick Duncan; languages: English 39%; Afrikaans, 56%; religion: European population: Christian (Dutch Reformed churches, 55%; Anglican, 19%; Methodists, 6%; Presbyterians, 5%).

History.—The chief events of 1941 fall under three heads: warfare, industrial expansion and internal political strains. The South African air force was active on many sectors of the East African front, and union land troops, after a rapid advance through Italian Somaliland, were the first imperial troops to enter Addis Ababa (April 1941), thanks largely to their excellent armoured cars and Negro transport drivers. Latterly, union forces had moved north into Egypt, but the consent of their parliament would be necessary before they could go outside Africa.

The union's industrial and military achievements had been remarkable for so small and divided a community; 150,000 British and Afrikaner volunteers were under arms, well equipped and fed from South African farms and factories. The civilian board of supply under Dr. H. J. van der Byl supplied ammunition of various types and armoured cars to other imperial forces, and large stores of foodstuffs were on hand. The poorer European folk showed themselves adaptable, and in spite of a shortage of machine tools and skilled labour, the framework of an industrialized community was being built up.

The budget reflected the growing strain of war. In 1939 a mere £14,000,000 was asked for, but for the year 1941–42 the union needed £72,000,000 out of a record total of £131,000,000. Of this amount £73,600,000 was to come from revenue and £57,300,000 from loan funds. One-quarter of the shortfall of nearly £8,500,000 from 1940 was to be made up by increased indirect taxation, and the remainder by increases in the company income tax and the "special contribution" of the gold mines (from 11% to 16%), the apportioning of the income of private companies among individual shareholders and a tax on undistributed profits to prevent evasion, and the deduction of ordinary income tax allowances from assessed taxation instead of from income before tax assessment. Other legislation included a far-reaching factory act and a workmen's compensation act which gave the government a monopoly of workers' insurance.

Money was plentiful, trade good and prosperity widespread, but the internal political situation was difficult. General Smuts, appointed a field marshal in the British army in May, had adequate majorities in both houses, but the *Ossewabrandwag* (Ox-wagon Sentinel), a so-called cultural Afrikaner association but in reality a nazi-minded organization, was strong. Its leader, Dr. van Rensburg, threatened recalcitrant Afrikaner politicians with violence, and after riots in Johannesburg, in which some of the police sided with the *Ossewabrandwag*, the government obliged all public servants to resign membership (February).

Meanwhile, the opposition Reunited Nationalist or People's party had split (Nov. 1940). General Hertzog, N. C. Havenga, ex-minister of finance, and some others broke away rather than agree to Dr. D. F. Malan's program, which ignored the British section. Havenga formed a small Afrikaner party to uphold neutrality and democratic parliamentary rule. He and Hertzog resigned their seats in the assembly (Dec. 1940). One wing of Malan's followers, led by O. Pirow, demanded a nazi new order, while the other advocated a narrow Afrikaner democracy similar to that of the republican Transvaal in the 1890s. Malan, who had made no comment on Germany's pact with the U.S.S.R.,

raised the cry of the "Bolshevik peril" when Great Britain allied itself with the U.S.S.R., but presently condemned Pirow's new order and offended the *Ossewabrandwag* (August). Hertzog then ranged himself with the Pirow faction by declaring that national socialism accorded with the Afrikaner tradition and was the only form of government that a victorious fuehrer would countenance (October). Havenga repudiated his old friend's new policy, but the internal politics of the union plainly depended upon the fortunes of war. South Africa on Dec. 9 declared war on Japan, Finland, Hungary and Rumania. (E. A. WR.)

Education.—State and state-aided primary and secondary schools (1938): European schools, 4,278; scholars, 386,880; native schools, 5,001; scholars 589,308; universities, number of students, 9,492.

Banking and Finance. Revenue, ordinary (est. 1941–42), £65,165,000; expenditure, ordinary (est. 1941–42), £72,000,000; public debt (March 31, 1941), £336,336,000; notes in circulation (May 31, 1941), £22,700,000; gold reserve (June 30, 1941), £51,800,000; exchange rate (1941), £1.SA=$3.98.

Trade and Communication.—External trade (1940) (exclusive of goods in transit and of gold bullion and specie): imports (total) £105,099,234; exports (domestic) £28,562,207; re-exports £5,528,430. Communications and transport: roads fit for motor traffic (1938–39) 87,495 mi.; railways, including South-West Africa (March 31, 1940) 13,645 mi.; airways, including South-West Africa (1939), passengers carried, 35,578; freight and mails carried, 2,640,984 lb.; mileage flown 1,751,453; shipping (1940) entered, 6,598; net tonnage 25,504,068; cleared, 6,554; net tonnage 25,315,168. Motor vehicles licensed (Dec. 31, 1939): cars and taxis, 318,628; buses, 1,763; vans and lorries, 50,249; tractors, 1,087; cycles, 23,452; wireless receiving set licences (1939), 221,282; telephones, instruments in use (1939) 190,195.

Agriculture, Manufacturing, Mineral Production.—Production (1939–40) (in metric tons): gold fine (1940), 436,631 kg.; diamonds (1939), 1,269,828 metric carats; maize, 1,824,700; coal (1939), 19,527,000; sheep, number (Aug. 31, 1939), 38,289,430; cattle, number, 11,852,736; wool (1939), 125,000; wheat, European cultivation, 416,700; cane sugar, refined, 474,500; iron ore (metal content) (1939), 312,000; pig iron and ferroalloys (1939), 300,000; steel (1939), 314,000; silver (1938), 1,135,374 fine oz.; manganese ore (metal content) (1939), 175,300; chrome ore (chromic oxide content) (1939), 72,600; asbestos (1938), 21,900; wine (1938–39), 1,555,000 hectolitres; tobacco (1938–39), European cultivation, 13,200; potatoes (1938–39), European cultivation, 172,900; oats, European cultivation, 80,700; barley, European cultivation, 20,500; copper (smelter production) (1939), 11,000; benzol (1939), 1,700; superphosphates of lime (1937), 164,000. Industry and labour (census 1939): establishments, 9,817; employees, European, 117,056; others, 189,087; value of gross output, £172,764,000; value added to materials used, £85,108,000. Employment index (average 1929=100): average 1939, 149; average 1940, 156.

South America: *see* ARGENTINA; BOLIVIA; PERU; ETC.

South Australia. A state of the Australian commonwealth 380,070 sq.mi. in area, bounded by longitudes 129° E. and 141° E., and by latitude 26° S. and the southern coast of the continent. The state governor in 1941 was Sir Charles Malcolm Barclay-Harvey. Pop. (est. Dec. 31, 1939) 597,045. Chief town and capital (pop. Dec. 31, 1939), Adelaide (322,990).

History.—The state elections held March 29, 1941 resulted in the return of the Liberal Country party government, under Thomas Playford, with increased strength. Voting is not compulsory in South Australia, and only about 50% of the electorate recorded their votes.

In January work was begun on the construction of a pipeline from the Murray river to Whyalla, a distance of 236 mi. The project was expected to take 2 years to complete and the estimated cost was £3,000,000. Construction and maintenance were undertaken by the state government, which entered into an agreement with the Broken Hill Proprietary, who was to pay a minimum of £40,000 a year for water supplied to Whyalla, and with the commonwealth government, which was to pay £37,500 a year for water supplied to the railways at Port Augusta. The new blast furnace at Whyalla, which had taken three years to build, began operations on May 26. Its output at the close of 1941 was more than 500 tons of foundry pig iron a day.

More than £4,000,000 worth of munition production orders were placed in South Australia during 1941, as well as large orders for clothing, etc., for oversea governments. Armament annexes were being established at Whyalla and Port Pirie, and extensive plants were being installed for forging and machining high explosive shells.

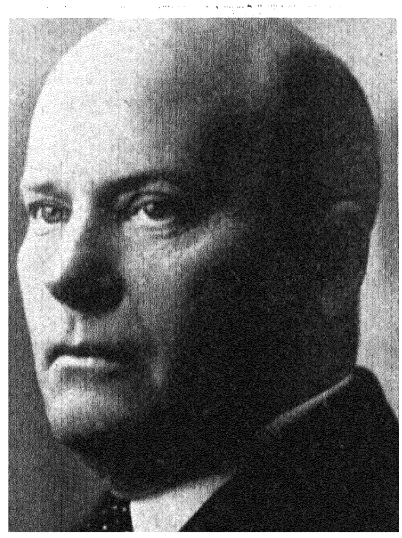
In consequence of these developments and of favourable pastoral and agricultural conditions, labour was scarce and the government contemplated some diversion of labour from unessential industries.

Finance.—In 1940–41: revenue, £A12,930,000; expenditure, £A13,010,000; debt outstanding (June 30, 1941), £A109,780,000.

Communication.—Roads (March 30, 1940), 23,848 mi. fit for motor traffic; railways (1939), government 2,558 mi. Motor vehicles licensed (March 31, 1941); cars, 58,360; trucks, 24,682; cycles, 9,143. Wireless set licences (March 31, 1941), 130,127.

Agriculture and Manufacturing. Wheat (1940–41), 18,000,000 bu.; barley (1940–41), 5,350,000 bu.; grapes (1938–39), 150,608 tons; currants (1939–40), 208,930 cwt.; wool (1939–40), 105,265,869 lb.; butter (1939–40), 22,938,381 lb. Industry, 1939: factories 2,067; employees 43,371; gross value of output, £A35,005,254; unemployment (March 31, 1941) 3.9%. (W. D. MA.)

South Carolina. A south-Atlantic state of the United States, and eighth of the original 13 to ratify the constitution, 1788; popularly known as the "Palmetto state." Area, 31,055 sq.mi., including 461 of inland waters; pop. (1940) 1,899,804; white 1,084,308; Negro 814,164; others 1,332; 75·5% rural; 24·5% urban; 0·3% foreign-born. Capital, Columbia (62,396). Other cities include Charleston (71,275); Greenville (34,734); Spartanburg (32,249).



J. E. HARLEY, who succeeded B. R. Maybank as governor of South Carolina Nov. 4, 1941. Gov. Harley died Feb. 27, 1942

History.—Gov. B. R. Maybank, though twice defeated by the courts, continued in 1941 to seek means of diverting part of the gasoline tax from roads to general purposes. A probation and parole board was created, but could not be given control of pardons, as Gov. Maybank desired, without constitutional change. Horse-race betting was legalized in several low-country "resort counties." Biennial sessions, twice popularly voted, again stranded on details. Prohibition, heavily voted, was enacted and provided that new revenues be found to replace the $3,000,000 from state liquor taxes by July 1, 1942. Legislation for regulating loan sharks again failed. Several Ku Klux klansmen were sentenced to prison for masked parades or whippings.

Gov. Maybank was elected U.S. senator to succeed J. F. Byrnes (*q.v.*), who was appointed to the U.S. supreme court. Maybank was succeeded by Lieut. Gov. J. E. Harley, Nov. 4.

Education.—Teachers' salaries were raised in 1941. Enrolment in white elementary schools for the year ending June 30, 1941 was 191,198; in white secondary schools, 74,874; in Negro elementary schools, 193,598; in Negro secondary schools, 19,372; in all public schools, 479,042. Expenditures for whites, $15,642,839; for Negroes, $2,810,917.

Public Welfare, Charities, Correction.—On Nov. 30, 1941, 62,045 families or unattached persons were certified to WPA, of whom 36.5% were working on WPA-financed projects. WPA expenditures in the state during the year ending June 30, 1941, were $29,283,509; average weekly employment was 29,798. During the same period, 17,415 needy aged received $1,652,596; 764 needy blind $97,352; 8,970 children $588,062, all the above funds being half federal and half state. State and counties shared equally in $216,035 spent for general relief to 2,153 persons. Unemployment insurance paid during the year ending June 30, 1941, amounted to $2,028,017. Insane and epileptics in the state hospital on June 30, 1941, numbered 4,670; on parole, etc., 730. Feebleminded have a special institution. The state penitentiary on June 30 had 1,321 inmates.

Communication.—Paved highways on June 30, 1941, totalled 6,803 mi.

Railroads totalled 3,563 mi. Several major aeroplane routes cross the state.

Banking and Finance.—There were 84 state banks (plus 4 branches) and 41 depositories and 22 national banks (plus 19 branches) June 30, 1941. Deposits and resources of each were respectively $63,344,183 and $72,327,309; and $127,529,000 and $138,984,000. Appropriations for general state expenses for the year ending June 30, 1942, totalled $13,483,937. Highway expenditures (gasoline and car licence income) exceeded this amount. Provision was also made for retiring a deficit of $1,831,936 in five years. The state debt on June 30, 1941 totalled $70,286,798, of which $63,432,960 was for highways. The federal government collected during the year ending June 30, 1941, $16,663,942 in internal revenues and $843,890 in import duties. Imports totalled $6,074,303 and exports $1,608,753.

Agriculture.—The value of 21 principal field crops in 1941 was $113,328,000; acreage harvested, 4,815,000; 17 vegetable crops, $5,883,000 from 87,020 ac. Droughts injured crops and caused a shortage of hydroelectric power. Farm electrification greatly expanded.

Table I.—*Principal Agricultural Products of South Carolina, 1941 and 1940*

Crop	1941	1940
Corn, bu.	22,316,000	23,733,000
Wheat, bu.	3,146,000	2,725,000
Oats, bu.	12,100,000	11,305,000
Hay, tons	477,000	438,000
Irish potatoes, bu.	2,548,000	2,875,000
Sweet potatoes, bu.	4,400,000	4,160,000
Tobacco, lb.	66,000,000	84,245,000
Cotton, bales	405,000*	066,000
Cotton seed, tons	180,000	430,000
Peaches, bu.	3,471,000	2,158,000

*Smallest since 1878.

Manufacturing.—The value of all manufactures for the year ending June 30, 1941 was $573,619,049; average employment was 145,889; wages, $118,625,941. The respective data for textiles alone were $382,753,951; 102,342; $87,078,249. War orders crowded many industries, including the building trades, especially near large military encampments.

Mineral Production.—The value of all minerals produced in South Carolina in 1939 was $5,422,079; in 1938 it was $4,364,034.

Table II.—*Principal Mineral Products of South Carolina, 1939 and 1938*

Mineral	Value, 1939	Value, 1938
Stone	$1,732,795	$1,315,999
Clay products	1,573,470	1,289,975
Raw clay	1,303,163	869,693
Gold	484,155	408,835

(D. D. W.)

South Dakota. A north-central state, admitted to the union Nov. 2, 1889; popularly known as the "Coyote state." Area, 77,047 sq.mi. (land area, 76,536 sq.mi.); pop. (1940) 642,961. Urban population, 158,087; rural population, 484,874; average inhabitants per square mile, 8.4. Ten cities had a population of 5,000 or more in 1940. Capital, Pierre (4,322). Largest city, Sioux Falls (40,832).

History.—Republicans retained complete control of the state administration, one U.S. senatorship and the state's two congressional members in 1941. Harlan John Bushfield began his second term as governor Jan. 7. The state legislature met in its 27th regular session for 60 days, passing amendatory, regulatory and routine laws necessary to the conduct of state business. Reduction of the general sales tax from 3% to 2% and modification of the state income tax met with popular approval.

Of 766 bills introduced, 375 became laws. George Mickelson, speaker of the house, and Lieutenant Governor A. C. Miller, president of the senate, proved able leaders in the legislative field.

The great Rushmore memorial in the Black Hills was completed by Lincoln Borglum who carried out the design of his sculptor father, Gutzon Borglum. The number of tourists passed the million mark, many drawn to the state by the Rushmore project.

Education.—The school census for 1941 was 182,542.

Communication.—On Jan. 1, 1939, there were 5,851 mi. of rural state highways, of which 4,932 mi. were surfaced. Expenditures in 1939 amounted to $6,685,000. On Jan. 1, 1939, there were 4,127 mi. of steam railways in the state.

Finance.—The state debt on June 30, 1941 was $41,436,000. Total receipts for the fiscal year 1940–41 were $32,665,669.46; disbursements were $29,934,593.42.

Agriculture.—South Dakota had its most successful crop season in a decade in 1941. The total value of all crops amounted to $127,000,000, as compared with $84,000,000 in 1940.

Principal Agricultural Products of South Dakota, 1941 and 1940

Crop	1941	1940	Crop	1941	1940
Corn, bu	41,700,000	50,112,000	Wheat, bu.	35,024,000	26,221,000
Oats, bu.	51,072,000	53,240,000	Hay, tons	2,085,000	1,650,000
Barley, bu	30,226,000	30,821,000			

Manufacturing.—Manufacturing continued to gain in 1941. The farm-to-town migration ceased but the state's population declined because of emigration to out-of-state defense areas. Principal industries were meat-packing, butter, bread and bakery products, printing and publishing, and poultry dressing.

Mineral Production.—Mineral production was valued at $24,811,231 in 1939 and $23,583,359 in 1938. By far the leading mineral was gold, valued at $21,648,760. Stone was valued at $998,444; sand and gravel, $722,046; raw clay, $217,622. (L. K. F.)

South Sea and Equatorial Islands. Howland island lies in the Pacific ocean, approximately 1,870 mi. southwest of Honolulu, in latitude 0°–48′–06″ N. It was surveyed in 1872 by the U.S.S. "Narragansett" and found to be about 2 mi. long, ½ mi. wide, 20 ft. above sea level at its highest elevation, of coral formation and with a fringing reef.

Baker island is in the Pacific ocean in latitude 0°–13′–30″ N., longitude 176°–28′–14″ W., approximately 1,880 mi. southwest of Honolulu, and within 13 nautical miles of the equator. It is of coral formation, about 1 mi. long east and west, and ¾ mi. wide, surrounded by a coral platform reef 200 to 400 ft. wide. Its highest point of elevation above sea level is 20 ft.

Jarvis island is in the Pacific ocean, approximately 1,500 mi. south of Honolulu, in latitude 0°–22′–37″ S., longitude 160°–01′–37″ W., 23 mi. south of the equator. It is of sand and coral formation, approximately 2 mi. long and 1½ mi. wide, and about 20 ft. above sea level at its highest point.

These three islands were settled in 1936, after having been uninhabited for many years. Representatives of the department of the interior placed four young Hawaiians on each island to maintain sovereignty of the United States and to obtain meteorological data essential to commercial aviation in the Pacific. United States citizens of Hawaiian ancestry were selected because of their adaptability to prevailing conditions and their proximity to the islands. The scarcity of vegetation and the absence of drinking water make it necessary to transport food, water and other supplies from Honolulu. This is accomplished by quarterly expeditions to the islands by coast guard cutters.

Canton island is the largest and most northerly of the Phoenix islands. It is approximately 1,850 mi. southwest of the Hawaiian group in latitude 2°–48′–58″ S., longitude 171°–42′–41″ W. It is a coral atoll containing a narrow strip of land varying from 50 to 600 yd. in width, enclosing a lagoon about 9 mi. long and 3 mi. wide at the west end. The rim varies in height from 10 to 20 ft. and is broken only by three or four lagoon entrances.

An air base has been established on Canton island by Pan American Airways in connection with its service from California to New Zealand. A hotel and other necessary facilities were now in operation, and regular aviation service was started with the first air mail flight from California on July 12, 1940. With the agreement of the state department, the interior department and the Civil Aeronautics authority, a member of the Pan American staff on Canton island has been designated acting field representative of the interior department, serving without compensation. The Hawaiian colonists were evacuated Oct. 8, 1940.

Canton and Enderbury islands are under the joint control of the United States and Great Britain, under an agreement com-

pleted in April 1939 between the two governments, providing for the common use of the islands for international aviation and communication for a period of 50 years. (G. J. S.)

So far as was known at the close of 1941, none of the islands in the South Sea and Equatorial group had been attacked by the Japanese.

Soybeans. U.S. production of soybeans in 1941 was estimated by the department of agriculture Nov. 1 as 111,300,000 bu. compared with 79,837,000 bu. in 1940 and a ten-year (1930–39) average of 35,506,000 bu. The preceding comparison indicates how soybeans advanced in a decade from the position of a minor U.S. forage crop to that of a highly important food and commercial crop. Soybean bread and meal and soybeans, roasted and salted as peanuts, have become common commercial products. Probably more than 100,000,000 lb. of soybean oil are used annually in the production of oleomargarine and cooking fats. Market activity in soybeans during 1941 frequently exceeded that of corn in trading on the Chicago Board of Trade—a fact that gains added interest when it is realized that corn is the United States' largest feed and food crop and that the nation's agriculture is basically a corn economy. Six states, listed in the accompanying table, produce the commercial soybean crop in the United States; their harvest in 1941 was 103,85°,000 bu. The remaining 7,442,000 bu. of the 1941 crop were grown in other states as a livestock feed and fertilizer crop. The United States in 1941 was second only to Manchoukuo in the production of soybeans. No 1941 figures were available from Manchoukuo and the Danube countries. In 1940, in response to inducements from the Japanese government, farmers produced 161,156,000 bu. of soybeans, compared with 144,952,000 bu. in 1939. Soybean meal is an important part of the German and other European army rations. Bulgaria increased its soybean acreage in 1941 owing to increased demand from Germany. Rumanian acreage also was increased to meet the growing European need for edible vegetable oils. The British blockade prevented the usual importations of vegetable oils and oilseeds from Africa and America, and the German-Russian war cut off Chinese and Manchoukuoan supplies, which previously to June 1941 had reached Germany via the trans-Siberian railway.

The U.S. acreage in soybeans in 1941 was 9,990,000 ac. compared with 10,528,000 ac. in 1940 and a ten-year average of 5,467,000 ac. The per-acre yield in 1941 was 18·8 bu. The 1940 yield and the ten-year average yield were the same, 16·1 bu. to the acre. The accompanying table gives the commercial production only and does not include that part of the crop grown in other states. (*See* also CHEMURGY.)

U.S. Soybean Production by States, 1941 and 1940

	1941 bu.	1940 bu.		1941 bu.	1940 bu.
Illinois	54,112,000	35,140,000	Ohio	12,800,000	8,400,000
Iowa	17,501,000	15,026,000	North Carolina	2,185,000	2,282,000
Indiana	15,436,000	10,989,000	Missouri	1,824,000	1,176,000

Spain. A totalitarian state occupying eleven-thirteenths of the Iberian peninsula in extreme southwestern Europe. Area (including the Balearic and Canary Islands): 194,200 sq.mi.; pop. (official est. June 1940): 26,053,230 (1930 census: 23,563,867). Capital: Madrid (1,194,756). Other chief cities (pop. est. 1940): Barcelona (1,398,942), Valencia (403,126), Seville (253,203), Malaga (232,136), Bilbao (228,418). Language: Spanish. State religion: Roman Catholic. Caudillo, or chief of state: General Francisco Franco (*q.v.*).

History.—Problems of economic reconstruction continued to dominate the Spanish scene in 1941, as the government strove to keep out of war, although maintaining its close association with Germany and Italy and carrying on a propaganda campaign for imperialism in North Africa and for stronger ties with Spanish America. The general economic situation, while somewhat improved over 1940, was still far from satisfactory. Food shortages and higher prices brought distress to the poor, undernourishment increased disease, and unemployment continued widespread. To alleviate these conditions, the government negotiated for increased food imports and strengthened its control over economic activities. Contracts were made with Argentina and Brazil for the delivery of large quantities of wheat and cotton, and additional credits were obtained for purchases from Great Britain, whose blockade authorities allowed increased quotas to pass through in order to facilitate Spain's rehabilitation. In October, after numerous sentences to hard labour (estimated as high as 50,000 in 11 months) had failed to bring satisfactory observance of laws against profiteering and hoarding, the death penalty was decreed for those selling "prime necessities" at exorbitant prices. Transport facilities, whose inadequacy was closely linked with economic distress, were a special concern of the government, which on Jan. 28 assumed ownership and operation of standard-gauge railways and created a government commission to control all transport services. A law of May 5 raised shipping subsidies 20% to 25,000,000 pesetas annually. To ensure more efficient regulation of industry, the government authorized on June 23 the formation of 24 national syndicates embracing all productive, processing and service activities, and on Sept. 25 set up a National Industrial institute to promote and finance the creation and development of industries, as well as to direct all government participation in private business and to manage government-owned factories and equipment.

Meanwhile the Falange, a largely middle-class movement closely patterned after Italian fascism, continued to strengthen its position in relation to other factions supporting the Franco government (notably the conservative "traditionalist" element comprising the army, the church and the monarchists). The Falange's leader, General Franco, remained, in theory and largely in practice, the supreme authority of the state; its national council of 100 members constituted the legislative body, and its 19-man political junta, headed by Franco's brother-in-law, Foreign Minister Ramón Serrano Suñer (*q.v.*), served practically as the government cabinet. In March, Falange officials were granted the privileges and immunities enjoyed by officers of the state, the army and the church, and in October the party received control of all information services, including press, radio, films and government propaganda. A further entrenchment in power resulted from the growth of the Falange militia and from the regimentation, in accordance with a decree of Dec. 1940, of all Spanish youth for political and pre-military training under Falange direction. The death of ex-King Alphonso (*q.v.*) on Feb. 28, shortly following his renunciation of claims to the throne in favour of the Infante Juan, simplified the problem of restoring the monarchy, but such was clearly not the intention of the government, although Alphonso's death was observed with solemn mourning throughout Spain.

A signal victory over the church was won in May, when a concordat with the Vatican recognized the state's right to make appointments to Spanish bishoprics, of which nine metropolitan and 61 suffragan sees had become vacant.

For reasons of both self-interest and ideology, the Franco government continued in sympathy with the axis, but the disrupted economy, social cleavages and dependence upon anti-axis powers for needed supplies precluded active participation in the war during 1941. Over extreme partisans of the axis, General Franco exercised a moderating influence; in May he ordered a drastic government shake-up, replacing a number of Serrano Suñer's pro-axis supporters with close friends of his own. On Dec. 19, following the involvement of the United States and Japan in the war, the government reaffirmed its "nonbelligerency" policy adopted in June 1940. Pan-Americanism was vigorously combatted, as the government intensified its campaign for the revival of Spain's influence on her former American empire. The Consejo de Hispanidad (Council of Hispanism), projected in 1940 and given tangible form in 1941, directed relations with Spanish America, where it co-operated with local units of the Falange. With the outbreak of war between the axis and the United States, Spain generally took over German and Italian diplomatic relations with Spanish America, and indications were that the Falange might be preparing to assume the burden of axis propaganda there as well.

Education.—Primary education is compulsory and free, and religious instruction has been restored as in the period of the monarchy. Education shared with agriculture and public works a government appropriation of 882,000,000 pesetas in 1941.

Defense.—Military service is compulsory. The army is closely integrated with the Falange and was unofficially estimated in 1941 to include approximately 320,000 actives and 300,000 trained reserves. The air force, separate from the army, had about 3,500 actives and 5,000 reserves. The navy consisted of some fifty gunboats, submarines and torpedo boats; most major units were either sunk or severely damaged during the civil war. Appropriations for defense were slightly more than 2,100,000,000 pesetas for 1941.

Finance.—The monetary unit is the peseta (official value in 1941: 9.13 cents U.S.); the gold peseta (value 33 cents U.S.) is used in foreign transactions. Gold reserves were almost negligible, and the currency was artificially controlled. The 1940 budget, appropriating 7,160,000,000 pesetas, was continued for 1941; an additional 1,500,000,000 pesetas were appropriated in March. The funded public debt on Dec. 31, 1940, was unofficially estimated at 23,885,000,000 pesetas. Foreign indebtedness in June 1940 was 1,200,000,000 gold pesetas, exclusive of the debt to Germany of perhaps 300,000,000 marks. The total currency in circulation was 12,460,000,000 pesetas. No gold or silver reserves against paper currency were required.

Trade and Communication.—Official Spanish trade figures were not published to any extent after 1936. Statistics for 1940 showed exports valued at 394,335,325 gold pesetas ($128,839,000) and imports at 620,585,225 ($202,745,000). Exports to the United States were $14,550,093 and imports $27,041,820. Wheat and other foodstuffs were the major import item, while fruits and raw materials (chiefly oranges, nuts, olives, cork and its manufactures, iron ore and pyrites, mercury and naval stores) constituted the bulk of the exports. No figures were released for 1941, but the import surplus was believed to have been appreciably reduced; the trend of shipments could not accurately be determined. In the first eight months of 1941 imports from the United States ($10,994,946) were less than half the figure for the same period 1940 and only slightly exceeded exports, which remained at the 1940 level. A "favourable" trade balance was unofficially reported for Spanish commerce with Great Britain, Germany, Italy and France; but imports from Hispanic America exceeded exports, with large shipments being taken of Argentine wheat and of Argentine and Brazilian cotton.

In 1936, at the outbreak of the civil war, railways totalled 16,986 km. There were 3,830 locomotives, 6,866 passenger cars and 98,570 freight cars, but 27% of the locomotives, 22% of the freight cars and 61% of the passenger cars were lost during the civil war. Replacements were slow, and at the beginning of 1941 less than 3,500 locomotives were in operation, together with 4,500 passenger and 89,000 freight cars. Despite equipment deficiencies, 168,000,000 passengers were transported in 1940, a 65% increase over 1935, partly explained by the shortage of gasoline. Rail freight movement was estimated at 40,500,500 tons, about 5% over 1935. All standard-gauge lines (totalling 12,382 km., of which only 1,600 km. were of double track and only 630 km. electrified) were placed under government control. Private motor traffic was virtually eliminated, and bus and trucking services were greatly curtailed by the shortage of gasoline. Air traffic increased greatly in 1940, with both Spanish- and foreign-owned lines opening new and extending existing services. In 1941 a new 50,000,000-peseta airport was projected for Barcelona, an important air centre. In 1940, the merchant marine comprised 900 vessels, with a gross tonnage of nearly 1,100,000; a 12-year government program called for the addition of 700,000 tons. In July 1940, 3,257 telephone stations and 325,309 telephones were in operation, representing a substantial gain following the end of the civil war. Late in 1940 international telephonic communication was restored. Certain German- and Italian-owned cables were cut, but British-owned cable connections continued in operation, as did international commercial radio services.

IN SPAIN, IN 1941, CHILDREN as well as adults had to wait in line for their meagre rations since the lack of food grew more and more critical

Agriculture.—Agriculture is the chief industry, although less than half the arable land was under cultivation in 1941. Production in 1941 was estimated greater than in 1940, but crop yields were below average, largely because of lack of fertilizers, insecticides and equipment. Main crops, with estimates of 1941 production (in metric tons except where otherwise indicated), were: wheat, 2,980,000 (1931–35 average yield: 4,393,000); barley, 1,800,000; rye, 422,000; oats, 600,000; rice, 204,000; olives for oil (1940), 1,444,555 (1939: 1,150,191); olive oil, 340,000 (1940: 284,053); oranges, 450,000 (1940: 700,000); beet sugar, 150,000 (1940: 100,000); cane sugar, 10,300; cotton (1940), 7,700 bales of 478 lb.; potatoes (1940), 70,000; wine, 18,000,000 hectolitres. Cork strippings in 1940 amounted to 35,000 tons (normally 60,000).

Manufacturing.—Absence of both official and unofficial statistics precluded accurate judgment in 1941 as to the extent of manufacturing recovery. Production continued to be hampered by shortages of machinery and raw materials and by inadequacy of transport facilities. Output of all factories in 1940, although below 1930 levels, was estimated to exceed that of 1939. Iron production was 620,652 tons and steel was 758,682, equalling the high levels of 1929 and 1930. At the beginning of 1941 there were ten blast furnaces with an annual capacity of 1,000,000 tons. Cement sales of 1,470,000 tons represented a 27% gain over 1935. The munitions industry worked at capacity, and lumber production compared favourably with pre-civil war years. On the other hand, operations of the large canning, shoe and soap industries were seriously curtailed by lack of raw materials, which affected also the important cotton textile industry. Wool-textile production, although much greater than in 1939, was below pre-1936 levels. For the first half of 1941, iron production was about 257,500 tons (25,000 less than for the same period in 1940) and steel output 358,500 (about 30,000 less). Cement production for the first 8 months was 875,000 tons, slightly less than in 1940. Unemployment was large and widespread.

Mineral Production.—Mining is second to agriculture. Production was erratic because of economic dislocations brought on by the civil war and the world conflict, and reliable statistics were not available in all cases in 1941. Coal production in 1940 was 9,417,283 tons (an all-time high), and iron output was estimated at 2,886,973 tons. Official production statistics (in tons) for the first half of 1941 showed: coal, 4,552,000; iron 797,500; iron pyrites, 239,211; zinc ore, 42,752; zinc metal, 6,936; copper ore, 72,238; black copper, 596; blister copper, 1,562; refined copper, 3,493; copper metal, 4,251; manganese ore, 4,410; wolframite, 243; tin ore, 127; metallic tin, 42; lead ore, 25,241; pig lead, 7,088. (*See* also WORLD WAR II.)

Spanish-American Literature.

The most striking feature of Spanish-American literature in 1941 was the number of good novels published during the year. In a broad generalization it may be said that most of these novels belong to the group of social works dealing

with the situation of the Indian peasant, the incipient industrial proletariat, the immigrant worker, and their specific problems. Ciro Alegría's *El mundo es ancho y ajeno* (which has been translated into English) is typical of this trend. Alegría is acutely conscious of the problem of the Indian land worker in Peru, deals with it from both a local and a human point of view which is intensely pathetic; it is a book well worth reading both as a work of art and as a social document for the better understanding of South America. Gonzalo Drago's *Cobre* is the novel of the workers of the foreign-owned copper mines of Chile, a realistic, violent book, a political pamphlet as much as a piece of fictional literature. Enrique Amorim's *El caballo y su sombra* presents a different facet of South American life; it is a study of the Uruguayan agricultural world portraying the conflict between the old latifundist and the newly arrived immigrant worker with his new ideas, methods and needs. In Ecuador, Gerardo Gallegos in his *Eladio Segura* presents an Andean novel, a psychological study of an ethnical group fatally predetermined, and Alfredo Pareja Díez Canseco in *Baldomera* offers his favorite theme of the impact of modern urban life on the Indian. Also dealing with Indian life is the Mexican National Prize in Literature *Nayar* by Miguel Angel Menéndez, the protagonist of which is a whole Indian tribe treated in a poetic, impressionistic mood, that almost escapes the rules of the novelistic genre.

Other good novels published in 1941 were: in Argentina, Bernardo Verbitsky's *Es difícil empezar a vivir*, first prize in the Ricardo Güiraldes literary competition, J. Carlos Onetti's *Tierra de nadie*, Renata Donghi Halperín's *El sol sobre las manos*, Juan Filloy's *Caterva*, excellent in psychology and brilliant in pathetic humour; and in Chile, Macedonio Fernández's *Una novela que comienza*, almost surrealistic in approach.

Minor works in the field of the novel were the Mexican Mauricio Magdaleno's *Sonata* which like his previous books ramblès off into exces ive lyricism after a good beginning; the Chilean Sofía Espíndola's *Sombra en llamas;* the Colombian Fernando González's *El maestro de escuela*, and the Salvadoran Trigueros de León's *Campanario*.

In the field of the short story, usually so good in Spanish-America, the year 1941 was not a happy one. Those deserving mention were: the Cuban Juan Bosch's *Dos pesos de agua*, a collection of dramatic, direct tales, simple in style; and Juan Draghi Lucero's *Las mil y una noche argentinas*, legends and tales of the Argentine West, the best of them being those taken from folk-lore. In passing we may mention also the Venezuelan Julián Padrón's *Candelas de verano*, the Chilean Oscar Castro's *Huellas en la tierra*, and the Mexican Efrén Hernández's *Cuentos*.

In the poetical production of 1941 Mexico took the lead with the publication of Xavier Villaurrutia's *Décima muerte y otros poemas no coleccionados* in which that profound and difficult poet stirs the deepest intellectual emotions of the reader, with Alfonso Reyes' delicate offering *Algunos poemas* (*1925–1939*) and with the great Enrique González Martínez's *Poemas truncos*.

In Argentina we find a book of *Coplas* by Antonio de la Torre, the best of his poems being those of popular and regional flavour; Luis Cané's *Bailes y coplerías* are good verses; also Mario Binetti's *La sombra buena*. The Cuban poet Mariano Brull published a book of verse *Solo de rosa*.

In Chile were published Stella Corvalán's *Sombra en el aire*, Washington Espejo's *Canto perdido*, Roberto Meza Fuentes' *Arbol de Navidad*, and a collection of poems by the creationist writer Vicente Huidobro *Ver y palpar, 1923–1933*.

The distinguished Ecuadorian poet Jorge Carrera Andrade printed his *Canto al puente de Oakland*, the Uruguayan Sara de Ibáñez an excellent book *Canto*, and Roberto Brenes Mesén, from Costa Rica, offered an anthology *En busca del Grial* of his previous books of verse.

Anthologies of national poetry were Rafael Heliodoro Valle's *Indice de la poesía centroamericana*, Juan Felipe Torruño's *Indice de poetas de El Salvador en un siglo, 1840–1940*, Rodrigo Miró's *Indice de la poesía panameña contemporánea*, and Guillermo Viscarra Fabre's *Poetas nuevos de Bolivia*. These are all interesting to the student of Spanish-American literature.

A book by Antonio Castro Leal must be mentioned, *Salvador Díaz Mirón. Poesías completas: 1876–1928* in which are included some forty poems by the author of *Lascas* which were either unknown or never before printed in book form.

The essay literature in Spanish-America in 1941 was important in the number as well as in the range and value of the works published. Not a few writers covered in substantial writings the economic, social and political problems of present day Spanish-America and of the world, probed into the past, studied questions of import in philosophy, aesthetics, literary and historical criticism.

Nothing more than a brief mention of some of these works is possible here. In Argentina were published Pablo Rojas Paz's *Alberdi*, Héctor P. Agosti's *El hombre prisionero*, José Gabriel's *Aclaraciones a la cultura*, Leopoldo Hurtado's *Espacio y tiempo en el arte actual*, Dr. Alejandro Raitzin's *Cultura, carácter y conducta*, Marcos M. Blanco's *Este vuelco del mundo*, Juan Pinto's *Panorama de la literatura argentina contemporánea*, Amado Alonso's *Poesía y estilo de Pablo Neruda*, María Rosa Lida's *El cuento popular hispanoamericano y la literatura;* in Cuba, Enrique Labrador González's *Manera de vivir* and Armando Guerra's *La mujer vueltabajera en la poesía cubana;* by Chilean writers we have Prof. Arturo Torres Rioseco's *Novelistas contemporáneos de América*, Andrés Sabella's *Crónica mínima de una gran poesía* and several books published on the occasion of the City of Santiago centennial such as Ricardo A. Latcham's *Estampas del Nuevo Extremo;* in Ecuador, Alejandro Andrade Coello's *La novela en América. Sus raíces* and Luis Bossano's *Los problemas de la sociología*. In Mexico, that master of the essay, Alfonso Reyes, published *Pasado inmediato y otros ensayos*.

By Peruvian writers were printed *Cien años de literatura y otros estudios críticos* by Prof. José Jiménez Borja, *Balance y liquidación del 900* by Luis Alberto Sánchez, and *Hombres e ideas en el Perú* by Jorge Guillermo Leguía. The distinguished Uruguayan philosopher published a new book *Fermentario*. And in Venezuela we find *Formación y proceso de la literatura venezolana* by Mariano Picón Salas, Alejandro Rivas Vázquez's *Orientaciones americanas*, and José Gil Fortoul's *El hombre, la historia y otros ensayos*.

(L. Mo.)

Spanish Colonial Empire. Total area (approx.) 128,100 sq.mi.; total population (est. Dec. 31, 1939) 1,005,000.

The table below lists the colonies, protectorates, etc., of Spain (*q.v.*) with certain essential statistics appropriate to each of them.

Spanish Colonial Empire

Colony and Area sq.mi. (approx.)	Population Estimated Dec. 31, 1939 (000's omitted)	Capital, Status, etc.	Principal Products (in metric tons)	Imports and Exports (in thousand pesetas)	Road, Rail and Shipping	Revenue and Expenditure (in thousand pesetas)
AFRICA Ceuta and Melilla, 77	115	Madrid, administered as part of Spain	exports (1934) raw materials 899,553, manufactures 12,892	(1934) imp. 47,546 exp. 14,500		
Morocco, Spanish, 8,080	750	Tetuan, protectorate *High Commissioner:* General Carlos Asensio	(1938) iron ore (metal content) 805,000; (1938) antimony ore (metal content) 81	(1938) imp. 123,146 exp. 71,143	rds. *c.* 500 mi. rly. 80 mi.	(1938) rev. and exp. 111,785
Spanish Guinea, including Fernando Po, Rio Muni and four small islands, 10,380	120	Santa Isabel, colony	(1934–35) cocoa 14,900 coffee	(1930) imp. 17,625 exp. 21,970		(1932) rev. and exp. 11,020
Western Sahara, including Ifni, Rio de Oro and Spanish Sahara, 109,600 . .	20	Villa Cisneros, colonies	fish and dates			(1929) rev. and exp. 6,947

Spanish Guinea: *see* SPANISH COLONIAL EMPIRE.

Spanish Literature. Even by 1941 Spain had not recovered sufficiently from the civil war to produce many books of note since early in 1939. In fiction, Concha Espina was still prolific with *Esclavitud y libertad* and *La Ronda de los galanes,* as was W. Fernandez Flórez with *El Hombre que compró un automóvil* and *Una Isla en el Mar Rojo.* José María Pemán published a drama, *La Danza de los velos,* and a collection of essays, *Crónicas de antes y después del Diluvio.* Under belles-lettres come also E. Giménez Caballero's *El Vidente* and J. de Entrambasaguas' *El Alma Sorprendida.* The late Cardinal Gomá published in 1940 a volume entitled *Por Dios y por España.* Sr. Menéndez Pidal published the third volume of his monumental *Historia de España.* Another substantial historical work was J. García Mercadal's *La España Imperial: Cisneros.* Miguel Artigas' *La Vida y la obra de Menéndez Pelayo* was being followed by a new edition of Menéndez Pelayo's complete works, and the Instituto de España was editing a series of anthologies from them.

Outstanding political works were R. Gay de Montellá's *El Fuero del Trabajo y sistema del Estado sindical-corporativo;* I. Serrano's more substantial treatment of the same subject in *El Fuero del Trabajo. Doctrina y comentarios;* and *Cuatro Estudios sobre sindicalismo vertical* by L. Legaz Lacambra and B. Aragón Gómez. L. Gabilán Plá and W. D. Alcahud edited the text of all measures passed by the nationalist government down to the end of the civil war (April 1, 1939: *Legislación Española,* 6 vols.). Manuel Aznar published a comprehensive *Historia Militar de la Guerra de España.* A biography of chiefly political interest was Aurelio Joaniquet's *Calvo Sotelo.*

Several notable books by Republican exiles abroad appeared in English: S. Casado, *The Last Days of Madrid;* S. de Madariaga, *Christopher Columbus;* J. Alvarez del Vayo, *Freedom's Battle;* A. Barea, *The Forge.* Among such works in Spanish were: E. Díez-Canedo, *El Teatro y sus enemigos;* Alfonso Reyes, *Capítulos de literatura española;* José Moreno Villa, *Locos, Enanos, Negros y Niños palaciegos;* Adolfo Salazar, *Música y sociedad en el Siglo XX;* Maria Zambrano, *Pensamiento y poesía en la vida española.* Spaniards in Mexico founded a monthly review, *España peregrina.* Catalonians in Paris revived the *Revista de Catalunya* and founded a new weekly, *El Poble Català.* The *Revista de Filología Española,* an offshoot from which was the new Argentine *Revista de Filología Hispánica,* recommenced publication in March 1941. A new literary review of outstanding quality, *Escorial,* made its first appearance in the autumn of 1940. (E. A. P.)

Special Libraries Association. Founded in 1909 to further the purpose of special libraries in business and industrial organizations, and to promote the collection, organization and dissemination of information; to develop usefulness and efficiency of special libraries and other research organizations; and to encourage the professional welfare of its members. As of Sept. 30, 1941, the association had 2,490 members in the United States and Canada. These members represent banking, advertising, insurance, finance, publishers, manufacturers, museums, specialized departments of colleges and universities and business branches of public libraries. The official journal, *Special Libraries,* is published monthly September to April, with bimonthly issues May to August. The association has 18 chapters in the United States and two in Canada. An annual convention is held each year in June. The association carries on a publications program which is professional in character. *Special Library Resources,* vol. I, was published in 1941.

The 1941–42 officers were: president, Laura A. Woodward, Maryland Casualty company, Baltimore, Md.; first vice-president, Josephine B. Hollingsworth, Municipal Reference library, Los Angeles, Calif.; second vice-president, Gladys R. Haskin, Cleveland School of Art, Cleveland, O.; treasurer, Marcella Hasselberg, Curtis Publishing company, Philadelphia, Pa. Directors: Ross C. Cibella, Hall Laboratories, Inc., Pittsburgh, Pa. (term expiring 1942); Harry C. Bauer, Tennessee Valley authority, Knoxville, Tenn. (term expiring 1943); Herman H. Henkle, School of Library Science, Simmons college, Boston, Mass. (term expiring 1944); Alma C. Mitchill, Public Service corporation of New Jersey, Newark, N.J. (term expiring 1942); national secretary, Mrs. Kathleen B. Stebbins, 31 East Tenth st., New York city. Executive office, 31 East Tenth st., New York city. (K. B. S.)

Spelman Fund of New York was chartered in 1928. The fund, during 1941, continued its program directed at the improvement of the methods and techniques in the field of public administration. During the year, the fund appropriated $787,500. The chairman of the Board of Trustees in 1941 was Charles E. Merriam. (C. MH.)

Spices. During 1941 attempts were made to grow herbs and spice seeds in the U.S. Sage is a favourite, particularly for seasoning pork products. But it grows in Yugoslavia and war prevented exports in 1941. From Oregon to Massachusetts farmers became interested in sage with dubious results. Better were the reports on red peppers and mustard seed, the latter crop yielding more tons than ever before. Moderate acreages of coriander and blue poppy seeds were harvested, proving they can be raised in the U.S. Where machinery cannot be applied, differences in production costs are startling. U.S. growers would be unhappy with a price of 40 cents per lb. for sage leaves against 6 cents per lb. (New York), at which price the Yugoslavs would be eager sellers.

Fewer steamers were available to bring spices to the U.S., and consequently freight rates advanced and reserve stocks diminished. Ensuing higher prices were without appreciable effect on living costs. The per capita annual use of imported spice is under 14 oz., with a 1941 retail value of about 1 cent per week. During the summer of 1941 trading with Japan ceased, cutting off the small red peppers (hontakas) seen in jars of pickles and chow chow; also a useful variety of mustard seed from occupied China and Japanese ginger. The supplies of Holland caraway and blue poppy in the U.S. were near the vanishing point. But blue poppy seed was again found in Turkey, emerging by way of Izmir or Basra. As tension in the Pacific fluctuated, prices for Netherlands-Indian, Malayan and Indian spices swayed between the advances already attained and a still higher range. The 1941 black pepper crop attracted little attention, but was normal. Ships were needed to move it, but rubber and tin had priority. There remained, however, enough pepper in the U.S. in 1941 to cover requirements until 1944. The countries of South and Central America were buying spices in the U.S. This new export business increased.

Imports of Spices by the U.S.A., Jan.-July 1940 and Jan.-July 1941

	7 mo., 1940		7 mo., 1941	
	Quantity, lb.	Value	Quantity, lb.	Value
Capsicum; red or cayenne peppers; chili, unground	1,204,463	$ 130,468	2,996,616	$ 278,542
Caraway seed	3,103,608	330,829	108,298	18,335
Cardamom seed	190,514	110,906	320,272	230,587
Cassia and cassia vera	6,101,438	582,085	7,516,436	808,597
Celery seed	916,495	99,152	437,599	84,672
Cinnamon, unground	601,614	80,534	1,853,312	232,380
Cloves, unground	3,130,240	431,830	6,397,837	831,155
Ginger root, unground	712,793	20,814	3,158,713	208,127
Mace, unground	517,855	180,799	726,543	180,753
Mustard, ground	761,789	347,152	520,056	223,176
Mustard seed, whole	4,003,555	253,650	3,486,134	186,673
Nutmegs, unground	2,940,630	358,998	4,787,183	501,038
Paprika, ground	2,066,415	582,630	3,160,537	743,193
Pepper, black, unground	10,388,184	373,562	27,714,088	1,121,908
Pepper, white, unground	2,192,208	173,922	6,966,665	466,198
Pimento (allspice)	895,805	120,238	1,891,871	299,940
Tonka beans	176,533	196,216	303,720	191,402
Vanilla beans	962,873	3,571,505	724,840	3,746,600
All other spices	4,549,713	271,841	10,728,089	828,636
Totals	46,406,725	$8,235,131	83,798,809	$11,181,912

Hungary and Bulgaria no longer shipped anise, paprikas and fennel seeds to the U.S. Test planting of paprika in the Gulf states and California in 1940 was inconclusive. It led to a larger effort in 1941, the protective duty of five cents per lb. being a real incentive. With the subjugation of France, northern India supplied the celery seed. Total imports in 1941 were 60% less than in 1940. Imports of nutmegs increased, at slightly reduced cost, there being but one market, the U.S. Gingers advanced sharply because of the difficulty of getting the 1941 main crop out from Sierra Leone. Madagascar adhered to the Vichy French government and could not obtain navicerts for its cloves and vanilla beans, leaving Zanzibar in a monopolistic position as to the former. Zanzibar wisely refrained from extreme price advances. Allspice (grown only in Jamaica, B.W.I.) touched a new high price as its manipulators perfected their technique. The usual reaction was observed—a rush to substitutes, principally a berry from Mexico (Eugenia tabasca), with a pronounced bay rum fragrance, something new for foods.

The heavy buying of the U.S. armed services had some effect on prices and supplies. (C. A. T.)

Squash Racquets.

Charles Brinton, a Princeton undergraduate, won the national amateur and national intercollegiate singles titles in 1941. His brilliant playing was the outstanding feature of the season. Brinton, in capturing the national crown that was defended by A. Willing Patterson, vanquished Hunter Lott of Philadelphia in the final after eliminating such fine players as Neil Sullivan and H. Sherman Howes. The doubles combination of Hunter Lott, Jr., and William E. Slack won the national title for the fourth successive year, defeating the team of Brinton and Stanley Pearson in the semi-finals.

The United States team won the Lapham cup, emblematic of international squash racquets team supremacy, by defeating a Canadian team in a 15-match series. Canada won the cup in 1939 and 1940. In the 19 years the cup was up for competition the U.S. won it 12 times.

In the New York state championship, Stanley Galowin, who put out Patterson in the national, annexed the title for the third year in a row, vanquishing Donald Frame of the Harvard club of New York. Richard S. Rothchild of the Downtown A. C. (N.Y.) won the Metropolitan (N.Y.) Squash Racquets association singles championship by defeating Arthur H. Barker in a match that required less than an hour to play, with Rothchild the dominating figure.

Joe Janotta, of Chicago, won the National Veterans' honors, and Murray Vernon, of the Downtown A. C., captured the Metropolitan Veterans' title.

In women's competition, Miss Cecile Bowes, of Bala-Cynwyd, Pa., retained the national title, defeating Mrs. Enos Throop, Jr., of New York, the 1941 Metropolitan champion, in the final in 15 min. playing time.

Miss Eleonora Sears, a former national title holder, lost out in the quarter finals. (J. B. P.)

Stalin, Joseph Vissarionovich

(1879–), Russian statesman, was born in Georgia and succeeded Lenin as virtual dictator of the soviet union in 1924 (see *Encyclopædia Britannica*). On May 6, 1941 Stalin assumed the premiership of the U.S.S.R. after the resignation of Vyacheslav Molotov (*q.v.*) from that office.

After the German invasion began June 22, 1941, Stalin, emerging from his accustomed seclusion of former years, made a number of public appearances and addresses. His new role in this respect was not unlike the relationship of the Tsars to Russian peasanthood in pre-revolutionary days. On July 3, in one of his rare radio addresses, he exhorted his people to "know no fear," to scorch the earth before the German advance. On July 19 he took over the post of defense commissar. On Oct. 19 he called upon all Muscovites for a last-ditch fight to save the capital. To the British on Nov. 6 he addressed a request for a second front in western Europe to hasten Germany's defeat. To the Americans on the same day he tendered his thanks for lend-lease aid. Previously Stalin had declared that "our war for the freedom of our country will merge with the struggle of the peoples of Europe and America for their independence and for democratic liberties." (*See* also UNION OF SOVIET SOCIALIST REPUBLICS.)

Stamp, Josiah Charles Stamp,

1ST BARON, OF SHORTLANDS, (1880–1941), British economist and banker, was born June 21 in London. In 1896 he started work as a lowly clerk in the inland revenue department; 40 years later he was one of the most powerful figures in British finance. During his lifetime he served as economic adviser on various government committees, was a director of the Bank of England and was chairman of the board of the London, Midland and Scottish railways. Lord Stamp exerted a powerful influence on British foreign policy during the critical years preceding the outbreak of World War II and he actively supported Neville Chamberlain's efforts to appease Hitler. A charter member of the Anglo-German fellowship, he attended the annual nazi party rally in Nuremberg in 1938 as Hitler's special guest. His pro-nazi leanings were overlooked when Britain went to war and he was appointed chief economic adviser to Chamberlain's war cabinet in Oct. 1939. Widely recognized as one of Britain's leading economists, he wrote many books and articles on economic subjects. Lord and Lady Stamp and their eldest son, the Hon. Wilfred Carlyle Stamp, were killed April 16 when German bombs crashed through their London home. (See *Encyclopædia Britannica.*)

Stamp Collecting: *see* PHILATELY.

Standards, National Bureau of.

The National Bureau of Standards was established by act of congress March 3, 1901. It was originally under the treasury department, but in 1941 was a bureau of the department of commerce. Its functions were the development, construction, custody and maintenance of reference and working standards used in science, engineering, industry and commerce. The bureau's services were available to the national and state governments, and under certain conditions to private firms and individuals. It acted as the principal testing laboratory of the federal government in connection with the purchase of supplies (other than food and drugs), and conducted research in co-operation with governmental agencies and with engineering societies and trade associations.

The bureau was made up of nine scientific and technical divisions, and three dealing with commercial standardization, as follows: electricity, weights and measures, heat and power, optics, chemistry, mechanics and sound, organic and fibrous materials, metallurgy, clay and silicate products, simplified practice, trade standards and codes and specifications. Each division consisted of from four to ten sections, which were the working units covering specialized fields.

On June 30, 1941 the bureau's staff consisted of 1,204 em-

ployees (including temporary appointees) and 80 research associates. The regular appropriation for the fiscal year 1941 was $2,037,500. In addition, $100,000 was provided for enlarging the optical glass plant and $21,000 for fencing the bureau's property and for employing additional guards. A tract of 12.5 ac. adjoining the bureau's property on the west and north was added to the site, which then comprised 67.8 ac. A new materials' testing laboratory was to be erected on this land, and plans for the building were being prepared in 1941.

During 1941 a large percentage of the bureau's work was connected with the defense program. Since the development of mechanized warfare has vastly increased the importance of uniform standards and precise measurements in the manufacture of military equipment, the bureau, as custodian of the national standards, has been called upon for many tests of materials and devices and for the investigation of new production processes.

The wide experience of the bureau's staff proved of great value to the army, navy, the National Advisory Committee for Aeronautics and the National Defense Research committee in solving many problems connected with the properties of materials and the design of equipment for service under unusual conditions.

In spite of the large volume of this military work, the bureau continued to serve American industries and the public in other fields. For instance, the standard frequency broadcasting service was improved by introducing accurate timing of the announcements which are given every five minutes on the continuous 440-cycle transmission. Plans were prepared for a new and improved transmitting station to replace the temporary one in use.

In co-operation with the Textile foundation, fundamental data were published on the properties of wool and other fibres. The availability of this information makes possible the development of new and more durable fabrics.

Working with the Copper and Brass Research association and the Federal Housing administration, tests were completed which gave, for the first time, accurate information on the strength of soft-soldered joints in thin-walled copper tubing, so extensively used in domestic plumbing installations.

A program of vehicle scale testing in co-operation with the states was completed ahead of schedule. Tests were made with the bureau's equipment in every state that did not have adequate facilities. The results of this were of such importance that 15 additional states had suitable testing equipment in order to maintain a continuous service.

The work on building materials and structures included tests of prefabricated units, wallboard, heating plants and other equipment. A survey of roofing materials in the north central states was completed, and a third report was issued giving results of the latest wear tests of floor coverings. Results of fire tests on many types of partitions, giving their effectiveness as fire barriers, were included in a report which should prove valuable to architects, engineers and building inspectors.

Two experts from the bureau's radio section accompanied the Louise A. Boyd Arctic expedition which sailed from Washington in the schooner "Effie M. Morrissey" on June 11, 1941. The expedition was to secure data on ionosphere conditions, geomagnetism and auroral phenomena, all of which have an important bearing on long-distance radio transmission. The United States coast guard and the Carnegie Institution of Washington co-operated with the bureau in developing the program and in providing instruments.

A complete report of the bureau's work to date on the physical properties of dental materials was prepared and was in course of publication in 1941. The report covered the beginning of its work at the request of the war department in 1919, the co-operative period with the Weinstein Research laboratories and finally the extensive program of the research commission of the American Dental association.

Several important meetings were held under the bureau's auspices, including the 31st national conference on weights and measures, the 19th annual conference of state utility commission engineers and the usual spring meeting of the American Physical society.

The bureau continued to aid the treasury department in the preparation of new and revised federal specifications, with particular emphasis on the use of substitutes for strategic materials. Purchasing agents for states, counties and municipalities were supplied with lists of manufacturers who certify that their products meet the requirements of nationally recognized specifications.

The new simplified plumbing code was widely used in 1941 in connection with federal housing projects. The national electrical safety code was thoroughly revised under bureau sponsorship. The report of the Interdepartmental Screw Thread committee was also revised and prepared for printing. (L. J. Br.)

Stanford University (The Leland Stanford Junior university). An institution of higher learning at Stanford university, Calif. (near Palo Alto), which in 1941 celebrated the 50th anniversary of its founding. In June a number of outstanding scholars participated in a symposium on "The University and the Future of America." In October thousands of Stanford alumni returned for exercises memorializing those held at the time of the opening of the university in 1891. The Hoover Library on War, Revolution and Peace was formally dedicated, with former President Herbert Hoover taking part in the program. "Birthday" gifts totalling $1,572,251.76 were received.

Under a $65,000 grant from the Rockefeller foundation, Dr. Ladislaus Marton, designer and builder of the first biological electron microscope, was brought to Stanford to develop and improve this new and important scientific tool. The school of engineering offered special courses in the summer quarter, various new defense training courses were initiated and the laboratories of the university took part in research projects on defense assigned by the federal government. Significant studies were made of poliomyelitis, epilepsy and cancer. With the increasing war tension and the expansion of the U.S. army and navy, a considerable number of the men of the university went into the armed forces or into war industry; but the number of women remained practically stationary. The faculty for the autumn quarter of 1941 numbered 617; the students, 4,077, of whom 1,347 were women and 917 were graduates. (R. L. W.)

Stang, Fredrik (1867–1941), Norwegian statesman, educator and jurist, became professor of law at Oslo university in 1897 and was president of the university from 1921 to 1927. He founded the Institute of Comparative Research in Human Culture, Oslo, in 1923, and headed that institution until his death. Stang was a member of the Norwegian Storting, 1906–09, and minister of justice, 1912–13. In 1914 he became a member of the Storting's Nobel committee, serving as its president after 1922. He died in Oslo, Nov. 15.

Stark, Harold Raynsford (1880–), U.S. naval officer, was born at Wilkes-Barre, Pa., on Nov. 12. Graduated from the U.S. Naval academy in 1903, he was commissioned ensign two years later and served on various ships and at various naval stations from 1903 to 1917. During World War I he was on the staff of Admiral William S. Sims, commander of the U.S. naval forces in European waters. He was chief of the naval bureau of ordnance from 1934 to 1937. On March 15, 1939 he was appointed chief of naval operations with the rank of admiral. After this appointment he was persistent in his pleas for a larger U.S. fleet and appeared a number of times before congressional committees to urge, usually with success, larger appropriations. In the spring of 1941 he announced his support of the lend-lease bill and of U.S. convoys in the Atlantic. On April 29 he revealed that U.S. patrols were already operating 2,000 mi. at sea. Stark was present with other ranking U.S. naval and army officers at the "Atlantic charter" meeting between Churchill and Roosevelt in August. The functions of his office were apparently altered by the shake-up of high naval personnel which followed the Japanese attack on Pearl Harbor in December. When Admiral Ernest J. King (*q.v.*) was appointed commander-in-chief of the U.S. fleet Dec. 20, he was made directly responsible to the president and secretary of the navy rather than to the chief of naval operations.

Stettinius, Edward R., Jr. (1900–), U.S. industrialist, born Oct. 22 at Chicago, Ill., and educated at the University of Virginia, where he was a student from 1919 to 1924. The son of a wealthy father, he went to work in 1924 as a common labourer with General Motors corporation. Within six years he was assistant to the president and in 1931 he was vice-president. In 1936 the U.S. Steel corporation made him chairman of its finance committee.

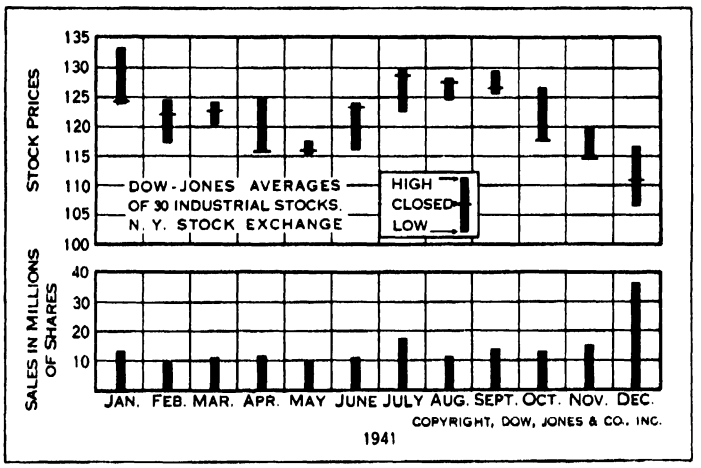
an important office theretofore reserved ordinarily for men with long years of experience as business executives. In April 1938 he was named chairman of the board of "big steel." Meanwhile he had served as liaison officer between the NRA and the Industrial Advisory board. In the fall of 1939 he was named director of the short-lived War Resources board, an agency appointed to formulate industrial mobilization in case of war. On May 28, 1940 President Roosevelt made him commissioner of industrial materials for the national defense council—a full-time job. In the Office of Production Management (*q.v.*), created Jan. 7, 1941, Stettinius became director of the important division of priorities, in which position he was succeeded Aug. 28, 1941 by Donald M. Nelson (*q.v.*). On the same day, Stettinius was appointed lend-lease administrator to succeed Harry L. Hopkins (*q.v.*). He was made special assistant to the president on Sept. 16 and was given the authority to approve all individual lend-lease allocations of less than $300,000,000. When aid to the Allies was consolidated under the Office of Lend-Lease Administration (*q.v.*) Oct. 28, Stettinius was named head of the new office with blanket powers to approve disbursements.

Stiles, Charles Wardell (1867–1941), U.S. medical zoologist, was born May 15 in Spring Valley, N.Y. He was assistant surgeon general of the U.S. public health service from 1919 to 1930 and was medical director of that service from 1930 to 1931. Dr. Stiles was the first to discover hookworm in the United States. He carried on extensive research among the poor in the southern states and found that their seeming laziness was largely due to this apparently insignificant parasite. He was a lecturer at Johns Hopkins university from 1897 to 1937; zoologist of the U.S. public health service from 1902 to 1910; professor of zoology at Rollins college from 1932 to 1938, and was associated with the Rockefeller Commission for the Eradication of Hookworm Disease from 1909 to 1914. He wrote widely on medical zoology and parasites of men and animals. One of his latest contributions was the *Early History of the Hookworm Campaign in Our Own Southern United States* (1939). He died Jan. 24 in Baltimore.

Stimson, Henry Lewis (1867–), U.S. statesman, of whom a biographical sketch appears in *Encyclopædia Britannica*. A Republican, he became an ardent admirer of Cordell Hull's policies as secretary of state (the office Stimson had held in Pres. Hoover's cabinet) and was always quick to defend Hull's actions against criticism. He favoured in particular a strong stand for the United States against Japan, Germany and Italy. Pres. Roosevelt appointed him secretary of war on June 20, 1940, the day Harry H. Woodring, resigned the office. Like his fellow cabinet-member, Frank Knox (*q.v.*), Stimson favoured a militant foreign policy in 1940 and 1941. He was among the first to support the lend-lease bill, revision of the neutrality act to permit U.S. convoys, extension of selective service and removal of the ban on the use of U.S. troops outside the western hemisphere.

Stock Exchanges: *see* STOCKS AND BONDS.

Stocks and Bonds. **Stocks:** *Nature of the Price Movements.*—Despite the existence of world war conditions, with the United States a participant, 1941 stock market movements were extremely small. In fact, the market in most important groups of stocks was surprisingly steady, at an extremely low price level, throughout the year. For nearly all groups of stocks, the price level sank gradually but not extensively from January to May; thereafter rose moderately until



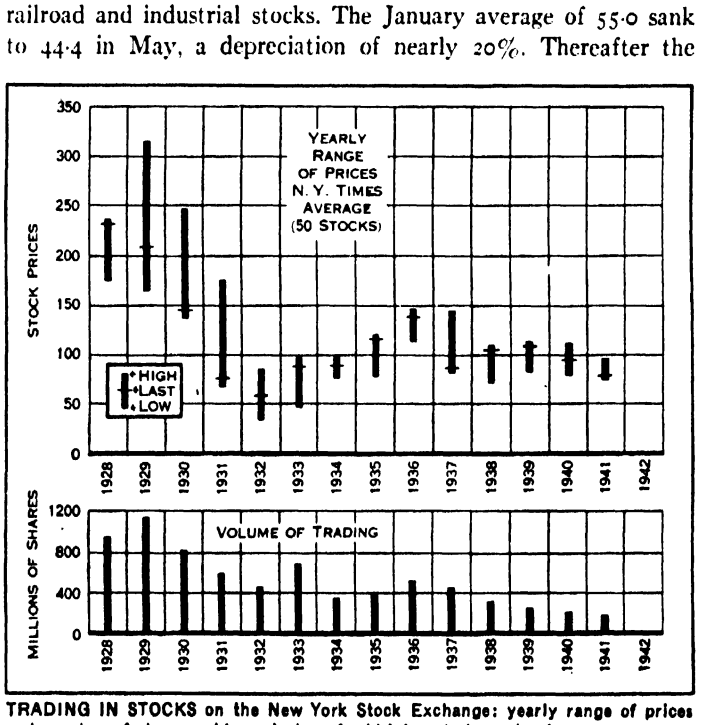
SALES AND PRICES on New York Stock Exchange, 1941

July; from July to year-end there was a gradual decline.

Using the Standard & Poor's barometer figures (average for each month based on daily closing prices), the average monthly price of 20 representative railroad stocks stood at 29·8 for Jan. 1941, as compared with 28·4 and 31·2 for December and January of 1940. Thereafter a slight decline occurred until June, when the monthly average stood at 28·7. The steadiness of the market for railroad shares, however, is indicated by the monthly averages of 28·4 for February, 28·7 for March, 29·0 for April, 28·7 for May and 28·7 for June. For July the monthly average rose to 30·0; it was 30·3 for August, 29·4 for September, 28·6 for October and 27·8 for November. In Dec. the average dropped to 24·9.

In the field of industrial stocks, using the Standard & Poor's average for 50 leading issues, the average monthly price stood at 102·6 for Jan. 1941, as compared with 103·0 and 119·0 for December and January of 1940. Following January of 1941, the monthly average sank gradually and moderately until May, when the monthly average price stood at 92·4. After May the average again rose to 101·7 for September, and then dropped to 88·2 for December, the low of the year.

Similar price movements by months occurred in other leading groups of stocks like the public utility, and copper and brass groups, although in each case the movement was somewhat larger. Public utility stocks fared rather adversely as compared with railroad and industrial stocks. The January average of 55·0 sank to 44·4 in May, a depreciation of nearly 20%. Thereafter the



TRADING IN STOCKS on the New York Stock Exchange: yearly range of prices and number of shares sold, exclusive of odd-lot and stopped sales

average price rose to 45·9 for July, and after that time there was a decline to 34·3 for December, or a decline of 38% since the first of the year. The December average of 34·3, it should be stated, compares with 70·4 for January of 1940. The copper and brass stocks monthly average price stood at 86·9 for January of 1941, at 83·4 for May, at 94·1 for July and at 82·4 for December.

*1941 copper and brass figures use 1935–1939 as a base period. All other figures use 1926 as a base period.
The above figures are an average for the month based on daily closing prices, except for copper and brass, which are weekly prices.
(Source of data: Standard & Poor's *Trade and Securities, Current Statistics.*)

Combining all of the aforementioned groups of stocks (ninety representative shares), the market showed a decline from 83·8 for January to 74·9 for May, and then an increase to 81·3 for September, and subsequently a decline to 69·5 for December, the low of the year and a decline of almost 17%.

At the close of Jan. 1941, the market value of all listed shares on the New York stock exchange stood at $40,280,000,000. On Dec. 31, the bottom of the year's decline, this market value stood at $35,785,946,000, a depreciation of only 10%. The aforementioned figures compare with a valuation of $45,636,000,000 for January, and $41,848,000,000 for December of 1940.

From the foregoing data, it is clear that 1941 stock market movements were distinctly downward, but in no sense sensational. The whole showing is rather surprising, in view of the tremendous enlargement of business activity throughout the year due to large war orders, the prosecution of a tremendous national defense program and the tremendous earnings of the larger corporations. All through the year the market seemed to have been influenced by fear and indecision. Apparently the market discounted future prospects and was, therefore, uninfluenced by improved volume of business and earnings. Probably the market lethargy and general price decline was attributable to certain outstanding factors, such as a prospective huge increase in taxes, a burdensome and growing national indebtedness, the prospect of inflationary tendencies with their increased cost of raw materials, as well as increased labour costs. In addition the year was marked by constant labour troubles, by the adoption of priorities in business, by price restrictions and business regimentation and by a flood of selling for tax-deduction purposes.

Number, Volume and Amount of Stocks.—According to the New York Stock exchange's compilation, the total of stocks listed on that exchange on Dec. 1, 1941, stood at 1,464,000 shares, with a market value of $37,882,000,000. This value compared with $41,848,000,000 and $45,505,000,000 at the corresponding dates of 1940 and 1939. Of 1941's total, United States stocks aggregated 1,424,000,000 shares, valued at $37,253,000,000, and foreign stocks 40,475,000 shares, valued at $629,040,000. The total of shares was distributed over 1,216 separate United States issues and 19 foreign issues, representing a total of 862 issuing corporations.

Total shares traded on the New York Stock exchange during 1941 amounted to 170,534,363, as compared with 207,605,359 shares during 1940; 262,015,799 shares in 1939; 297,446,059 shares in 1938; and 1,124,991,000 shares in 1929, the largest total on record. From the standpoint of activity in sales, the 1941 market, as was the case in 1940, may be described as relatively stagnant. The New York Curb market had sales during 1941 of 34,690,900 shares, as compared with 43,041,774 shares during 1940. For other security exchanges of the country data were not available at the time of this compilation, but the other United States exchanges are relatively unimportant as regards volume of transactions, in comparison with the New York Stock and the New York Curb exchanges.

Bonds: *Price Movements During the Year.*—Using the Standard & Poor's barometer figure for sixty representative corporate bonds (average for each month based on daily closing prices), the average high price stood at 99·87 for January and 98·65 for February.

Thereafter, for the balance of 1941, the high average price varied between 100·4 for April and 85·5 for December.

Moreover, the monthly fluctuation between high and low was very meagre. Only during March was there a range between high and low as great as 3·25 points.

The yearly price movement thus shows a remarkably stable bond market during 1941, and at a comparatively high price level. The unsettled conditions prevailing in the stock market, as already explained, probably caused many to put their faith in presumably nonspeculative bonds. Again, the flotation of new bond issues was comparatively small throughout the year, thus bringing to the fore a considerable pressure for investment by insurance companies and other large investment concerns. For the year 1941, according to the New York Stock exchange's record, bond and note flotations of American corporations totalled only $2,277,772,000. But exclusive of refunding issues, investment trusts and holding companies, the total flotation amounted to only $1,018,166,000.

Number, Volume and Amount of Bonds.—According to the New York Stock exchange's compilation, the total par value of bonds listed on that exchange at the end of December stood at $58,236,901,000, with a market value of $55,033,616,000. This value compares with $54,139,000,000 and $50,374,000,000 for January 1941. The increase in the par value of bonds during the year is largely attributable to the issuance of large amounts of new United States government securities. Of 1941's total, United States corporation bonds amounted to (end of December) $16,861,810,000 par value, with a market value of $12,689,815,000; foreign company bonds with a par value of $897,654,000 and a market value of $689,506,000; United States government bonds (inclusive of corporations and subdivisions) with a par value of $38,217,692,000 and a market value of $40,567,112,000; and foreign governments (inclusive of subdivisions) with a par value of $2,882,000,000 and a market value of $1,305,000,000. The

total listed bonds of United States corporations were distributed over 895 issues with 448 issuers; of United States government with 77 issues and 7 issuers; and foreign governments with 197 issues and 80 issuers. Total bonds traded on the New York Stock exchange during 1941 amounted to $2,114,098,550, as compared with $1,671,598,875 during 1940 (the *New York Times* report) and about $2,048,000,000 for 1939.

Stock Exchanges.—During 1941 the New York Stock exchange not only made a considerable number of important changes in its rules, but also began consideration of a number of important prospective changes in policy. The most important of these actions may be grouped under five main headings:

Changes With Respect to Current Business Practices.—Effective Feb. 24, the committee on member firms of the New York Stock exchange announced that "approvals of member and member firm participation in secondary distributions would be announced on the stock ticker, and that such approvals would be conditional upon the distributor or syndicate manager keeping his books open for at least one-half hour after the announcement, in order to receive member and member firm applications for participation." On Jan. 4, a special committee on hours for business was appointed to report on this subject. Said report was accepted by the board of governors on Feb. 13, and the recommendation was to the effect that there be no change in the hours of business of the New York Stock exchange.

Proposed Legislative Changes.—On Feb. 12, a hearing was held before the ways and means committee of the New York assembly in the interest of a reduction in transfer taxes on exchange transactions. William McC. Martin, Jr., president of the exchange, appealed for a reduction of the New York state transfer tax and elimination of existing double taxation on odd-lot transactions. According to his testimony, "fully 88% of the shares listed on the New York Stock exchange are also traded on one or more of the out-of-town exchanges, where no tax is imposed upon the sale or transfer of stocks or where the taxes are moderate in comparison to those exacted by New York state."

Mention should also be made of the transmission by the department of stock list of the New York Stock exchange (July 10) to presidents of listed corporations of a letter from the American Institute of Accountants "outlining the procedure which, in its opinion, should be adopted in the interests of full and clear disclosure of federal tax provisions." This matter had previously been called to the attention of listed corporations by the department of stock list, which had already given its endorsement to the recommended procedure.

Various amendments were also offered to revise the Securities Exchange act. On April 14, Rep. James W. Wadsworth of New York offered amendments to the five acts administered by the SEC, including "simplification of registration procedure; fair hearings before adoption of rules or regulations; prohibition of publication of charges until proven; redress or appeal against an act of the commission; and amendment of the preamble of the Securities Exchange act to instruct the commission to encourage and foster orderly, active, stable and liquid markets." Again, on Aug. 7, the Securities and Exchange commission and a committee representing the financial industry submitted to the House Committee on Interstate and Foreign Commerce and the Senate Banking and Currency committee, 86 amendments to the securities acts. Of these, 48 related to the Securities act of 1933; 36 to the Securities and Exchange act of 1934; and two to the Federal Bankruptcy act. According to the announcement, the commission and the industry committee agreed upon 55 of the amendments submitted, and disagreed with respect to 31.

Multiple Line Trading.—On Feb. 14, 1940, a special committee of the New York Stock exchange reported in favour of the rigid enforcement of the exchange's constitutional provision prohibiting members of the exchange from dealing on another exchange in securities which are listed on the New York Stock exchange, and this action was approved by the board of governors on Feb. 28, 1940. Later, on April 12, 1940, Gov. Lehman signed the Williamson bill, removing prohibition of a stock exchange from making rules preventing a member from trading with members of other exchanges, thus facilitating the New York Stock exchange's enforcement of a rule against multiple trading privileges. Accordingly, the board of governors of the exchange ruled that, effective Sept. 1, "members and member firms may not act as dealers, odd-lot dealers, or specialists on other exchanges in securities which are listed on the New York Stock exchange, but may continue to accept orders from customers for execution on such other exchanges." The Securities and Exchange commission, however, on Oct. 25, 1940, requested the New York exchange to rescind its ruling, and thereupon the exchange advised that it "would await the SEC report of its investigation, in order to ascertain if any new facts had been developed, before reaching a final decision on the commission's request."

On August 13, 1941, the committee on member firms of the New York Stock exchange granted to all members and member firms temporary exemption from the multiple dealing rule, pending final determination of the proceedings before the SEC. Finally, on Oct. 4, the SEC announced the findings and opinion of the commission with respect to multiple dealing, and ordered the exchange "to amend its constitution, effective Oct. 6, to make clear that members of the exchange would not be prevented from acting as odd-lot dealers or specialists upon regional exchanges in securities listed on the New York Stock exchange." Following this order, on Oct. 27, the president of the exchange announced that the exchange had determined not to file a petition for a court review of the order.

Changes in Commission Charges and Differentials.—Two actions are important in this respect. One, on July 10, provides that, effective July 14, the Association of Bond Brokers of the New York Stock exchange reduce commission and clearing charges by 50% for United States government bonds and New York city corporate stock. The other, approved Nov. 3, provides that, effective Nov. 10, "the odd-lot differential on stocks selling at less than $1 and more than ⅛th would be increased from 1/16th to ⅛th. For stocks selling at ⅛th or less, the differential would be half the selling price." According to explanation by the odd-lot dealers of the exchange, the aforementioned change was made in order to cover their expenses.

Reorganization of the Government of the Exchange.—On March 5, at a general meeting of the members, the president of the New York exchange suggested that "the reorganization of the exchange be further extended by a reduction in the board of governors from 32 to 16 members; that the seven standing committees be reduced to three by elimination of the executive, member firms, public relations and stock list committees; and that the work of the eliminated committees be administered by a paid staff." This suggestion was approved by the board of governors on March 12, and the president was authorized to appoint a special committee to prepare amendments to the constitution for improving the government of the exchange.

The aforementioned amendments were submitted on July 23, were approved by the membership on Aug. 6, and were slated to become effective Sept. 30. They provided that the board of governors be reduced from 32 to 25; that all standing committees be abolished; that the rule-making powers of the committees be transferred to the board of governors; and that the election of the nominating committee be held at the same time as the election of governors. The broad objectives of the change, according to the announcement, were "to establish the board of governors as the exchange's sole policy-making body; to centralize administrative authority in the president; and to provide the constitutional framework for a competent, responsible and representative government of the exchange." On Sept. 22 announcement was also made of the reorganization plans of the Association of Stock Exchange Firms, "designed to convert the association into a dynamic and vigorous trade body of national scope." The plan, as announced, was approved by the association's membership on Oct. 7.

Financial Record of the New York Stock Exchange.—On Feb. 25, 1941, the annual financial report of the New York exchange and affiliated companies, for the year ending Dec. 31, 1940, was submitted to the members, showing a net loss for the year, after depreciation, of $981,348, compared with $1,149,373 in 1939. Data submitted to the SEC (Sept. 18) disclosed that member firms of the exchange made a small profit on all types of operations during the first half of 1941. According to press accounts, however, "firms receiving their income mainly from security commissions suffered a loss, while firms that received more of their income from noncommission activities showed a profit. The average return on capital invested in member firms was estimated at 3.2%." This meagre return is probably typical of all the other exchanges, and shows the state of retrogression in U.S. speculative security markets as compared with the prosperity of the late '20s. All through the year 1941 the price of New York Stock exchange seats was exceptionally low, the latest quotation being only $25,000.

Mention should also be made of an amendment to the constitution of the New York Stock exchange, retroactive to Jan. 1, 1941, which would apply the principal of the gratuity fund reserve in excess of $500,000 in reduction of amounts payable by members upon the deaths of other members. On Dec. 31, 1941, the net worth of the gratuity fund was $1,927,824, and this amendment, it was estimated, would relieve members of gratuity contributions for four or five years. Legal approval of the amendment was secured from the court of appeals of New York state on Dec. 5.

(S. S. H.)

Stolz, Joseph (1861–1941), U.S. dean of reform rabbis of America, was born Nov. 3 in Syracuse, N.Y. He was graduated from the University of Cincinnati in 1883 and the following year completed his theological studies at the Cincinnati Hebrew Union college. Reverend Stolz was a member of the Chicago school board from 1899 to 1905, a member of the Chicago Crime commission, organized many Jewish charities in Chicago, and aided in their unification. He served as president of

the Central Conference of American Rabbis, and as president of the Chicago Rabbinical association. He was a rabbi in Chicago congregations from 1887 until his retirement in 1927. He died in Chicago, Feb. 7.

Stomach Disorders: *see* ALIMENTARY SYSTEM, DISORDERS OF.

Stone, Harlan Fiske (1872–), U.S. jurist, was born Oct. 11 in Chesterfield, N.H. He worked his way through Amherst college, where he was an honour student, receiving the degree of B.S. in 1894 and M.A. in 1897. He then worked his way through Columbia School of Law by teaching in a Brooklyn academy; he received his law degree in 1898. The same year he was admitted to the New York bar. He was a lecturer and professor of law, and for a time dean, of the law school at Columbia, 1899–1923. On April 7, 1924 he was appointed attorney general of the United States by President Calvin Coolidge. In this position he inaugurated a number of anti-trust proceedings, most notable of which was that against Aluminum Company of America. On March 2, 1925, he became an associate justice of the U.S. supreme court.

On June 12, 1941, President Roosevelt named him chief justice to fill the vacancy created by the retirement of Charles Evans Hughes.

In politics Chief Justice Stone has been regarded as a liberal Republican, having upheld many of the New Deal policies.

Stone. The following table lists the various types of stone produced in the United States, and the division of the total output into dimension stone and crushed stone.

Production of Stone in the United States

(In thousands of short tons or thousands of dollars)

Name of Stone	1939	1940		
	Total	Total	Dimension	Crushed
Basalt	16,091	15,716	22	15,694
Granite	12,041	10,881	658	10,222
Limestone	100,846	112,658	1,082	111,576
Marble	228	240	89	151
Sandstone	8,854	6,498	172	6,327
Others	9,387	7,740	83	7,656
Total	147,447	153,733	2,107	151,626
Value	$158,462	$160,044	$21,417	$138,627

Dimension Stone.—Sales of dimension stone in 1940 were 8% less in quantity and 16% less in value than in 1939. The 1940 distribution by uses was 83% for building construction, 9% for monumental work, 3% for flagging and 5% for curbing and paving blocks. Beside the tonnage listed above, there were 154,450 tons of slate sold as dimension stone in 1940.

Crushed Stone.—Sales of crushed stone in 1940 improved by 4% over 1939 in both quantity and value. Concrete and road metal took 61%, metallurgical and refractory used 16%, agricultural used 6% (all limestone), railroad ballast 5%, and riprap 3%, while various industrial processes (alkalies, carbide, glass, paper, sugar) took 5% and 4% was unclassified.

Basalt.—The high proportion of crushed stone in the basalt classification is explained by the fact that the chief use for the basalt group (including traprocks) was in highway construction and concrete aggregate.

Granite.—Building construction used 64% of the granite dimension stone sold in 1940, monumental work 26% and curbing and paving blocks 10%; 81% of the crushed stone was for concrete aggregate and road metal, 8% for railroad ballast, 6% for riprap and 5% for other uses.

Limestone.—Of the total dimension stone sales in 1940, more than half was limestone, all but 1% building stone. Concrete aggregate and road metal took 55% of the crushed limestone, metallurgical flux 20%, agriculture 8%, railroad ballast 5%, riprap 3% and other uses 10%. The figures above do not include 33,986,000 tons of limestone quarried for the production of portland cement, nor 9,774,000 tons used in the manufacture of lime.

Marble.—Dimension stone in 1940 was divided 73% for building construction and 27% for monumental stone; crushed marble is mainly made from defective material or waste from the production of dimension stone.

Sandstone.—Dimension sandstone in 1940 was mainly used for building construction, this accounting for 59%, while 27% went to flagging, and 14% for curbing and paving blocks. Concrete and road metal took 53% of the crushed sandstone, refractory uses 13%, riprap 5%, railroad ballast 3%, with 25% unclassified.

Other Stones.—The list of stones other than those listed that are used to some extent is quite large, but the aggregate amount is comparatively small. The dimension stone is mainly for building construction, and the crushed stone for concrete. (G. A. Ro.)

Stonehaven, John Lawrence Baird, 1ST VISCOUNT, OF URY (1874–1941), British statesman, was born April 27. He was educated at Eton and Christ Church, Oxford, and he entered the diplomatic service in 1896, serving in minor posts in Vienna, Paris, Cairo, Buenos Aires and Addis Ababa. He sat in commons from 1910 to 1925 as a member of the Coalition Unionists. He was parliamentary undersecretary of state for the home office, 1919–22, and minister of transport and first commissioner of works, 1922–24. He was created a baron in 1925 and in the same year became governor general and commander-in-chief of Australia, a post he held until 1930. Baron Stonehaven was chairman of the Conservative party organization, 1931–36 and was made a viscount in 1938. He died at his home in Stonehaven, Kincardineshire, Aug. 20.

Straits Settlements. One of the large subdivisions of British Malaya, the others being the Federated and Unfederated Malay States (*qq.v.*). It is administered by a governor with an advisory council. Governor in 1941 (appointed in 1934): Sir Thomas Shenton Whitelegge Thomas. The seat of administration is Singapore (*q.v.*). Area, 1,356 sq. mi.; pop. (June 30, 1940) 1,406,120. The Chinese are the most numerous element in the population, with Malays second and Indians third. The Straits Settlements include the two chief ports and transhipment centres of British Malaya—Singapore and Penang. The administrative subdivisions are: Singapore island, Penang island, Province Wellesley, Malacca, Labuan, Pangkor, Christmas island and the Cocos islands.

Penang island and Province Wellesley were rapidly overrun when the Japanese invaded Malaya in force in Dec. 1941.

Education.—There were 417 schools in 1941 (60 in the English language) in the Straits Settlements and two institutions of higher education, Raffles college and King Edward VII College of Medicine, both at Singapore.

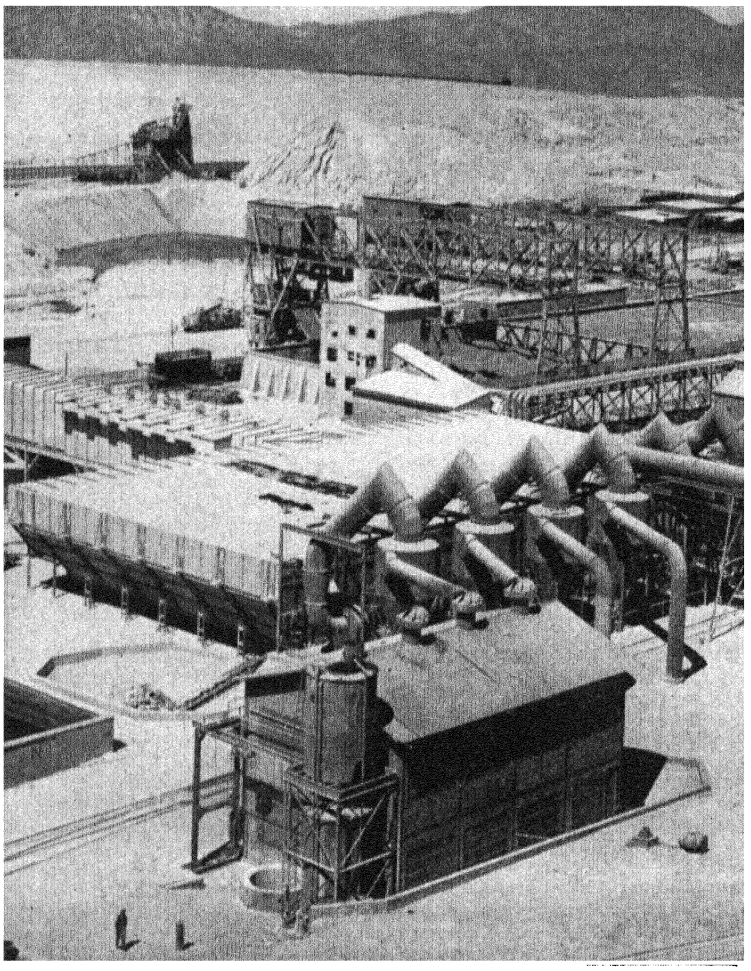
Finance.—The estimates for 1941 called for a revenue of £5,400,977 and expenditures of £6,684,081. There was a long-term public debt of 30,000,000 Straits dollars. The unit of currency is the Straits dollar (47.51 cents U.S. in 1941).

Trade.—The foreign trade of Malaya in 1939 was £72,406,000 of imports and £85,923,000 of exports, rubber and tin being the principal exports.

Communication.—There were 1,067 mi. of metalled and 138 mi. of gravel roads in the Straits Settlements at the end of 1939. There were 3,581 mi. of telegraph and telephone lines. (W. H. CH.)

Strategic Mineral Supplies. Although such a procedure has been advocated for some 15 years, it was not until midyear of 1939 that congress finally embarked on a program of purchasing and storing supplies of strategic materials. However, this program was started too late and on too small a scale to have accomplished much before the outbreak of World War II in September 1939 caused so much disorganization in the markets, and such a shortage of shipping facilities as to make further progress slow and difficult. By midyear of 1940 it had become so evident that more speed must be made that the Metals Reserve company, a subsidiary of the Reconstruction Finance corporation (*q.v.*), was established as a buying agency for mineral and metal supplies. From published reports of this agency it appeared that up to Oct. 22, 1941 orders had been placed for materials aggregating close to 7,250,000 tons, valued at more than $1,000,000,000, and that delivery had already been made on over a million tons.

With purchases of many imported materials hampered by war conditions, the speeding up of industry incident to the defense program inaugurated by the United States caused some shortages to appear, and when lend-lease aid was superposed on the defense program the impending shortages became more acute. Then as time went by it became apparent that the original plans had not anticipated the enormous amounts of mineral and metal products required by a modern program of mechanized warfare, and successive upward revisions had to be made in the requirements



THE U.S.-OWNED COPPER DEPOSITS at Chuquicamata, Chile, largest in the world, were worked ceaselessly in 1941 as military demands increased for the strategic metal

schedules. Finally, on top of all this, on Dec. 7, 1941, the attack by Japan brought the United States in as an active participant of the war on her own account, and naturally this was expected further to accentuate the demands that must be filled, and increase the shortages that were already becoming manifest.

These increased demands became so great through the successive stages of development that not only had special attention been required to maintain the supplies of the so-called strategic minerals, but there were created shortages in such common metals as steel, copper, lead and zinc, the supply of which had not been expected to cause any serious difficulty. A curious feature of this situation was that of the entire metal list, the ones of which the supply is best maintained were mercury and antimony, both of which were on the strategic list since it was first established. However, it had not been definitely established that some of the shortages might not have been caused, or at least intensified, by overbuying on the part of some who had been trying to protect their own future supplies at the expense of others who could not secure their due share. In any case, the United States was faced in 1941 with a situation far worse than anything that had been considered possible, and price control, priorities, rationing and substitution were being called upon to help in the solution of the difficulty.

Axis Supply.—All of the axis powers were lacking in many more of the essential mineral products than the Allies. In one short month of action Japan not only deprived the United States of manganese and chromite from the Philippines, tungsten and antimony from China, and tin and petroleum from Malaya and Netherlands East Indies, to mention only a few of the major items, but actively threatened to gain control of these areas with the advantage of access to these supplies for her own use. Of these two points, the latter was far more important, for the United States could better afford to do without these things than it could afford to see the enemy gain the use of them. In the course of four years of conquest, two without war and two with war, Germany succeeded in supplying most of her really pressing shortages from the countries that were occupied. Chief among those supplies still troublesome were petroleum, manganese, nickel, chromium and tungsten. Considering the rate of progress, most of the real improvement was made in the first year of the war, and in view of the wider area covered, as compared with the resources acquired with them, the position at the end of the second year of war showed a relatively lower degree of sufficiency for the axis than at the end of the first year. (G. A. Ro.)

Strikes and Lock-outs.

The United States, Canada and Great Britain publish current statistics of strikes and lock-outs, their causes and results, together with detailed reports upon the more important strikes of each year. Most of the other nations report them less regularly;

Table I.—*Number of Strikes, Workers Involved, and Man-Days Lost, 1935—December 1941

Monthly Labor Review, United States Bureau of Labor Statistics (Dec. 1941)

Year and month	Number of strikes			Workers involved in strikes		Man-days idle during month or year

*Strikes involving fewer than 6 workers or lasting less than 1 day are not included in this table nor in the following tables. Notices or leads regarding strikes are obtained by the Bureau from more than 650 daily papers, labour papers, and trade journals, as well as from all government labour boards. Letters were written to representatives of parties in the disputes asking for detailed and authentic information. Since answers to some of these letters had not been received, the figures given for the late months are not final. This is particularly true with regard to figures from September on and these should be considered as preliminary estimates.

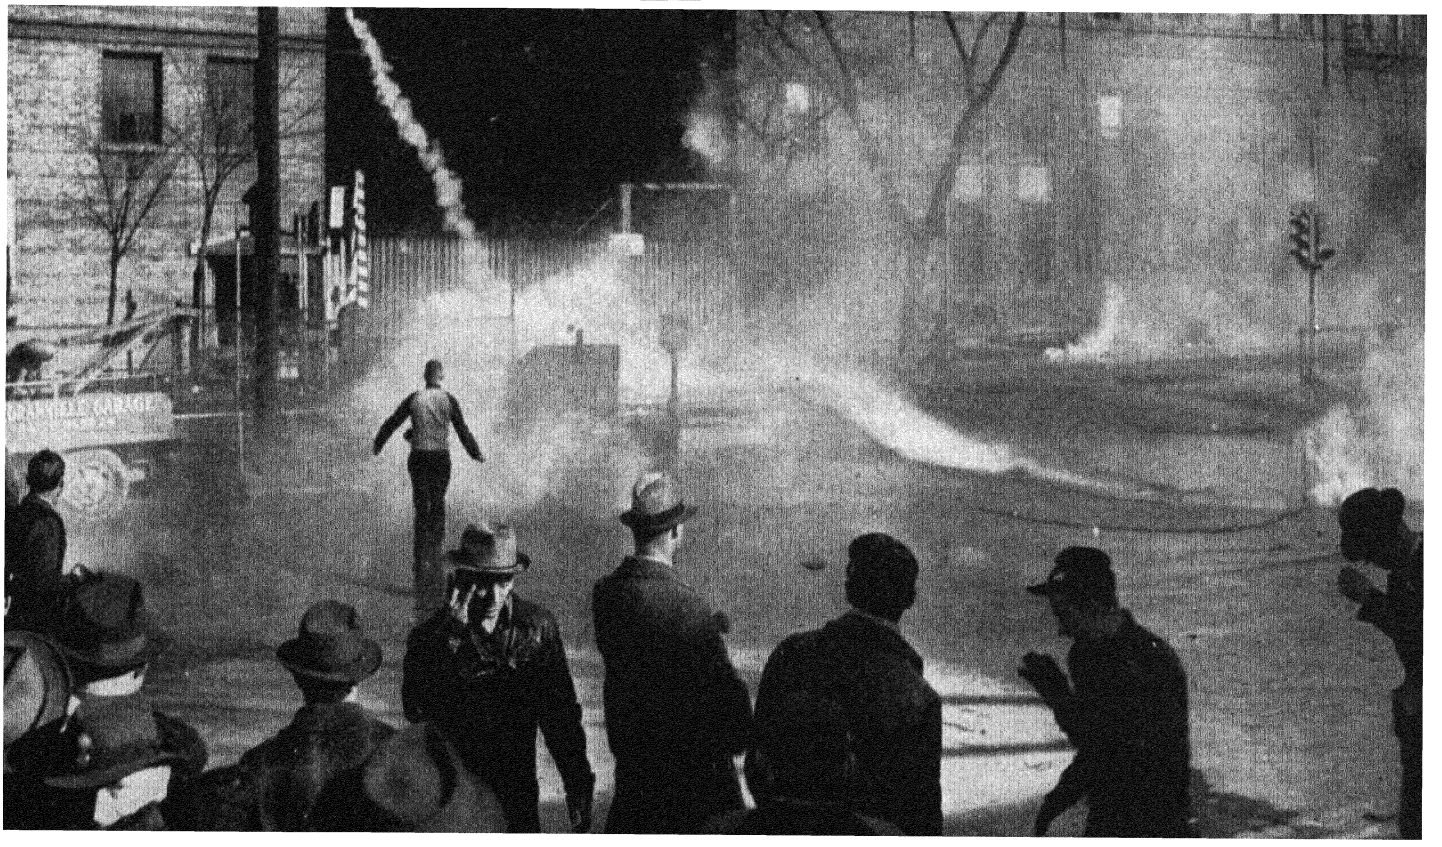
Centre, left: U.S. ARMY REGULARS were summoned by President Roosevelt June 9, 1941 to open the North American Aviation plant at Inglewood, Calif. after a "wildcat" strike had stopped work on large orders for military aircraft

Below: TEAR-GAS BATTLE at the main gate of the Allis-Chalmers plant in Milwaukee, closed by strike from January 22 to April 8, 1941



some not at all. The Canadian department of labour published a report on strikes throughout the world in the *Labour Gazette*, March 1937.

The political situation in Germany, Italy, Russia and Japan made it "inadvisable" for wage earners to undertake strikes. The European war added Czechoslovakia, Poland, France, Norway, Denmark, the Low Countries, Bulgaria, Rumania, Greece, Finland, to the area in which strikes would be ruthlessly suppressed.

The year 1940 saw less strike activity in the United States than in 1939 but a definite increase in the number of strikes toward the end of the year which continued on into 1941, when strike activity was much greater than in either 1939 or 1940. There were 4,223 strikes started during 1941, compared with 2,613 in 1939 and 2,508 in 1940.

In 1939 there was a loss of 17,812,219 man-days, in 1940 only 6,700,872, and in 1941, 22,571,388. During 1937 the loss of man-days was 28,424,857. The maximum loss of man-days in any month of 1941 was 7,099,392 in April. The next largest month was 4,876,744 in April 1939.

Table I on page 628 shows for the United States the number of strikes, workers involved and days lost, 1935–41. The year 1937 was still the record year in number of strikes since 1917. The number of strikes began to increase in 1933 and rose steadily through 1937. The number declined steadily through 1940 and increased again in 1941.

The monthly reports on strikes issued by the U.S. bureau of labour statistics indicated that close to one-half of the strikes of 1941 involved some question of union recognition, with wages the other major issue. This distribution was characteristic of 1937 through 1941. Tables IV and V show the causes of British disputes and their results. Two contrasts with the U.S. situation stand out—in Table IV the absence of "union recognition" unless included in "questions involving trade union principles," and in Table V the large percentage of the strikes which ended definitely in favour of the employers.

Canada had only 192 strikes in 1940 involving 63,469 workers and but 259 involving 97,779 employees in 1941. (*See* also DEFENSE MEDIATION BOARD, NATIONAL; DEFENSE, NATIONAL [U.S.]: *Labour;* NATIONAL LABOR RELATIONS BOARD; NEWSPAPERS AND MAGAZINES; UNITED STATES: *Labour Problems.*)

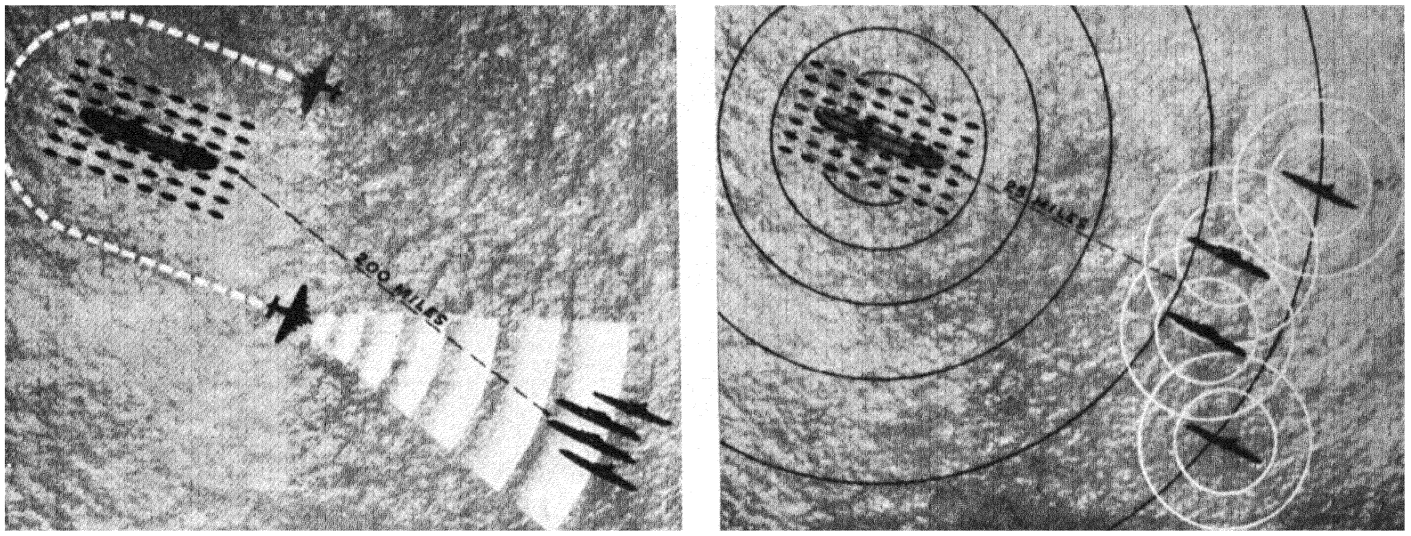
Strontium. World production of strontium ores is small, usually under 10,000 tons annually. The United States had been importing 2,700–2,800 short tons annually, mostly celestite (strontium sulphate) from England, and 250–350 tons of strontium chemicals from Germany, produced from local deposits of strontianite (strontium carbonate). Access to German sources for chemicals was entirely cut off by the war, and production from domestic deposits was begun in 1940, and both strontium metal and chemicals were being produced from domestic ore.

(G. A. Ro.)

Stuart, James Everett (1852–1941), U.S. painter, was born March 24 in Maine. He discovered a process of painting on aluminum sheets by which the pigments could be made to attach themselves to and become part of the metal painted. His earliest sketches of the Sacramento and San Joaquin rivers in California date from 1861. These he later developed into pictures showing the natural beauty of California in early days. The scenes of his landscapes range from Alaska to the Panama canal and from Maine to California. Five of his paintings on aluminum, four of them "Sunset Glows" and the fifth "Raspberries," sold for $15,000 each. He died Jan. 1, in San Francisco.

Submarine Warfare. **The War on Shipping.**—During the three months of warfare in 1939



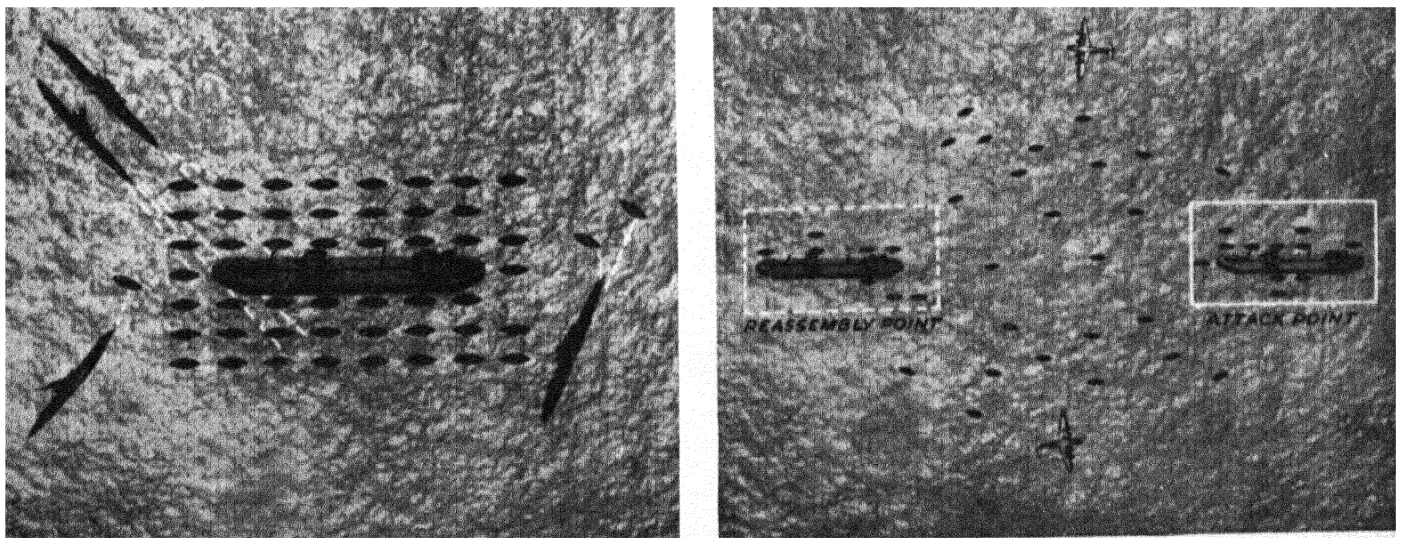
TYPICAL SUBMARINE ATTACK upon a British merchant convoy. (Left) A German scouting plane spots the convoy and radios the size and location to a central base which relays the information to submarines in the vicinity (in this case 200 mi. distant). The submarines ordinarily travel three or four together. (Right) Moving below the surface by day and travelling at top speed on the surface at night, the submarines trail the convoy. They can pick up the sound of the ships' engines long before their own motors are detected

the total loss of merchant shipping owned by and available to the Allies was admitted to be 781,000 tons.[1] It was estimated that the total loss of Allied and neutral shipping during 1940 was 3,548,500 tons; the British admiralty later closely confirmed this with an official figure of 3,519,048 tons. Experience since 1939 had demonstrated that official figures released by the admiralty on this subject were correct although there was usually a considerable time lag before the revised and verified figures were made available. German claims were highly exaggerated, so much so that one would not go far astray if nazi figures on merchant sinkings were divided in half to obtain a close estimate of the truth. It seemed advisable, therefore, in estimating the shipping losses of the Allies during 1941 to rely on British official admissions as far as possible, and to estimate from pertinent statements by the prime minister and the admiralty for months for which no figures were given. Other estimates that came to the attention of this writer usually had been made from press reports of known sinkings and were generally incomplete and misleading.

During the year 1941 the veil of secrecy was drawn over merchant shipping losses by the admiralty, although an occasional glimpse behind the veil was vouchsafed. In April British officialdom announced that thereafter losses would be given out monthly instead of weekly, and after June even monthly figures were discontinued. After that time statements of losses were in very general terms, though affording a hint of the truth. Based on available information, the table of losses on p. 632 is presented.

The dawn of 1941 was dark. Mounting losses of merchant shipping caused largely by the quickened tempo of submarine warfare during the closing months of 1940, forewarned of critical losses ahead. It appeared that the Battle of the Atlantic was the crucial one for Britain and that sinkings would reach a figure beyond all possibility of replacement. That the most deadly foe was the U-boat was verified by the nazi Admiral Raeder's announcement that two-thirds of all sinkings were by submarine action, and the British took such steps as were possible to forestall the spring drive. Heavy air raids on submarine bases on the Norwegian and French coasts and on submarine building yards were continued; the shipbuilding program was further accelerated, even the president of the United States calling for a speed-up in American construction. The new type of escort and anti-submarine vessel, the small corvette, began to prove its worth and more

[1]All assertions or opinions contained in this article are the private ones of the writer and are not to be construed as official or reflecting the views of the U.S. navy department or of the naval service at large.



(Left) Fanning out, the submarines pounce at night from different angles. Two fire torpedoes diagonally through the convoy, thus lessening the probability of misses, while a third engages an armed merchantman and the fourth concentrates on stragglers. All then turn about, fire torpedoes from their rear tubes and flee before destroyers can overtake them. (Right) After the attack has passed, the ships reassemble under the direction of British planes

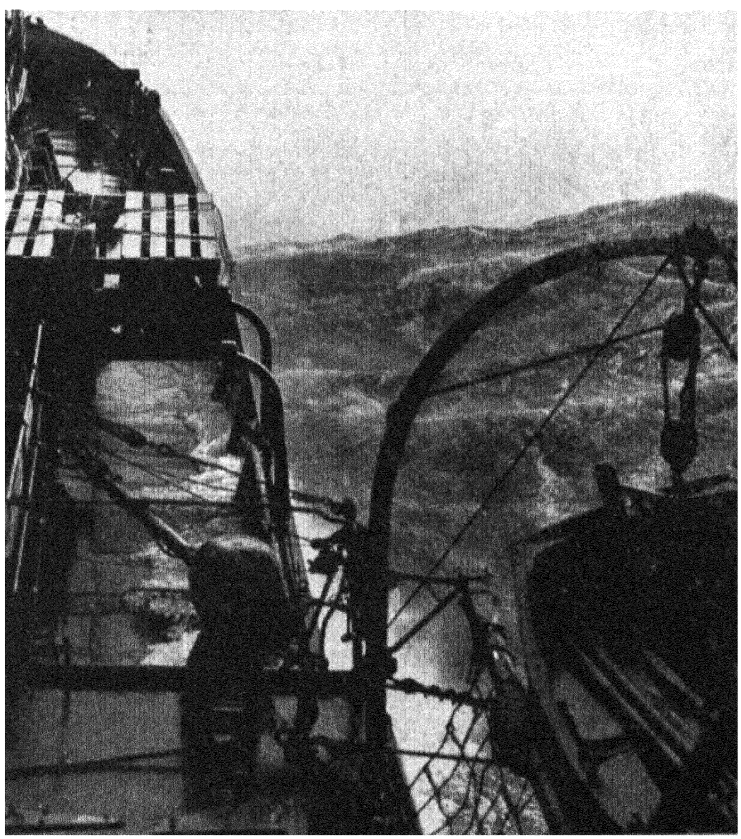
were placed on the building ways. In spite of these remedies January losses were nearly 500,000 usable tons, more than in any previous month.

In February losses were somewhat less, 340,000 tons, and a further reduction to 307,500 tons occurred in March. Tempestuous seas and thick weather undoubtedly were responsible for this falling-off, and pessimism still reigned. Statements from neutral sources that the nazis had ready for the spring campaign about 600 submarines, 300 of which would be on the hunt at a time, were alarming; Hitler himself threatened publicly that Britain "will find out whether we slept through the winter—new types of submarines are going to be brought into the expanded warfare." On top of this the addition of 12 Danish submarines to the German flotillas caused scarcely a ripple. In mid-March the British high command recognized the gravity of the situation by creating an overlord of the Atlantic; the experienced Admiral Sir Percy Noble was named as commander in chief of the western approaches to Britain. In late March it became apparent that U-boats were extending their sphere of action; attacks were reported within 1,500 mi. of New York and off the western bulge of Africa, and Germany extended the submarine war zone to within three miles of Greenland.

April lived up to its advance notices; losses mounted to the greatest monthly toll yet taken, 589,500 tons of Allied and neutral merchantmen, but nearly 200,000 tons of this was lost by bombing in Greek waters while evacuating the retreating British expeditionary force. But this huge total was still well below the heaviest monthly loss in World War I 834,000 in April 1917. Further steps were now taken to combat the underseas menace. In the most intensive raid up to Jan. 1, 1942, hundreds of tons of explosives and 30,000 incendiaries were dropped on the submarine building yards at Kiel. Ten United States coast guard cutters, splendidly equipped as escort vessels, were turned over to the Royal navy. President Roosevelt extended the United States navy's patrol of the seas "as far as necessary for defense of the western hemisphere"; this meant that British escort vessels could largely be dispensed with in the western Atlantic, permitting concentration in the vital area between Eire and Iceland. There was further reason for optimism in the fact that a breakdown of late losses showed that barely 40% were due to submarine attacks—aircraft, mines and surface warships accounting for the rest.

During May and June wolf-packs of U-boats were very active and their toll was heavy. But even in June it became apparent that the new United States policy of all-out aid was beginning to be effective. U.S. navy ships and aircraft were now searching out, trailing and reporting axis craft in the western reaches of the Atlantic and that this was having a telling effect

THE CORVETTE, here shown riding a rough sea, was one British answer to the submarine menace in 1941. These small 1,100-ton ships, designed for convoy duty, can be built in a third of the time required to complete a destroyer



Allied and Usable Neutral Tonnage Losses

1939 Total Losses	781,000
1940 Total Losses	3,519,000

1941	Monthly Average	Grand Total
January	488,000*	4,788,000
February	340,000*	5,128,000
March	307,500*	5,435,500
April	589,500*	6,025,000
May	658,000†	6,683,000
June	420,000†	7,104,000
July	250,000‡	7,354,000
August	200,000‡	7,554,000
September	150,000‡	7,704,000
October	150,000‡	7,854,000
November	125,000§	7,979,000
December	250,000¶	8,229,000
Total for 1941		3,708,000
Grand Total for War		8,229,000

*Figures from British admiralty and ministry of information.
†These figures have been adjusted to meet the admiralty total through June of 7,103,980 tons.
‡Churchill stated total losses July–October inclusive less than 750,000 tons.
§Admiralty said November loss was lowest since the fall of France.
¶Includes probable Allied losses to Japan in the Pacific.

was indicated by Admiral Raeder's bitter complaint that these patrols were "aggressive" and his violent warning against American participation in convoying. June saw the loss of the first United States merchantman, the "Robin Moor," torpedoed in the South Atlantic; this treacherous act was soon followed by others of like nature, and these served only to strengthen the American resolve to assist in all measures short of war to eradicate the U-boat from the seas.

The crest of the submarine wave was reached during the second quarter; in succeeding months losses fell off sharply and in mid-November Prime Minister Churchill averred that during the four months, July through October, the total loss was less than 750,000 tons. This astonishing improvement must be laid to the following factors: (a) the increase in aid lent by United States naval forces in patrolling and escorting as far as Iceland; (b) the entrance of Russia and the consequent withdrawal of strong nazi air squadrons from the Atlantic to the eastern front; (c) the recall of U-boats from the Atlantic for use in the Gulf of Finland and the Barents sea; (d) more and heavier air raids on submarine bases and building yards; (e) increased numbers of corvettes for escorting convoys; (f) faster and better constructed merchantmen in service; (g) the growing use of auxiliary aircraft carriers with convoys; (h) increased flying patrols around the United Kingdom.

Whatever the reasons, it appeared that the submarine threat was definitely on the wane. Even nazi sources admitted that July sinkings were nearly 50% less than in June, and the bettered conditions were further reflected by an increase in the British food ration and the substantial reduction of certain marine insurance rates. So improved was the situation that in late November the ever-candid Winston Churchill was moved to announce, "We are once again masters of our destiny."

Still better, London declared that the losses for November were the lightest since the fall of France—probably less than 100,000 tons; this was an early report, and since later returns always swell the initial figure, it was considered that 125,000 tons was a safe estimate for this month. No report of losses for December were given out by Jan. 1, 1942, but such data as were available indicated no great increase over November in the Atlantic. A new factor, however, now influenced the over-all picture the declaration of war on Britain and the United States by Japan. Nipponese submarines immediately became active on Pacific trade routes, sinking vesssels even within sight of the California coast. From this cause and by the seizure, as claimed by the Japanese, of 200 British and American bottoms in the Orient, total losses were undoubtedly swollen far beyond the November figure. December tonnage losses, by submarine and otherwise, were estimated at 250,000 tons.

Throughout the year Britain, with the ever-increasing aid of the United States, made valiant efforts to offset shipping losses with new construction. Since the United Kingdom already was near top production, it early was apparent that increased losses must be met by American shipyards, and this was impressed upon builders as early as January by President Roosevelt. (*See* SHIPBUILDING; SHIPPING, MERCHANT MARINE.) The augmented program had not only to replace actual sinkings but to make up for merchantmen so damaged as to be temporarily out of service (estimated at times to be as much as 1,000,000 tons) and for the retardation in their turnaround due to slow convoys and bombed terminal facilities. On the last day of March the United States added to the pool by taking over 28 Italian, 36 Danish and 2 German vessels interned in its ports. In April it was authoritatively announced that combined British-American building amounted to 2,000,000 tons a year, only a fraction of that necessary to offset losses. In June the United States took over British shipping routes in the Pacific, thereby releasing more British merchantmen for the North Atlantic lifeline; this stopgap was insignificant in view of the July announcement of Admiral Land of the U.S. Maritime commission that in 1941 the United States would produce 134 new ships and 574 in 1942, a total of about 6,000,000 tons. In October Admiral Land again committed himself to the effect that American ship construction had now caught up with losses. The law permitting the arming of United States merchantmen, as passed in November, was expected also to act to decrease sinkings. The last shipbuilding report of the year, in December, stated that the British alone were producing 80,000 new tons a month but, although every sinew was being strained by the democracies, this was still only a fraction of that necessary.

In World War I the war against shipping was distinctly one-sided, but in 1941 it proved to be a game at which two could play. The axis powers, in addition to their Mediterranean lines of communication, acquired by

conquest a long Atlantic coastline, and the overtaxing of railroad facilities made it necessary to augment land communications with a considerable amount of sea transport. Britain was not slow to take advantage of this situation. Submarines and aircraft were launched against these lines with considerable success, and British, Greek, Dutch and even Yugoslav submarines were on the hunt for essential axis supplies in the Mediterranean with troopships as their choicest tidbits. That the toll of these campaigns was felt was indicated by the fact that in April Germany found it necessary to requisition 53 Vichy-French ships to replenish losses. In June the British minister of economic warfare said that losses of enemy bottoms amounted to 3,000,000 tons and that the axis faced a shipping crisis. Prime Minister Churchill in November stated that during the preceding four months 1,000,000 tons of enemy shipping had been sunk or severely damaged. With the new Allied attack on Libya in mid-November the Italy-Africa lines came under still more vigorous attack. No year-end figures of axis losses were available but, with due allowance for exaggerated claims, it seemed reasonable to assume that the dead loss was certainly in excess of 1,000,000 tons.

In summary, the war on shipping was deadly serious. Its toll equalled or exceeded that exacted in 1940 and the rate of replacement of merchant tonnage was as yet not nearly adequate. But there was reason for real optimism. Losses in the Atlantic were definitely on the decline and, if American aid was not diverted in too large quantities to the Pacific, it appeared that the Battle of the Atlantic was well on its way to being won. Victory in the northern sea lanes meant, however, not ultimate victory but the survival of Britain. It was but a necessary prelude to ultimate victory.

Submarines in Naval Actions.— During 1941 both axis and Allied submarines took as their main objective their enemy's supply lines. Naval actions played a minor and incidental role and resulted in most cases only when an enemy warship chanced to come into the field of vision of a periscope which was primarily searching out merchantmen. In 1940 Britain expended considerable submarine effort in blockading axis ports and in hunting submarines with submarines. While it was probable that these activities were still practised to some extent, it became increasingly evident during 1941 that the admiralty realized greater damage could be inflicted by harassing the enemy's vital lines of communication. There were no real naval actions in which submarines played a part in co-operation with surface warships, although there were many isolated attacks on men-of-war, troopships and naval auxiliary vessels.

Early in January the British "Thunderbolt," which was the reconditioned and rechristened ill-fated "Thetis," claimed the sinking of an Italian submarine. A few days later the British "Tuna" engaged in a surface gun duel with a U-boat and claimed serious damage. In March the admiralty announced the sinking by submarine action of an Italian cruiser of the "Condottiera" class, while under escort of two destroyers. Late the same month Germany stated that U-boats were working in co-operation with the battleships "Scharnhorst" and "Gneisenau" in a new raiding technique; this seemed to be the one case of the year of co-ordinated submerged and surface attacks, but as it was aimed at the shipping lanes it could scarcely be termed a naval action. Since the nazis claimed the sinking of only 30,000 tons, it was certainly not a great triumph.

In April the British admitted that the light cruiser "Bonaventure" had been sunk by a U-boat while on escort duty. Later this month during the brief fighting in Yugoslavia occurred, not strictly a naval action, but one of the most daring submarine exploits of the war. The British submarine "Regent," dodging minefields and with the White Ensign flying, put into the Yugoslav port of Cattaro in search of the fugitive British minister to Belgrade. Capturing an Italian officer and holding him as hostage, the commanding officer sent his mate ashore to search the city. Finally discovered by aircraft, he was heavily bombed but fought off his attackers for some time. After nine hours he was forced to submerge and pick his way to the open sea without having accomplished his mission.

In late June the neutral Turkish ship "Refah," transporting naval personnel, was torpedoed and sunk close to Turkish territorial waters. While the assailant was not positively identified there existed strong reasons to believe it was Italian. In early July the admiralty claimed that a British submarine had sunk an Italian heavy cruiser, probably the "Gorizia," as well as three anti-submarine craft; this was vehemently denied by the fascist high command. Late that month the nazis asserted the U-boat sinking of a British destroyer and corvette on convoy duty. Early in August the British claimed the torpedoing of an Italian light cruiser and a floating drydock by their submarines, but failed to verify that these had been sunk. Germany in late August again claimed the submarine sinking of a destroyer and a corvette while acting as convoy escorts, and Britain countered with an assertion, unverified, that a fascist submarine had been sunk by a British submersible.

In September the British light cruiser "Hermione" reputedly chanced upon an Italian submarine on the surface, rammed it and cut it in half; fascist headquarters retaliated with the assertion that the unfortunate submarine must have been British rather than Italian. About the same time Germany stated that 65 Russian transports and 27 warships had been sunk in the Finnish gulf during the preceding week, probably by aircraft and submarines combined; the types of warships were not mentioned, which led to the belief that no major units were lost. Soon after this the soviet high command announced the capture of a U-boat in the Barents sea, and London followed up with a report of the capture of another by a bombing plane assisted by destroyers. The month ended with a British statement that during September their own and Dutch submarines had destroyed, besides numerous merchantmen, two Italian destroyers.

Early in November the admiralty admitted the loss of the destroyer "Cossack," of "Altmark" fame, probably by submarine attack. But the outstanding submarine naval achievement of the year came later in the month when the hitherto unsinkable aircraft carrier "Ark Royal" met its fate at the hands of a U-boat within a few miles of the safety of Gibraltar. Berlin also claimed that the newly repaired battleship "Malaya" was struck in the same attack and severely crippled, and it appears probable that U-boats were lurking in the vicinity for the particular purpose of intercepting these ships. The admiralty denied any serious damage to the "Malaya."

Following this blow and until the end of November submarine actions were plentiful. Britain asserted that two cruisers, one destroyer and several supply ships had been eliminated from the diminishing Italian navy by submarine and aircraft torpedoes; the Canadian navy minister reported that two Canadian corvettes had engaged and sunk a U-boat; Berlin claimed that a U-boat, probably operating from a Greek base, had torpedoed a British battleship at Salum on the Egyptian frontier; the Royal navy submarines "Tigris" and "Trident," operating in the Barents sea, reputedly sank at least eight strongly protected German transports and supply ships en route to Murmansk.

In early December a British submarine was reported to have attacked three Italian cruisers in the central Mediterranean, and one was believed to be sunk; shortly thereafter the remaining cruisers were subjected to a fatal attack by British and Dutch destroyers which were probably directed to their prey by the submarine. In mid-December the admiralty announced the loss of the light cruiser "Dunedin" in the Atlantic, by U-boat action, and at about the same time the cruiser "Galatea," near Alexandria, was struck by three submarine torpedoes and sank immediately. A week later the nazi high command announced the sinking of a British aircraft carrier in the Atlantic by a U-boat, but there had been no confirmation of this loss. At the year drew to a close British sources admitted the loss of the destroyer "Stanley" and the auxiliary catapult ship "Audacity" (ex-German "Hannover") in submarine attacks on a North Atlantic convoy.

Soviet Submarines.—The nazi attack on an erstwhile friend, Russia, brought strong new submarine forces into action, but it is doubtful whether they were so placed as to have any immediate effect on the war. The soviet navy had concentrated on building a submarine fleet large in numbers but of unknown capabilities. While definite information was lacking, it was believed that Russia entered the war with between 200 and 300 undersea craft, mostly small types for work in coastal waters. Probably one-third of this fleet was based on Vladivostok, far from the theatre of action, the remainder being divided between the Gulf of Finland, the Black sea and the White sea. No news of soviet submarine actions in the Finnish gulf had passed the rigid censorship but the presence of many nazi warships and troopships in this area during the encirclement of Leningrad presented many opportunities for attacks and it is unlikely that they were entirely missed. The only definite reports from submarines operating from Archangel came in late November when the Russians claimed the sinking of three nazi troopships in the Barents sea. At year's end the Black sea was still closed to the Germans, and soviet submarines there had had no opportunity to prove themselves.

United States Ships Attacked.—Early in the summer began a series of promiscuous attacks on nonbelligerent shipping, especially that flying the United States flag and that which was under the flag of Panama although United States owned. In September these attacks were extended to naval vessels and the United States was brought to the verge of war with the axis powers. On Sept. 4 it was announced that the destroyer "Greer" had been attacked but not hit while trailing a submerged U-boat. A counter-attack was proclaimed as probably successful but, since Berlin stated it had later reports from the submarine, this is doubtful. In mid-October the destroyer "Kearny," while assisting to beat off an attack on a convoy, was torpedoed but not sunk near Iceland, with 11 casualties. Official nazi quarters denied this attack but claimed to have sunk two British submarines at about the same time and place; however, the attack occurred during darkness and it is probable that the "Kearny" was tallied as one of these. At the end of October the U.S. destroyer "Reuben James" was torpedoed and sunk with great loss of life near the positions of the former attacks. Diplomatic protests now came to an end and action took the stage.

War in the Pacific.—On Dec. 7 occurred the unprovoked and unexpected Japanese air raid on Pearl Harbor, involving the United States in war on two oceans, spreading the conflict around the globe. New and powerful submarine flotillas became engaged in the conflict. The United States had well over 100 submersibles ready for action and Japan was known to have at least 70 modern boats, probably many more. A minimum of a dozen Dutch submarines were operating from the Netherlands East Indies, and the 70 or more Russians at Vladivostok remained a distinct threat. The first submarine action occurred in conjunction with the attack on Pearl Harbor when Japanese "baby" submarines penetrated the innermost defenses; while the damage inflicted on United States naval craft by this means was unknown it was probably relatively light and it was doubtful if any of the submarines that entered were able to escape. Within a week Dutch submarines were in action in Malayan waters against Nipponese troop convoys and claimed to have bagged four heavily loaded transports. In mid-December Admiral Hart, commanding the U.S. Asiatic fleet, reported successful submarine actions on two Japanese transports and one destroyer. Further reports of successes were anticipated as submarines returned from extended patrols.

Submarine Losses.—With the sole exception of Britain no belligerent power makes a practice of announcing its submarine losses. Nor do any of them, except in unusual circumstances, announce the losses they believe they have inflicted on their adversaries, for the stated reason that secret sinkings have a more deleterious effect on enemy morale than those broadcast to the world—a case where ignorance is not bliss. Any attempt, therefore, to estimate aggregate losses is pure guesswork, based only on such hints as occasionally emanate from those in a position to know. With these apologies the following is submitted.

Germany.—The nazis have admitted not a single sinking. Estimated 1940 losses were at least 60 but, considering Churchill's statement in April 1941, that there had been 74 verified sinkings until then, this estimate appeared to be an underestimate, for there is a wide gap between verified sinkings and actual sinkings. Press reports contained items concerning the loss of only 23 U-boats during 1941, but such reports were made only when the circumstances were exceptional. A further hint was contained in a November statement by the admiralty that a total of 1,276 submarine survivors had been captured. If entire crews were taken prisoner this would roughly indicate that 30 submarines had been destroyed, but it must be remembered that in most cases only a few members of the

crew can be saved and that in the majority of cases there are no survivors. Using captives as the best available figure on which to base an estimate, and generously computing that one-third of each crew was rescued, it would appear that at least 90 submarines were sunk from which survivors were captured. Figuring further that less than half of those sunk yielded prisoners it seemed reasonable to assume that at least 200 German and Italian submarines were sunk in 1941. The year ended with an admiralty statement announcing that nazi losses were so heavy that great difficulty was being experienced in getting and training U-boat crews.

Italy.—The press reported only five submarine losses by Italy in 1941 and only one of these was officially admitted by the fascists. Lacking other figures, Italian losses were included in the preceding paragraph with those suffered by Germany, based largely on numbers of prisoners taken by the British. In view of the depletion of its flotillas it is probable that Italy's 1941 losses were about the same as in 1940—an estimated 20 submarines.

Japan.—One large submarine was known to be sunk off Hawaii early in December and another off the Pacific coast shortly thereafter. President Roosevelt announced on Dec. 8 that "a number" had already been smashed and Secretary of the Navy Knox followed this up on Dec. 22 with a statement that "several" had been "dealt effectively with." It seems reasonable to assume that at least six were destroyed before 1942. In addition to these Japan admitted the loss of five "baby" submarines.

Great Britain.—Although announcements were considerably delayed, the admiralty consistently reported the loss of its submarines. Experience has shown that admiralty admissions of naval losses were correct and the writer knows of no reason to doubt its submarine figures. In September announcement was made of the 31st submarine loss of the war, this being only the ninth of the year. There were no more reports (indicating perhaps that these candid admissions were at an end), but assuming that losses continued at the same rate a total of 12 during 1941 is estimated. This considerable reduction over 1940 may be due to different methods of employment; submarines were being kept on enemy lines of communication rather than on blockade duty off heavily mined enemy ports. With British losses might be included the admitted destruction of the Free-French submarine "Narval" by Italian naval action and the loss of one Dutch submarine in a minefield, for these were operating under the Royal navy.

United States.—The navy department admitted no losses. Japanese officialdom, however, claimed to have destroyed nine enemy submarines, nationality unstated. If true, it may be assumed that the majority of these were American.

Russia.—Submarine news from Russia was almost totally lacking. The nazis, however, claimed to have captured four undamaged soviet submarines in a Latvian port and to have destroyed "a number" by bombing in the Black sea. In the naval actions near Kronstadt there were undoubtedly other losses, but there was no indication that the Russian flotillas suffered heavily.

New Construction.—*Germany.*—During the winter of 1940–41 the usual alarming reports emanated from Sweden and Switzerland on the rapid rate at which German yards were producing submarines. In February it was rumoured that 600 U-boats were ready for the spring offensive, although admittedly many of them were of the so-called "minnow" type. Such a number would not be in excess of nazi boasts but it was considered doubtful in view of subsequent events that they were actually in existence. In fact some naval authorities placed the total number of U-boats in commission at the start of the spring drive as low as 180. The truth must lie between the two figures, but it was at least clear that Germany had never reached its vaunted rate of "a submarine a day" in spite of vastly increased production facilities resulting from the occupation of conquered countries. Available information indicated that nazi submarine construction ran to two principal types: (1) a large U-boat, over 1,000 tons, with high surface speed and long cruising radius for striking in distant waters; (2) the "minnow" type, 250–300 tons, 13 knots surface speed and with but three torpedo-tubes, for work around the British Isles and in coastal waters. The latter requires less than half the crew of the former and since there was a great scarcity of trained submarine personnel, this undoubtedly was a factor in determining the number of each type to be constructed. A new type, specially adapted to the new tactics described in the following section, appeared in numbers. While no detailed data were available, they were said to be 500 to 800 tons with a range of 8,000 to 10,000 mi., at least 18 knots surface speed, high manoeuvrability and heavier protection against gunfire than is usual in a submarine.

Italy.—Little was known of Italian submarine construction and it was doubtful, in view of heavy fascist losses and lack of material and skilled labour, whether it was keeping pace with sinkings. In September Italian authorities claimed that "small secret assault boats" which were little more than man-carrying torpedoes had sunk several supply ships at Gibraltar. The Italians had previously demonstrated a genius for submarine eccentricities so it is possible that these boats were also submersibles.

Japan.—For years the Japanese had put forth no information on naval construction of any kind. It was known, however, that submarine building went on rapidly and that they were producing many large, long-range craft capable of a round-trip to the shores of America. Japan, like Italy, goes to extremes, as witness the use of two-man submarines at Pearl Harbor. These tiny weapons are but 41 ft. long, propelled entirely by storage batteries, with a top surface speed estimated at 24 knots and a range of 200 mi. at low speed. They carry two 18-in. torpedoes plus a suicidal charge of high explosive under the stern. It had been known for several years that such craft were in existence, but since they require the attendance of a mother-ship at any distance from home shores they have distinctly limited capabilities and are in the nature of special weapons. In view of the restricted industrial facilities of Japan it was doubtful if a rate of submarine construction could be maintained that would offset expected losses.

Great Britain.—British submarine construction is likewise a closed book during wartime. Never a strong advocate of the submarine as a weapon, it is doubtful if Britain was replacing much more than her losses, in spite of valuable services rendered. One reason for this was, of course, the urgency of constructing cargo carriers and antisubmarine craft with consequent use of all available shipways. Reports indicated that the admiralty was specializing in smaller and simpler submarines than heretofore, for use in the Mediterranean and other narrow seas.

United States.—There was a greatly accelerated rate of construction in the United States from 1939 on and submarines were being launched at the rate of several a month. The majority of these were large modern vessels (1,500 tons) with a heavy torpedo armament and enough range to carry the war to Japan. There were also building a number of smaller, simpler ships (about 800 tons) for more limited use. It seemed probable that the building rate would be greatly stepped up during 1942.

Russia.—There has always been much secrecy and much conjecture regarding the soviet program. About all that is known is that the Russians specialized in this type of naval weapon, and that they ran to numbers rather than to size. Most of their submarines were believed to be small short-range craft, some of which even approached the "baby" submarines of Japan.

Aside from the new German type for night surface attacks and the Japanese two-man boat, there were no outstanding developments in submarine construction during the year. Radio and supersonic listening devices were greatly improved, but such improvements were of more help to the anti-submarine craft on the surface than to the submarine below the seas.

Submarine Tactics.—The German high command several times during the year hinted the employment of new submarine tactics and on two occasions spoke of co-ordinated attacks on convoys by surface warships and U-boats. No details of such collaboration were available but the results of these attacks were in no way alarming.

The "wolf-pack" tactics developed in 1940, however, were improved upon. From such information as was gleaned from meagre reports it appeared that far-ranging nazi aircraft spot and trail a convoy and, by radio, converge all nearby U-boats on its path. In the western Atlantic a submarine substitutes for the plane, trailing the convoy just outside the range at which it can be sighted. When the wolves are on the scent they follow, on the surface but unseen, during daylight, and at night go in to the kill. One U-boat starts the attack on signal and the others follow in succession throughout the night. While most attacks are from the flank and torpedoes are fired at random into the mass of merchantmen, an occasional daring skipper goes directly through the convoy, firing to port and starboard until his torpedoes are expended. Upon completion of the attack the U-boat submerges to escape counterattack; when danger is past it emerges and, with its superior speed, takes station for attack the following night. Such attacks sometimes last for several days. For this purpose was the new type of submarine, described in the preceding section, designed; it is in reality a low, fast torpedo boat, capable of submerging when necessary.

Combatting such tactics is difficult. The assailants are hard to see and harder to hit, and they disappear when attacked. Increase in numbers of escorting vessels is a help, but the real answer appeared to be the inclusion of an aircraft carrier in the convoy. With an air patrol around the merchantmen during daylight, trailing observation planes could be driven off and U-boats on the surface en route to their night stations could be forced under, effectively preventing their arrival on position in time to be of use. That the British were already making use of this countermeasure was verified by announcement of the loss of an auxiliary aircraft carrier, a former merchantman, from a convoy.

Another new German development was the probable use of submarine tenders in isolated arctic seas, making it possible to use the smaller type U-boats against the sea lanes of the western North Atlantic, out of range of air patrols from the United Kingdom. These small boats would normally be unable to range so far to westward, but the presence of a mother-ship from which to re-fuel and re-victual extends their radius of action sufficiently to warrant their use in these waters.

Strategically, it is worth while to note the undoubted use of Dakar as a nazi submarine base. It was reliably reported that at least a dozen U-boats, although flying French colours in port, were operating from there against convoys from Freetown and the Cape of Good Hope with the object of cutting one more vital life-line to Britain. The providing of heavy escorts at such a distance from British naval centres is a problem of considerable magnitude. (*See* also BLOCKADE; INTERNATIONAL LAW; NAVIES OF THE WORLD; NEUTRALITY.) (E. E. HA.)

Suez Canal.

The Suez canal is a link in the shorter of the two lines of communication between Great Britain and the east—the Mediterranean and the cape routes. Its strategical character is twofold and lies in the advantages its use confers, and the disadvantages which its use by an enemy would impose, upon the British empire. The importance of time in war, the need for the most effective use of shipping tonnage, the strategical necessity for economy in the employment of fighting forces—all of these combine to establish the superiority of the Mediterranean over the cape route: thus, the voyages from England to Bombay, Yokohama and Melbourne via Suez are respectively 42%, 23% and 8% shorter than by the cape route. It is, however, essential to bear in mind that the canal is only a link in the chain of communications, and unless the other links by which it is approached—the Mediterranean and Red seas—are also secure for traffic, the canal is isolated and can serve no

positive purpose. The essential corollary therefore to a diplomatic policy of holding the waterway is a naval policy which ensures a strength adequate to protect the waterways of approach.

The canal could serve the purposes only of an enemy who should hold Egypt. But the fact of his holding that country and its neighbour Palestine would imply his command of the sea and the expulsion of the British fleet from its bases in the Levant. The possession of the canal would then put it in its power to send armies and sea forces to the south and to maintain them from its European sources. The East African colonies would be exposed to most powerful attacks by land and sea, the trade of the Indian ocean subjected to injury by ships operating from bases in East Africa, and even the alternative route to India and Australia via the cape would be threatened. It was the fact that the German cruiser operations in World War I were hampered by a want of oversea bases, and that the possession of African bases would tend to curb the opposition of Australia and India to German expansion in the east, that German naval authorities in 1916 urged the importance of acquiring colonies in Africa.

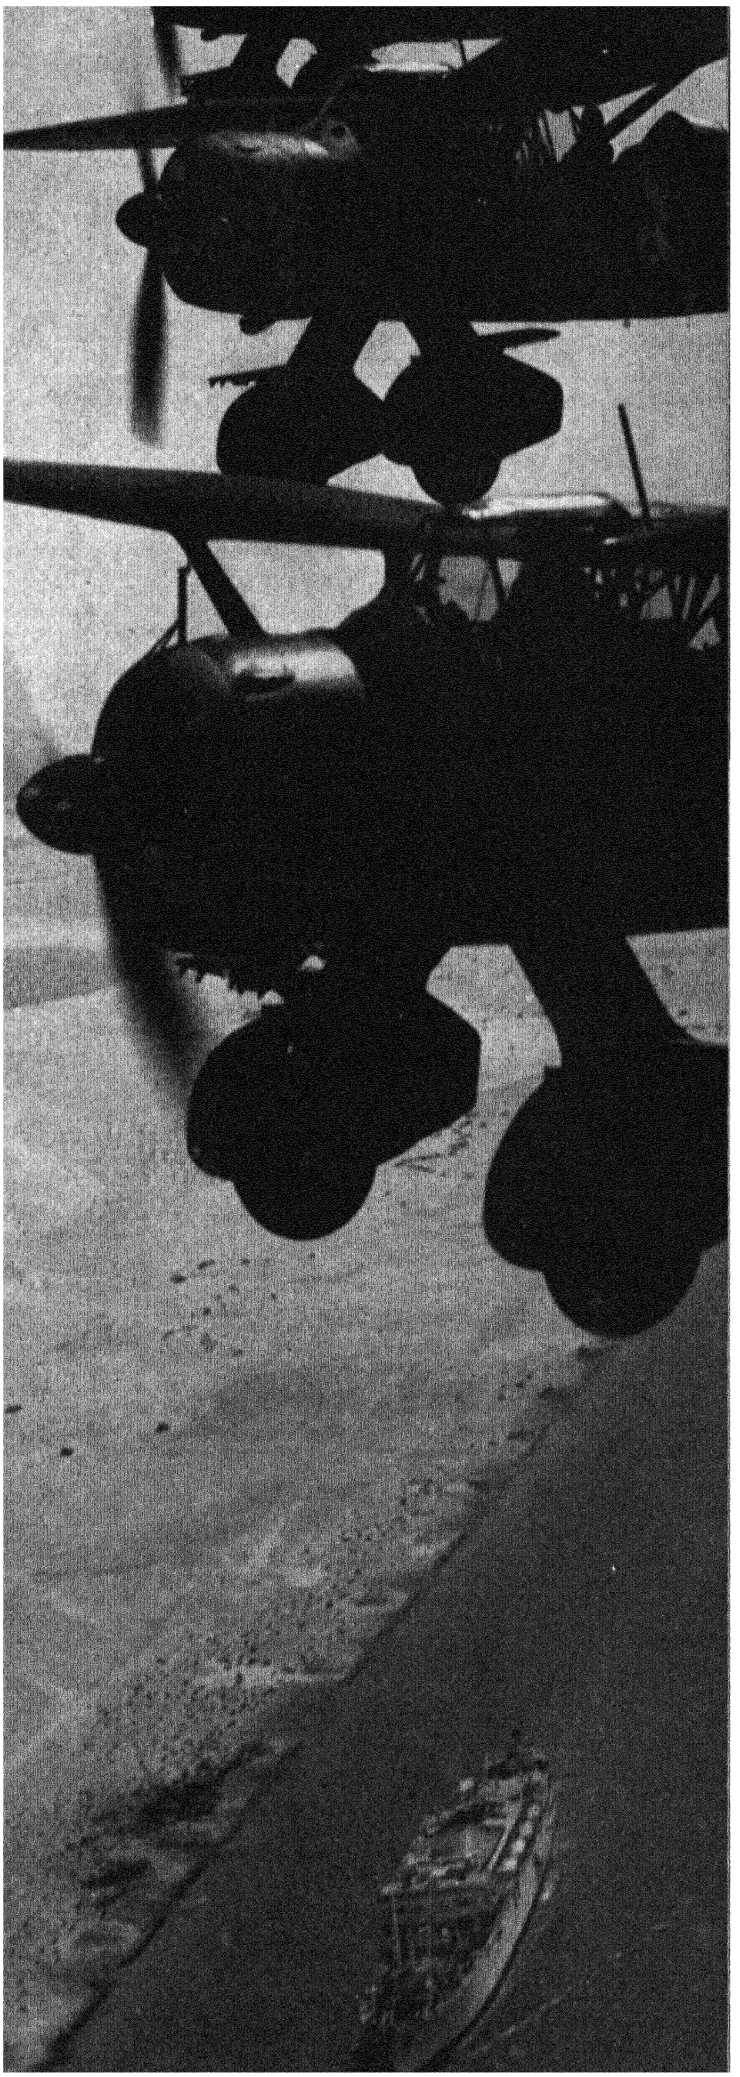
Though the Suez canal was neutralized by the convention of 1888 which established that there should be freedom of movement for all shipping in time of war and forbade the commitment of any act of hostility in the zone, two signatories to that convention, Germany and Turkey, broke the engagement and attacked the canal in Feb. 1915. The ineffectiveness of agreements unsupported by force has been made manifest in other ways, and Great Britain's treaty with Egypt of Aug. 26, 1936, while recognizing the full independence of Egypt, recognized also the British interest in the security of the Suez canal and a British right to maintain there a garrison of 10,000 troops and a force of aircraft. Under modern conditions of warfare the navigation of the canal is capable of being interrupted from a distance by aircraft laying mines, directly attacking ships, and also blocking the waterway. Though the constantly increasing range of aircraft brings almost all the Mediterranean countries within striking range of the canal, it is still important to keep them at the greatest distance possible, since distance diminishes the intensity of attack and increases the powers of defense. (H. W. Ri.)

Suffolk and Berkshire, Charles Henry George Howard,

Earl of (1906–1941), British scientist, was born March 2. He was a fellow of the Royal Society of Edinburgh, 1936, and won first class honours in pharmacology, 1937. In the early part of World War II, the earl acted as the British supply ministry's liaison officer between British and French scientific organizations. After the fall of France the earl volunteered to conduct experiments on unexploded time-bombs dropped on London by nazi raiders. He headed a "suicide" crew that successfully extricated a number of these bombs from London ruins, but one of the delayed-fuse missiles exploded in London May 12 killing the young peer. He was awarded posthumously the George cross for conspicuous bravery.

Sugar.

The need for diverting sugar to the manufacture of high-test molasses to be made into alcohol, essential in the manufacture of smokeless powder, was one of the two principal reasons the U.S. government, beginning Dec. 13, 1941, ordered restrictions on the consumption of sugar in the United States. The other reason for freezing all stocks held by wholesalers, jobbers and industrial users, and subsequently adopting per capita rations, was that the war with Japan had cut off normal supplies of sugar from Hawaii, the Philippines and other Pacific



R.A.F. PATROL PLANES over the Suez canal in 1941

sources. Also, the general shortage of shipping interfered with normal receipts of sugar from Cuba and other Caribbean sources. The OPM restrictions limited 1942 consumption in the United States to the consumption of 1940, which was 6,890,000 short tons. Restrictions forbade any receiver to take, in any month, more than a 30-day supply of sugar. In the latter part of 1941, the U.S. government began negotiations to buy all Cuban sugar and molasses above Cuban consumption requirements. On Dec. 18, 1941, congress extended the Sugar act through 1944 and raised conditional payments to producers from 60 to 80 cents per 100 lb. of recovered sugar in production up to 350 tons, with graduated reductions in payments on production above 350 tons. Only two or three years previously the huge annual over-production of sugar was one of the most difficult problems in world trade. To help equalize that situation and to protect sugar growers in the United States and insular possessions, the U.S. government adopted annual quota allotments of imports from Cuba, the Philippines, Hawaii, Puerto Rico, the Virgin Islands and a small amount from other countries. But at the end of 1941 practically any amount from any source was welcome. Estimates of the Philippine sugar crop in 1941 were 1,092,000 tons, compared with 1,053,228 tons in 1940; Hawaii, 968,800 tons in 1941 and 968,912 tons in 1940; Puerto Rico, 931,997 tons in 1941 and 1,018,793 tons in 1940. The 1941-42 production in Cuba was expected to be around 3,600,000 tons. Cuba shipped about 2,800,000 tons to the United States in 1941. In the United States, production of sugar-cane in 1941 was estimated at 5,063,000 short tons, with a sugar yield of possibly 431,000 short tons, raw value 96°. The preceding year's harvest was 3,797,000 tons of cane and 332,000 tons of sugar; the ten-year (1930–39) average was 4,362,000 tons of cane and 355,000 tons of sugar, all grown in Louisiana and Florida. Louisiana production was 3,978,000 tons of cane; Florida, 1,085,000 tons of cane. Sugar-beet production in the United States in 1941 was 10,090,000 short tons, about 18% less than the record 1940 crop of 12,292,000 tons. The ten-year average was 9,284,000 tons. Beet sugar manufactured in 1941 was 1,451,000 tons, equivalent to 1,552,570 tons raw value. In 1940 it was 1,773,000 tons (1,897,000 tons raw value); the ten-year average was 1,363,000 tons (1,458,000 tons raw value).

U. S. Production of Beet Sugar by States, 1941 and 1940

State	1941 short tons	1940 short tons	State	1941 short tons	1940 short tons

Suicide Statistics. In 1939, the latest year of record, there were 18,511 deaths from suicide in the United States, corresponding to a death rate of 14.1 per 100,000 of total population. The most current picture of the situation is obtained from the records of industrial policyholders of the Metropolitan Life Insurance company whose experience follows closely that of the general population of the United States. According to this insurance experience, the death rate from suicide for the first nine months of 1941 was 12% lower than that for the corresponding period of 1940. The decrease in suicide mortality reflects, in large degree, the improvement in business conditions, for there has been found to be a very close inverse relationship between the two.

Since data were not available to show the effect of World War II on suicide in the nations in conflict, a brief review of earlier experience may be pertinent. During periods of war, there is usually a pronounced decline in suicide mortality, not only in belligerent countries, but also in neutral nations. Thus, during World War I, suicide rates in the principal countries fell without exception. A study of Massachusetts and Connecticut data established a decline in suicide mortality during the Civil War of the United States. In the course of the Franco-Prussian War (1870–81), the deaths from suicide in France were fewer than the average for the four preceding years. The decline in suicide during war is found among women as well as men, although it is more marked among the latter.

A recent study of "suicides that failed" showed that more women than men attempt self-destruction, but that men are much more resolute in their efforts than women. Although suicidal attempts are rare under 15 years of age, more than one-half of the total attempts by women were made under the age of 30, according to this study, while among men, the proportion for the same ages was one-quarter. Attempts at self-destruction were more successful at the higher ages than at the younger. Thus, it was found in this study that among men at ages under 25, one-sixth of the attempts resulted in death, while at ages 50 and over the ratio was two out of three. For women at ages under 25, one attempt in every 18 ended in death, but at ages 50 and over, the purpose was accomplished in one-half of the attempts. White persons in the United States are more likely to attempt suicide than the Negroes.

Although motives for suicide cannot be stated with definiteness, it has been found that lack of interest in life, poor health, domestic difficulties, or financial troubles usually precede attempts at self-destruction.

(A. J. Lo.)

Sulphur. World production of sulphur in 1940 was 3,700,000 metric tons, 75% in the United States, 10% in Italy, 4% in Japan, and 2% each in Spain, Chile and Netherlands East Indies. Production in the United States in 1940 increased 31% to 2,732,088 long tons, while shipments increased 15% to 2,558,742 tons. Imports practically ceased, but exports steadily expanded and reached 766,213 tons in 1940, 746,468 tons of crude and 19,745 tons of refined. Shipments to Great Britain and Canada more than doubled since 1938, the two accounting for about two-thirds of the total. Domestic consumption in 1940 was estimated at 1,848,000 tons, up 16% from 1939. Sulphur was in 1941 being recovered in elemental form from smelter gases in a number of countries, but nothing was known as to the magnitude of the recovery, and the extent to which this by-product replaced native sulphur. (G. A. Ro.)

Sumatra. Lying northwest of Java (*q.v.*) and adjacent to the Malay peninsula, from which it is separated by the narrow Strait of Malacca, Sumatra is after Java the richest, and after Borneo (*q.v.*) the largest, of the islands of the Netherlands Indies archipelago. Area, 182,900 sq.mi.; pop. (1931) 8,254,843. It is almost bisected by the equator, lying between 5° 4′ N. and 5° 59′ S. The interior is mountainous and wooded; the two highest mountains are Mount Indrapura, with an elevation of 13,700 ft., and Mount Ophir, with an elevation of 10,483 ft. There are some fertile and well-watered lands along the coast. The natives specialize in the cultivation of rice and there are European rubber and coffee plantations. Sumatra's mineral resources include gold, silver, coal and oil. Sumatra is divided into ten Residencies, or administrative units. There has been an effort to promote migration from Java, which is only about one-third as

large and has more than five times as many inhabitants; the government appropriated funds to help the settlers, especially young married couples. The Palembang district was especially favoured for this assisted migration. Sumatra also shared in the program of industrialization which was launched for the East Indies after this great colonial empire was cut off from the Netherlands by the German occupation of the latter country. The program called for the building of oil refineries, bauxite smelters, aluminum factories, a chemical plant and a paper mill. (*See* also NETHERLANDS COLONIAL EMPIRE; DUTCH EAST INDIES.) (W. H. CH.)

Sunday Schools.

The International Congress on Christian Education, held in Mexico City, Mex., July 16–20, 1941, under the auspices of the World's Sunday School association and the National Council of Evangelical Churches in Mexico, assembled 508 delegates from Mexico and 454 delegates from other countries, including Guatemala, Honduras, Nicaragua, Argentine, Brazil, Chile, Uruguay, Paraguay, Peru, Canada, the United States of America, Cuba, Puerto Rico, the Dominican Republic, Egypt, the Belgian Congo, the Gold Coast of Africa, Burma, China, Korea, and the Philippine Islands. The proceedings of the congress were published in English and in Spanish. It was preceded by a smaller Conference for Sunday School Workers held at Cuernavaca, July 13–15, and followed by a Conference on Christian Literature for Latin America, July 21–25.

The congress noted as reasons for encouragement: increased Sunday school attendance in many countries; increased recognition that religious education is an integral part of the work of the church; increased interest in the reading and study of the Bible; a mutual approach of evangelism and Christian education; the greater extent to which preparation for service in Christian education is being included in the training of ministers in theological schools; the development of education for lay service of various types; and increased interest of youth, where free, in religion. It recognized the need for better curriculum materials, better prepared teachers, and more effective provision for the underprivileged, including the great number of people who cannot read.

In countries occupied by Germany, Christian youth conferences were forbidden in many places, but Sunday schools were being conducted in the homes of people. In spite of war, the work continued effectively in China, under the direction of the National Committee for Christian Religious Education, which celebrated its tenth anniversary in July. Madame Chiang Kai-shek, one of the vice-presidents of the World's Sunday School association, sent a heartening message to the International Congress at Mexico City. (*See* also CHURCH MEMBERSHIP.) Superphosphates.

The production of superphosphates in the United States in 1940 was 4,522,175 short tons, and shipments 4,820,571 tons, increases of 14% and 7% respectively over 1939. Imports were negligibly small (10,017 tons in 1940), but exports were somewhat larger, 141,289 tons in 1940, against 95,224 tons in 1939. The consumption of phosphate rock in the production of superphosphates in 1940 was 2,564,844 tons, or 64% of the total output. (G. A. RO.)

Supply Priorities and Allocations Board.

The Supply Priorities and Allocations board was set up by President Roosevelt Aug. 28, 1941, "in order to assure unity of policy and co-ordinated consideration of all relevant factors involved in the supply and allocation of materials and commodities among the various phases of the defense program and competing civilian demands." In the executive order which called the board into being, the duties of the board were outlined in this manner:

Consistent with the basic defense policies of the president, the Supply Priorities and Allocations board shall:

a. Determine the total requirements of materials and commodities needed respectively for defense, civilian and all other purposes; establish policies for the fulfilment of such requirements, and, where necessary, make recommendations to the president relative thereto.

b. Determine policies and make regulations governing allocations and priorities with respect to the procurement, production, transmission or transportation of materials, articles, power, fuel and other commodities among military, economic defense, defense aid, civilian and other major demands of the total defense program.

The executive order named the membership of the board as follows: Vice-President Henry A. Wallace (*q.v.*), chairman; William S. Knudsen and Sidney Hillman (*qq.v.*), respectively director general and associate director general of the Office of Production Management; Secretary of War Henry L. Stimson (*q.v.*); Secretary of the Navy Frank Knox (*q.v.*); Leon Henderson (*q.v.*), head of the Office of Price Administration and director of the division of civilian supply in OPM; and Harry L. Hopkins (*q.v.*), special assistant to the president. Donald M. Nelson (*q.v.*) was named executive director of the board.

At its first meeting, SPAB laid down for the national economy a general policy of "cutting off the fat and hardening the muscles," and stated that "production shall be stimulated and organized to the limit of the nation's resources." In subsequent meetings the board adopted a series of policy declarations designed to make the nation's defense effort effective. It ruled, for example, that expansion of productive capacity to meet purely civilian demand could not be undertaken if the expansion would require large quantities of critical defense materials; it called on military and civilian defense authorities for detailed estimates of military and civilian requirements as far in advance as possible; it directed that every effort be made to expand domestic production of all critical materials; it denied priority applications for material to build an oil pipe line from Texas to New York, holding that the materials involved were more greatly needed in other phases of the defense effort; and it undertook to provide the needed equipment to make possible expanded production of dairy products.

On Oct. 9, 1941, SPAB announced one of its broadest policy decisions, ruling that priorities assistance thereafter could not be granted for any public or private building construction project which was neither essential to national defense nor necessary for the public health and safety.

Subsequently, the board approved OPM proposals for a 10,000,000-ton expansion in steel production capacity, and directed OPM to develop an allocation system for steel. It followed that action by calling on OPM to obtain detailed production programs, industry by industry, for 1942, to the end that the most vitally needed materials could be distributed through an allocation program rather than through the system of issuing priority ratings.

At the request of the Economic Defense board, SPAB on Dec. 2, 1941 agreed to do everything feasible in order to make possible the delivery of 218,600 tons of tin-plate to other republics in the western hemisphere during 1942. Shortly thereafter it extended the principle set forth in the building construction policy to the fields of public and private electric power, holding in substance that no new projects should be undertaken unless they could be shown to be essential either for national defense or for the public health and safety, and that both public and private power bodies should be treated alike during the national emergency.

Disturbed by increasing reports of inadequate efforts to get the greatest possible production of copper, SPAB early in Dec. 1941 directed OPM to hold an inquiry on the subject and to submit to SPAB a report summarizing all suggestions regarding methods of increasing production.

On the day that the United States declared war on Japan, SPAB called for "a vastly expanded national effort" and laid down the rule that the nation must strive for "the greatest production which is physically possible." It followed this action immediately by making an extensive survey of all critical raw materials coming from the Pacific area, and by setting in motion a program designed to ensure adequate military production even in case further shipments of such materials should be cut off by enemy action. On Dec. 26, 1941, the sale of new tires for pleasure cars was prohibited by the Office of Price Administration, to conserve the nation's supply of rubber.

SPAB was set up as a policy-making body rather than an administrative agency. In general, its activity took the line of setting broad policies to be followed by OPM and other defense agencies; of charting the course by which actions affecting production and supply were to be taken, and of stating principles to guide the civilian phase of the defense effort. (*See* also DEFENSE, NATIONAL; PRIORITIES; and the various articles on related defense agencies (PRODUCTION MANAGEMENT, OFFICE OF, etc.) (D. M. N.)

War Production Board.—President Roosevelt announced on Jan. 13, 1942 that he would establish, by executive order, a War Production board to

take over the functions of the SPAB, which was to be abolished with the creation of the new board. He appointed Donald M. Nelson to head the new board and announced that Nelson's decision on all questions of production and procurement of U.S. arms would be "final." Thus the administration met the long-standing demand for the appointment of one man with absolute control over the arms program—the same control that Bernard Baruch exercised in the War Industries board during World War I.

Supreme Court of the United States. The year 1941 was one of the most momentous in the history of the supreme court, due not only to the shift in personnel, but also to the shift from an overwhelmingly conservative to a vestigially liberal bench.

The last of the old guard, Mr. Justice McReynolds, retired, as did the distinguished eleventh chief justice, Charles Evans Hughes. Death took the eminent liberal jurist, Louis Dembitz Brandeis (*q.v.*). To fill the two vacancies (Brandeis having retired in 1939), President Roosevelt appointed Senator James F. Byrnes and Attorney-General Robert Jackson to the court, bringing the total of the president's appointments to seven. Since the remaining two justices, the new Chief Justice Harlan F. Stone and Mr. Justice Roberts, had frequently upheld new deal statutes, President Roosevelt in 1941 had an almost unanimously sympathetic tribunal in the highest court of the nation.

Against this background it is not surprising that the new deal scored a number of victories; the power of congress to regulate wages and hours, despite a ruling to the contrary in an earlier case; the widening power of congress over activities which may be deemed essential to a nation's welfare even though such activities are purely local or intrastate; and the power of states to regulate trade in the public welfare despite a long line of cases which required that industries, before they could be regulated, must be (technically) affected with the public interest. Administrative boards, which had become the arbiters on national economic questions were judged and approved by the high court, and several dissents of yesterday became the law of the land today.

New appointees to the bench came from the political arena. Mr. Justice James F. Byrnes was an ardent new deal senator who had already indicated his belief that the constitution had been amended (1) in the manner specifically prescribed by the constitution; (2) by custom; and (3) by judicial interpretation. Mr. Justice Robert Jackson was attorney-general, to which post he was appointed from private practice. In his writings, particularly on the supreme court, he manifested a marked impatience with the emasculation of laws by the judiciary.

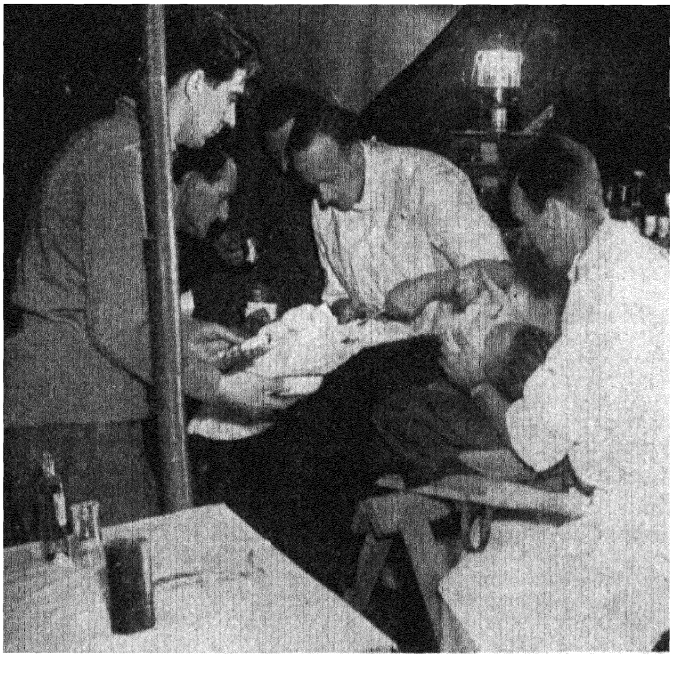
Work of the Court.—As for the work of the court, taxation and labour predominated in number. Constitutional and administrative issues loomed large in significance. On the whole the government prevailed, with a total of 88 cases won as against 28 lost. These were:

	For Govt.	*Against Govt.*		*For Govt.*	*Against Govt.*
Federal taxation . .	33	8	State taxation . . .	11	3
Federal labour . . .	8	3	State regulation . .	8	0
Federal regulation .	10	4	State criminal . . .	0	2
Federal criminal . .	7	3	State miscellaneous .	3	3
Miscellaneous . . .	8	2			
			Total	88	28

With the passage of the constitutional crisis in the supreme court and its settlement, there came to the court a unity which did not characterize that high tribunal in years past. While there were variant judgments in the application of principles and attitudes, there was a conspicuous absence of a "mortal clash of irreconcilable doctrines." The result, a liberal construction of those clauses which impose limitations upon congress or which limit the power of the states without regard to national needs. Perhaps one of the most significant aspects of the court's decisions was its evaluation of and regard for administrative agencies. Said Chief Justice Stone, "Courts are not the only agency of government that must be assumed to have the capacity to govern." "That means that judicial review performs its function when it vindicates the authority of the law and the decencies of fair procedure. Beyond this, the correction of errors of policy or of judgment is the business of the agencies which make them or of legislative reform."

Primary characteristics of the supreme court's work at its 1940–41 term, determined only from consideration of its written opinions were: (1) There were fewer instances than usual of constitutional cases, that is those involving questions of whether governmental action comported with the requirements of the federal constitution; (2) There was a larger number of decisions than in immediately preceding terms involving the construction and application both of federal and state laws; (3) There were fewer opportunities than ordinarily for the court to give expression to its views regarding civil liberties, but in the few instances the court maintained its record for protection of civil liberties; (4) An unusual number of opinions dealt with problems of the procedure and jurisdiction of federal courts; (5) An even more stringent limitation than heretofore declared was placed by the court on judicial review of administrative action. (*See* also CIVIL LIBERTIES; LAW.) (B. WE.)

Surgery. The widespread use of various sulphonamide compounds in the cavities of the body as a preventive against infection was introduced in 1941. In one series of cases of acute appendicitis in which perforation of the appendix occurred with local and sometimes general peritonitis, the mortality rate in those cases in which the sulphonamide preparations were introduced into the peritoneal cavity, as well as administered subcutaneously and orally, was half what it had been prior to their use. In cases of trauma to the skin or deeper structures and in the performance of plastic procedures of various types, after cleansing of the wounds and introduction of sulphonamide crystals a high percentage of primary healing occurred after suture. In this connection, too, new preparations were introduced—sulphadiazine and sulphaguanidine. The function of the latter was presumably to decrease the bacteria of the large intestine but this was not of appreciable benefit. It should be understood that none of



BRITISH FIELD HOSPITAL UNITS were rushed to the fighting front as empire troops advanced in the first Libyan campaign of early 1941. Here a surgeon operates on a soldier wounded at Bardia

THIS ENGLISH BOY, unable to talk one year after a severe head injury sustained in a 1940 air raid, was regaining his speech in 1941 following the removal of blood clots (subdural haematoma and subcortical haematoma) from the part of the brain that controls speech (Broca's area). The operation itself was one with which brain surgeons have long been familiar

the sulphonamide compounds should be used except under the direction of a practising physician.

Experience showed that in fractures of the neck of the femur (hip) the approximation of the broken fragments by various methods of metal fixation, such as long thin nails placed under roentgenoscopic control, has produced a much higher incidence of healing than when other methods were used. This so-called nailing method applied to certain fractures of other long bones also received some general and apparently justified acclaim, since it produced as accurate an approximation as possible under roentgenoscopic control and hence the period of healing by calcification was shortened.

An increasing series of cases in which penetrating wounds of the heart have been repaired successfully, with recovery of the patient and return to reasonable activities, was reported.

By opening the left pleural cavity and splitting the left side of the diaphragm, tumours of the lower portion of the oesophagus and the upper third of the stomach were made more accessible to surgical removal. After removal of the tumour the oesophagus and stomach are joined together by suture, and the incision in the diaphragm is closed around the stomach below the point of anastomosis. In several cases of this type the operation was performed successfully. (*See* also ANAESTHESIA; MEDICINE.)

Surinam (DUTCH GUIANA). A Netherlands colony in northeastern South America. Area, 54,291 sq.mi.; pop. (1940) 156,332. In addition, an estimated 19,032 bush Negroes and 2,616 Indians live in the jungle. In 1937, 29·2% of the population was British Indian, 20·3% Javanese in origin. The chief cities are Paramaribo, the capital (54,853), and Nieuw Nickerie (3,788). Government is in the hands of an appointed governor and a partially elected council. Governor: Dr. J. C. Kielstra.

History.—The outstanding event in Surinam's history during 1941 was the arrival of U.S. troops Nov. 24, as the result of an earlier agreement between the United States and the Netherlands government in exile, with the object of providing necessary protection to the colony's valuable bauxite mines. The government of Brazil, in a corollary action, pledged itself to maintain military vigilance along the Brazil-Surinam frontier. The troops, whose numbers were not disclosed, were located in some 20 or more camps and acted solely in a military capacity. Their presence in no sense constituted an occupation nor was Netherlands sovereignty in any way infringed.

Education.—The colony had about 132 schools (43 government) in 1941, in addition to Indian and bush Negro schools in the jungle. In 1940, enrolment totalled 21,278, of whom 11,100 were in Paramaribo.

Finance.—The monetary unit is the guilder, officially valued in 1941 at 52½¢ U.S. and, after May 1940, tied to Netherlands Indies currency. Formerly, the colony's expenditures regularly exceeded revenues, necessitating a home government subsidy.

Resources and Trade.—Surinam is practically undeveloped except along the narrow coastal plain, which includes 150 sq.mi. devoted to agriculture and the bauxite deposits, with Moengo, on the Cottica river, the main centre of exploitation. Until July 1941, when a concession was granted to a Netherlands corporation, bauxite mining was entirely controlled by United States capital. Bauxite, first developed in 1922, is now the principal export commodity. Stimulated by war demands, production rose from 511,619 tons in 1939 to 615,434 tons in 1940, and by mid-1941 exports were running in excess of 100,000 tons monthly (Sept. 1941: 114,000 tons). All bauxite exports are taken by the United States and make up almost all United States purchases. Under normal conditions, around 65% of exports go to the United States; the proportion was 89.3% in 1940, however, and 92% in the first half of 1941. Other exports are sugar to Great Britain, balata to the United States and Great Britain, rice to the West Indies and miscellaneous foodstuffs. Imports, from the United States (57% in 1940) and the Netherlands (13.4%) were valued at 8,519,684 guilders in 1940, and comprised foodstuffs, fuel and manufactured goods. In the first half of 1941, exports were $2,405,353 in value (United States 92%), imports $1,275,015 (United States 65%).

Communication.—External communication is by steamship and air. Along the coast there are 13 km. of railway and fairly good roads. Interior communication is by rivers and trails. (L. W. BE.)

Swaziland: *see* BRITISH SOUTH AFRICAN PROTECTORATES.

Sweden. A democratic monarchy of northern Europe. Area, 173,347 sq.mi.; pop. (est. 1940) 6,370,538. Capital, Stockholm (est. Dec. 31, 1941, 605,575). Other principal cities are Goeteborg (Gothenburg, est. 1940, 281,302); Malmoe (155,465); Norrkoeping (70,835); Haelsingborg (62,310). Religion, Lutheran Christian. Ruler in 1941: King Gustavus V (*q.v.*); prime minister: Per Albin Hansson.

History.—In 1941, Sweden's fundamental problem was neutrality. By the events of 1940 she had been virtually surrounded by the expanding German reich, and forced into a certain economic dependence. In many ways pressure was severe, especially when Germany attacked the U.S.S.R. in June 1941. The nazis demanded passage across Sweden of a division of soldiers from Norway to Finland; and the Swedish government felt it necessary to grant the demand, calling it an isolated instance, necessary to uphold friendly relations. As the months went on, tension increased between Germany and Sweden. Several times there seemed to be a nazi press campaign against the Swedes who, according to German papers, were blind to the advantages of the "new order." The Germans asked why Sweden sent only 1,500 volunteers to Finland in 1941, while in the war of 1939–40, before Germany took up arms against bolshevism, Sweden had sent her neighbour 9,000 men. The Germans objected to the still-free Swedish press. Certainly Swedish opinion was divided regarding the Finnish-Russian war, and the former foreign minister, Rickard Sandler, had to appeal to the people to "understand Finland and hope with Norway."

Among the peoples fighting the axis, condemnation of Sweden blended with envy and respect. Free Norwegians tried to be satisfied with the Swedish resentment against the execution of Norwegian labour leaders, and they were thankful for the prefabricated houses sent them. Britain opened a new cultural relations office in Stockholm, and the U.S.S.R. agreed to a settlement with Sweden on claims in the occupied Baltic states (May 30). Swedish diplomats fell heir to a vast amount of business representing Germany in Egypt, Iceland, Greece; representing the U.S.S.R. in Germany, Finland, Hungary, Italy, Rumania and Slovakia; and representing the Netherlands, Norway, Ice-

land and Hungary in many places. With the United States, relations were cordial but contact was difficult; however, ships did get through to carry 41,000 Christmas packages (largely coffee and dried fruit) to Sweden in Dec. 1941.

Economically, Sweden suffered severely despite her neutrality. The poor crops of 1940 were not compensated for by the 70% harvest of 1941; shipping was reduced to about 50% of normal activity; livestock had to be slaughtered because fodder was not obtainable (some fodder was made of pulp wood). The food situation was bad, though not desperate; the larder was cut 7% in 1940, and probably about 20% in 1941. Coffee was nearly gone in Dec. 1941, after a last ration of one pound per person for the previous four months. Food and clothing were also rationed, and a man often carried as many as 25 ration cards. The famous smörgåsbord was prohibited in restaurants. Marine losses were heavy. Five out of 20 ships that attempted to sail the Atlantic were lost; three destroyers were blown up in an apparent accident; three steamers with cargo were confiscated by the Germans in Norwegian waters during the 1940 invasion. Also the beautiful "Kungsholm" was taken over by the United States and the reconstructed "Stockholm" was sold to Italy because no safe-conduct could be obtained to bring her home.

On the credit side of the ledger stood the completion of the Falsterbo canal in southern Sweden. This waterway, together with 20 mi. of dredged channel, permits Swedish vessels to pass from the North sea to the Baltic inside Swedish territorial waters and thus avoid German mine fields. Although pig iron was decreased in 1941 (because of shortage of coal) and rubber was short, the aluminum supply was sufficient, lubricants were being made from tar, copper production was up and iron ore maintained itself. Some 100,000 vehicles ran on wood or charcoal gas, and one ingenious baker ran his trucks on alcoholic vapour from bread dough. United States films were still getting through, and Sweden was creating a reserve of medical and other emergency supplies valued at more than 400,000,000 kronor.

Treaties were made for the commerce of 1942, providing *e.g.*, for a purchase of 50,000,000 kr. of goods from Norway. With Germany a treaty was made, carefully regulating the exchange so that no direct state credits were granted, and so that Germany should pay off her deficit of 100,000,000 kr. for 1941.

A critic of the compromises of Swedish sovereignty called the land "a country on vacation." If so, it was a tense and active vacation, with everyone professedly on the alert to man the guns if his neighbours took the one step too far.

Education.—In 1937-38, there were 567,579 pupils and 27,858 teachers in the elementary schools, and 90,087 students in secondary schools. In the five universities, 7,606 students were enrolled in 1940. Sweden's budget for educational expenses in 1941-42 was 256,387,000 kronor.

Defense.—Figures on defense were not available after the outbreak of war. Prior to Sept. 1939 the following facts were valid: All men 20–45 were liable to conscription. The infantry consisted of 20 regiments and one corps; cavalry of four regiments, artillery of seven regiments, the *Train* of four corps and the *Intendance* of three companies. The navy took about 5,000 annual conscripts and had a permanent body of about 5,500. On Jan. 1, 1941, the navy possessed eight coast-defense ships, two cruisers, ten destroyers, 21 torpedo boats and 16 submarines. The air force had not in 1938 reached its quota of 255 officers, 175 noncommissioned officers and 1,015 enlisted men. At the end of 1941, 16 squadrons were being planned. Total estimated expenditure for defense in 1940–41 was 2,055,206,000 kr., as compared with an average expenditure in the years 1931–35 of 122,601,600 kr.

Finance and Banking.—The monetary unit is the krona (26 U.S. cents at par, 23.94 cents on Nov. 8, 1941). Revenues, 1940–41, were 2,029,162,000 kr.; expenditures were estimated at 1,555,871,700 kr. The national debt on Dec. 31, 1940 was 4,518,002,412 kr. In 1940 there were 28 private banks with deposits of 4,793,477,000 kr.

Trade.—In 1940, exports amounted to 1,337,936,000 kr. (1,889,112,000 kr. in 1939) and imports 1,999,266,000 kr. (2,498,685,000 kr. in 1939). The chief articles of export in 1939 were paper and manufactures (500,466,638 kr.); iron and steel (269,741,501 kr.); iron ore (231,840,366 kr.); wood and wood products (215,286,956 kr.); nonelectrical machinery (114,812,455 kr.). Chief articles of import were coal and coke (260,801,838 kr.); nonelectrical machinery (225,159,463 kr.); iron and steel (219,410,306 kr.); vehicles and parts (140,920,390 kr.); mineral oils (134,339,796 kr.); electrical machinery (93,068,552 kr.). Exports went chiefly to Great Britain, Germany, the United States and Norway. These countries, plus Belgium and the Netherlands, supplied most of Sweden's imports.

Certain statistics announced for 1941 indicated that Germany delivered to Sweden only 3,200,000 tons of coal out of a promised 4,000,000 (normal imports of coal are 8,000,000 to 9,000,000 tons), and 230,000 tons of merchant iron out of the promised 305,000. In Sept. Germany was 72,000,000 kr. short of balancing her trade with Sweden. Total Swedish-German trade turnover of 1941 was 1,755,000,000 kr. (as of Dec. 15). Up to Oct. 1941, 18 ships from overseas had arrived in Gothenburg; 20 had gone out, of which five were lost. From Jan. to Oct. 1941, Sweden exported 981,000,000 kr. of goods and imported 1,205,000,000 kr.

Communication.—On Dec. 31, 1940 there were 10,231 mi. of railroads. In 1939 there were 53,787 mi. of highways, practically all listed as "improved." Motor vehicles licensed (Dec. 1940) numbered 81,334. Airways (1939) flew 1,536,000 mi. and carried 60,000 passengers. Telephones (Dec. 31, 1940) numbered 908,653 (about 145 per 1,000 people), putting Sweden second only to the U.S. in the per-capita ratio of telephones. Telegraph mileage was 11,040. There were 1,470,375 licensed radio sets and 35 broadcasting stations.

Sweden's merchant marine earned 442,000,000 kr. in 1940, up 2,000,000 from 1939. Some shipping was permitted by agreements with Germany and Britain, and Sweden attempted to make herself as independent as possible by dredging channels and cutting a one-mile canal through the Falsterbo peninsula in southern Sweden.

Agriculture.—The harvest of 1941 was reported to be about 70% of normal. The principal agricultural products in 1939, with yields in short tons, were as follows: sugar beets, 2,094,370; potatoes, 2,059,096; oats, 1,416,456; wheat, 941,364; mixed grain, 656,971; barley, 275,575; rye, 416,669.

Manufacturing.—The total value of production in 1939 was 8,151,768,000 kr. There were 644,360 workers in 19,092 establishments. The chief manufactures were machinery and metal, 2,518,576,000 kr.; wood and paper, 1,489,655,000 kr.; foods, 1,395,787,000 kr.; clothing and textiles, 801,799,000 kr.; chemicals, 392,569,000 kr.; electrical equipment, 302,984,000 kr.; beverages, 230,845,000 kr.; stone, etc., 229,054,000 kr.; and leather, 228,717,000 kr.

The relentless increase in prices was indicated by the wholesale price index (based on 100 for 1935), which rose from 115 in 1939 to a high of 175 in Sept. 1941.

Mineral Production.—Production of the leading minerals in 1939 was as follows: iron ore, 15,197,633 tons; iron and steel, 1,300,900 tons; cast iron, 709,923 tons; coal, 489,085 tons; arsenic ore, 267,065 tons; sulphur pyrites, 211,352 tons; fire clay, 153,168 tons. Silver production amounted to 7,226,855 oz.; gold, 2,149,220 oz. (F. D. S.)

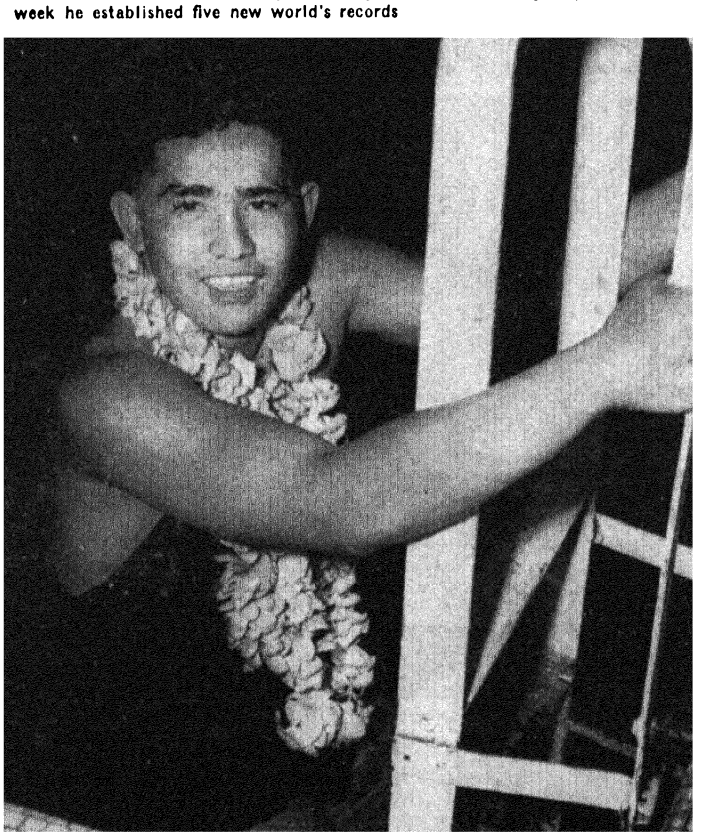
Swimming. The spread of international hostilities hit competitive swimming hard in 1941. Although the warring nations encouraged activities, conducting the usual national championships for women, girls and boys, most of them were obliged to cancel the senior title tests for men and all customary inter-

BILLY SMITH, 16-year-old Hawaiian swimmer, after he had set a new world's record of 2:07.7 for the 220-yd. free style at Honolulu May 16, 1941. In one week he established five new world's records



country matches.

The year's highlight was the leap to fame of a virtually unknown 16-year-old Irish-Hawaiian schoolboy, William Smith, Jr., of Honolulu. The lad gained recognition as the greatest middle-distance swimmer ever developed by breaking free-style world's records from 220 yd. to 800 m. His top feat, 9 min. 50·9 sec. for 800 m., attained in a 100-m. bath, is equal, allowing for the gain at the turns, to about 9 min. 43 sec. for the distance in a 50-m. pool, the length of course over which was set the listed standard of 9 min. 55·8 sec. Smith cut the marks for 220 yd. to 2 min. 7·7 sec. and 400 yd. to 4 min. 38·5 sec.

Five other world's records were bettered by swimmers of the United States. Adolph Kiefer clipped the back-stroke figures for 100 yd. to 57·8 sec.; 150 yd. to 1 min. 30·4 sec.; 200 m. to 2 min. 23 sec., and 400 m. to 5 min. 10·9 sec. Teams representing Yale, Michigan and the Chicago Towers club shaded the 400-yd. relay record of 3 min. 30·7 sec., a Yale four taking final possession in 3 min. 27·7 sec.

Very little news emerged from Europe, but Artem Nakache of France was credited by cable with lowering the 200 m. breast-stroke world's record for men from 2 min. 37·2 sec. to 2 min. 36·8 sec. No official confirmation arrived.

Notable were the great strides made throughout Central and South America. The swimmers of El Salvador, in particular, improved so amazingly that they were able to break all national records for men and women by wide margins.

Five South American champions engaged in a competitive tour of the United States and garnered their good share of the laurels. Miss Maria Lenk, of Brazil, only woman member of the team, more than once beat North American breast-stroke records. Hawaiians scored their third and greatest triumph in the outdoor championships of the United States, winning eight of ten swimming events and running up a huge total of 71 points.

(L. DE B. H.)

Switzerland, a confederation of west-central Europe, bounded N. and E. by Germany, S. by Italy and W. by France. Area 15,944 sq.mi.; pop. (est. 1941) 4,200,000. Chief towns: Berne (cap. 121,976), Zürich (329,780), Basle (162,559), Geneva (123,286), Lausanne (89,632). Government: republican confederation of 22 cantons, joined together by the federal constitution of May 29, 1874, but with large powers of local control retained by each canton; central executive, a federal council of seven members; president (Jan. 1, 1942), Dr. Philippe Etter. Languages (census 1930): German 2,924,314; French 831,100; Italian 242,034; Romansch 44,204, and others 24,797. Religion (1930): Protestant 2,230,536; Roman Catholic 1,666,317; Jews 17,973.

History.—The party composition of the national council, or lower house of the federal legislature of 187 members, was as follows, according to the elections of Oct. 1939: government coalition: Radical Democrats 50; Catholic Conservatives 44; Farmers, Traders and Citizens 21; other parties: Liberal Democrats 6; Independents 9; Young Farmers and Free Democrats 6; Social Democrats 45; Dissident Socialists 4; no party 2.

With a sturdy citizen militia, good mountain defenses, and a firm neutral policy, Switzerland continued in 1941 to remain a haven of peace and security in the midst of a war-torn Europe. On Aug. 1, 1941, the whole country celebrated in traditional fashion the 650th anniversary of independence.

With the French collapse in June 1940, the Swiss position had become critical. The country was thenceforth ringed about by territory under nazi or fascist control. Its profitable tourist trade evaporated. It had to support thousands of refugees who poured across its frontiers from France, as well as some 60,000 French soldiers who sought protection under the Swiss flag and were interned for the duration. The German and Italian press complained loudly and threateningly that the Swiss newspapers were pro-British because they printed British war communiqués.

BELATED CHRISTMAS PACKAGES for British prisoners in Germany, stacked in a railroad station at Geneva, Switzerland in the spring of 1941. Switzerland acted as mediary for the daily delivery of more than 60,000 pieces of mail between the belligerents during the year

After the declarations of war by Japan, Germany and Italy against the United States in Dec. 1941, the Swiss government consented to take care of the interests of both groups of belligerents in addition to the burden already assumed of representing the interests of numerous other countries at war.

Economic Conditions.—After the German occupation of France in 1940, Switzerland was almost completely cut off from trade with overseas countries and was forced into greater economic dependence on Germany. By a commercial treaty signed July 19, 1941, Germany extended until the end of 1942 her clearing agreement with Switzerland and agreed to deliver monthly 13,500 tons of iron and 14,500 tons of petroleum, plus certain amounts of sugar, potatoes, alcohol and poultry feed; in return the Swiss were to supply cattle, fruits and milk products.

Rationing of seven food products was introduced soon after World War II began. Gradually the rationed items were extended and the allotments were cut down. The rations in Dec. 1941 included 14 oz. of cheese, three eggs, and 200 gr. of tea, coffee, cocoa or substitutes per person per month, and were estimated to provide a total of 2,311 calories, as compared with the average U.S. daily diet of about 3,000 calories. Syria and Lebanon. Independent republics, formerly French mandated territories, bordering the eastern Mediterranean south of Turkey. Area 77,700 sq.mi.; pop. 3,600,000; chief towns: Damascus (cap. of Syria, 225,000), Beirut (cap. of Lebanon, 180,000). Commander-in-chief in the Levant: General Catroux; president of Syria: Sheik Taj-ed-Dine-el-Hassani; of Lebanon: M. Naccache. Language: Arabic; religion, Mohammedan.

History.—At the beginning of 1941 the economic situation in Syria and Lebanon was rapidly deteriorating, owing to the British blockade and to the requisitioning by the German and Italian armistice commissions of all raw materials and food stocks. On March 12 insurrections took place all over Syria and Lebanon. Gen. Henri Dentz, who had been appointed high commissioner and commander-in-chief in the Levant by the Vichy government in Dec. 1940, tried at first to suppress the uprisings, and was forced to proclaim a state of siege in many Syrian cities (Mar. 25). Meanwhile negotiations with the nationalist leaders for the application of some kind of Franco-Syrian treaty were proceeding without great success.

In May the activities of German agents in the near east culminated in the Rashid Ali revolt in Iraq. It then became known that the Vichy authorities and Gen. Dentz, instead of practising strict neutrality, were allowing the use of Syrian aerodromes by German aircraft, and sending war materials to the Iraqi rebels. In view of this, the British and Free French took action to prevent the establishment of axis forces in Syria. Operations started on the morning of June 8, and proceeded with caution so as to avoid unnecessary bloodshed and destruction. They were terminated by the convention of Acre, signed July 12. (*See* WORLD WAR II.) The military occupation of Syria was then undertaken by the British and Free French forces. The civil administration was entrusted to Gen. Catroux, Free French delegate-general and plenipotentiary, and commander-in-chief of the Free French forces in the Levant. On the day the Allied troups entered Syrian territory, Gen. Catroux in the name of Gen. de Gaulle (*q.v.*) and Free France published a proclamation in Cairo addressed to the Syrian and Lebanese peoples in which he stated his intention "to put an end to the regime of the mandate and to declare those peoples free and independent." This declaration of independence and sovereignty was guaranteed by the British government and was preceded and followed by a statement that "Great Britain has no territorial ambition whatsoever in Syria and the British government recognizes the particular historical and other privileges of France in these territories," made by the prime minister and the foreign secretary of Great Britain. The necessary consent to put a legal end to the mandate regime was to be asked in due course of the League of Nations and the U.S.A., which have a special convention with France (1924) in regard to their privileges in Syria and Lebanon.

In August General de Gaulle paid an official visit to Syria and Lebanon. The independence of Syria was officially proclaimed by Gen. Catroux Sept. 27, and that of Lebanon Nov. 26. Both the president of the Syrian republic, Sheik Taj-ed-Dine-el-Hassani, and the president of the Lebanese republic, M. Naccache, promised equality of rights to every religious sect and individual liberty to members of all races and nationalities.

Finance.—Monetary unit, the Syrian pound (divided in 100 piastres). Revenue 1938 (at the rate of 20 francs=one Syrian pound) 588,787,596 francs. Expenditure 509,085,433 francs. Notes in circulation (June 30, 1939) £ Syrian 35,600,000; reserves (June 30, 1939), gold £ Syrian 3,500,000; foreign assets £ Syrian 31,800,000.

Trade and Communication.—Imports (1938) £ Syrian 64,500,000; exports (1938) £ Syrian 29,300,000. Roads (1939) *c.* 1,900 mi.; railways (1939) 890 mi.

Agriculture.—(1939) metric tons: wheat 607,000; barley 370,000; maize (1938) 27,500; oats 5,400; potatoes (1938) 41,600; tobacco 3,400; wine (1938) 43,000 hectolitres; cotton (1938) 8,400; cotton-seed (1938) 17,600; sesamum (1938) 5,300; olive oil (1938) 15,300; wool (1938) 9,900; raw silk 200. (*See* also FRENCH COLONIAL EMPIRE.)

Syrup, Sorgo and Cane.

Among the foods contributing to the national supply of sweets, with the United States experiencing a sugar shortage, were syrups or molasses made from sweet sorghum[1] and from sugar cane. In the early settler days of the middle west, sorghum or sorgo was often the only sweetening used, sugar not being available. Settlers called sorghum syrup "long sweetening," and sugar "short sweetening." Sorghum syrup is produced in 17 states and the production in 1941 was 11,681,000 gal. from 190,500 ac.; yield, 61·3 gal. per ac. Production in 1940 was 11,267,000 gal. Syrup produced from sugar cane in the United States in 1941 was 18,374,000 gal. from 113,000 ac., produced in eight southern states. Production in 1940 was abnormally low, 13,415,000 gal. (*See* also BEE-KEEPING; MAPLE PRODUCTS.) (S. O. R.)

[1]Sweet sorghum is also grown extensively in the United States for forage and hay, a crop of 15,040,000 tons having been produced from 8,582,000 ac. in 1941. Grain sorghums (non-saccharine) produced 153,968,000 bu. of grain from 8,903,000 ac. in 1941; grown chiefly in subhumid areas of the United States.

Table Tennis.

For the second successive year the war in 1941 caused cancellation of the International Table Tennis federation's world championship matches for teams and individuals. The influx of young stars into the armed forces, combined with the compact nature of the game, made table tennis one of the most popular forms of indoor recreation at military posts in all the nations at war. International competition being out of the question, national associations in Europe confined their activities largely to staging exhibitions for the Red Cross and similar organizations; in England more than £3,000 was raised through the exhibitions of two former world singles champions, Viki Barna and Richard Bergmann.

There were no changes in the playing rules except in the U.S.A., where a new ban on all types of finger-spin services was pronounced successful after a year's experiment and where the regulations against strictly defensive play were tightened. Louis Pagliaro and Sally Green retained their U.S. national singles titles, New York retained the national team title, and Culver-Stockton college won the Bradley intercollegiate trophy. (C. Z.)

Tagore, Sir Rabindranath

(1861–1941), Indian poet and author, was born May 6 in Calcutta, India. The famous Indian poet and philosopher, who won the Nobel prize for literature in 1913, took up painting at the age of 68 and exhibited his works in Moscow, Berlin, Munich, Paris and New York city.

He delivered the Hibbert lectures at Oxford, England, in 1930 and published his last work in English, *The Religion of Man*, in 1931. He died in Calcutta after a long illness, Aug. 7. (See *Encyclopædia Britannica.*)

Taiwan: *see* FORMOSA.

Talc.

The production of talc and the related minerals, ground soapstone, pyrophyllite and pinite, reached a new record high in 1940, with sales totalling 281,375 short tons, an increase of 11% over previous record figure of 1939. Canadian production, usually of the order of 10,000–15,000 short tons annually, was reported by value only in 1940, at $229,640, a gain of 35% over 1939.

South Africa had a small output, 1,757 short tons of talc in 1940, but that of pyrophyllite approached 10,000 tons.

A new deposit of talc was opened in Newfoundland, and shipments were made to England, in the attempt to replace material formerly imported from Manchoukuo.

World production was of the order of 550,000–560,000 metric tons, of which the United States supplied about 46%, Manchoukuo 14%, France and Italy 10% each, Norway and India 5% each, with a number of smaller producers. (G. A. Ro.)

Tariffs. War superimposed upon tariff systems other and more direct methods of controlling trade, notably licensing requirements and exchange controls. Direct controls became more numerous, more complicated, and more drastically applied.[1] Generally tariffs were left unaltered when direct controls were established, but in a few cases import duties were eliminated (*e.g.*, British duties on machinery) to avoid restricted supplies and higher domestic prices; or tariffs or fees were raised in order that the higher prices might contribute to the state revenues. The year 1941 did not bear out the professions of the Germans that they were establishing a multilateral clearing centre in Berlin for the trade of Europe. They, in fact, kept a tight rein on continental trade either by direct administration or by centring control in a bilateral arrangement with each single country, by controlling agreements of other countries with each other, and by not allowing the free transfer of credits in Berlin.

Except for certain Trade Agreements (*q.v.*) in the Americas, the history of tariffs was relatively unimportant in 1941. This was true despite a world-wide tendency toward greater flexibility in tariffs through progressive transfer of power of control from legislatures to executives. "In Aug. 1939—that is, before outbreak of the war—the executive branches of most European governments had almost unlimited authority to alter import duties."[2] In the British Dominions and in many Latin-American countries executive powers were less sweeping; and in Latin-America the war did not produce the sweeping changes that characterized the British Dominions.

The belligerents made relatively little use of the tariff as a means of controlling trade. The government of the United Kingdom, for example, in 1941, made or extended perhaps a dozen minor tariff changes; but they issued some scores of orders relating to import or to export licences and some 2,000 statutory rules and orders to regulate domestic production, distribution and prices. The free entry of certain fish was extended for a year, certain excises on medicinals were repealed, certain gifts were exempted from duty, and several chemicals, from key industry duty. Military equipment and supplies for American naval and air bases in British possessions in the western hemisphere were made exempt. While it was essentially only a matter of bookkeeping, there was an exemption from duty of a considerable list of products of which the imports were mainly for government account.

Throughout the world even among the non-belligerents, the stress of war's insatiable hunger shifted the emphasis of governmental policies from promotion of exports to promotion of imports. Turkey's change of slogan was significant. It was: "We buy from those who buy from us." It became: "We sell to those who sell to us." The change of emphasis, however, showed itself only in limited degree in reductions of import duty. There were, however, widespread increases of export duties and licence restrictions or embargoes on exports, to reserve supplies for the country of production. Barter and compensation agreements, such as those forced by axis neighbours on Sweden and Switzerland, favoured imports into countries which held the whip hand.

United States.—Throughout the world generally, 1941 saw the usual scattering increases of duties on revenue-producing imports as well as for protective purposes, and scattering reductions on raw materials or on necessities whose enhanced prices made importation burdensome. The government of the United States almost alone continued through 1941 a policy of general tariff reductions by making trade agreements with other countries. The twelfth trade agreement with a Latin-American country, that with Argentina, became effective Nov. 15, 1941. In this agreement Argentina reduced its tariff rates on 39 classifications of goods, covering about 18% of the United States exports to Argentina, although certain reductions were not to become effective until the customs revenue had further recovered. The United States granted reductions on imports representing in 1940 44·5% of total imports from Argentina, and larger percentages in earlier years. Argentina cut her rates generally by 30% to 50%; many of the rates were estimated to be equivalent to 50% to 100% ad valorem, with some on automobile parts ranging to higher levels. The United States halved or approximately halved import duties equivalent to from 60% to 120% ad valorem on canned or cured meats, oleostearine, some wools, casein and tallow. On two of the major items, quebracho extract and hides, rates of 15% and 10% were halved. The duty on flaxseed was cut.

The United States on Dec. 23 signed a second supplemental trade agreement with Cuba to become effective Jan. 5, 1942. It pledged further concessions on sugar and tobacco, bringing the reductions to one-half of the statutory rates. The Cuban reductions were chiefly on fruits, vegetables and a few other edibles, and generally meant new or further cuts by one-quarter to one-half.

Also on Dec. 23 President Roosevelt announced approval of the declaration of policy of the Joint War Production Committees of Canada and the United States, including the statement that "Legislative and administrative barriers, including tariffs, import duties, customs and other regulations or restrictions of any character which prohibit, prevent, delay or otherwise impede the free flow of necessary munitions and war supplies between the two countries should be suspended or otherwise eliminated for the duration of the war." This remained to be implemented.

The United States gave notice of trade negotiations with Chile, Uruguay, Iceland and Peru. It was known that informal discussions were begun with Mexico and certain British Dominions.

On the other hand, under the flexible tariff law, the United States raised the duty on crab meat from 15% to 22½% ad valorem (Sept. 21); and in connection with domestic price raising measures, limited imports of wheat and wheat flour to annual quotas of 800,000,000 bu. and 4,000,000 lbs. (May 29).

South America.—The ministers of finance of Brazil and Argentina signed an agreement on Oct. 6, 1940, expressing adherence in principle to the idea of complementary rather than competitive development of their countries. Following this a conference of representatives of Argentina, Brazil, Chile, Bolivia and Paraguay, Jan. 27 to Feb. 6, 1941, agreed on 9 conventions and 17 resolutions in the sense of encouraging trade between them. The conventions related to parcel post, tourist travel, free passport visas, transit trade, pipelines, etc. A Regional Office of Economic Studies was to be established. The difficulties of the landlocked states, Bolivia and Paraguay, were recognized especially in an undertaking not to claim under the most-favoured-nation clause any favours extended by any signatory power to these states and to no others.

A treaty of Jan. 23, 1940, between Argentina and Brazil containing lists of tariff reductions became definitively effective on Nov. 11, 1941.

On Nov. 21, 1941, Argentina and Brazil signed a treaty "with the object" according to the preamble, "of arriving at the progressive establishment of a system of free interchange which will enable the arrival at a customs union between the Argentine Republic and the United States of Brazil, open to limitrophe countries, which would constitute no obstacle to any broad program of economic reconstruction which, on the basis of the reduction or elimination of customs tariffs and other commercial preferences, tends to promote international trade on the multilateral and unconditional principle of the most-favoured-nation."

The two countries agreed to promote establishment of new industrial, agricultural and livestock activities not, up to then, in existence in either country, and they agreed to admit products of such industries free of duty for 10 years, and without other restrictions, and to protect them against dumping from outside sources. Articles produced in only one of the countries would not be met by protective duties in the other, but rather would receive special preferences, not to be extended to other suppliers.

Brazil and Chile agreed upon lists of tariff reductions, provisionally effective Dec. 15, 1941.

By the treaty of Oct. 15, 1941, Guatemala and El Salvador agreed upon a large measure of free trade between the two countries, and on Aug. 26, Haiti and Santo Domingo signed a treaty for mutual reduction of tariff rates. By a convention of Sept. 24, 1940, the United States abandoned its supervision of the Customs Administration of Santo Domingo, effective April 1, 1941. (*See* also TRADE AGREEMENTS.)

United Kingdom.—In the Dominions, as in all regions of the United Kingdom, direct war controls were vastly more important than changes in

[1] The District Bank, Limited, published a Digest of the United Kingdom Exchange Regulations, in 55 pages.

[2] U. S. Tariff Commission, Regulation of Imports by Executive Action, 1941.

tariff rates. However, the Canadian budget effective April 30, 1941 cut in half most of the duties on products of Britain, although woollens and footwear were reduced by only one-quarter, and no reduction was made on alcoholic beverages, tobacco, sugar and silk. This action was to be valid for the duration of the war. It was inspired by warring Britain's acute need of foreign exchange; and it was unusual in that in the past Canadian discriminations against United States trade were increased chiefly by raising rates on imports from outside of the empire rather than by lowering the rates for British products. In June and later many British products were exempted from dumping duty, *i.e.*, they were freed from penalty if the export values were declared without including the British taxes of 16⅔% or 33⅓%; and in December the whole anti-dumping law was suspended except in respect of fruits and vegetables. In November munitions and supplies of war were exempted from duty, and the lists of exports embargoed were enlarged and consolidated, and further enlarged effective Dec. 30, after the United States set up war embargoes. During the year Canada signed most-favoured-nation treaties with Paraguay, Chile and Ecuador. Ecuador removed from Canadian products the 50% surtax imposed under the trade-balancing policy.

In Australia the quota and licence systems were drawn closer, and the sales taxes (applicable also to imports) previously 5%, 10% or 15% ad valorem were made more commonly 10% or 20%. On imports the sales tax was levied on the duty-paid value, *i.e.*, it might amount to 40% of the price at which the foreign supplier sold the article.

South Africa increased rates on cigarettes, beer and gasoline; and granted rebates, generally of the whole duty, on numerous materials and findings of various industries. New Zealand, chiefly by licences and quotas, maintained as far as possible the policy of confining trade to the United Kingdom.

India raised specific rates on certain textiles, and reduced the duty on wheat to the nominal rate of two annas per cwt. (B. B. W.)

Tasmania. A state of the Australian commonwealth, forming an island 26,215 sq.mi. in area to the southeast of the mainland, from which it is separated by 140 mi. of Bass strait. Pop. (est. Dec. 1940) 243,057. Chief towns: Hobart (cap., 65,450); Launceston (33,250). The state governor in 1941 was Sir Ernest Clark.

History.—The Labour government, under the premiership of R. Cosgrove, continued in office during 1941. The state budget resulted in a deficit of £180,000 as compared with the estimate of £220,000.

Agricultural conditions were favourable, and the allotted quota of 15,000 acres of flax was planted during the season. There was an active demand for Tasmanian hardwoods both on the mainland and in New Zealand. The government planned a vigorous reafforestation policy in view of the big expansion of this industry which seemed likely to develop in the next few years.

Manufacturing industries worked to full capacity, and by the end of 1941 there was a pronounced shortage of skilled workers. In July the federal government announced that, in accordance with its plans to spread its munition factories throughout the commonwealth, a gun ammunition factory was to be erected in Tasmania at a cost of £500,000.

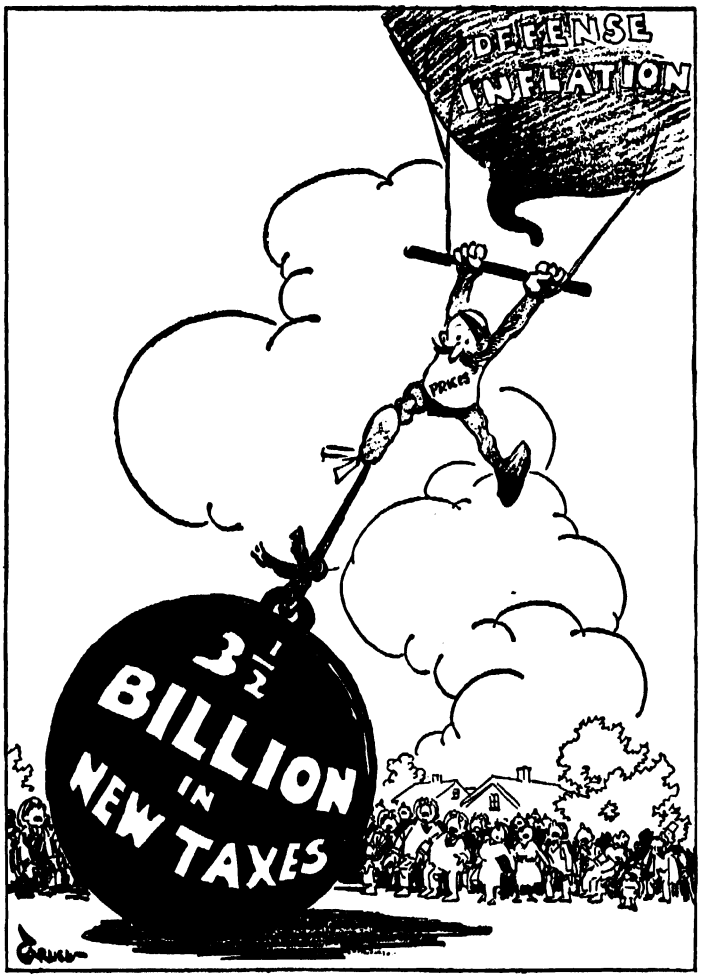
Finance.—Revenue (1940–41), £A2,920,000; expenditure £A3,110,000; public debt (June 30, 1941), £A218,162,000.

Communication.—Dec. 31, 1939: roads, 9,350 mi.; railways: government, 658 mi.; private, 132 mi. Motor vehicles licensed (March 31, 1941): cars 17,964; trucks 5,493; cycles 3,342. Wireless receiving set licences (March 31, 1941) 44,513. Telephones (June 30, 1939) 18,013.

Industries.—Production 1938–39: primary £A8,142,441; secondary £A5,398,659. Labour, 1939–40 average: factory employment, 13,970 employees; unemployment (March, 1941) 3.6%. (W. D. Ma.)

Tassin, Algernon de Vivier (1869–1941), U.S. author and educator, was born Dec. 11 in Fort Halleck, Nev. After receiving his M.A. from Harvard in 1893, he became an actor and playwright but deserted the stage in 1905 to lecture at Columbia university. He was named associate professor of English in 1931, retiring in 1941. He originated the course, "The Analysis of the Written Word," which stressed the value of oral reading of literary selections. Tassin was the author of *The Magazine in America* (1916); *The Craft of the Tortoise* (1919); *The Rainbow String* (1921) and *The Oral Study of Literature* (1923). He died in Montclair, N.J., Nov. 3.

Taxation. "Runaway taxation," as the result of growing fear of "runaway inflation," was the prospect faced by the people in the United States as the year 1941 drew to a close. Already a reality was the $3,500,000,000 Revenue act of 1941, the heaviest taxation measure ever passed by the congress of the United States. The additional revenue produced by this legislation was expected to bring total annual tax receipts of the federal government to between $12,000,000,000 and $15,000,000,000, depending upon the size of the national income. The rate of increase in national income, as governmental spending accelerated during the final quarter under the defense production program and the entry of the United States into the world-wide war, indicated a record-breaking total of approximately $95,000,000,000. It was estimated that the revised federal revenue code would produce about $15,000,000,000 a year were the national income to reach $100,000,000,000.



THE TAX BILL OF 1941 was effective in delaying "the balloon ascension," observed Carlisle of the *Des Moines Register*

But before the ink had dried on the president's signature (Sept. 20) to the Revenue act of 1941, it was apparent to close observers of fiscal affairs that even $15,000,000,000 a year in revenue would be wholly inadequate to finance even a reasonable proportion of the colossal undertakings of the United States government. Earlier in the year Secretary Morgenthau had announced the aim of the treasury department, in the interest of fiscal solvency, to raise by taxes at least two-thirds of the government's expenditures, thus limiting borrowing to one-third. However, the realization of this worthy ambition seemed hopeless as each succeeding month recorded vastly increased expenditures requiring borrowing at the rate of 50% or more of treasury outgo.

Demands of Secretary Morgenthau, certain members of congress and prominent individuals and organizations all over the country for immediate elimination of all unnecessary nondefense expenditures—estimated to save from $1,000,000,000 to $2,000,000,000—were met by feeble gestures from congress and the White House.

No worthwhile savings were made. Congress did, nevertheless, create in the Revenue act a joint congressional-administrative committee to investigate the federal budget and recommend possible savings, based upon a report of the director of the budget bureau.

The result of the committee hearings indicated possible curtailment of nondefense spending for the fiscal year beginning July 1, 1942, but no appreciable savings for 1941 or the early part of 1942. (C. A. Sr.)

Income Tax.—The income tax is the most important single source of tax revenue for the federal government. In the fiscal year 1941, federal income tax collections amounted to $3,462,038,000, or 47% of total federal internal revenue and customs. The individual income tax accounted for $1,417,655,000, and the corporation income and excess profits tax for $2,044,373,000.

Income taxes produced 12%. of estimated total state tax revenues (exclusive of unemployment compensation taxes) during the fiscal year 1941. Collections from this source were at an all-time high of $420,000,000 in 1941. This amount compared with $358,000,000 in 1940 and $233,000,000 in 1930.

Individual Income Tax.—The Revenue act of 1941, applicable to taxable years beginning after Dec. 31, 1940, made extensive changes in the federal income tax. Personal exemptions were lowered, surtax rates were substantially increased, a simplified return was provided for small taxpayers, and special provision was made with respect to reporting of income from noninterest-bearing securities sold at discount.

Personal exemptions were lowered from $2,000 to $1,500 in the case of married persons and heads of families and from $800 to $750 in the case of single persons. The 1941 act did not change the $400 credit for dependents but provided that a dependent counted to constitute an individual as head of a family cannot be counted again as a dependent for purposes of the $400 credit. Formerly, an unmarried person (or a married person not living with husband or wife) maintaining a home for a person who also qualified as a dependent received in addition to the personal exemption as head of a family a credit of $400 for such dependent.

Surtax rates under the 1941 act ranged from 6% on the first $2,000 of surtax net income to 77% on the portion of surtax net income in excess of $5,000,000. These rates included the 10% defense tax which was formerly imposed separately. The surtax rates applied to the entire surtax net income; formerly, the first $4,000 of surtax net income was exempt from surtax. The normal tax rate of 4% was not changed.

In order to simplify the preparation of returns and the determination of tax for the small taxpayer, a simplified tax return, the use of which was optional, was provided for individuals with gross incomes of $3,000 or less derived solely from salaries, wages, compensation for personal services, dividends, interest, rent, annuities and royalties. A schedule on the return indicated the amount of tax to be paid at various levels of gross income by persons of different marital status. To determine the amount of his tax, an individual merely ascertained the amount of his gross income, subtracted $400 for each dependent for whom a credit was allowable and referred to the schedule to find the amount of his tax. The taxes shown in the schedule were computed to recognize personal exemptions and average deductions (interest paid, taxes paid, etc.) not allowable if the schedule was used. Nonresident alien individuals, estates or trusts were not allowed to use the simplified method.

The tax on nonresident alien individuals not engaged in business or having an office in the United States was increased generally from 16½% to 27½%. Under prior law, these rates as applied to residents of a contiguous country could be reduced to not less than 5% by treaty. The 1941 Revenue act authorized this reduction by treaty in the case of residents of any country in North, Central or South America, the West Indies or Newfoundland.

With respect to income from noninterest-bearing securities issued at a discount (of which the notable example was U.S. defense savings bonds), the 1941 Revenue act extended to taxpayers on the cash basis the privilege of electing to report as income the increase in the redemption price as it accrues. Under prior law, a taxpayer on the accrual basis reported the increment on such securities as it accrued, whereas a taxpayer on the cash basis was required to treat the entire increment in value as being income in the year of redemption or maturity.

Federal income tax data for 1939, compiled from income tax returns filed in 1940, showed that in that year there were 7,715,660 individual and taxable fiduciary returns of which more than half were taxable. Net income in excess of $15,000,000,000 was reported on taxable returns and total tax liability was $928,700,000. Preliminary statistics for 1940, which reflected the lowered exemptions of the Revenue act of 1940, indicated that the total number of returns increased to 15,246,000, of which 7,520,000 were taxable. Returns for 1941 which would reflect the further lowering of exemptions under the Revenue act of 1941 were expected to reach 22,007,000, of which it was estimated 13,200,000 would be taxable.

Individual income was in 1941 taxed in 31 states and the District of Columbia. In all but three of these, the rates were progressive, the minimum rates ranging from 1% to 3% and the maximum rates from 3% to 15%.

Four additional states taxed income from intangibles at flat rates. Five states in the above two groups imposed surtaxes, two of which applied only to income from intangibles and one to income from speculative transactions. With one exception, surtaxes were imposed at flat rates.

In no instance, however, did the maximum state income tax rate, including both normal and surtax, exceed 15%. Moreover, 22 states permitted the deduction of federal income taxes from gross income in computing net income for individual income tax purposes. The provision which permitted this deduction was adopted in Idaho in 1941. In the same year, Wisconsin, which formerly allowed the total amount of federal income taxes to be deducted, limited the deduction to 3% of net income. As a result of the lowering of personal exemptions under the federal income tax by the 1941 Revenue act, the federal tax in 1941 reached lower income groups than those reached by state income taxes. The personal exemptions allowed under state income taxes were at a higher level in 28 states for single persons and in 26 states for married persons. Credit for dependents was the same as the federal in 13 states, lower in 17 states and higher in 2 states.

Although some states preceded the federal government in employing the income tax, more than half the states imposing it in 1941 adopted it in 1929 or thereafter. After 1937, no additions were made to the list of states which tax income. Constitutional amendments authorizing the imposition of graduated personal net income taxes were proposed by the Pennsylvania and Washington legislatures in 1941 and were to be submitted to the electorate for approval. Philadelphia's tax on earned income of individuals and unincorporated business represented the only locally imposed income tax in the United States.

The states made numerous revisions in individual income taxes during 1941. Maryland lowered its rates, and South Dakota both lowered the rates and increased the exemptions. West Virginia increased the rates on incomes of $4,000 and over. New York's emergency 1% tax was permitted to lapse, but Massachusetts and Wisconsin extended their temporary surtaxes. Massachusetts also enacted an additional 3% surtax, the proceeds of which are to be used for old-age assistance.

California added a new section to the individual income tax which affords relief to persons receiving lump-sum payment for personal services rendered over a period of five calendar years or more by providing that the tax shall not exceed the amount due had such income been received in equal proportions in each of the years included in the period. This provision was similar to one adopted in 1939 in connection with the federal individual income tax.

Corporation Income and Excess Profits Tax.—The Revenue act of 1941 made no important changes in normal tax rates on corporations. The 10% defense income tax was integrated with the basic rate, and the resulting rates were rounded to the nearest per cent. A surtax of 6% on the first $25,000 of surtax net income and 7% on the balance was imposed.

The normal tax rate applicable to corporations with normal tax net incomes of more than $25,000 or less were taxed at lower graduated rates, ranging from 15% to 19%. In the case of corporations with incomes of slightly more than $25,000, the law provided for an alternative tax which was designed to accomplish a gradual transition between the tax on corporations with net incomes of $25,000 and less and the tax on those with net incomes in excess of that amount.

The rate of tax on nonresident foreign corporations, not engaged in business within the United States and not having an office or place of business therein, was increased from 16½% to 27½% on dividends, interest and other fixed or determinable annual or periodical income from sources within the United States. The rate of withholding at source was increased accordingly. In the case of nonresident corporations organized under the laws of any country in North, Central or South America, or in the West Indies or Newfoundland, these rates might be reduced by treaty.

Corporations were subject to an excess profits tax which was enacted in 1940 and made applicable to taxable years beginning after Dec. 31, 1939. This tax was retroactively amended by the Excess Profits Tax amendments of 1941 and was again amended by the Revenue act of 1941. The changes made by the Excess Profits Tax amendments of 1941 were in the nature of relief provisions which were concerned with: (1) the carry-over of unused excess profits credit to succeeding years; (2) the restoration to base period income of abnormal deductions; (3) relief for corporations that experienced rapid growth during the base period; (4) relief in cases of abnormal conditions during the base period; and (5) the use of predecessor's earning experience by corporations resulting from tax-free exchanges or reorganizations.

The chief changes in the excess profits tax by the Revenue act of 1941 were: increases in rates, reduction in invested capital credit, reversal of the deduction for income and excess profits taxes and more liberal allowances for new capital.

The excess profits tax rates were increased by 10 percentage points in each bracket and ranged from 35% on the first $20,000 of adjusted excess profits net income to 60% on all adjusted excess profits net income in excess of $500,000.

Corporations were permitted an excess profits credit which might be computed under the income plan or under the invested capital plan. Under the former, the credit was 95% of average excess profits net income for the base period 1936–1939. Prior to the 1941 changes, the invested capital credit was 8% of invested capital (equity invested capital plus 50% of borrowed capital). Under the new law, the credit was 8% on the first $5,000,000 of invested capital and 7% on the remainder. In order to provide more liberal credit where new capital had been added, the definition of equity invested capital was amended in 1941 to allow new capital to be counted at 125% of its value.

Under the prior law, the income tax was allowed as a deduction in the computation of the excess profits tax. In order that excess profits net income might not be reduced by that part of the income tax which was computed on income not subject to the excess profits tax, the deduction was reversed. As a result, the excess profits tax might be deducted in computing normal tax and surtax, but the normal tax and surtax could not be deducted in computing the excess profits tax.

General corporation income taxes were also levied by 32 states and the District of Columbia. One additional state restricted its corporate tax to income from intangibles. Seven states imposed graduated rates, the minimum rates ranging from 1% to 3% and the maximum rates from 5% to 8%. The other 26 states and the District of Columbia imposed flat rates, ranging from 1½% to 8%. Rates of 2%, 4% or 6% were most frequent.

During 1941, corporate tax rates were reduced by South Dakota. Arkansas changed from a flat rate of 2% to a rate graduated from 1% on the first $3,000 of net income to 5% on all income in excess of $25,000. Massachusetts and New York extended the temporary additional taxes on corporations, and Massachusetts enacted an additional surtax of 3% for purposes of financing old-age assistance.

The deduction of federal income taxes from gross income in computing net income for state corporate income tax purposes was permitted in 19 states prior to 1941. During 1941, Idaho was added to the list of states permitting this deduction, and Wisconsin revised its provision to limit the deduction to 10% of net income.

Preliminary federal income tax statistics for 1939 showed that 515,960 corporations filed income tax returns for that year, of which 199,479 reported net incomes and 270,138 reported deficits. The remaining 46,343 corporations were inactive during 1939. The aggregate net income of the corporations reporting net incomes was $8,826,713,029; the total deficits of the corporations with no net income were $2,092,147,535. Returns with net income indicated a total tax liability of $1,232,256,254, including $1,216,450,292 income tax and $15,805,962 declared value excess profits tax.

(R. BL.)

"Nuisance" Taxes.—Under the revised law, corporations and the consuming public will pay close to $1,000,000,000 a year in new and increased excise or "nuisance" taxes. These include higher taxes or new taxes on billiard and pool tables, pin-ball machines, bowling alleys, playing cards, sporting goods, distilled spirits, brandy, wines, automobiles and trucks, tires and tubes, admissions, cabarets, club initiations and dues, radios, fancy matches, safety deposit boxes, cosmetics, perfumes, long distance telephone calls, telegraph, cable or radio messages, monthly telephone bills, wire and equipment service, electric light bulbs, luggage, gas and oil appliances, photographic apparatus, electric signs, various rubber articles, commercial washing machines, optical equipment, furs, jewellery, transportation of persons by rail, air or water, and sundry other things. The excise taxes became effective October 1 in most instances. A new kind of tax, a "use tax," is imposed on automobiles and motor boats. The owner of an automobile is assessed $5 a year for its use, and a graduated tax is levied on owners of motor boats. The new excise tax schedule is expected to add $1,000,000,000 a year to the revenue derived from so-called "hidden taxes."

Estate and Gift Taxes.—Estate and gift taxes were increased. Estate taxes continued to allow a $40,000 credit and then start the imposts at a rate of 3% on the first $5,000 of taxable estate. Then they rise sharply until a tax of 77% is reached for amounts above $10,000,000. Gift taxes start, after the same $40,000 exemption, at 2¼% on the first $5,000 of net and climb to 57¾% after passing the $10,000,000 amount.

Corporation Taxes.—Corporation taxes were sharply increased also. A new surtax on corporate earnings was imposed, starting at 6% on earnings of $25,000 or less and moving up to 7% on all above that figure. Increase in excess profits taxes by 10 percentage points in each bracket was provided. Corporations with net earnings of more than $25,000 a year will continue to pay 24% normal tax also. Those with smaller earnings will pay 15% on the first $5,000 net income, 17% on the next $15,000 and 19% on the next $5,000. Under the 1940 revenue act, the regular income tax was treated as a deduction in figuring the excess profits tax. This deduction was eliminated in the Revenue act of 1941. In fact the process is reversed, so that the excess profits tax is allowed as a deduction in figuring the income tax. Retained in the new law was the alternative choice to the corporation of computing excess profits upon either a basis of percentage return on invested capital or average earnings for the years 1936–39. The capital stock tax was boosted from $1.10 to $1.25 per $1,000 of declared value.

The treasury department fought unsuccessfully to knock out the "average earnings" method of calculating excess profits. Had its recommendations been accepted by congress, all corporations would have been compelled to use the invested capital formula in figuring excess profits. Although the administration failed in this plan, which would have borne down heavily on companies with conservative capital structures, it did achieve a partial victory by getting the average earnings formula reversed.

New Taxes.—Faced with the gigantic task of financing the war effort not only of the United States but also of a host of Allies, the U.S. treasury urged congress to expedite the passage of a second revenue act in 1941 and proposed radical new tax devices. But congress refused to consider additional tax legislation during its 1941 session. However, the house ways and means committee prepared to start work immediately after convening of the second session of the 77th congress on a tax bill to raise between $5,000,000,000 and $8,000,000,000 in additional taxes. Among the new types of taxes to be considered are a withholding tax up to 15% on wages and salaries (similar to the social security tax method), confiscation of all corporate earnings above a flat percentage of net profits and a manufacturers' sales tax. In addition to raising revenue to meet vastly expanding expenditures, one of the objectives of the government is to divert to the treasury a large part of the individual spending power that results from the defense program, and thus to help check inflation.

State and Local Government Taxes—Accredited estimates of state and local government taxes for 1941 placed the total at approximately $9,000,000,000, an increase of almost $500,000,000 over the previous record year of 1940, when $8,538,000,000 was collected. The state and local per capita tax for 1941 approximated $70. State tax revenue was derived principally from levies on property, incomes, estates, sales, pay rolls (for unemployment compensation), licences and other special business assessments. Ten states retained some form of poll tax. Of major importance to local governments were real estate and personal property assessments. Excessive taxation of residential realty and overvaluation of this type of property for tax purposes in many cities have served to arouse citizens to organized protest.

Extravagant spending by state and local governments, pursuant to the fiscal policy of the federal government, resulted in the most formidable array of protest organizations in the history of the United States. Some 1,200 taxpayers associations, backed by other thousands of civic and business groups, were raising their voices in opposition to loose spending, the needless creation of indebtedness and various degrees of political graft in state, county and municipal official affairs. Impetus was given to the organization movement in 1940 and 1941 by the stiff federal taxes imposed to help finance the national defense efforts and to speed up production of armament for the nations resisting axis aggression. While no accurate census was available, it may be assumed that the various taxpayers and citizens groups working together for economy in government represented several million citizens.

National Tax Organizations.—The scores of taxpayers organizations in every state in the union represent the practice of democracy in its truest form. These organizations keep before elected officials the fact that they are public servants, and at the same time they serve to impress upon citizens generally their own potentialities in relation to government. Of course, not all so-called taxpayers organizations are worthy of support, as this field has been invaded by racketeers at times. But with better interrelations between the various state and national groups, the racketeer is more readily discovered and exposed.

Although there has been in the past no central clearing house through which the achievements of the hundreds of taxpayers organizations can be accurately appraised, nevertheless there are definite records of what is being done in the various states to justify the assertion that hundreds of millions of dollars have been saved. There are also definite steps being taken toward a national cohesion of effort. The record shows that these economies have been accomplished through direct action in referendum on bond issues, appearance before official political bodies, court action and constant vigilance. The magnitude of the job confronting taxpayers engaged in procuring better government at economical and efficient levels may be seen when it is realized that there were in 1941 more than 175,000 political units—states, counties, municipalities, townships, school and road districts, park, water-supply, drainage, irrigation boards, etc.—having the power to spend public funds. Many also have the power to issue bonds and levy taxes. This topsy-turvy system imposes on the taxpayer, for state and local taxes alone, a burden of approximately $14,000,000,000 annually. (*See* also SUPREME COURT OF THE UNITED STATES.)

Great Britain.—Although the British tax rates on corporate income are stiffer than those of the United States, local and miscellaneous federal taxes in England are considerably lower. In Great Britain the corporate rates provided for in the 1941–42 budget are 100% on profits in excess of "standard earnings" (representing average earnings in one of three base periods plus 6% on common stock), but with 20% of the excess profits tax credited for return after the war. On the remaining net income the basic rate is 50%. In the United Kingdom nearly one-half the tax receipts are from levies upon income and profits, whereas in the United States comparable taxes produce only about one-third of total collections. In England the national government is the principal taxing agent, imposing about 90% of the total, while in the U.S. the federal government, even with recently broadened taxes, imposes only about 60% of all taxes. Estimating that federal, state and local taxes in the United States during the 1941–42 fiscal year would approximate $22,500,000,000, the per capita tax burden was $168. The total volume of taxes imposed by the British government in April 1941, together with "local" taxes, was expected to yield close to £46 or $184 (converted at $4 to the pound) per capita for the United Kingdom (England, Wales, Scotland and North Ireland). An unmarried individual with an income of £150,000 is required to pay £142,924 in income and surtax, or an effective rate of 19*s.* ½*d.* in the pound. On lower incomes a single person earning £500 a year is taxed £156 2*s.* 6*d.* or 6*s.* 3*d.* in the pound, whereof £26 13*s.* 4*d.* is reserved as a postwar credit; a £1,000 income pays a tax of £381 2*s.* 6*d.* or 7*s.* 7½*d.* in the pound, of which £43 6*s.* 8*d.* is reserved as postwar credit. Taxation had been extended downward to incomes as low as £120, on which tax of £7 10*s.* is payable annually. The postwar credit system applies only to incomes up to £1,500. Above that amount, the effective rate rises rapidly, an income of £10,000, for example, paying £6,862 7*s.* 6*d.*, or 13*s.* 8¼*d.* in the pound.

Canada.—In 1941 about five times as many Canadians as in 1939–40 had to pay income taxes, and the rates were all higher. The national defense tax is paid by almost everyone receiving income, salary or wages. Canada's war profits tax provides a flat levy of 75% on all net income above an "average earnings" base, and a normal tax of 18% on the remainder, or, as an alternative, a straight 40% tax for a company having little or no excess profits. The Canadian law permits (which the U.S. does not) the filing of consolidated returns for normal as well as excess profits, by which the loss of one subsidiary may be offset against the profit of another, upon payment of 2% higher normal tax.

Australia.—A change in governments late in 1941 brought about a change in the budget, the main difference being the dropping of the compulsory loan plan of former Prime Minister Fadden. Greater reliance was placed by the Curtin Labour government on increased taxation of high incomes, heavier company taxation and indirect imposts. To help cover the gap between war outgoings and taxes at existing rates, the last government proposed to raise £25,000,000 in obligatory loans, and a further £7,000,000 in additional taxes. That would have left £122,000,000 to obtain by loans from the public and the banks. In the new budget, £22,000,000 was to be raised by extra taxation, and the amount unprovided for was raised to £138,000,000. The Labour government relies upon voluntary offerings to achieve what the Fadden government proposed to do to a great extent by compulsion. Since the middle incomes were hit hard by the previous budget, no new taxation was proposed on incomes up to £1,500 a year. Ordinary tax on companies is increased from 2*s.* to 3*s.* in the pound, and the wartime company tax is so increased in grades, on profits above 8% of capital, to reach a 60% rate of tax on the portion of profits above 2[illegible]% of capital. Here again, a main purpose is to deter nonessential expansion. On private incomes, rates of 16*s.* 8*d.* in the pound apply after £2,500; those above £1,500 already pay 10*s.* in the pound on the excess.

Germany.—Tax receipts of the reich for the fiscal year 1941–42 would approximate 13,000,000,000 marks, which is 42% of expenditures totalling 74,000,000,000 marks. In line with the general policy of the National Socialist regime, the shifting of the tax burden from the shoulders of individually owned business to industrial and commercial corporations proceeded in 1941. Under a new decree, a liberal tax remission plan was made applicable to individually owned companies, while business corporations were penalized by an increase of 25% of the existing tax on incomes. These taxes in 1941 were 37½% of net profits for corporations with annual income of less than 100,000 marks and 55% for corporations earning more than that amount. (*See* also BUSINESS REVIEW: *Legislation Affecting Business;* INITIATIVE AND REFERENDUM.)

(C. A. SR.)

Taylor, Henry Osborn (1856–1941), U.S. historian and philosopher, was born Dec. 5 in New York city. He graduated from Harvard college in 1878 and from the Columbia law school in 1881. After publishing a treatise

on private corporation law in 1884, which ran into five editions, he abandoned law as a career and devoted his life to the study of ancient literature and philosophy. A painstaking and thorough scholar, he spent ten years in gathering material for his first work in this field, *Ancient Ideals, A Study of Intellectual and Spiritual Growth from Early Times to the Establishment of Christianity,* 2 vols. (1896). He spent four years completing *The Classical Heritage of the Middle Ages* (1901), and another ten years on the writing of his chief work, *The Medieval Mind,* the fifth edition of which appeared in 1938. He wrote a number of other historical works. In Nov. 1940 he was elected to the American Academy of Arts and Letters. He died in New York city, April 13.

Tea. Except for green tea, which comes chiefly from Japanese-dominated areas, there was little cause for concern in 1941 over the United States' immediate tea supply. Approximately 80% of the tea consumed in the United States is black tea produced in India, Ceylon, Java and Sumatra. Authority for the foregoing assertions was Benjamin Wood, managing director of the American Tea bureau, as quoted by the *Tea and Coffee Trade Journal,* New York city. Imports of tea into the United States in the first 11 months of 1941 were 99,165,092 lb. In the same period of 1940 United States imports of tea were 90,618,179 lb. These increased receipts, however, the *Tea and Coffee Trade Journal* pointed out, included large shipments of tea re-exported to Canada, which was said to have a six months' supply at the beginning of 1941. The U.S. army bought between 1,750,000 lb. and 2,000,000 lb. of tea in 1941. In Dec. 1941 the British government arranged to buy from the Netherlands Indies 48,000,000 lb. of tea in 1942, the same quantity the British bought from the Netherlands East Indies in 1941. Both the United States and Britain recognized tea as one of the necessary foods and therefore granted it shipping priority. The British armed forces in 1941 employed 1,500 mobile tea kitchens, according to the American Tea bureau, to serve tea to soldiers in Britain and on the war fronts. About 1,000 tea kitchens were operated by the Y.M.C.A., the remainder by the Salvation Army, the Woman's Volunteer service and the government. (S. O. R.)

Telegraphy. The unsettled state of world affairs during the year 1941 interfered considerably with international communication by telegraph and with the orderly progress and development of the art of telegraphy. Nevertheless certain improvements made in the direction of increased speed, accuracy and economy considerably advanced those aims.

Maximum Usage of Trunk Lines continued to be a major subject of attention and was constantly being furthered by means of such devices as carrier systems, the varioplex, reperforator switching, improved repeaters, subcentre switching, the extended use of direct circuits, etc.

Vacuum-Tube Repeaters, which for some years have been used extensively in telephone circuits but have not heretofore been particularly successful in telegraph circuits, have been improved and were in 1941 used in such circuits for relatively long periods of time without attention. They may be installed at offices which lack the staff required to operate and maintain the electromechanical type of telegraph repeater.

Reperforator Switching was further improved and additional offices equipped with this apparatus which eliminated manual relays of telegraph business and thus assured greater speed, accuracy and economy. Users of leased wire systems were also making extensive use of reperforator switching.

Facsimile Telegraphy showed continued improvement through intensive laboratory work and experience and was coming more and more into use. An improved type of cut-blank recorder was developed on which received messages were recorded upon blanks fed from a continuous roll of printed paper and were cut off at the end of each message. Another type of recorder was arranged to repeat, automatically, a message of which a number of copies were desired. A compact type of transmitter for use in patron's offices was well on the way to be released for general usage. A development of the facsimile telegraph, known as Multifax, a business machine for the automatic preparation of stencils, offset plates, hectograph carbons, etc., was improved, so that it was possible in 1941 by this means automatically to prepare clear master copies, either locally or at a distance, in considerably less time than by other methods and to be assured of absolute accuracy. In some forms of facsimile apparatus the speed of transmission and recording was greatly increased.

Coded Telegraphy has long been resorted to by governments and by individuals who for any reason wish to preserve secrecy in their communications. A new development, Telekrypton, greatly facilitated the ease and accuracy with which telegrams might be coded and decoded by properly authorized and equipped persons and at the same time increased the difficulty of decoding by unauthorized persons.

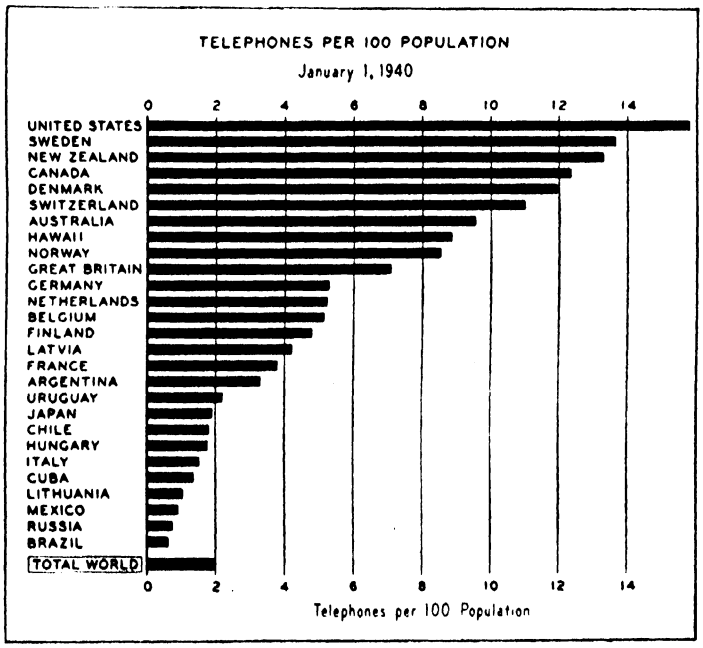
Statistics.—Reliable statistics covering the telegraph systems of the world were not available in 1941 but the latest data for the United States showed approximately the following land lines plant (aside from that controlled by telephone companies) devoted to the public service:

Miles of pole line	246,337
Miles of underground conduit (single duct)	6,133
Miles of aerial wire	1,832,535
Miles of aerial cable wire	110,476
Miles of underground cable wire	329,411
Miles of land line submarine cable wire	6,315
Total miles of wire (approximately 75% copper)	2,284,747
Number of public telegraph offices	23,400
Approximate investment in operating land lines plant	$370,000,000

The submarine cable telegraph system of the world consisted of about 360,000 mi. of cable, containing about 432,000 mi. of copper conductor and representing a capital outlay of about $400,000,000. Approximately 80% of the total mileage of submarine cable was provided by private enterprise and the remainder by government administrations. (A. N. Ws.)

Teleki, Pál, Count (1879–1941), Hungarian statesman and geographer, was born Nov. 1 in Budapest. Count Teleki's interests were varied. He was an authority on geography, chief boy scout of Hungary after 1929, and an able politician and statesman. His political career started in 1905 when he was elected to parliament. He was appointed prime minister and minister of foreign affairs in 1926, and in 1939 he was again named prime minister, retaining that post until his death. While Teleki was not averse to using Germany's might in winning back the lost province of Transylvania from Rumania, he nevertheless feared that a too great dependence on Hitler would jeopardize Hungary's independence. This misgiving was seen in the disclosure after his death that Count Teleki was one of the Hungarians who backed the book *Why Germany Cannot Win the War,* which broke all sales records in his country. But the German stranglehold on Rumania and Bulgaria in early 1941 placed Hungary in a precarious position. Worried by the grave turn of events and by the impending invasion of Yugoslavia, the 61-year-old statesman took his life on April 3 in Budapest. (See *Encyclopædia Britannica.*)

Telephone. The demand for telephone service in the United States in 1941 was greater than in any preceding year. By the end of the year it was estimated that there would be about 23,500,000 telephones in service in the United States, an estimated gain for the year of about 1,550,000. This was more than a 40% increase over the 1940 gain. The estimated

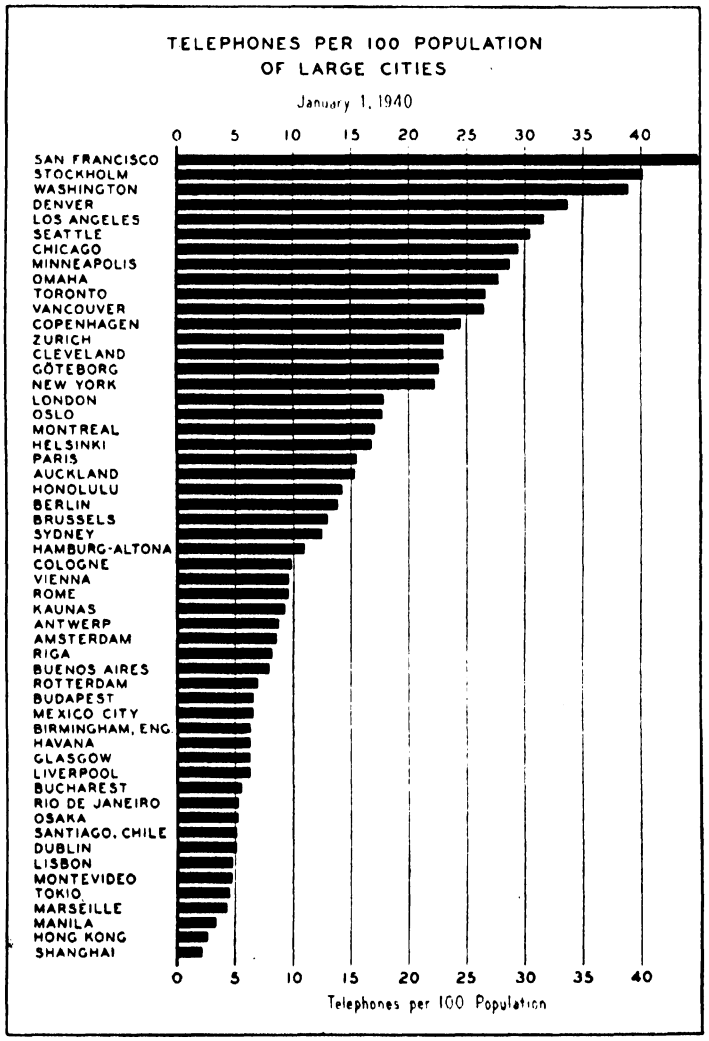


average number of daily telephone conversations grew to 105,000,000, some 7,000,000 above the corresponding 1940 figure. Completed toll calls in 1941 totalled more than 1,000,000,000, approximately 15% more than in 1940. The number of longer haul calls was about 28% greater than in 1940. The increase in toll calls was greatest in those parts of the country where defense activity was most intense. A sharp, but by no means the sharpest, relative increase occurred at Washington, D.C., where long-distance traffic during 1941 was nearly 60% greater than in the preceding year. In the week following the Japanese attack on Hawaii, Washington toll traffic was 110% more than the year before, and toll traffic generally throughout the country at that time was the heaviest in history.

Saving of Essential Materials.—To meet the unprecedented demand for telephone service suggested by these figures, expenditures for new plant construction were estimated at $450,000,000 for the year. This vast expansion, carried out in the face of growing shortages of a number of materials, called for the use of substitute materials wherever they could be used effectively and for the conservation of existing facilities and materials to the fullest extent.

Studies of basic materials and their applications in the telephone field have been actively carried forward by telephone research workers for many years. The experience gained in these studies facilitated changes in design and manufacture which permitted large quantities of scarce materials to be saved for the production of armaments. For example, the annual consumption of aluminum in the Bell System based on production rates and substitutions in effect on Nov. 1, 1941, was reduced approximately 1,900,000 lb., by using other materials where aluminum would normally have been employed. On the same basis the saving of zinc was at the rate of about 5,200,000 lb. and of nickel about 300,000 lb. a year.

In addition to the substitution program the telephone companies from the beginning of 1941 undertook to cut their over-all needs for materials by deferring certain projects that were to have been undertaken in order to improve service. For example, replacements of old manual central offices by dial equipment were reduced from the original program. Used materials were extensively repaired and re-used, and numerous other measures of a corresponding nature were voluntarily introduced. These voluntary restrictions reduced substantially the needs of the telephone industry for scarce materials. By autumn, however, as the supply problem became more difficult, the telephone companies adopted a number of special engineering and operating practices directed toward meeting the essential service needs of the present and immediate future with the least possible current consumption of materials. Replacements of old manual central offices by dial equipment were practically eliminated. The number of pairs in exchange cables being placed were cut in some cases to only one-fourth of the number that would be normally used. Additions to dial offices were limited to the estimated requirements for one year. Moreover, the repair and re-use of materials were still further extended. These emergency procedures involved some sacrifice in the quality of service, and since they did not allow for any margins beyond the foreseeable needs of the immediate future, the industry's ability to meet sudden increases in demand for service was, of course, affected.



Some 1941 Achievements.—Even without the problems presented by the material shortage, the 1941 telephone job was difficult and unusual in many respects and its accomplishment was a source of satisfaction, particularly because of the direct importance of so much of the work in connection with the defense (later the war) effort of the nation.

A multitude of new defense establishments were created during the year—army and navy cantonments, air fields, naval bases, huge plants for the manufacture of all sorts of armaments. Many of these were built from the ground up in isolated rural sections. This meant that telephone facilities capable of handling heavy traffic had to be quickly installed in numerous areas where previously there had been little or no demand for telephone service.

Under the army's direction, systems of communication for use in the event of air attack were developed and put into service in both the Pacific and Atlantic coastal areas. These systems employ to a considerable extent the regular facilities of the telephone companies.

Work on the new transcontinental cable went forward steadily during the year, and the 600-mi. section connecting Omaha, Neb., with Laramie, Wyo., and Denver, Colo., was completed in Dec. 1941. New construction on this route was also completed between a point near San Francisco and Sacramento, Calif. Construction of the Laramie-Sacramento section was in progress in 1941 and when completed in 1942 there would be an all-cable route from coast to coast. Many other cable additions were made, including the extension of the eastern toll cable network to Norfolk, Va., and of the Pacific coast toll cable network to San Diego, Calif. Both cities became increasingly important centres of war activity.

The manufacturing and research branches of the industry were called upon to design and manufacture large amounts of communication equipment for military purposes. In the Bell Telephone laboratories alone about 100 different military research jobs were under way in the latter part of 1941 and telephone manufacturers were busy making tens of thousands of communication items for military planes, battleships, aircraft carriers and other military uses.

Television.

For the year 1941, as in 1940, technical advances in television appear to have been limited to those growing out of work in the United States. Because it had not been at war for the greater part of the year, the situation in the U.S. differed from that in Britain and Germany (which were formerly centres of television development). So far as is known, little television activity existed outside of the U.S.A. during 1941, and whatever was done was believed to have had a direct military application.

Progress in the U.S.A., up to December, was principally in the improvement of television as a home broadcast service. Much of what had been planned in 1940 was accomplished. The National Television Systems committee, sponsored jointly by the Federal Communications commission (*q.v.*) and the Radio Manufacturers association, rendered its report. That committee was appointed to unify the radio industry as to technical standards to be endorsed for television broadcasting, and under the leadership of Dr. W. R. G. Baker it succeeded in its task. The result was a change from the "441 line definition," previously suggested as standard, to a new value of 525 lines per picture. Definition of this order permitted television to surpass, in pictorial content, the 16 mm. "home movie" and to approach the 35 mm. professional or theatre practice. This represented about the maximum detail possible within the limitation of channels 6 megacycles in width which have been adopted for the standard or commercial home television channels in the range of 50–80 megacycles. It seemed possible that wider bands and thus still higher pictorial content might later be provided on channels of double or treble these frequencies.

In May 1941 the Federal Communications commission issued its new rules, stabilizing commercial television in line with the agreement reached within the industry and setting the date for

the change from experimental to commercial television as July 1. On that date the National Broadcasting company's New York television station WNBT began commercial operations with five sponsored programs, and television broadcasting was at last on its way to a self-supporting basis parallel to that of sound broadcasting. Other television broadcasting stations which went into either experimental or commercial operation are WCBW of the Columbia Broadcasting system and W2XWV of Dumont, in New York, WRGB of the General Electric company in Schenectady, N.Y., WPTC of Philco in Philadelphia, Pa., WTZR of Zenith in Chicago, Ill. and KTSL of Don Lee in Hollywood, Calif.; all of these adopted the new 525-line standard operation with the new transmission standards.

Television receivers in which the images are projected from a relatively small cathode ray tube to a much larger screen, of moderate size for home use or great size for the theatre, were further improved and demonstrated to the public during the year. Progress in colour television continued, including its use with the newer screen-type projection receivers. Development work in improved synchronizing methods, on colour systems, the possibility of using special screen materials having the capacity of "remembering" the pictures so as to reduce flicker at substandard scanning speeds, was carried forward as far and as fast as the necessary emphasis on production and design of military radio materials would permit. However, the priorities established for war radio apparatus necessarily slowed down not only research and program development activities, but also worked against the manufacture of new receivers for use in the home. Thus, even in the cities where broadcast television programs are regularly available, the seeing audience is not growing in number as rapidly as would have been expected if the system had been permitted to get its commercial start in less critical times.

Of technical applications to military needs nothing can be said, but it is interesting to observe that the very wartime conditions that retarded the expansion of the television service turned completely about in the last month of the year and were by the end of the year actually stimulating that growth. Having encountered the obvious difficulties in training civilian defense workers rapidly and in large numbers by sending skilled lecturers and demonstrators around the cities to talk to small groups of workers, the authorities began to take advantage of the unsurpassed facility for mass instruction that could be had from television.

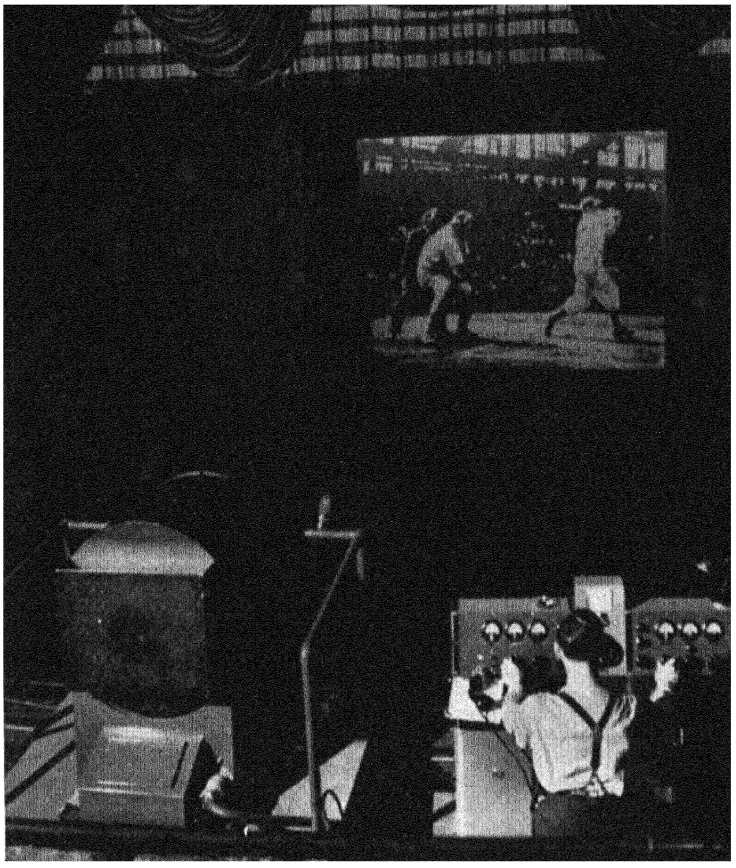
Regular instruction and demonstration programs were being put on the air from television studios in New York, Philadelphia and Schenectady, and other cities were expected to follow suit. Receivers installed in homes, as well as sets in radio stores, were made available to student fire and air-raid wardens, and these were to be supplemented by other receivers set up in police stations and other civilian defense training centres.

(J. V. L. H.)

Great Britain.—The suspension of commercial television development in Great Britain, dating from the end of 1939, continued and few contributions to the science were disclosed although considerable research was carried on in the application of television technique for war purposes.

J. L. Baird, who continued his private research on colour television, demonstrated a successful 600-line picture in April. The system, originally demonstrated in 1939, uses a cathode ray tube in conjunction with a two-colour filter. In its original form a mirror drum rotating at 6,000 r.p.m. produced a 34-line field which was interlaced three times to give a 102-line picture, the alternate fields being red-orange and blue-green. The improved system increased the number of lines to 200, which were interlaced three times to give 600 lines. It was claimed that the use of two instead of three colours enabled pictures of greater detail to be sent over the existing channels.

In December Baird demonstrated an experimental stereoscopic television image in colour. The principle involved is the transmission of two pictures in rapid sequence, one corresponding to the image seen by the right eye and the other to that seen by the left. Alternate halves of a projection lens at the receiving end are exposed by a rotating shutter so that the left and right eyes of the viewer are presented with left and right images in turn. Coloured glasses, as in the anaglyph process, are not used.



REPRODUCTION OF TELEVISION IMAGES on full-sized motion picture screens was accomplished in 1941

A novel system of scanning films using an apertured disk scanner was described by Espley and Walter. The continuously moving film is illuminated by a split optical system to remove picture flicker and a device is included for exact compensation of film shrinkage. To avoid trapezium distortion the optical system is provided with a magnification which is variable in time instead of space—the magnification of the projection system is increased for the period of the second scan in the complete picture and the pitch of the scanning spiral is also modified. The diameter of the scanning holes in the disk is only 30–40 microns.

Tellurium. Production of tellurium in the United States rose to 85,622 lb. and sales to 88,096 lb. in 1940, both record figures. Canadian production declined by more than half in 1939, to 22,985 lb., and was not reported in 1940.

Tenant House Purchase Program: *see* HOUSING.

Tennessee. A south central state, 16th to enter the union, called the "Volunteer State." Land area, 41,961 sq.mi.; pop. (1940) 2,915,841; rural, 1,888,635; urban, 1,027,206; rural farm, 1,271,944; native white, 2,395,586; Negro, 508,736; foreign-born, 11,320; other races, 199. Capital, Nashville (167,402). Other cities include Memphis (292,942); Chattanooga (128,163); Knoxville (111,580).

History.—Governor of Tennessee in 1941 was Prentice Cooper; secretary of state, Joe C. Carr; attorney general, Roy Beeler. Commissioners were as follows: agriculture, C. C. Flannery; conservation, J. Charles Poe; education, B. O. Duggan; finance and taxation, George McCandless; highways and public works, C. W. Phillips; institutions, A. T. Taylor; welfare, Paul Savage; insurance and banking, J. M. McCormick; labour, S. E. Bryant; public health, W. C. Williams; railways and public utilities, W. D. Hudson, Porter Dunlap and Leon Jourolman.

Education.—In 1940, of 5,627 elementary schools, 1,497 had three or more teachers; the number of one-teacher schools declined from 3,555 in 1927 to 2,561 in 1940. Enrolment in elementary schools in 1940 was 524,459. In 1940 there were 591 high schools with a total enrolment of 123,-

672; the number of teachers, 4,935.

The state university enrolled 7,104 pupils in 1940, with a teaching staff of 471 full- and part-time teachers. Enrolment in state teachers' colleges was 9,778 in 1940; full- and part-time teachers, 304. The state maintained seven institutions for higher learning; enrolment at the regular session was 11,847 in 1939–40.

Public Welfare, Charities, Correction.—In June 1940, 104,504 people received public assistance amounting to $4,049,000; WPA recipients, 33,600; amount, $1,608,000; old-age recipients, 40,303; amount, $406,000; aid to dependent children, 36,041 (14,187 families); amount, $261,000; aid to blind, 1,607; amount, $18,000. In 1940 there were seven correctional institutions with 4,209 inmates; expenditures, $1,165,528. In 1939, payment for unemployment compensation was $4,582,000; number of initial claims, 120,000; continued, 1,045,000. Separate schools are maintained for the blind, the deaf and the underprivileged; three state hospitals for the insane; a home and training school for feeble minded.

Communication.—In 1940, of about 82,000 mi. of public road, 7,520 were state highways; state expenditures were $10,794,757 for the year ending June 30, 1940. There were 3,573 mi. of railroads in 1941; 27 private and secondary airports; 605 mi. of airways; approximately 300,000 telephones. Water-borne commerce on the Tennessee river in 1940 amounted to 2,206,913 short tons; Cumberland river, 852,138; Mississippi river, 7,055,675 short tons from the Ohio river to Baton Rouge and 1,841,068 at Memphis.

Banking and Finance.—In 1941 there were 71 national banks with 17 branches, and 226 state banks with 33 branches; assets, $561,994,000 for national and $191,728,240 for state banks; deposits, $511,854,000 for national banks and $167,084,447 for state banks. Savings and loan associations in 1939 numbered 49, with assets of $26,948,211.

State receipts for the year ending June 30, 1940, were $72,752,466; expenditures, $70,954,907. The gross debt in 1941 was $95,120,000 and the net debt $91,133,000.

Agriculture.—There were 247,617 farms in 1940; 18,492,898 acres in farms, with 6,158,662 acres of crop land harvested. Gross value of agricultural production was $192,403,000; cash farm income, $141,256,000. Cash farm income from crops was $66,566,000; from livestock and livestock products, $58,483,000; government payments to farmers, $16,207,000. Gross farm income from crops was $86,761,000. Drought in 1941 decreased the yields of tobacco, corn and hay 5% to 10%. The forest area is about 14,000,000 acres.

Table I.—*Leading Agricultural Products of Tennessee, 1941 and 1940*

Crop	1941	1940
Corn, bu.	69,615,000	68,250,000
Tame hay, tons	2,148,000	1,974,000
Cotton, bales	600,000	509,000
Wheat, bu.	5,415,000	4,068,000
Tobacco, lbs.	91,523,000	110,348,000
Potatoes, bu.	2,604,000	3,476,000
Sweet potatoes, bu.	4,664,000	4,176,000

Manufacturing.—In 1939, 2,289 manufacturing plants yielded products valued at $728,087,825, of which $320,341,902 was added by manufacture. The number of wage earners increased from 107,645 in 1925 to 131,874 in 1939; wages paid in 1939, $109,661,769.

Table II.—*Principal Industries of Tennessee, 1939 and 1937*

Industry	Value of products	
	1939	1937
Rayon and allied products	$59,724,728	$59,132,660
Hosiery	33,798,963	29,219,241
Meat packing, wholesale	28,266,104	29,491,149
Chemicals	25,639,499	38,048,635
Cooking and other edible fats	19,787,646	36,457,022
Footwear (except rubber)	17,740,737	20,807,976
Flour and other grain mill products	16,147,788	22,673,578
Cottonseed oil, cake, meal linters	15,390,972	20,150,709

Minerals.—The total value of minerals produced in Tennessee in 1939 was $40,119,893, as compared with $32,428,512 in 1938.

Table III.—*Principal Mineral Products of Tennessee, 1939 and 1938*

Mineral	Value 1939	Value 1938
Coal	$10,402,000	$9,007,000
Stone	8,312,077	4,237,351
Cement	5,613,477	5,063,628
Phosphate rock	3,856,505*	....
Sand and gravel	1,967,356	1,605,040
Ferro-alloys	1,442,967	779,013
Lime	893,161	901,460
Coke	527,535	508,771
Clay, raw	425,008	347,035
Barite	372,348	209,040
Manganese ore	128,176	77,806

(C. E. A.)

Tennessee Valley Authority.

The Tennessee Valley authority, a corporative regional agency of the United States government, created by Act of Congress in 1933, had, in 1941, developed a commercially useful channel in 464 mi. of the Tennessee river as far upstream as Chattanooga, Tenn., provided behind its dams 4,000,000 acre-feet of storage capacity reserved for flood control and attained an electrical generating capacity of 1,058,905 kilowatts from which electricity was being supplied to 76 municipalities and 38 electric co-operatives in the valley (which consists of portions of Alabama, Georgia, Kentucky, Mississippi, North Carolina, Tennessee and Virginia).

In the furtherance of TVA's five-fold mandate to develop navigation, flood control, electric power, national defense, and the region's agricultural economy, congress had appropriated $454,869,270 to Aug. 1, 1941 and had authorized TVA to issue $70,000,000 in bonds (of which $65,072,500 has been issued) in the largest construction and regional development programs ever directly undertaken by the U.S. government.

In addition, TVA, since its inception, had utilized Wilson dam, near the southernmost tip of the Tennessee river, representing an investment of $31,300,000.

To supply sufficient electric power to the rapidly expanding national defense industry became TVA's chief concern in 1940. The nation looked to the Tennessee valley for the bulk of its production of aluminum, a metal of vital importance to aeroplane manufacture. The Aluminum Company of America was doubling its huge plant at Alcoa, Tenn.; the Reynolds Metals company was bringing a great new plant into production at Muscle Shoals, Ala. Called on to supply swiftly mounting quantities of electric power, TVA was authorized by congress in 1940 to build Cherokee dam, on the Holston river, and the Watts Bar steam plant; in 1941, to build four dams on the Hiwassee river and its tributaries (Apalachia and Chatuge dams on the Hiwassee, Nottely dam on the Nottely river, Ocoee dam No. 3 on the Ocoee river). An agreement between the Aluminum Company of America and TVA, signed in 1941, further enhanced the amount of available power by placing the company's dams in the hands of the TVA for operation as units of the unified system. Under the contract the Aluminum company, owner of Fontana dam site on the Little Tennessee river, transferred the site to TVA, opening the way for the building of Fontana as soon as authorized by congress.

TVA's Cherokee dam was closed in Dec. 1941; the schedule called for completion of the Watts Bar, Nottely and Chatuge in 1942; Fort Loudoun in 1943; and Kentucky in 1944.

TVA dams on the Tennessee river, in the order of their progression up the 650-mi. waterway, were as follows, with those under construction in 1941 indicated parenthetically in their sequence: (Kentucky dam, mile 22.3, in Kentucky); Pickwick Landing dam, mile 206.7, in Tennessee; Dam No. 1, mile 256.8, in Alabama; Wilson dam, mile 259.4, in Alabama; Wheeler dam, mile 274.9, in Alabama; Guntersville dam, mile 349, in Alabama; Hales Bar dam, mile 431.1, in Tennessee; Chickamauga dam, mile 471, in Tennessee; (Watts Bar dam, mile 530, in Tennessee; Fort Loudoun dam, mile 602.3, in Tennessee).

Tributary storage dams built and operated by TVA are Norris dam, in Tennessee, on the Clinch river, 79.8 mi. from the mouth; and Hiwassee, in North Carolina, on the Hiwassee river, 75.8 mi. from the mouth.

Every one of the main-stream dams creates a link in a chain of lakes providing slack-water navigation the year round. Nine-foot navigation was provided by Ohio river dam No. 52 of the U.S. army engineers for a distance of 22.3 mi. up the Tennessee from Paducah, Ky. to the point at which Kentucky dam was being built. The 184.3 mi. next upstream to Pickwick Landing dam had a controlling minimum depth of 6 feet at extreme low water, but generally 7- to 7½-foot depths were maintained and the full 9-ft. channel was to be completed by Kentucky dam. From Pickwick Landing the 323.3 mi. upstream to Watts Bar, 65.8 mi. beyond Chattanooga, the then head of navigation, the 9-ft. channel was maintained, except for short stretches in which minimum controlling depths of 7 and 6 ft. remained to be increased to the standard navigation depth of 9 ft., principally by dredging. Controlling channel depth was to be increased to 9 ft. with 2-ft. overdepth, over the entire 650 mi. between Paducah, Ky. and Knoxville, Tenn., by the dams under construction and incidental development, including dredging, all to be completed in 1944.

The TVA in 1941 was supplying to municipal and co-operative systems, for distribution to more than 427,000 customers at uniformly low retail rates, electrical energy carried over approximately 5,600 mi. of TVA transmission lines, and was supplying electricity to large industrial consumers, among them the Aluminum Company of America, the Monsanto Chemical company, the Reynolds Metals company, the Victor Chemical works and the Electro Metallurgical company.

In 1941, sales of electricity by the Tennessee Valley authority amounted to approximately $21,000,000 annually. The TVA basic residential rate schedule per month was in 1941: for the first 50 kwh., 3 cents a kwh.; for next 150 kwh., 2 cents a kwh.; for next 200 kwh., 1 cent a kwh; for next 1,000 kwh., 4 mills a kwh.; for all over 1,400 kwh., 7½ mills a kwh.

TVA and 73 municipalities and co-operatives had acquired utility properties from privately owned companies for purchase prices totalling $116,700,000. TVA purchased transmission lines, generating plants and several of the smaller distribution systems for $55,500,000. The municipalities and co-operatives paid $61,200,000 for the major distribution systems and for relatively minor water and gas properties that were associated with the electrical holdings.

The total acquired distribution properties served approximately 288,135 customers in Alabama, Georgia, Mississippi, North Carolina and Tennessee. Largest single purchase was consummated in 1939 when TVA, 22 municipalities and 11 co-operatives bought all the electric properties of the Tennessee Electric Power company, serving 142,110 customers, for $78,-

600,000, of which the authority's share was $44,949,400.

Flood control by TVA dams, estimated to effect an average annual saving of $100,000,000 in flood damages on the Tennessee and portions of the Ohio and Mississippi rivers, was to be increased by addition to the system of Cherokee dam (whose reservoir would be of the heavy storage type, as were the Norris and Hiwassee reservoirs) and by construction of Apalachia, Chatuge, Nottely and Ocoee No. 3 dams. Controlled storage at TVA dams was 4,000,000 acre-feet and would be increased to 10,800,000 acre-feet by dams under construction, principally by Cherokee and Kentucky dams.

At the Muscle Shoals munitions plant, constantly maintained in a state of readiness for defense production, highly concentrated phosphate fertilizer developed by the authority had been produced to a total of more than 400,000 tons in eight years. About 138,000 tons of the superphosphate had been distributed to 35,691 privately owned farms, covering 5,446,835 acres in 29 states, where, with the co-operation of state agricultural extension services, it was used to demonstrate how an improved plant food, low in cost to the land, can aid agriculture. The authority in 1941 was engaged in rebuilding portions of the Muscle Shoals plant to produce ammonium nitrate for use in munitions. Capacity of the plant will be 300 tons a day.

A method of producing alumina, the raw material of aluminum, from abundantly available clays, was among the most important research achievements of the authority.

TVA relations with construction employees were formalized in a contract with the Tennessee Valley Trades and Labor council, representing 15 labour unions affiliated with the American Federation of Labor.

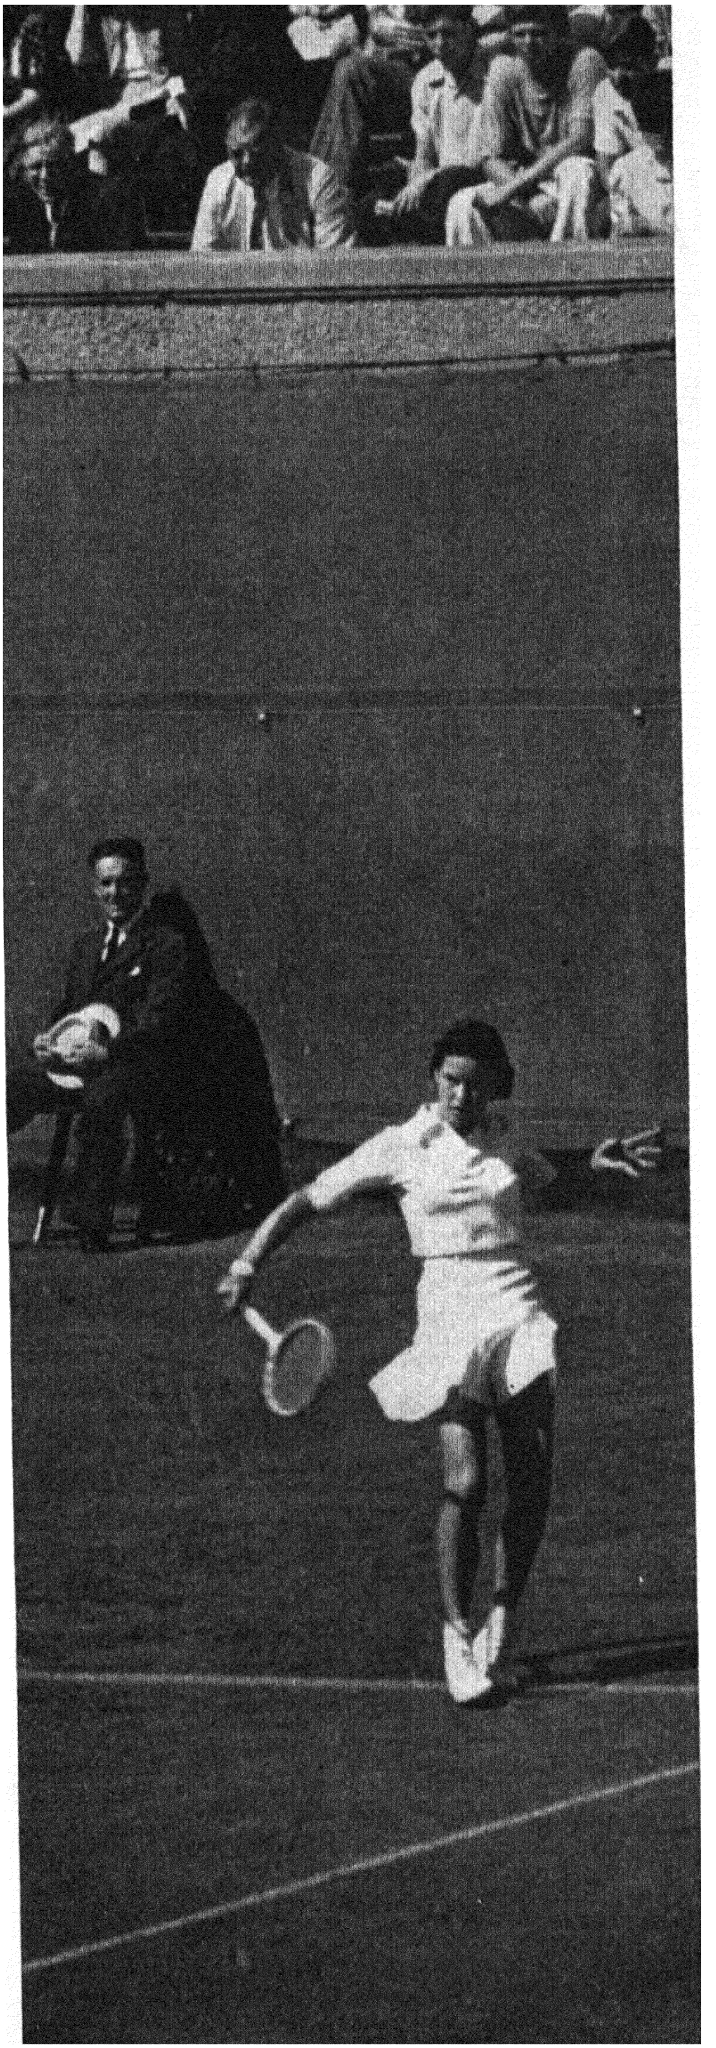
The authority was in 1941 headed by a three-member board of directors: David E. Lilienthal, chairman; Dr. Harcourt A. Morgan, vice-chairman; and James P. Pope. The board's policies were executed by a general manager, Gordon R. Clapp. (*See* also DAMS; ELECTRICAL INDUSTRIES; PUBLIC UTILITIES.) (W. L. S.)

Tennis. Competitive tennis in 1941 was largely concentrated in the United States, the only principal tennis-playing nation not actively at war (until December). Tournaments, however, were held in South America, and the championship of the Argentine was won in Nov. 1940 by Donald McNeill and Miss Dorothy Bundy of the United States. In December the largest Brazilian tournament was held in Rio de Janeiro, Elwood Cooke and his wife, the former Sarah Palfrey, being victorious.

In the U.S. two players dominated the larger tournaments during the year: Frank Kovacs and Robert E. Riggs, who was champion in 1939. Between them they won most of the tournaments held in Florida and elsewhere in the south in winter, and Kovacs defeated Riggs in the semifinals of the indoor championships at Oklahoma City, Okla., in March. Kovacs went on to beat Sabin in straight sets in the finals to win his first national title.

Frank Parker won the clay court championships at Chicago, Ill., in June, beating McNeill, the 1940 title holder, in the semifinals, and the eastern clay court championships at New York city, as well as the Spring Lake, N.J., title, which he won for the eighth time. Directly the scene shifted to grass, however, Riggs and Kovacs were on top. Riggs won at Seabright, N.J., with the loss of only one set. Kovacs was triumphant at Rye, N.Y., while Riggs beat his rival at Southampton, Long Island, in three sets. The only important tournament McNeill was able to win in 1941 was at Newport, R.I., where neither of the other two competed.

With most important foreign players busy in a grimmer game, the 60th national singles championships was held as usual early in September on the grass courts of the West Side Tennis club at Forest Hills, Long Island. Good crowds watched a tournament that was rather uninteresting until the semifinals. This round brought forth two fine matches. In the first, McNeill, playing below his 1940 form, was badly beaten by Kovacs, who played extremely well. Riggs was lucky to beat Frederick R. Schroeder in the twelfth game of the fifth set. Schroeder, who is a courageous and forceful hitter in the Californian tradition, is holder of the national doubles title with John A. Kramer, also of California. Schroeder is undoubtedly one of the most promising young players of the year. The finals were disappointing. Save in the first set, which he won, Kovacs was not permitted to play as he did against McNeill, and was hardly a factor in the match. Riggs thus recaptured his title, which he had lost the



SARAH PALFREY COOKE defeated Pauline Betz in straight sets Sept. 7, 1941 at Forest Hills, L.I. to win her first U.S. women's singles championship

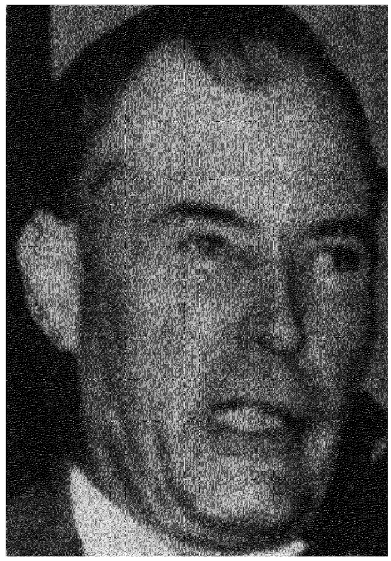
previous year. Mrs. Sarah Palfrey Cooke, playing in her third final, defeated Miss Pauline Betz and for the first time took the woman's singles title. She had already won the doubles title with Miss Margaret Osborne of California, this being her ninth title in that event. No feminine player stood out in the field as did Miss Alice Marble, who turned professional early in 1941.

Perhaps the one most important thing about tennis during the year was not the winning or losing of titles by a handful of publicized performers, but the fact that more people played the game in the United States in 1941 than ever before. The chief reason for this was to be found in the recreational program of the WPA, which since 1935 had been spending public moneys to construct and improve some 12,000 courts all over the country. These courts, as a rule, in or around cities, were open to the public on payment of a small fee. This advance in democratic recreation occurred with little notice. It was the outstanding event in the tennis world of 1941. (J. R. Tu.)

Ter Poorten, Hein: *see* Poorten, Hein ter.

Texas. A south-central state of the United States, admitted to the union in Dec. 1845; popularly known as the "Lone Star state." Area, 263,644 sq.mi. (plus 3,695 sq.mi. of inland water surface); pop. (1940), 6,414,824. Rural population was 3,503,435 or 54.6% of the total. Negroes and other non-whites constitute 14.5% of the population. Capital, Austin (87,930). The three largest cities are Houston (384,514); Dallas (294,734); San Antonio (253,854).

History.—The legislature met in Jan. 1941 to begin the longest session (170 days, until July 4), and to pass the heaviest tax bill, in the history of the state. Little other legislation of importance was enacted, except a law to repress strikes in defense industries; hostility between the governor and the legislature caused frequent impasses.



COKE STEVENSON, lieutenant governor of Texas, was sworn in as governor Aug. 8, 1941 to succeed W. Lee O'Daniel, who was elected to the U.S. senate

After the death of U.S. Senator Morris Sheppard (*q.v.*) in April, Gov. W. Lee O'Daniel called a special election for June 28, meanwhile appointing Andrew Jackson Houston, 87, son of the hero of San Jacinto to the vacant seat O'Daniel himself announced his candidacy for the office; Senator Houston died in June; and O'Daniel barely defeated Congressman Lyndon Johnson, who had the strong support of the national administration. The three leading candidates were O'Daniel (175,590 votes), Johnson (174,279), Gerald Mann (140,807); 22 other Democrats, 2 Republicans, 1 independent, 1 Communist also ran.

Coke R. Stevenson, lieutenant governor, was inaugurated as governor on Aug. 8. Other ranking officers of the state in 1941 were Gerald Mann, attorney-general; Charlie Lockhart, treasurer (resigned in October, succeeded by Jesse James); Bascom Giles, commissioner of general land office; J. A. McDonald, commissioner of agriculture; L. A. Woods, superintendent of public instruction; George H. Sheppard, comptroller. The railroad commission was composed of Ernest O. Thompson, Jerry Sadler and Olin Culberson. On Gov. Stevenson's inauguration, H. L. Winfield became acting lieutenant governor.

Education.—Elementary schools on Dec. 31, 1941 had an enrolment of 830,849 white pupils and 185,294 Negro. Secondary schools had an enrolment of 312,027 whites and 38,213 Negroes. The total teaching staff was 49,210. During the session of 1940–41 the University of Texas enrolled 11,146 students and employed a teaching staff of 594. The enrolment of other state-supported colleges in 1940–41 was as follows: Texas Agricultural and Mechanical college, 8,748; North Texas State Teachers college, 6,288; East Texas State Teachers college, 3,666; Sam Houston State Teachers college, 2,614; Southwest Texas State Teachers college, 3,107; Stephen F. Austin State Teachers college, 1,842; West Texas State Teachers college, 1,914; Sul Ross State Teachers college, 1,017; John Tarleton Agricultural college, 1,642; Texas College for Women, 3,787; Texas College of Arts and Industries, 2,020; Texas College of Mines, 1,872; Texas Technological college, 5,598; Prairie View State college (for Negroes), 2,221.

Public Welfare, Charities, Correction.—In 1941, 163,910 recipients of old-age assistance received a total of $28,497,112; 2,186 blind persons received $107,150; 2,729 dependent children received $47,700. Payments for general relief to about 9,000 cases amounted to $1,022,500. The weekly average of persons employed by the WPA in Texas during 1941 was 70,589.

The state in 1941 maintained 22 eleemosynary institutions, half of them hospitals for mental and nervous cases. There were also sanatoriums for tuberculars, schools for the blind and for the deaf (white and Negro); two homes for delinquent children; two for white orphans and one for Negro; one for crippled children; a home for Confederate veterans and one for the widows of veterans. The total population of these institutions in 1941 was about 24,000.

Communication.—The state in 1941 had 23,122 mi. of state maintained highways, as follows: unimproved, 1,662 mi.; grading, small structures, 1,421 mi.; gravel, stone, etc. surface, 1,828 mi.; asphalt surface, 12,753 mi.; concrete and brick, 5,367 mi.; state park roads, 91 miles.

During the decade 1931–41 the state highway department spent an average of $42,500,000 a year, most of which was used to build new roads and bridges. Texas had over 22,000 mi. of railway track in 1941.

Banking and Finance.—On Dec. 31, 1941 there were 391 state banks in Texas, with total resources of $312,860,757.94, including savings; individual deposits of $202,571,066.83, and deposits in savings departments of $9,773,646. At the beginning of 1941 there were 446 national banks in Texas with total resources of $1,695,662,000. Total deposits amounted to $1,534,702,000. There were 129 insured savings and loan associations in Texas with total assets of $101,904,728.

Receipts of the state treasury for the fiscal year ending Aug. 31, 1941 were $202,132,389.80. Expenditures were $166,073,022.68. The state gross debt was $44,782,367.29; the net debt, $37,150,557.61.

Agriculture.—The total value of agricultural production in Texas during 1941 was estimated at $595,000,000. The total acreage harvested was about 26,836,000. The total cash income from crops, livestock and government payments amounted to $695,000,000. The year 1941 was excellent for pasture, but rains injured small grains, wheat and corn, and delayed cotton planting.

Table I.—*Leading Agricultural Products (Marketings) of Texas, 1941 and 1940**

Product	1941	1940	Product	1941	1940
Cotton, bales	2,787,231	3,135,784	Oats, bu.	7,106,000	6,503,000
Cottonseed, tons	891,916	1,003,453	Corn, bu.	12,335,000	11,463,000
Wheat, bu.	35,868,000	24,934,000	Grain sorghums	15,824,000	11,430,000

*Courtesy Bureau of Business Research, University of Texas.

Manufacturing.—According to the 1940 census, the value, in 1939, of products manufactured in Texas was $1,530,220,676. In the same year, 19,531 salaried persons and 126,992 wage-earners were employed (on an average) in the 5,376 industrial establishments. Salaries paid amounted to $43,677,071, and wages amounted to $128,138,703.

Table II.—*Principal Industries of Texas, 1939*

Industry	Value of Products	Industry	Value of Products
Petroleum refining	$698,850,077	Flour and grain mill products	$41,250,858
Meat packing, wholesale	85,461,048	Oil-field machinery	41,149,017
Nonferrous metals, products	82,377,947	Bread, bakery products	32,994,866
Cottonseed oil, cake, meal, etc.	44,406,882	Nonalcoholic beverages	24,459,290

Mineral Production.—The total value of mineral production in Texas during 1941 was estimated at about $750,000,000. About 90% of the total value was from petroleum products (oil and gas). No important new oil fields were discovered during the year. The value of oil production in 1940 was estimated at $488,194,740.

Table III.—*Principal Mineral Products of Texas, 1939 and 1938*

Mineral	Value, 1939	Value, 1938	Mineral	Value, 1939	Value, 1938
Oil	$478,330,000	$539,150,000	Cement	$12,152,780	$11,488,866
Natural gas	141,535,000	133,486,000	Carbon black	11,102,763	10,052,206
Sulphur	28,498,473	(unavailable)			
Natural gas gasoline	25,807,000	19,781,000			

(C. W. Ra.)

Texas, University of. An institution of higher education at Austin, Tex. The 59th annual session opened Sept. 19, 1941. Main library holdings climbed to the 675,000 volume mark. With a 25% increase in state appropriations for the 1941–42 fiscal year, the university increased its teaching staff to 615 members and expanded graduate work and research. A total of 167 new courses were added, thus bringing the total to 1,379 in 46 fields. Courses in subjects relating to national defense were strengthened, defense activities were co-ordinated under a student-faculty committee, and women students registered for civilian defense services in a campus-wide program. Research projects dealing with national defense were speeded up. During the spring semester of 1941, 700 men were trained in 28 special defense engineering short courses, and this program under the U.S. Office of Education was greatly expanded in the fall. The medical branch embarked on a large-scale program of research and service, including cancer research; it operated 12 months, instead of 9, during the academic year, to speed up the training of doctors and nurses for army and navy service, and installed a U.S. army surgical unit. Enrolment at the main university totalled 9,411 as of Oct. 1, 1941, and at the medical branch 414 in the School of Medicine and 183 in the College of Nursing. (H. P. R.)

Textile Industry. The boom which the national defense program brought to the textile industry in 1940 continued at an accelerated rate in 1941 and reached new all-high production peaks. As Pearl Harbor transformed the defense program into a war program in the closing weeks of the year, it became evident that another year of record production was ahead.

Textile World's index of mill activity for 1941 was 188, on the basis of 1923–25 as 100. This represented an increase of one-third over the index of 142 for 1940, which in turn was 8% over the 1939 index of 132, which again was 28% over the 1938 index of 103. In other words, textile activity in 1941 set a new annual high for the third successive time.

By individual branches of the industry, cotton consumption in 1941 exceeded that of 1940 by about one-third; wool consumption increased by at least one-half; silk, on the way out, dropped more than one-third; filament rayon made a gain of about one-sixth; and rayon staple use increased about one-third.

U. S. Consumption of Textile Fibres, 1941
(In millions of lb.)

	Cotton	Silk	Wool	Rayon
January	415.7	3.3	46.9	35.0
February	390.4	3.4	47.0	31.6
March	420.5	3.2	53.0	35.4
April	453.1	2.9	52.8	38.7
May	454.4	2.9	57.0	40.2
June	430.9	3.1	55.7	38.3

Statistics from *Rayon Organon*.

Silk Crisis.—The most dramatic phase of the year 1941 in textiles was the Japanese crisis in the summer, which led to a government order freezing all stocks of raw silk. This was the first taste the U.S.A. had of the privations which were in store for it as more and more materials and products came into short supply for civilian use. Women stormed the retail counters. Hosiery mill employees were thrown out of work, and here too was the first opportunity for the country to get a preview of what was going to happen in the way of dislocation of labor through the transfer of emphasis from civilian production to wartime production. Mills started to switch hurriedly to other materials, principally rayon, but even the supply of that material was not ample. Nylon production continued to increase, but it promised to come more and more into demand for government use. The prospect ahead for the silk hosiery industry was not bright. There were many problems ahead, particularly in connection with the appearance and wearing qualities of the hosiery made out of new materials. Eventually, of course, this production problem would be overcome.

Organized Research.—One of the most important developments during 1941 was the crystallization of a well organized plan of co-operative research. This was brought about by a working arrangement effected between the Textile foundation, a semi-government organization, and the Textile Research Institute, Inc., by which the latter would gradually become the centralized research organization in the industry. This revitalized program was held generally as a most essential step, in view of the demands which conservation, substitution and simplification problems were going to place upon the technique and economics in textile manufacture and distribution. (*See* also COTTON; RAYON; WOOL.) (D. G. Wo.)

Thailand (Siam). A kingdom of southern Asia between Burma and French Indo-China, extending southward into the Malay peninsula; area 198,247 sq.mi.; pop. (census 1937) 14,464,489, (est. 1940) 15,718,000. Chief towns: (pop. 1937) Bangkok (cap. 681,214); Chiengmai (544,001); Khonkaen (473,475); Chiengrai (443,476). Ruler: King Ananda Mahidol; language: Siamese; religion: Buddhism. Thailand was occupied by Japan Dec. 8, 1941.

History.—In January 1941 Japan offered to mediate in the hostilities which had broken out at the end of 1940 upon the Vichy government's refusal of Thailand's territorial demands in Indo-China. Both France and Thailand accepted the mediation offer, and hostilities ceased Jan. 28. After several prolongations of the armistice, an agreement was signed in Tokyo March 11, and a treaty and two protocols were signed May 9. France ceded some 25,000 sq.mi. of territory, including the districts of Paklay and Bassac and a large part of Cambodia. The ceded districts were to be demilitarized. Japan guaranteed the settlement, and both Thailand and France undertook not to make any agreement with a third power directed against Japan.

On March 12 Thailand resumed diplomatic relations with the U.S.S.R., which had been interrupted since 1917, and recognition of Manchoukuo was announced in August. A Japanese ambassador to Bangkok was appointed in the same month for the first time.

A tense situation arose when Japan occupied south Indo-China in July and stationed mechanized troops near the Thailand border. Thailand stated at the time that it would fight in defense of its independence against any aggressor. On August 6, U.S. Secretary of State Hull stated that a Japanese move into Thailand would be regarded as threatening U.S. security in the Pacific, and Anthony Eden said in parliament that any action threatening the independence of Thailand would be a matter of immediate concern to Great Britain.

Japan, faced with this united opposition to further aggression declared war upon the United States and Great Britain Dec. 7, 1941 before proceeding to the invasion of Thailand. The 100,000 Thai troops offered little resistance and soon laid down their arms altogether at the command of their government. The government on Dec. 8 readily acceded to the Japanese ambassador's

request that Japanese troops be permitted to march through Thailand. (*See* also WORLD WAR II.) (M. Cs.; X.)

Education.—In 1938–39: government schools 429; scholars 61,297; local public and municipal schools 11,072; scholars 1,484,483; universities 2; students (1937) 11,525.

Banking and Finance.—(1941) revenue est. 137,969,000 baht; expenditure, capital (est. 1941) 56,056,000 baht; public debt (Jan. 1, 1940) 72,400,000 baht; notes in circulation (Sept. 30, 1940) 202,000,000 baht; reserves (Sept. 30, 1940) gold 97,000,000 baht; foreign assets 122,000,000 baht; exchange rate (average 1940) 1 baht=35.15 cents; (June 1941) 1 baht=36.97 cents.

Trade and Communication.—Foreign trade 1939–40 (merchandise): imports 194,686,000 baht; exports 216,268,000 baht. Communications: roads, state highways completed (1938) 1,815 mi.; railways, open to traffic (1938) 1,925 mi.; airways, length of route opened (1938) 444 mi.; motor vehicles licensed (1937–38): total 11,439 (cars 5,910; lorries 4,233; buses 146; cycles 559); wireless receiving set licences (1938) 29,834.

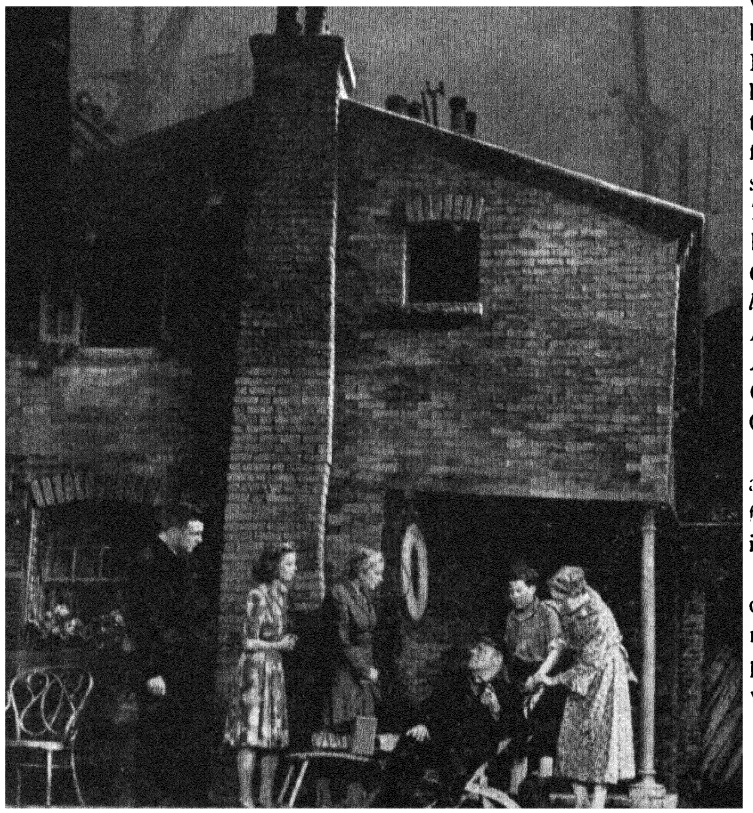
Agriculture and Mineral Production.—Production (in metric tons): rice (1939–40), 5,082,700; rubber (1939, exports) 42,000; tin ore, metal content (1939) 17,300; tobacco (1938–39) 20,400; cotton ginned (1938–39) 1,200; maize (1938–39) 5,600.

Theatre.

The prosperity of the theatre in the United States during 1941 was hardly matched by dramatic quality. A number of plays with a successful popular appeal saw production and in the lot there were several that made an honest gesture toward critically reputable drama, but none could soundly be listed in the catalogue of real importance. In this situation, the New York Drama Critics' Circle waywardly bestowed its award for the relatively best American play of 1941 on Lillian Hellman's anti-nazi *Watch on the Rhine*, with William Saroyan's superior *The Beautiful People*, which was financed into a run of 64 performances by the author, as the runner-up. The ballot was 12 to 6. The Pulitzer award was eccentrically given to a play produced in the previous season, to wit, Robert Sherwood's *There Shall Be No Night*.

The year was further disappointing in the critical collapse of playwrights who in the past have been looked to for drama of some standing. Maxwell Anderson's anti-nazi *Candle in the Wind* indicated a sharp decline even from his antecedent *Journey to Jerusalem*, and had to rely on Helen Hayes's popularity for box-office life. S. N. Behrman's anti-dictator *The Talley Method* was considerably inferior to much of his previous writing and, for all of Ina Claire's presence in the cast, was a quick failure. Elmer Rice's anti-nazi *Flight to the West* was feeble dialectic melodrama

FREDERICK BRENNAN'S *The Wookey*, first U.S. play about England in the latest war, opened on Broadway in Sept. 1941, with realistic settings by Jo Mielziner



and got only a short distance. Paul Green's dramatization, with the author, of Richard Wright's plea for justice to the Negro, *Native Son*, missed most of the novel's vitality. And so with the others.

It became markedly evident that what was largely the reason for the native drama's debility was the determination of the playwrights, both established and novice, to convert the stage into a medium for propaganda and to sacrifice what artistic talents they might possess to an indignant exposition of the crimes of Hitler, the barbarism of racial intolerance, the danger to the democratic ideal and ideologies of a piece. The result was a stage that took on more and more the aspect of a soapbox and the drama more and more that of a patriotic—and at times gratuitous—rally.

It was to the exhibits designed purely for light amusement that the theatre had consequently to look for its share of critical reason. The plays and shows in this category were all that the drama in the higher category was not. Among the pleasures in this direction, produced specifically in 1941, were Joseph Kesselring's *Arsenic and Old Lace*, a hilarious farce treating of mass-murder; Owen Davis' and the Lockridges' *Mr. and Mrs. North*, an entertaining family-detective lark; Francis Swann's *Out of the Frying Pan*, a comedy about youngsters struggling to get a foothold in the theatre; Rose Franken's *Claudia*, a perceptive comedy dealing with a young girl's difficult adaptation to the marriage state; Noel Coward's *Blithe Spirit*, a gay farce having to do with returned wifely ghosts; etc.

In the department of musical shows, there were *Lady in the Dark*, with Gertrude Lawrence triumphing beautifully over a dubious Moss Hart book; the Porter-Fields *Let's Face It*, a very sprightly specimen of its genre; George Jessel and company's burlesque-flavoured and ribald *High Kickers;* Sigmund Romberg's melodious *Sunny River;* the Olsen and Johnson insane *Sons o' Fun;* etc.

And, in both categories, such prosperous hold-overs from the previous season as *My Sister Eileen* and *Hellzapoppin, Life with Father* and *Panama Hattie*, and *The Man Who Came to Dinner* and *Cabin in the Sky* and *Pal Joey*.

But if the year was not notable for dramatic quality, there was no doubt as to its quality in acting performances. The outstanding of these was that of Judith Anderson as Lady Macbeth in the Maurice Evans-Margaret Webster revival of the Shakespearean tragedy. With one voice, the critics hailed it as the finest they had seen. The hitherto applauded Evans, however, disappointed his audiences; his Macbeth was largely a recitation, as such satisfactory enough but leaving much to be desired in the more important direction of acting. Other first-rate 1941 examples of the histrionic craft, however, were sufficiently provided by Ina Claire in the aforementioned *The Talley Method*, Helen Hayes and John Wengraf in *Candle in the Wind*, Paul Hernried in *Flight to the West*, Dorothy McGuire in *Claudia*, Katharine Cornell in the revival of *The Doctor's Dilemma*, Canada Lee in *Native Son*, Paul Lukas in *Watch on the Rhine*, Edmund Gwenn in *The Wookey*, Bobby Clark in *All Men Are Alike*, Flora Robson in *Anne of England*, Grace George, C. Aubrey Smith and Joseph Buloff in *Spring Again*, Cornelia Otis Skinner in *Theatre*, and others.

The little summer theatres, numbering more than 80, prospered as they had never before, many of them turning a profit for the first time. Business with many of them was so surprisingly good, indeed, that their seasons were extended.

The National Theatre Conference, which embraces not only independent little theatres throughout the country but those connected with the colleges and universities, broke away from its principle of attempting to duplicate plays that have had a Broadway production and for the first time essayed, and successfully,

the presentation of a completely new work, Saroyan's *Jim Dandy*.

The professional road theatres again indicated that their patronage was reserved mainly for companies headed by star actors and actresses. The Lunts, Helen Hayes, Katharine Cornell, Tallulah Bankhead and such thus played to big trade, whereas other players, with names less well known, frequently found sparse audiences. The chief exceptions were, again, the plays *Tobacco Road* and *Life with Father,* which drew audiences despite relative unfamiliarity with their leading actors.

Conspicuous American playwrights who failed to provide productions during 1941 included Eugene O'Neill, who, though he had completed two new plays, announced that he did not care to venture production until 1942 or maybe 1943; Robert Sherwood, who temporarily abandoned dramatic composition in favour of government service in connection with the war; Sidney Kingsley, who had finished a play on Thomas Jefferson but whose service in the army temporarily delayed production; John Steinbeck, who was working on a play in novel form, much after the manner of his *Of Mice and Men;* George Kelly, Marc Connelly and Thornton Wilder.

One of the most encouraging things about the theatre was the failure and closing of the great number of plays whose signal lack of merit was discernible at one and the same time to both the professional critics and the lay audiences. Some of these plays lasted but a single night; some but two or three; and others, despite attempted forcing, expired forlornly in a week or two. It became evident that no longer, as in other days, could producers foist upon audiences wares that were worthless—and, to give them their due, the producers themselves seemed to concur.

A concluding word on revivals. In the case of Shakespeare, aside from the *Macbeth* already noted, there was a wretched *As You Like It,* with Helen Craig an amateurish Rosalind, and a badly bungled *Twelfth Night,* vouchsafed by the Chekhov Theatre studio. The Theatre Guild offered a poor revival of O'Neill's *Ah, Wilderness!* and a jazzed one of Sheridan's *The Rivals.* The Cornell revival of Shaw's *The Doctor's Dilemma* was capital, and the Experimental Theatre's *The Trojan Women* a prime disaster.

(G. J. N.)

Statistics of the Theatre in New York City, 1941 and 1940

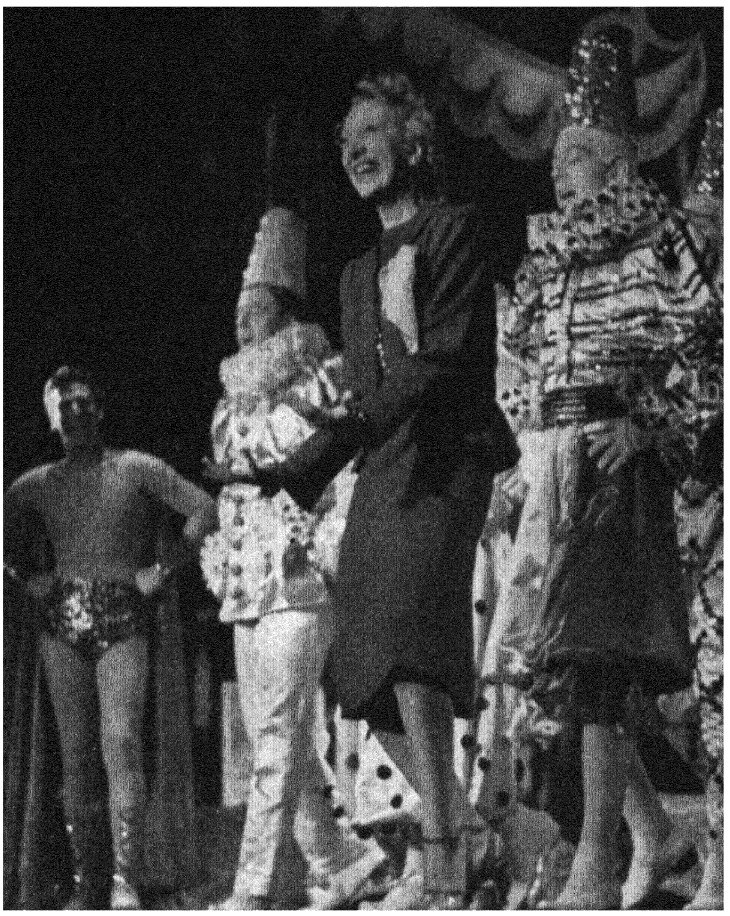
	1941	1940
Productions	94	116
Musical comedies	20	29
Plays	74	87
Premières	69	75
Successful productions	21	22
Performers employed	1,414	1,659
Tickets sold	7,360,000	6,048,000
Approximate cost of productions	$2,000,000+	$2,000,000
Estimated number of shows booked for other cities	106	103

(X.)

Great Britain.—In Shakespeare's time the actors left London and went on tour when the plague was visiting the city and it was deemed politic to close the theatre. Modern warfare, with its plague of bombing, had much the same effect on the British theatre in 1941. Most of the leading players went in and out of London in the course of presenting old successes and spent much of their time in winning new audiences in the country.

John Gielgud, for example, with an all-star cast, revived Barrie's *Dear Brutus,* which seemed profound during World War I but now struck some people as rather whimsy and flimsy. It was a beautifully staged and superbly cast production and, after a spring season in London, it had a long and popular tour, during which Gielgud could think out the plans for a more important matter, his production of *Macbeth.* Noel Coward, returning from his travels, gave London the benefit of a new play. His *Blithe Spirit* is a very light, almost farcical, comedy about a too successful essay in spiritualism which lands a man with the spook of his last wife as well as with the continuing presence of his present one. It is the kind of joke that might easily seem to be in the worst of taste, but the whole was written and produced in a sufficiently fantastic way to make death and its survival seem a laughing matter. At any rate, the public laughed in large numbers. Another new piece was *The Nutmeg Tree,* an agreeable comedy by Margery Sharp, with a nice part for Yvonne Arnaud. But for the rest, novelties were scarce.

Serious plays about the war were written but laid aside. Those who live amid bombs and gunfire do not wish to be reminded of them in their hours of relaxation. The *Journey's End* of World War I followed it at an interval of ten years. The *Journey's End* of World War II is being laid up in the consciousness of some author and even, perhaps, put to paper. But it will not be acted just yet. The immediacy of total war is too tragic for immediate tragedy.



THE MOST NOVEL PLAY of Broadway's 1940–41 season was *Lady in the Dark,* a drama-musical about psychoanalysis, written by Moss Hart. Gertrude Lawrence (second from right) played the lead

The classics, new and old, had their appeal. The "Old Vic" company presented both in London and on tour, assisted by C.E.M.A. (Council for the Encouragement of Music and the Arts), Shakespeare's *King John* and Chekhov's *The Cherry Orchard.* The dramatic work of C.E.M.A. expanded considerably during 1941, and special tours were organized in industrial areas and villages, which included a repertory of authors including Euripides, Shakespeare, Milton, Shaw, Chekhov, Bridie and T. S. Eliot. This organization, enjoying government support and charged with the double duty of keeping alive the best and taking it to the most, so far justified itself that it easily might become the origin of important future developments in publicly assisted drama.

There was no doubt that the public, especially in the big towns, wanted entertainment which would take them out of, rather than into, themselves. The decorative, rather than the intellectual, pleasures of the theatre prevailed. The vogue for ballet and opera continually increased and the Sadler's Wells teams had an immense welcome wherever they went. A new ballet company called the International visited London and was encouraged to prolong its stay. The famous French mime *L'Enfant Prodigue* was also successfully revived for the fourth time in 50 years, another sign of affection for the pleasures of the painted stage.

There was also an obvious eagerness to see "star" performers and radiant personalities. Miss Vivien Leigh, coming from her world-conquering appearances on the screen, appeared in a revival of Bernard Shaw's *The Doctor's Dilemma,* and this drew enormous houses in the provinces. Despite the fact that Mr. Shaw has a big film public, it would be absurd to suppose that the glamour of Miss Leigh's presence did not affect the box office. Mr. Shaw offered no new play, but Sean O'Casey had one published, *The Purple Dust,* a hilarious comedy, which was expecting production.

(I. Br.)

Theosophical Society, The.

An international organization for promoting the brotherhood of man, regardless of race, creed or colour. The sole prerequisite for fellowship is a belief in the principle of universal brotherhood and an earnest desire to make it practical. The society is strictly nonpolitical and unsectarian. It is composed of autonomous lodges and national sections, with international headquarters at Point Loma, Calif., U.S.A. The leader, Dr. G. de Purucker, under the constitution has paramount authority in all matters concerning the general welfare of the society. No officer or fellow receives any salary for his theosophical work.

The society is inspired by the principles of theosophy, which may be defined as a formulation by great seers and sages of the origin, structure, operations and evolution of the universe and

man, but its fellows are not asked to subscribe to any creed or dogma. The society was established by Helena Petrovna Blavatsky and others at New York in 1875, and spread widely throughout the world. Its work is carried on by the publication of books and magazines in many languages, public and private meetings, lectures and study classes, etc. The curriculum of Theosophical university at Point Loma includes among other collegiate courses special courses in theosophy to prepare students to work in the theosophical field. Special training is given in the religious and philosophical subjects of former ages, including all languages in which these are found. (J. H. FL.)

Therapy: *see* SERUM THERAPY; CHEMOTHERAPY; MEDICINE.

Thompson, James Westfall (1869–1941), U.S. historian, was born June 3 in Pella, Ia. He received his Ph.D. at the University of Chicago and was a faculty member of the university's history department from 1895 to 1932. He was professor of European history at the University of California, 1932–39, and professor emeritus after 1939. An internationally known scholar in mediaeval history, Thompson regarded his last work, completed in June 1941, *History of Historical Writing*, as his chief contribution to historiography. His other publications include: *Wars of Religion in France, 1559–1576; The Huguenots, Catherine de Medici and Philip II* (1909); *The Last Pagan* (1916), *The Lost Oracles* (1921); *Feudal Germany* (1929); *The Living Past* (1931); *The Medieval Library* (1939); and *Literacy of the Laity in Middle Ages* (1939). He died in San Francisco, Sept. 30.

Thompson, Reginald Campbell (1876–1941), British archaeologist and Assyriologist, was born Aug. 21. After studying at St. Paul's school and Caius college, Cambridge, he became assistant in the Egyptian and Assyrian department of the British museum. From 1907 to 1909 he was assistant professor of Semitic languages at the University of Chicago. He was later commissioned by the British museum to conduct excavations at Nineveh, Carchemish, Abu Shahrein, Wadi Sarga and Behistun. Dr. Thompson was author of *A Dictionary of Assyrian Chemistry and Geology* (1936), and *Digger's Fancy* (1938). During World War I he served in the British Intelligence service in Mesopotamia and was promoted to the rank of captain. In World War II he acted as home guardsman. Dr. Thompson died during the week end of May 24, it was reported from London.

Thyroid: *see* ENDOCRINOLOGY.

Tibet. A country of central Asia, lying N. and N.E. of the Himalayas, mainly a high tableland. Nominally a Chinese dependency, it is in practice independent. Area, about 450,000 sq.mi.; estimates of the population vary from 750,000 to 6,000,000; 2,000,000 is probably nearer the truth. The religion is Lamaism, a late form of Buddhism modified by animism and primitive magic, and education is in the control of the many monasteries.

The boy Lhamo Dhondup (born in Dec. 1933) who was discovered in 1939 after a search lasting some years and officially recognized as the 14th dalai lama, was enthroned at Lhasa in 1940 as Lingerh Lamutanchu. The British and Indian governments alone sent missions, B. J. Gould, political officer for Sikkim representing both.

The dalai lama and his cabinet received the approval of the Chinese national government at Chungking, and diplomatic interchange between the countries was resumed. Internal peace seemed to be more assured in 1941, although nationalists were working toward the transformation of Tibet into a modern state.

Timoshenko, Semyon Konstantinovich (1895–), Russian army officer, was born in Furmanka, Bessarabia, of peasant parents. He was drafted into the imperial army, 1915, and joined the Red army during the revolution of 1917, winning renown as a guerrilla leader. After the revolution, he studied strategy in Soviet military academies, and from 1935 to 1938 he commanded a number of Russian military districts. During the Russo-Finnish conflict, 1939–40, Timoshenko built a replica of the Mannerheim line just behind Russian positions and had his troops rehearse every operation before attacking the Finnish chain of fortresses. On May 8, 1940 he was appointed people's defense commissar and was given the rank of marshal, but he was transferred from this post July 20, 1941, and took active command of Russian armies on the western zone of the German-Russian front. In the early stages of the German-Russian war, Timoshenko's armies were compelled to fight defensive actions because of nazi superiority in mechanized power. On Oct. 23, 1941, he was shifted to the southern front; a month later he opened a surprise offensive, recaptured Rostov and Taganrog and routed the German armies of Gen. von Kleist. Timoshenko's brilliant coup paved the way for Russian offensives along the entire Russo-German front and established his reputation as one of the ablest generals of World War II (*q.v.*).

Tin. War demand increased the world tin output in 1940 to a new record high at 237,800 long tons, an increase of 28% over 1939, and 13% over the previous record of 1937. The appended table of world production includes estimates for 1941, based on the exports from leading producers during the first 10 months of the year.

World Production of Tin
(Long tons)

	1937	1938	1939	1940	1941
Belgian Congo	8,900	7,300	9,700	12,500	14,300
Bolivia	25,100	25,400	27,200	37,900	40,000
China	10,500	11,200	10,900	?	?
Dutch E. Indies	39,800	21,000	31,400	44,400	53,000
Malaya	77,500	43,200	56,000	85,400	81,200
Nigeria	10,500	7,300	10,900	10,300	11,800
Siam	16,500	13,500	17,000	17,400	16,200
World total	209,100	149,700	184,300	237,800	246,000

It is to be noted that among the countries having export quotas assigned by the International Tin committee, all except the Netherlands East Indies were consistently under-exporting, and that the total of this deficit rose to well over 50,000 tons. While it is possible that this might be taken as an indication that these countries reached their production limit, it is more likely that larger shipments were prevented by lack of adequate shipping facilities.

In 1940 imports of tin into the United States increased 78% over 1939, to the record figure of 124,810 long tons, while the total for the first three quarters of 1941 was 114,181 tons, or at an average rate of 152,240 tons for the year. It is possible though that this figure would not be maintained, as events in the far east in December disorganized shipping from this area. Deliveries to consumers in 1941 were 143,342 tons, against 115,339 tons in 1940; during the first three quarters deliveries were at a rate of 159,000 tons for the year, but were out 40% in the last quarter.

There were seven small tin smelters in operation in the United States in 1940; during the year tin ore with a tin content of 3,000 tons was imported for their use, and 1,746 tons of tin was produced. Ore receipts for these plants in the first three quarters of 1941 had 1,870 tons of tin content, of which about 60% was from Netherlands East Indies, 30% from Bolivia, and the remainder small amounts from Mexico, Argentina, South Africa, Portugal and Indo-China. In addition, 14,502 tons of tin content was received in the same period from Bolivia, for the smelter that was being built near Galveston, Texas, under government supervision; this plant was planned for 18,000 tons of metal annually, but in view of the Japanese activities that began in the Malayan area early in December, it is probable that the capacities of all plants would be increased, if the necessary ores could be secured.

The attack by Japan on Malaya, Netherlands East Indies and the Straits Settlements, which were responsible for more than half of the world's tin output in ore, and for only a slightly smaller percentage of the smelting capacity, dealt a heavy blow to the main centres of tin supply for the Allied countries. The loss of these areas, with Indo-China and Thailand, would give to Japan control of two-thirds of the tin producing capacity of the world, and reduce the potential supply of the Allies to an impossibly low level.

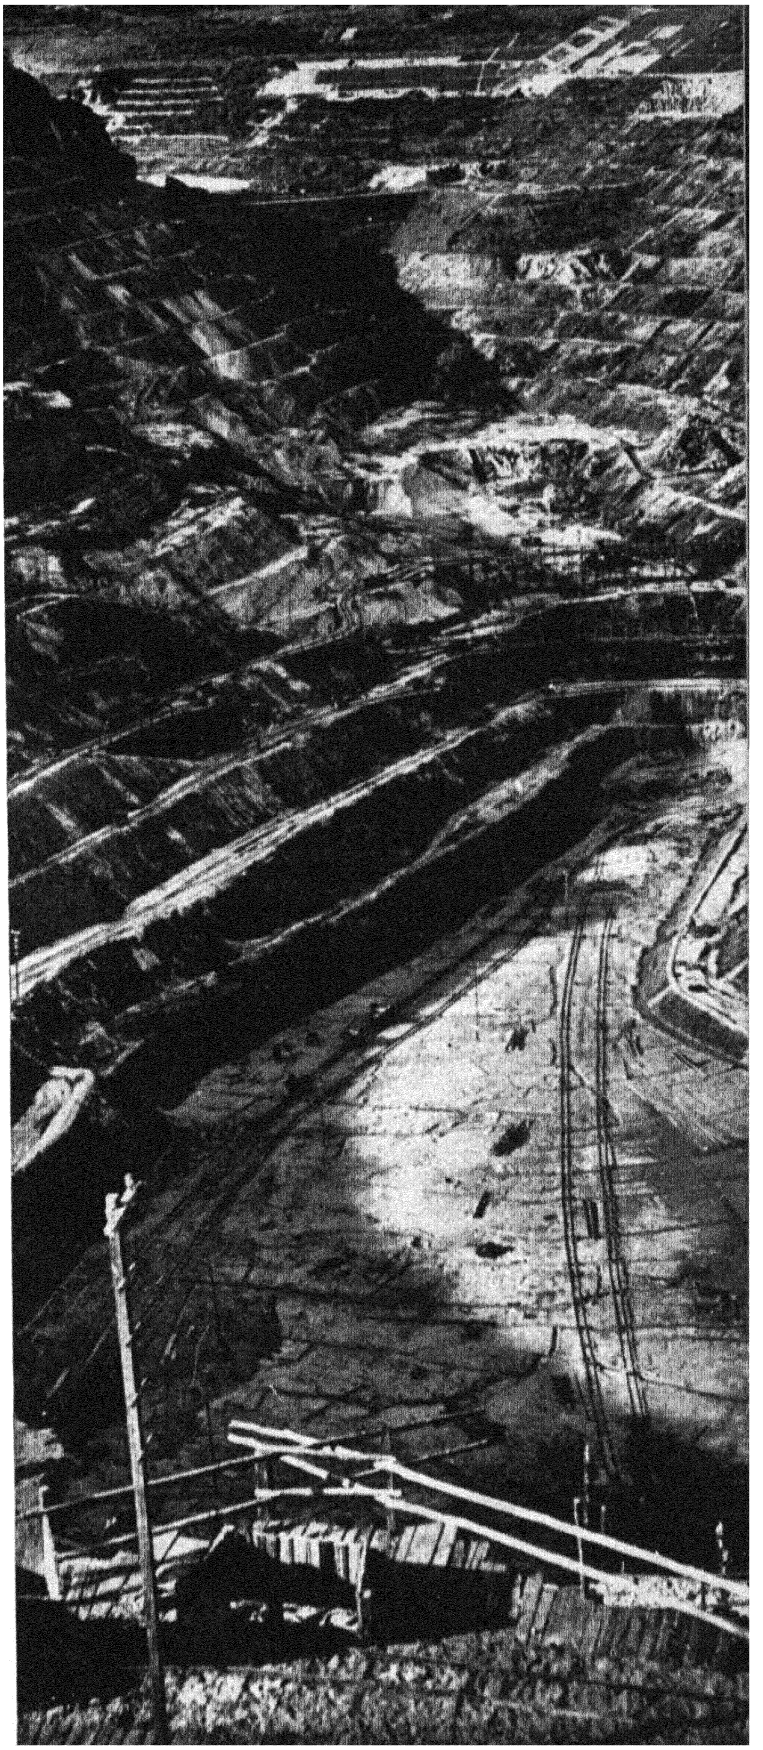
During the first half of 1941 the price of Straits tin in New York increased from 50·1 cents to 55·25 cents, later dropping to 53·0 cents, which was still considered too high, and on Aug. 16 the Price Administration set a top price of 52·0 cents for Grade A tin, 51·0 cents for 99%, and intermediate prices for intermediate grades.

(*See* also METALLURGY; MINERAL AND METAL PRICES AND PRODUCTION.) (G. A. Ro.)

Titanium. The production of titanium ores is not reported in the United States, but was apparently increasing as the demand grew. Imports have been expanding rapidly for several years, and included 286,576 short tons of ilmenite and 442 tons of rutile in 1939; decreasing to 215,525 tons of ilmenite and 156 tons of rutile in 1940; ilmenite imports decreased again in 1941, the total for the first three quarters of the year dropping to 156,737 tons, but rutile increased to 930 tons; the ilmenite was almost entirely from India, while most of the rutile was from Brazil, with smaller amounts from Australia and India. Shortage of lead and zinc was cutting down their use in pigments, and demand was increasing for titanium. (G. A. Ro.)

Titulescu, Nicolae (1883–1941), Rumanian diplomat and statesman, was born in Craiova, the son of a prominent Rumanian jurist. Educated in Craiova and Paris, he became professor of law at the universities of Jassy and Bucharest. Titulescu entered Rumanian politics in 1912 and five years later, at the age of 34, he was appointed minister of finance. In 1927 Titulescu became foreign minister in the Bratianu government. Under his tutelage Rumania championed collective security, entered both the Balkan and Little ententes and embarked on a policy of friendship with France and the U.S.S.R. His support of a pro-French policy was so militant that his political enemies called him "foreign minister-at-large of France." Titulescu's power waned with the unopposed rise of Hitler's Germany. His countrymen had lost all faith in collective security and Titulescu was dropped from the cabinet in Sept. 1936, while he was in France. As Rumanian fascists had openly threatened to kill him, the former foreign minister was forced to remain abroad. In 1937 he returned to Rumania, but fled again to France in 1940. He died at Cannes on March 17.

(See *Encyclopædia Britannica.*)



TIN MINE in British Malaya, source of nearly a third of the world's production in 1941 before its capture by the Japanese

Tobacco. Production and distribution of tobacco in 1941 acutely reflected different governmental policies rather than economic forces. In China the Japanese continued a government policy that forbade growers to sell tobacco to United States, British and Chinese manufacturers, who previously manufactured 75% of the cigarettes produced in China. Japanese

agencies paid low prices and then forced manufacturers either to pay high prices or to import American leaf, which was difficult or impracticable. Chinese growers responded by diverting tobacco acreage to food crops; production in 1941 was only 85,000,000 lb. of tobacco compared with 123,000,000 lb. in 1940. Reports reaching the United States just previous to the Pearl Harbor raid (Dec. 7, 1941) said the Japanese had raised the price to growers 30% and, as an additional inducement, offered free lodging, medical treatment, motion picture shows and radio programs to farmers to bring their tobacco to market. In unoccupied China, efforts were being made to introduce tobacco culture in western provinces.

In the United States, tobacco production of all types in 1941 was estimated by the department of agriculture as 1,279,872,000 lb. from 1,350,000 ac., compared with a 1940 crop of 1,455,802,000 lb. from 1,407,900 ac. The ten-year (1930–39) average was 1,394,839,000 lb. and the average planting was 1,676,220 ac. The Manchurian crop in 1941 was 38,000,000 lb., as against 36,000,000 lb. in 1936. The Japanese empire (Japan, Chosen and Taiwan) reported a crop of 122,000,000 lb. of flue-cured tobacco in 1941 and 120,000,000 lb. in 1940. In Turkey, British and Germans competed actively for Turkish tobacco as well as for Turkish good will. Storage of the 1941 crop of 120,503,000 lb. became an acute problem in Turkey, as lack of Black sea shipping had prevented Germans from removing a large part of their purchases from the 1940 crop of 149,300,000 lb. Rumania increased plantings from 31,765 ac. in 1940 to 41,167 ac. in 1941, to help make up the German tobacco shortage. Rumania's crop in 1941 was 25,794,000 lb., as against 20,948,000 lb. in 1940. Canadian immigration officials authorized a special arrangement by which 1,300 United States tobacco primers and 1,300 curers were imported by motor from Virginia, the Carolinas and Georgia to help harvest and cure the 1941 crop estimated (Aug. 30) at 67,300,000 lb., compared with 60,400,000 lb. in 1940. Of the 1941 crop, 53,600,000 lb. was flue-cured (cigarette type tobacco). The Canadian government estimated 8,000,000 lb. would be shipped to Great Britain, where a tobacco shortage in the summer of 1941 resulted in voluntary rationing for a short time. The Swedish tobacco monopoly announced that one-third the space occupied by tobacco in each cigarette would be replaced by a paper mouthpiece to alleviate a tobacco shortage and save an estimated 1,800,000 lb. annually.

Cigarette smoking continued to increase in 1941 throughout most of the world. In India, for example, the increase was at the rate of 5% a year, and in 1941 the Indian government followed the example of many other countries and began training growers in the technique of producing American, flue-cured, cigarette-type tobacco. The flue-cured crop in India in 1941 was 49,427,000 lb.; it was 35,760,000 lb. in 1940. Java cut domestic plantings in 1941 and produced its largest flue-cured crop, 13,000,000 lb. compared with 4,000,000 in 1940. New Zealand increased its flue-cured crop from 2,500,000 lb. in 1940 to 3,100,000 lb. in 1941 by obtaining seed from Canada after the United States had prohibited the export of seed. Australia planned a crop of 9,000,000 lb. for 1941, but harvested only 500,000 lb. more than the 1940 crop of 5,000,000 lb. Mexico reduced plantings in 1941 because the 1940 crop of 52,300,000 lb. had created a surplus carry-over. The 1941 crop was 33,000,000 lb. Sumatra, the world's chief source of cigar wrapper, lost its European market in 1940, and reduced its 1941 crop to 15,900,000 lb. The 1940 crop was 24,500,000 lb.

U. S. Production of Tobacco by Types, 1941 and 1940

Type	1941 lb.	1940 lb.	Type	1941 lb.	1940 lb.
Flue-cured	650,605,000	756,563,000	Fire-cured	75,783,000	103,703,000
Air-cured (light)*	381,054,000	408,615,000	Cigar filler	68,183,000	68,303,000
Air-cured (dark)	34,150,000	42,518,000	Cigar binder	60,315,000	66,511,000
			Cigar wrapper	9,782,000	9,499,000

*Of the 1941 air-cured (light) crop, 351,232,000 lb. were Burley. (S. O. R.)

Tobago: *see* WEST INDIES, BRITISH.

Togo, Shigenori (1882–), Japanese statesman, was born in Kagoshima, Japan. Graduated in 1908 from the Tokyo Imperial university, where he specialized in law, he entered the foreign service in 1912. After serving in minor diplomatic posts in Europe and Asia, 1912–20, he was made chief of the first section of the European and American bureau of the foreign office, 1921–23. He headed the European and American bureau of the foreign office, 1933, and the Asiatic bureau, 1934.

Togo was ambassador to Berlin, 1937, and was appointed ambassador to the U.S.S.R. in 1938. While in Moscow, he was instrumental in negotiating agreements that ended the dangerous Russo-Manchoukuoan border incidents. He became foreign minister in Gen. Hideki Tojo's cabinet Oct. 17, 1941. On Nov. 30, 1941, Togo rejected as "fantastic" a U.S. proposal for settling the far eastern crisis and stated anew Nippon's determination to proceed with its program for a "new order in Asia." A week later Japan and the U.S. were at war.

Togoland: *see* MANDATES.

Tojo, Hideki (1884–), Japanese army officer and statesman, was born in Tokyo, the son of Gen. Eikyo Tojo, master strategist of the Russo-Japanese war of 1904–05. A graduate of the Military Staff college, in 1915, he went to Germany in 1919 as military attaché and studied military strategy. Returning to Japan, he became an instructor in the Military Staff college and subsequently filled a number of important war office posts. In 1940, the Japanese army clamoured for a stronger war policy and Premier Konoye (*q.v.*) was compelled to give the war portfolio to Tojo. On Oct. 18, 1941, Tojo, then a lieutenant general, became premier after Prince Konoye resigned under a bombardment of criticism for his failure to better relations with the United States without sacrificing Japan's ambitions to create a "new order" in the far east. Tojo also took over the war and home ministry portfolios and on assuming office, he pledged his government to adhere firmly to its pro-axis and east Asia policy. A grim foreboding of war between the U.S. and Japan was seen in his first public statement that Japan would settle the far east crisis "by quick action, not words." On Dec. 13, 1941, six days after Japan attacked Hawaii, Tojo said Japan was "fighting in self-defense and the cause of righteousness," and he cautioned the people to prepare for long, hard war.

Tokyo. The capital and largest city of Japan, Tokyo had a population (1940) of 7,001,460; area 257 sq.mi.; situated at 35° 41′ N. and 139° 45′ E. at the head of the bay of the same name on the southeast coast of Honshu, the main island of Japan. Almost 10% of the entire population of Japan proper lives in Tokyo. The city has grown substantially because of the invariable attraction of a wartime capital and because new workers are always in demand for the munitions industries. Tokyo more than doubled in population between 1931 and 1932 because of a reorganization which brought into the city administration a number of outlying communities. It is a city of striking contrasts, with large western-style office buildings in the central section and endless streets of little houses and shops, built of the familiar Japanese building materials, bamboo and clay. Its vulnerability to air attack, especially with incendiary bombs, has often been commented on. Practice blackouts are severely enforced; but there has been little indication that any elaborate system of shelters has been prepared.

Tokyo is not included in the Japanese system of prefectures, but is an independent self-governing municipality, with a city council and board of aldermen and a mayor at the head of the administration. The city budget for 1939–40 amounted to 256,394,000 yen. There were 1,906 elementary and middle schools in Tokyo at the time of the last educational census, with 1,118,399 pupils. There were 104 higher schools, including 22 universities, with 107,302 students. In 1941 there were 32 libraries in Tokyo, with a total of 1,927,382 books. The largest of these was the Imperial library at Ueno, with 875,028 volumes. Tokyo is served by a variety of means of communication, including buses, streetcars, a circular city railway, a rather incomplete subway and taxicabs. Gasoline-driven vehicles have suffered because of the war shortage of oil, and charcoal was substituted wherever possible as a source of fuel. There was rationing of rice, sugar, matches and other articles of consumption and a growing shortage of many comforts. Tokyo is the centre of one of the four main industrial regions of Japan, the others being Osaka, Nagoya and North Kyushu. (W. H. CH.)

Tomatoes. Production of tomatoes in the United States in 1941 was 24,317,000 bu. (53 lb. to the bu.) for fresh marketing and 2,730,200 tons for processing. The 1940 crop was 24,126,000 bu. for fresh marketing and 2,275,800 tons for processing. The ten-year (1930–39) average annual production was 20,238,000 bu. for fresh marketing and 1,579,600 tons for processing. (For imports of fresh tomatoes *see* MARKET GARDENING; *see* also TRUCK FARMING for lend-lease purchases of tomatoes by the U.S. department of agriculture.) The acreage for fresh market tomatoes was 201,370 in 1941, compared to 204,970 ac. in 1940 and a ten-year (1930–39) average of 183,160 ac. The acreage of tomatoes for processing was 455,310 in 1941, compared to 409,580 ac. in 1940 and a ten-year average of 372,600 ac. The yield for fresh market tomatoes was 121 bu. per ac. in 1941, compared to 118 bu. in 1940; 110 bu. per ac. was the ten-year average. The yield of tomatoes for processing was 6 tons per ac. in 1941, compared to 5·56 tons in 1940 and a ten-year average of 4·23 tons per ac. The value of the fresh market crop was $36,968,000 for the crop year of 1941, the department of agriculture estimated as against a value of $29,867,000 in 1940 and a ten-year average of $24,645,000.

U.S. Production of Fresh Market Tomatoes by Leading States, 1941 and 1940

Toronto. Second largest city of Canada and capital of the province of Ontario, Toronto had a population of 657,612 in 1941 and an area of 34 sq.mi. It is a well-built and prosperous city largely concerned in the industries of mining and manufacturing and in the distribution of goods. Lines of the two Canadian railways and excellent motor highways radiating from the city make it easy of access to all parts of the province of Ontario, the two adjacent provinces of Quebec and Manitoba and border points in the United States.

The city corporation, in addition to the usual municipal services, owns and operates through commissions the city and suburban street railway and bus system and the local hydroelectric system, with exclusive distribution of electricity for light, heat and power. Toronto enjoys good air service through transcontinental and local routes.

The Canadian National exhibition, in its 64th consecutive year in 1941, is said to be the greatest annual exhibition in the world; the attendance in 1940 was upwards of 2,000,000. The University of Toronto, in its many faculties, had an attendance of more than 7,000 students in 1941. (G. R. G.)

Town and City Planning. Planning reports from central Europe ceased to arrive in the United States. Dutch journals from Amsterdam and Leiden indicated continued planning and housing activity during the early part of 1941. An article in the *American City* for August described city planning in the soviet union.

In England, two planning journals carried throughout 1941 full accounts of planning activities in the British isles. On July 17, 1941, Lord Reith announced the creation of a council of ministers as a Central Planning authority in embryo to ensure the administration of the town and county planning acts and to carry out the recommendations of the first Uthwatt report for the post-war period. Letchworth, the first garden city in England, reported in 1941 a thriving town of 20,000 inhabitants, with 14,000 workers in factories, 300 ac. of parks and 7,000 street trees.

In the Americas, planning sessions were held at the National Conference on Planning in Philadelphia in May and at the Inter-American Congress of Municipalities in Santiago, Chile in September.

In the United States, the defense program brought about important shifts in population and produced many congested cities and towns.

Charlestown, Indiana, grew during the year from less than 1,000 inhabitants to a busy industrial town supporting a $74,000,000 smokeless powder plant. In San Diego, Calif., thousands of houses were built to house workers in the great anti-aircraft factories. Old or new plants were located in most of the important cities of the country.

In Chicago, San Francisco, Detroit, Baltimore and Richmond there was renewed activity in planning to meet changing conditions. The adoption of the Community Facilities act by congress made federal funds available to local communities for construction of facilities needed in connection with war work.

The location of war industries in many cases neglected local plans; but the second Lanham act for defense housing required that housing and community facilities projects should be checked against local plans. The National Resources Planning board cooperated with state planning boards to provide trouble-shooter consultants to aid defense areas in the preparation of local plans.

Local planning in the United States is dependent on state enabling acts. In 1941, Kansas passed a City Planning act and Michigan, Minnesota, Nebraska and Utah passed zoning acts. Michigan, Illinois and New York passed laws to provide for the creation of urban redevelopment corporations. Most American cities suffered from blighted downtown districts. The Urban Land institute issued in 1941 proposals for downtown Boston, Cincinnati and Milwaukee.

In many cities public work reserve projects were planned for execution in the post-war period. During 1941 there was accelerated activity in city planning stimulated by defense necessities which resulted in an unprecedented public opinion in favour of adequate financial support for city planning.

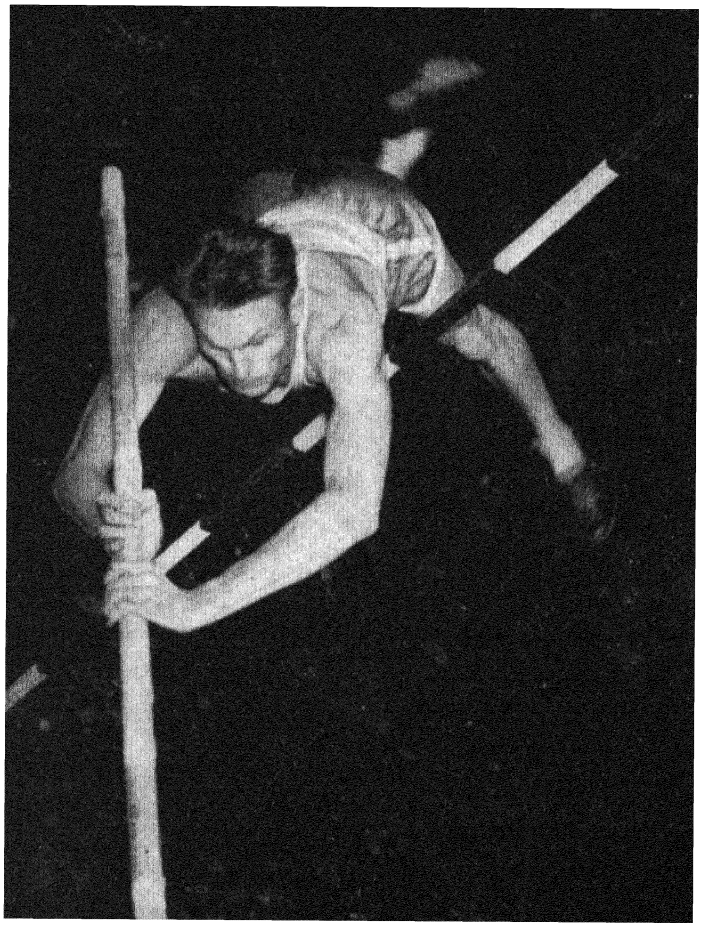
Toyoda, Teijiro (1885–), Japanese admiral and statesman, was born in August. He graduated from the Japanese naval academy in 1905 and later from the naval staff college. He was at one time naval attaché in London and attended the naval conferences of 1927 and 1930. He was a signer of the naval treaty of 1930, and in 1934 he became chief of the general affairs section of the naval technical department. In 1937 he was appointed commander-in-chief of the Sasebo naval station. He was minister of commerce in the cabinet of Premier Prince Konoye, (*q.v.*) and succeeded Yosuke Matsuoka (*q.v.*) as foreign minister in July 1941. That he was considered a moderate in his views was due, probably, to the fact that he is a brother-in-law of the head of one of Japan's five great industrial organizations, the house of Sumitomo. When Premier Konoye's third cabinet resigned Oct. 16, 1941, Toyoda was succeeded in the foreign ministry by Shigenori Togo (*q.v.*).

Track and Field Sports. Although the war caused the cancellation of the 1940 Olympic games, a new international games competition was being organized known as the Pan-American games, to be held for the first time in Buenos Aires, Argentina, Nov. 21 to Dec. 6, 1942. These games are scheduled for every four years, between olympic years. The Pan-American games, as announced by Avery Brundage, president of the United States of America Olympic committee, were being planned with Carlos Mihanovich, of Buenos Aires, a member of the organizing committee of the Argentina Confederation of Sports. Athletes from Canada, Haiti, Trinidad, Jamaica, Cuba, Mexico and each of the 21 republics in the Pan-American union would compete. Secretary of State Cordell Hull promised the full co-operation of the U.S. government because of its vital interest in the games as a means of further improving relations between the United States and the Pan-American nations.

Considered an off-Olympic year, 1941 forgot its lack of international competition and produced as brilliant a track and field season as the U.S. had ever experienced.

CORNELIUS WARMERDAM cleared the bar at 15 ft. 5¾ in.—a new world's pole-vaulting record—June 7, 1941 at Compton, Calif.



The spike-shoe idol of the United States was Gregory Rice, ex-Notre Dame star, awarded the N.Y. Track Writers association trophy as the outstanding athlete of the 1941 indoor track season. He received the same award in 1940. Winning nine straight races on the boards proved his consistency, particularly his world-record efforts at two and three miles. His two-mile mark of 8:53.4 in the New York A.C. indoor games surpassed the listed world outdoor record of 8:56 and approached within a fifth of a second of the mark credited to Taisto Maki, of Finland. He then reduced that time to 8:51.1, the fastest two miles ever run by man, indoors and out, in the feature event of the *Chicago Daily News* annual meet in Chicago.

Next for the honour of wearing the track crown in 1941 was Leslie MacMitchell (in his 21st year) because of his great progress during the year, in equalling Glenn Cunningham's and Chuck Fenske's competitive indoor mile standard of 4:07.4, in the Baxter mile, becoming the top miler of the year by virtue of his victory in five feature one-mile races during the 1941 indoor season, as well as his winning outdoors of the I.C.4-A., N.C.A.A., and A.A.U. one-mile crowns. MacMitchell had stronger competition to beat in the mile than Rice had in the two-mile and he demonstrated greater versatility. He was being primed for a 4:04 mi. or better under record-breaking conditions during 1942, according to Emil von Elling, his N.Y.U. coach, and Bob Giegengack, Fordham coach.

The far west received sectional honours in trackdom because of the supremacy of its leaders in six events of the National A.A.U. championships, in Philadelphia, Pa., which as a whole were the best ever recorded. Top performances included world's records of 15 ft. 5¾ in. by Cornelius Warmerdam in the pole vault after clearing over 15 ft. seven times in four meets; 6 ft. 11 in. by Lester Steers of Oregon in the high jump; Ben Eastman's "quarter" in 46.4 sec. was flashed by Grover Klemmer of California in the 440-yd. run; an American record of 174 ft. 8¾ in. by Archie Harris of Indiana in the discus throw; an American native record of 234 ft. 3½ in. by Bob Peoples of Southern California in the javelin throw, and a world record of 7:35.5 by California in the two-mile relay.

Klemmer also broke the 400-m. world record with a dazzling 46 sec. flat and he ran on two Golden Bear relay teams that cracked the one-mile standard with 3:09.4 and the two-mile with 7:34.5. Harold Davis equalled Jesse Owens's 100-m. figures with 10.2 sec. Fred Wolcott did 13.7 sec. over the high hurdles to equal Forrest Towne's 110-m. and 120-yd. records in the same race. Incidentally, wind invalidated a 9.2 sec. 100-yd. dash by Carlton Terry, Tex., and a 20.2 sec. 220-yd. dash by Harold Davis, of Salinas college.

Indoor Sports.—Indoor world records were eclipsed, too. John Borican suddenly turned on the power at 600 yd. and set up a new mark of 1:10.2. Al Blozis, of Georgetown, sent the 16-lb. shot to a new indoor figure of 56 ft. 2⅞ in., also making a clean sweep of every title he sought with the metal sphere. After Earl Meadows, winner of the 1936 Olympic title, went to new heights of 14 ft. 7⅛ in. in the pole vault, he predicted that vaulters would be able to clear 16 ft. and, perhaps—shades of the pioneers!—even 17 ft., with the aid of a new take-off box he has designed. Bob Wright, of Ohio State, was credited with a new indoor mark of 7.3 sec. in the 50-yd. high hurdles, clearing five hurdles instead of the customary four for the distance. Joe McCluskey, N.Y.A.C., galloped to a new world indoor record in the two-mile steeplechase in 9 min. 35.4 sec., clipping 11.4 sec. from his own indoor record made nine years ago.

Miscellaneous.—A youngster who has the makings of a second Wooderson, Lovelock, MacMitchell or Cunningham at one-mile, appeared in the person of Bobby Ginn, of the University of Nebraska, a 124-lb. sophomore. Ginn flashed a 4:10.0 performance in the California-Nebraska dual meet, at Berkeley, Cal., the fastest outdoor mile of the early 1941 summer season. Liebowitz, of Idaho, is credited with a 4:09.3 mi. in a local conference meet in Moscow, Ida.

Spectacular performances predominated during a 65th annual I.C.4-A. championships, held in Triborough stadium, on Randalls Island, N.Y., when an eight-man team representing New York university, led by Leslie MacMitchell, won the team trophy. MacMitchell not only won the

172.8½—Johnson, Cabot Mill A.C.

one-mile title, but also ran his fastest half-mile in 1:53 for his first 880-yd. victory, and unexpectedly ran the second leg on the winning one-mile relay. Norman Ewell, of Penn State, won both the 100- and 200-yd. dashes and the running broad jump. The Olympic club of San Francisco won the outdoor National A.A.U. track and field team title, and the N.Y.A.C. won the team title indoors.

Women.—Keen competition marked the National A.A.U. track and field championships for women, at Ocean City, N.J. The high spot of the meet was a new championship record in the 200-m. dash by Jane Lane, an 18-year-old senior at Wilberforce university, who beat Stella Walsh, one-time Polish Olympic ace, in 25.2 sec., two-tenths of a second under the championship mark set by Miss Walsh. Miss Lane also won the 100-m. title. Miss Walsh won individual high scoring honours with 28 points, winning the discus, broad jump, and second in the 200-m. Tuskegee (Ala.) institute won the team championship by scoring 112 points. (J. B. P.)

Trade Agreements.

One of the most significant developments in the commercial relations of the United States with foreign countries during 1941 was the signing on Oct. 14 at Buenos Aires of a reciprocal trade agreement with Argentina. While the purpose of this agreement, which became provisionally effective on Nov. 15, 1941, was to expand markets by modifying the tariff and other barriers restricting the flow of trade between the two countries, its full significance could not be regarded as limited to the expansion in trade which was expected to take place. Viewed in its broader aspect, it was an achievement of great importance, reflecting the untiring efforts of the United States government to implement its policy of inter-American economic co-operation and good neighbourliness.

Conclusion of a reciprocal trade agreement with Argentina in 1941 increased to 12 the number of other American republics with which such agreements were in effect. The twelve countries were Argentina, Brazil, Colombia, Costa Rica, Cuba (a supplementary trade agreement with Cuba was signed at Havana on Dec. 23, 1941, to become effective on Jan. 5, 1942), Ecuador, El Salvador, Guatemala, Haiti, Honduras, Nicaragua and Venezuela.

By strengthening commercial relations between the other American republics and the United States, trade agreements contributed substantially to hemisphere solidarity, and additional agreements with those countries were in prospect. During 1941, negotiations with a view to concluding a trade agreement with Chile continued. On May 13, public notice of intention to negotiate an agreement with Uruguay was given, and a similar notice in regard to Peru was issued on Dec. 29, 1941. Meanwhile, one of a series of agreements reached on Nov. 19, 1941, by the governments of the United States and Mexico, as solutions to a number of problems of mutual interest, related to the decision of the two governments in principle to negotiate a reciprocal trade agreement. It was agreed that formal announcement of intention to negotiate the trade agreement should be made in due course, in accordance with the pertinent provisions of law.

In addition to the trade agreements in effect with other American republics in 1941, agreements had also been concluded, since the Trade Agreements act was passed in 1934, with the United Kingdom (including Newfoundland and the non-self-governing British colonies), Belgium, Canada, Czechoslovakia, Finland, France, the Netherlands, Sweden, Switzerland and Turkey. On Nov. 17, 1941, public notice of intention to negotiate a trade agreement with Iceland was given.

The trade-agreements program of the United States, as carried out by the agreements already concluded and those which might be entered into during and after World War II, was one of the most important means of assuring to all nations the greatest measure of economic freedom and access on equal terms to the raw materials and markets of the world. Adherence to this objective as a basis in part for postwar economic reconstruction was announced by the president of the United States and by Winston Churchill, the British prime minister, in the fourth point of the "Atlantic Charter" issued jointly by them on Aug. 14, 1941, following their historic meeting at sea.

Because of the influence of World War II it would be difficult if not impossible to measure statistically the effects of the trade-agreements program in 1941. However, the results of the program during the prewar period demonstrated its value as a means of restoring the foreign trade of the United States. As a result in large part of the concessions obtained from foreign governments in trade agreements on specified American export products, and of the general provisions of the agreements which constitute guarantees against discriminatory treatment of American trade, the tendency in prewar years was for U.S. exports to the trade-agreement group of countries to increase faster than U.S. exports to the nonagreement group.

Developments prior to World War II emphasized the fact that trade barriers and discriminations, as manifestations of economic nationalism, are among the underlying causes of war. Trade barriers, by impeding international commerce, caused diminished national incomes, depressed standards of living, increased unemployment, financial instability and social unrest. Trade discriminations lead to constantly shifting trade currents, commercial uncertainty and insecurity, recriminations and retaliations, trade conflict and international economic tensions.

The objectives of the trade-agreements program, as carried out under the act of June 12, 1934, were the reduction of excessive trade barriers and the elimination of trade discriminations. Since, in this way, the trade-agreements program counteracted the growth and spread of economic nationalism, the continued leadership of the United States in carrying out the principles and objectives of the program, both during and after World War II, was expected to be of vital importance to the re-establishment

and maintenance of a just peace. (*See* also INTERNATIONAL TRADE; TARIFFS.) (D. AN.)

Trade Unions: *see* LABOUR UNIONS.
Traffic Accidents: *see* ACCIDENTS.

Trailer Coaches. The trailer coach industry experienced what amounted to a boom during 1941. Several new manufacturers entered the field and many of the established manufacturers were forced to increase production facilities.

This was due, in a large part, to demand for defense housing. The United States government found that the trailer coach, sleeping four and completely equipped with heating, cooking and lighting arrangements, and priced far below any other method of housing, proved to be an ideal temporary and semipermanent home.

Manufacturers were not slow to improve insulation, interior arrangements, construction and other items entering into the building and production of these coaches. Shortage of some materials that were customarily used in production of trailer coaches made it necessary to use substitutes. In many instances, it was found that the substitute proved superior to the material formerly used.

In addition to the unpredictable demand for temporary housing, the United States government in 1941 used trailers for mobile field units, radio stations, officers' headquarters, photographic equipment and developing, field hospitals and many other purposes. It is estimated that 90% to 95% of the trailer coaches produced in 1941 was directly or indirectly used for defense purposes.

The government built a number of well equipped trailer parks for the exclusive use of defense workers, purchased trailers and rented them for a low rate to these people. Several hundred other excellent new parks were established during 1941 by private groups. (P. E.)

Trans-Jordan. Trans-Jordan lies to the east of Palestine, bounded on the north by Syria, on the northeast by Iraq, on the southeast and south by Saudi Arabia.

It is an Arab principality which, under a local Arab administration, forms part of the British-mandated territory of Palestine (*q.v.*). Like the land west of the Jordan, it is under the supervision of the British high commissioner for Palestine and Trans-Jordan, Sir Harold Alfred MacMichael, who is represented in Trans-Jordan by a British resident, Alec S. Kirkbride. The prince of Trans-Jordan is Emir Abdulla ibn Hussein; the prime minister is Tawfiq Abdul Huda. Area: 34,740 sq.mi.; pop. *c.* 350,000. Religion: Mohammedan, with about 30,000 native Christians. Capital, Amman, the ancient Rabbat Ammon. Chief cities: Amman (25,000), Es-Salt, Maan.

History.—During 1941 the country gained in political importance at the time of a pro-German government's rise to power in the neighbouring Arab kingdom of Iraq (*q.v.*). The regent of Iraq, a relative of the emir of Trans-Jordan, fled to Amman. It was of the greatest importance to the British that, partly because of the efforts of the emir of Trans-Jordan, the Arabic tribes remained loyal to their alliance with Great Britain and did not heed the call to revolt and holy war which emanated from the Baghdad radio at that time. It was from their bases in Trans-Jordan that British troops started for Iraq and finally succeeded in reinstalling the legal regent of Iraq and bringing the country back to its alliance with Great Britain. In reward for this important help, it was understood that promises were given to Emir Abdullah and to the Arabs for greater independence after the successful termination of World War II.

Education, Defense, Communication, Finance.—There were, in 1939, 191 schools with 13,854 pupils. Government contribution to education was £27,874. The defense forces of the country were organized in the Arab legion with 47 officers and 1,577 men in 1941. The Hejaz railroad runs through the country from north to south, and there are about 1,400 mi. of good motor roads. For 1939–40, revenue amounted to £513,971, expenditure to £510,293. Public debt amounted on Dec. 31, 1939 to £155,107. The value of the local currency is identical with British currency. The economy of the country is almost completely agricultural, partly still in a very primitive stage. (H. Ko.)

Transylvania: *see* HUNGARY; RUMANIA.

Trap-shooting. Of the several star performers among clay bird trapshooters during 1941, none shone as bright as Walter S. Beaver, of Conshohocken, Pa., in the number of victories in title events. Beaver, a leading shooter for nearly a decade, won the class AA crown in the national amateur singles and the class A doubles, the eastern states singles and doubles, high-gun honours in the New York state trapshooting championship, the Pennsylvania state championship, and tied with Joe Hiestand, eventual winner in a shoot-off, for the class AA target championship in the Grand National meet at Vandalia, Ohio. Numerous victories in feature shoots comprised his successes for the year, his best score being 199 out of a possible 200 in the eastern states meet in Stratford, Conn.

Even more important than Hiestand's victory was the crowning of Walter L. Tulburt as winner of the Grand American title for 1941.

M. F. Schwar, of Emmaus, Pa., who had been shooting clay birds for only two years, captured the high scratch prize (group 2 off 20 yards) at the Travers Island (N.Y.A.C.) traps in the three-day battle for the amateur championship of the U.S. in May, when Beaver won the group 1 title, at 25 yards, B. Higginson won the group 2 title at 22 yards, and W. Mekel won the group 4 event at 18 yards. In this title shoot, C. W. Phellis won the class A title, H. MacElrath the class B, J. Jannefelser the class C, Harry Hammer class D and N. Quinn, Jr., class E. Mrs. Mary Conde defended the women's title which she won in a shoot-off with Mrs. Van Marker.

By breaking 100 straight clay targets, A. S. Cornhill won the George H. Lyon Memorial trophy, the first important shoot of the 1940–41 season, over the Travers Island traps. (J. B. P.)

Truck Farming. Vegetables grown for processing in 1941 in the United States exceeded by 24% the 1940 record crop and totalled an equivalent of 11,498,200 tons, the department of agriculture estimated. The 1940 crop was 10,765,100 tons. The acreage in 1941 was 1,590,770, compared with 1,379,000 ac. in 1940. In addition, vegetables grown for fresh market in 1941 amounted to 6,570,200 tons from 1,679,860 ac. (*See* MARKET GARDENING.) Unprecedented as was the volume of truck crop production in 1941, the secretary of agriculture announced in December a still larger program of production for 1942, calling for a pack of 44,000,000 cases of canned tomatoes, 38,000,000 cases of canned peas, 24,000,000 cases of canned corn and 12,500,000 cases of canned snap beans. This enormous increase was part of the lend-lease program of shipping food to Britain. The department of agriculture was to buy all U.S. grade C canned tomatoes offered through Dec. 31, 1942, at a base price of 95 cents per doz. for no. 2 cans, f.o.b. cannery; all Alaska and

sweets U.S. grade C canned peas offered through Oct. 31, 1942, at $1.10 per doz. for no. 2 cans, provided the respective canner had been certified by the agricultural department's state defense boards.

Table I.—*U.S. Production of Principal Vegetables for Processing, 1941 and 1940*

	1941	1940
Asparagus, California only	37,970 tons	53,880 tons
Beans, green lima	38,400 tons	26,140 tons
Beans, snap	126,420 tons	114,220 tons
Beets	106,700 tons	70,700 tons
Cabbage, for kraut	206,200 tons	185,200 tons
Corn, sweet	1,102,200 tons	731,500 tons
Cucumbers, for pickles	7,860,000 bu.	6,298,000 bu.
Peas, green	345,250 tons	307,120 tons
Pimentos	11,180 tons	13,020 tons
Spinach	34,800 tons	39,000 tons
Tomatoes	2,730,200 tons	2,275,800 tons

The U.S. department of agriculture began March 15, 1941, its expanded program of purchases of vegetables and other foods for shipment to Britain under provisions of the lend-lease act. While the bulk of these supplies was for export, a part was available to the Red Cross and other U.S. relief agencies.

Table II.—*Lend-Lease Purchases of Vegetables by the U.S., March 15–Dec. 1, 1941*

Commodity	Quantity	F.O.B. Cost
Canned tomatoes	5,343,143 cases	$9,002,035
Canned tomato paste	69,675 cases	246,328
Canned tomato purée	43,000 cases	81,500
Canned potatoes	581,400 cases	1,164,219
Canned peas	218,919 cases	475,709
Canned carrots	20,000 cases	27,750
Canned beets	14,500 cases	20,750
Canned green beans	11,866 cases	22,420
Canned celery	1,250 cases	4,500
Canned spinach	1,250 cases	3,188
Dry beans	190,075,900 lb.	8,416,415
Dried peas	21,271,100 lb.	882,496
Carrots	114,464 bu.	56,662
Onions	18,500 sacks (50 lb.)	9,250
Onions, dehydrated	319,000 lb.	133,810
Potatoes, white	2,292,758 bu.	1,082,181
Cabbage	155,016 bu.	44,854
Beets, fresh	97,404 bu.	50,613
Snap beans	3,021 bu.	1,964
Peas, fresh	82,465 bu.	76,692
Tomatoes, fresh	46,887 bu.	34,075
Corn, fresh	33,594 bu.	14,417
Celery	72,952 stalks	1,459
Cauliflower	2,400 crates	1,320

Tuberculosis. **Diagnosis.**—*Tuberculin Test.*—The Tuberculosis committee of the American Student Health association reported in April 1941 that for the academic year 1939–40 there were 248 colleges and universities with some form of tuberculosis control program. In 1932–33 there were only 12 and in 1938–39 only 165 such institutions. The enrolment in the 248 schools with some program in 1941 was 680,201. The committee agreed that tuberculin testing is a prime prerequisite to any other items in a tuberculosis case-finding program. It recommended that tuberculin be administered by the intradermal method of Mantoux. Among the 248 with a tuberculosis program, 213 employed the tuberculin test, which was administered to 123,389 students, of whom 25.4% reacted. This is in contrast to 14,318 tested in 1932–33, when 35% reacted. A decrease in the incidence of reactors had been observed each year since the work began. In 1939–40, 637 new cases of tuberculosis were detected among the students and 39 others who were not students. There were also 338 old cases; these students had been treated and were back in school.

The testing of cattle with tuberculin was continued throughout the nation despite the fact that every county in the United States had been classified as a modified accredited area. In 1940, of 12,222,318 cattle tested, only 0.46% reacted. This brought the grand total of tuberculin tests of cattle in the United States since 1917 to 229,714,023. During this time 3,768,201 reactors had been removed from the herds of the United States. There is no nation in the world whose cattle herds are so little affected with tuberculosis and whose citizens are so free from the bovine type of tuberculosis as the United States. Feldman called attention to the fact that cattle may become tuberculin reactors through association with humans who have contagious tuberculosis. He reported a case of human tuberculosis in an adult bovine.

X-ray.—Much interest was manifested throughout the year in the various methods of making X-ray inspections of the chest. Miniature films were tried in several places. Douglas *et al.* concluded that they were of value in the examination of large groups of individuals. Edwards reported on the use of regular size paper film in the examination of about 750,000 persons and declared them entirely satisfactory.

Further work was reported by Farness, Olson *et al.* to show that evidence of calcium deposits in the lung as seen on X-ray films should not be assumed to be due to tuberculosis unless better proof is available.

Observations on Special Groups.—Tice reported the results of tuberculin tests with X-ray films of the reactors in a large number of Chicago school children. He confirmed the findings of so many previous workers that among school age children chronic pulmonary tuberculosis is rare.

Alt *et al.* reported on tuberculosis among medical students at the Northwestern university medical school. The factors which they considered to be of importance in the development of this disease among students were exposure to patients, cross infection among students and overwork. Israel *et al.* reported an alarming tuberculosis situation among students of nursing in a Philadelphia hospital.

Pollak *et al.* found tuberculosis a problem of the first order in the Peoria state hospital for the mentally ill. Hilleboe *et al.* examined 1,264 mentally ill patients and found 158 with minimal, 74 with moderately advanced and 14 with far advanced tuberculosis. On the basis of further work they were of the opinion that in the state where they worked there were 1,400 cases of tuberculosis among the patients institutionalized for mental illness. Altshuler and Bailey examined 4,477 inmates of the Eloise, Mich. hospital and found 276 cases of tuberculosis. Among the 1,200 employees 42 cases were found. They advised that mentally ill patients with tuberculosis be treated by strict isolation methods.

Bogen *et al.* called attention to the fact that workers caring for patients with tuberculosis could only be shielded from exposure to such infection by conscious and conscientious precautions. He found that by the use of relatively simple measures the air and dust in the general vicinity of tuberculous patients "may be kept free from these dangerous germs."

Treatment.—Much interest was manifested in the drainage of cavities in tubercular lungs. The cavity is entered through the chest wall and suction is employed. Although much credit has been given Monaldi for this work, the procedure was practised by Eloesser of California in 1936.

Drug treatment in tuberculosis had been almost abandoned until Feldman and Hinshaw found that sodium p,p'-diaminodiphenylsulphone-N,N'-didextrose sulphonate, known under the trade name of Promin, a sulphonamide derivative, is effective in controlling experimental tuberculosis in guinea pigs. They inoculated each of a group of animals with a lethal dose of tubercle bacilli of the human type. These animals were then divided into two groups, the first of which received no Promin; the second group was subdivided into groups which had Promin treatment begun at different intervals after inoculation with tubercle bacilli. The drug was mixed with the animals' food. All of the animals which did not receive Promin developed widespread disease and died. In none of the treated animals did widespread disease develop and none died of tuberculosis. Indeed, in 60% of the animals no visible lesions could be found at postmortem examination in any part of the body, and in the remainder small, atypical and apparently insignificant lesions were found. This was the first time in history that a drug had been found to control tuberculosis in animals.

Effects of War on Tuberculosis.—Dr. Kendall Emerson, managing director of the National Tuberculosis association, reported that in England and Vichy France tuberculosis was definitely increasing and that in at least one of the lowland countries it had reached almost epidemic proportions. This is what happened in some nations during World War I. It is due largely to the fact that numerous persons with contagious tuberculosis kept in isolation in times of peace were required to give service during war, such as caring for children and other light work, which brought them in contact with large numbers of persons to whom they spread their disease. Others who already had tuberculosis well controlled were in danger of its becoming activated.

Tung Oil: *see* VEGETABLE OILS AND ANIMAL FATS.

Tungsten. World production of tungsten concentrates was estimated at 44,600 metric tons (60% WO_3 basis) in 1940, against 38,000 tons in 1939, with China, Burma, Portugal, United States and Bolivia as the leading producers, supplying more than 80% of the total. United States production increased from 4,287 short tons of concentrates in 1939 to 5,319 tons in 1940. Imports for consumption in the United States in 1940 were 5,415 tons, with a tungsten content of 2,805 tons; general imports were 9,241 tons, with a tungsten content of 4,833 tons, 46% from China, 20% from Bolivia, 10% from Argentina, 6% each from Portugal and Australia and 4% from Peru. The difference between general imports and imports for consumption added 2,028 tons of tungsten content to the stocks in bonded warehouses. Imports in bond for smelting and re-export had a tungsten content of 674 tons. Imports for consumption increased heavily in 1941. the total for the first three-quarters being 8,500 tons, with a tungsten content of 4,441 tons, of which 52% was from China, 28% from Bolivia, and 36% from South America. Chinese shipments held up remarkably well, considering the handicap of transportation over the Burma road. Renewed efforts on the part of Japan to cut the Burma road, and added difficulties of ocean transportation with Japan actively engaged in war with the United States, were new handicaps to be met, and it was quite possible that shipments might be cut off.

Fortunately shipments were increasing from South America (1,611 tons of tungsten content in three-quarters of 1941, against 1,073 tons in all of 1940). Increases that might have been built up from other countries were offset by decreases elsewhere, and it was largely from South America that future increases were to be expected, since practically the entire output of the continent had been contracted for, and shipments from that direction were less subject to interruption. Government loans in considerable amount were made to China, payment to be made in tungsten, but of course receipt of these payments was subject to the hazards of transportation conditions, and it was to be assumed that Japan would make these as unfavourable as possible. (*See* also MINERAL AND METAL PRICES AND PRODUCTION.) (G. A. Ro.)

Tunis: *see* FRENCH COLONIAL EMPIRE.

Tunnels. The year 1941 saw much less activity in tunnelling than in previous years. This was no doubt due to economic conditions brought about by World War II.

It seems highly fitting to record here, for reasons to be stated, the death (Dec. 17, 1940) in London of the inventor of the hooded shield, Sir Harley H. Dalrymple-Hay, news of which was received in Feb. 1941. In shield tunnelling in dangerous ground it was customary to timber ahead length by length with the tunnel lining rings, almost to the extent of building a timber tunnel to receive the shield. The invention of extending the upper two-thirds of the shield as a cantilever or "hood," and of course as part of the shield structure, brought about the complete elimination of all such timbering in advance of the shield, a great saving in the loss of compressed air in the tunnel workings, with much added safety to the miners in setting forward timber breasting wholly under protection of this extension. The first use of this form of shield in Great Britain was in the construction of the Baker street and Waterloo railway under the Thames in 1901 and its first use in the United States was in New York under Morton street of the Hudson and Manhattan railroad in 1905. There was little opportunity for the use of this shield in Great Britain, but in New York it was used to great advantage and in ways that its inventor would not have dreamt of, enabling tunnels to be built in bad ground in the vicinity of and below the elevation of foundations of heavy buildings, even obviating underpinning. It brought about great economy and safety in construction of tube tunnels at a speed two- and threefold what had hitherto been possible with a shield having its face on one plane.

On the Delaware aqueduct tunnels of New York city an 85-mi. stretch was completed with the exception of a short length at the upper end. Concrete lining, on which extraordinary progress had been made, was also near completion.

Brooklyn-Battery Tunnel.—The largest tunnel work started during the year was the Brooklyn-Battery tunnel in New York city, extending from the Battery by way of Governor's Island to Hamilton avenue, Brooklyn. This is a 2-tube highway tunnel of about one mile in length. It will be partly in rock and partly in bad ground of the glacial drift, in the proportion of about 5 to 1 respectively. The external diameter of these tunnels of cast iron lining is 31 ft. 6 in., with a 21-ft. roadway.

Chicago Subway.—In Chicago the initial program of the subway system to the extent of 8.5 mi. was completed during the year. As part of this system two sections in the Chicago loop give station accommodation under Dearborn street and State street of great length (3,886 ft. and 6,145 ft. respectively). These station lengths consist of two shield-driven tunnels converted by mining into one great structure having a centre or island platform. Elsewhere tunnelling was done by hand mining and all work was done with the aid of compressed air.

Carleton Tunnel.—To drain the deep workings of the world famous gold mines at Cripple Creek, Colo., the so-called Carleton tunnel, 8 by 11 feet for a length of six miles, was completed after much trouble with a heavy flow of water which ran as high as 20,000 gal. per minute. After this flow had subsided, conditions revealed that it was desirable to by-pass this bad area and continue the tunnel on a new alignment. About Aug. 1 the contact zone between Pikes Peak granite, through which the tunnel had been driven, and the gravel-filled crater in which the mines lie—the goal of this bold scheme—was achieved. Work was in progress in driving laterals and raises to drain the various mines in this crater area. The speed of driving this tunnel, which of course is unlined and unfinished, was very high and averaged about 50 ft. per day.

Continental Divide Tunnel.—The United States bureau of reclamation continued to construct a very large tunnel project in Colorado called the Continental Divide tunnel, as part of the Colorado-Big Thompson Irrigation and Power project. The tunnel will have a finished diameter of 9 ft. inside concrete lining, being a rock excavation of more than 12 ft. in diameter. The stretch of tunnel driven from the west portal encountered much bad ground in passage through a fault. At the east end better conditions prevailed and the extraordinary progress of 65 ft. per day was being maintained. By Jan. 1, 1942 this heading had progressed about 20,000 ft. Much attention was paid to ventilation and additional efficiency was added on this long heading by the installation of a track signal system for the operation of trains. The tunnel as a whole will be 13 mi. long.

Duchesne Tunnel.—The bureau of reclamation also started the construction of the Duchesne tunnel near Kamas, Utah, as part of the Provo-Irrigation system; it will be 10½ ft. in diameter and 6 mi. long.

Highway Tunnel.—Under the Mobile river at Mobile, Ala., the sunken Highway tunnel, 3,450 ft. long, was opened to traffic on Feb. 20. This tunnel of steel and reinforced concrete was built in sections on dry land floated into position over a prepared trench dredged to receive them and sunk into position. It accommodates a roadway 21 ft. wide for traffic in each direction.

London.—In London during the period of air raids the extensive system of deep underground railways was no longer being extended. However, certain short lengths of projected links of the system were being driven as air raid shelters from about 20 shafts. It was reported these would provide for the shelter of about 90,000 people. (J. Fe.)

Turkestan, Chinese: *see* SIN KIANG.

Turkey. A republic in southeastern Europe and western Asia. Area 296,500 sq.mi.; pop. (Oct. 20, 1940) 17,869,901. Capital, Ankara. Chief cities: Istanbul (789,346);

BRITISH GEN. SIR JAMES H. MARSHALL-CORNWALL reviewing Turkish troops in Jan. 1941, as Hitler's threat to the Balkans drew the two nations closer

Smyrna (184,362); Ankara (155,544); Adana (89,990); Brusa (77,348); Eski-Shehr (60,614); Gazi Antep (57,314). Religion: Mohammedan. President, General Ismet Inönü; premier, Refik Saydam.

History.—During 1941 Turkey maintained its nonbelligerent attitude, but with the growth of German power in the Balkans and especially with German aggression against the soviet union, Turkey moved from its previous position as a nonbelligerent ally of Great Britain to a more and more outspoken neutrality, but did not resist German encroachments upon what had been previously and frequently claimed as Turkey's vital defense zone. On the contrary, Turkey facilitated Germany's occupation of Bulgaria and its invasion of the soviet union by two preceding diplomatic moves which assured Germany of Turkey's complete neutrality. Nevertheless Turkey declared until the end of 1941 that it remained faithful to its alliance with Great Britain and that it would defend its territory against any invasion. Turkey did not neglect to continue its fortifications and troop concentrations in Thrace so as to be prepared for any eventuality, but it refused to use its armed forces to form any united stand with Yugoslavia and Greece against the German domination over the Balkans, in spite of repeated declarations which could have been interpreted in that sense.

In Jan. 1941 Anglo-Turkish talks between general staff officers were held in Ankara, and authoritative editorials declared that not only would Turkey defend its frontiers, but that it regarded Bulgaria and Greece as within its security zone and hence could not remain indifferent to any move against them. But the Turkish-Bulgarian accord which was signed on Feb. 17, pledging mutual nonaggression, was the first clear sign that Turkey might yield and that it might remain immobile in case of a German invasion of Bulgaria. Nevertheless, the Turkish press continued to express its strong sympathy for Great Britain and for the Greeks who were then fighting against Italy. At the end of February the British foreign secretary, Anthony Eden (*q.v.*), arrived in Turkey accompanied by Gen. Sir John Dill, chief of Britain's imperial general staff, and received a very warm welcome. It was officially announced that Britain and Turkey had reached "full agreement on all points" concerning the Balkans and the eastern Mediterranean.

At the beginning of March a personal message from Chancellor Hitler to the Turkish president was brought to Ankara, without, however, producing any immediate effect. The German ambassador Franz von Papen worked very hard to draw the Turks closer to Germany. The results of his efforts began to show after Germany's successful occupation of Greece and Yugoslavia. On March 24 Turkey and the soviet union exchanged declarations, according to which the soviet union promised Turkey complete neutrality, based upon the nonaggression pact of 1925, in case of Turkey's defense of its territory against aggression. Of much greater importance was the surprising German-Turkish friendship treaty which was signed in Ankara on June 18. The two countries bound themselves to respect each other's territories, to take no measures aimed directly or indirectly against the other contracting party, and to consult on all questions affecting their common interest. Even more important was the simultaneous declaration according to which the radio and the press of both countries were to act in a spirit of friendship and mutual confidence, which would thus put an automatic end to all anti-nazi propaganda in Turkey. Closer economic cooperation between the two countries was also announced. In spite of the fact that the Turkish foreign minister Shukru Saracoglu declared that the new pact maintained Britain's former treaty with Turkey intact, the Turkish press and radio proclaimed their complete neutrality, the Germans began a new trade drive for the purpose of obtaining chrome, copper and other ores, which so far had been shipped to Great Britain, and the pact served Germany in its plans for an invasion of the soviet union a few days later. On Aug. 12 Great Britain and the soviet union gave Turkey formal assurances that neither had aggressive intentions against the Dardanelles or Turkish territory, assurances made necessary by the German "nerve war" which tried to insinuate that similar intentions existed.

Meanwhile British-German competition for Turkish trade grew more bitter. Dr. Kurt Clodius visited Turkey in an effort to get all Turkish exports. Finally Turkey agreed to deliver chromium to Germany in 1943, after the expiration of the agreement which existed in 1941 with Britain; in exchange Germany was to begin immediate delivery of war materials to Turkey to an amount of not less than 80,000,000 lire before the end of 1943. At the same time two Turkish generals, one the director of the Turkish mili-

tary academy and one a columnist on military affairs, accepted Chancellor Hitler's invitation to visit the German-Russian front.

On the other hand, Turkey celebrated on Oct. 29 the 18th anniversary of the republic with a mighty display of its military power. Confidence in the Turkish attitude was expressed in the fact that the United States had decided to give Turkey full lend-lease aid. The Turks registered their appreciation of the move, but by the end of 1941 the Turkish attitude remained as undetermined as it had been during the year. With the outbreak of war between the United States and Germany, Japan and Italy, Turkey hastened to declare its complete neutrality.

Education and Defense.—The number of elementary schools in Turkey in 1939 was 7,862, with 547,122 boy and 266,410 girl students; there were 290 secondary schools of all kinds, with 86,787 male and 33,744 female students, and 17 institutions of higher learning, with 8,557 male and 1,833 female students. Total expenditure on education amounted to £T.29,785,240. The army is based on compulsory service for all men between 20 and 46. Its strength is about 20,000 officers and 175,000 men in peacetime. The Turkish navy is small and consists largely of older ships. In 1940 the air force was estimated at 370 first-line aircraft. Later information on the strength of the army, navy and air force was a military secret. The budget estimates for 1940 amounted to £T.93,977,000 for the army, £T.6,979,000 for the navy and £T.78,294,000 for the air force.

Finance, Trade, Communication.—The Turkish monetary unit is the Turkish pound (=76.46 cents U.S., Sept. 1941), divided into 100 piastres. The estimated revenue and expenditure for 1940–41 amounted to £T.268,481,000 and £T.268,476,321, respectively. The grand total of the public debt amounted on May 31, 1939 to £T.619,385,681. Imports for 1939 amounted to £T.118,248,934, exports to £T.127,388,997, of which the largest part went to Germany, the United States, Italy and Great Britain. The principal articles of import were cotton piece goods, iron and steel manufactures machinery, mineral oils and cotton and woollen yarns, while the principal exports consisted of tobacco, hazelnuts, mohair, chrome, figs, opium and cotton. The exports in 1940 amounted to £T.111,629,000, while the imports had shrunk to £T.68,923,000. It is interesting to note that during 1940 Great Britain surpassed Germany, as regards both exports and imports, but was surpassed by Italy, which had taken the lead during the first months of 1940. Turkey had 4,574 mi. of railroads and 5,987 mi. of good roads in 1941. No foreign planes pass over Turkey.

Agriculture and Industry.—Chief agricultural products are cereals, tobacco and cotton; among livestock there were 25,299,730 sheep, 11,185,457 ordinary and 5,236,691 mohair goats in 1941. Hazelnuts, figs, raisins and olive oil are also important products for export. The industrialization of Turkey has made considerable progress, especially in textiles and in paper, glass, sugar and cement industries. Turkey is rich in minerals, especially coal, of which 2,696,397 metric tons were mined in 1939, chrome, with an output of 183,539 tons, borax, zinc ore, emery, copper and lead.

Udet, Ernst (1896–1941), German flier, was born April 26 in Elberfeld, Germany. As a lad he was fascinated by aviation and constructed model planes and gliders. He joined the German air force in 1914, fought with the Richthofen squadron on the western front, and was credited with shooting down 62 Allied planes during the war. After World War I, he became a stunt flier and thrilled crowds in Europe and the United States with his daring and skill. In 1937 he successfully landed his plane on the superstructure of the zeppelin "Hindenburg" while it was in flight. When the nazis came to power, Udet was made head of the technical division of the new air force, and in 1940 he was appointed general of aviation by Hitler. Udet played a vital role in building up the *Luftwaffe* into one of the world's most formidable air forces, and he urged the adoption of parachute troops and gliders. A Berlin dispatch said Gen. Udet died Nov. 17 in an accident "while experimenting with a new weapon."

Unemployment. Unemployment fell to the lowest levels in 1941 since 1929. This was the characteristic picture in the various nations, although various localities and industries in many of the nations did not exhibit the expansion of employment typical of the general situation. The steady spread of war and the increased significance of industrial production of almost all kinds in the "total war" beginning in 1939 resulted in an increasing tempo of economic activity throughout 1940–41.

The writer has less confidence than formerly in the employment statistics of many nations. War diverts attention and funds from such activities as gathering statistics. Probably the general picture derived from the data reported by the nations to the International Labour Office is correct but one would not be justified in basing precise calculations and comparisons upon the available data. The published figures are of two principal kinds, each gathered in several different ways: statistics of employment; *i.e.*, of the number of people at work, and statistics of the number of people in need of work. Employment statistics are derived from "establishment" reports collected by mail or through field agents or labour inspectors. Unemployment statistics are furnished by the employment exchanges (applications for work), unemployment insurance systems (applications for benefits), unemployment relief records, reports of trade union secretaries and censuses of unemployment.

The various types of statistics agree reasonably well in their picture of what happened in the different countries, but not always upon the extent of the changes which occurred.

Great Britain and Northern Ireland have three-fourths or more of their wage earners (about 15,000,000) under unemployment insurance. These constitute about 90% of the British labour supply. In 1939 the employment exchange statistics showed an average of 1,513,560 wholly or temporarily out of work. In 1940 the average number was 963,536 and then gradually declined to 270,289 by Aug. 1941. If the 4,750,000 not covered by the insurance act were included in the figures, the unemployment percentage would be more apt to fall than to increase, since military service, the police, civil service, teaching and other relatively stable occupations were in this group.

Registrations of unemployed persons at the employment offices of Eire increased fivefold from the pre-depression years to 1935. There was an average of 119,148 unemployed persons registered in 1935. The registration averaged 84,054 in 1940 and 106,000 in Jan.–Feb. 1941, and 58,000 in Aug. 1941. That was high unemployment for Ireland in 1941 and reflects the adverse effect of the war upon that country.

Unemployment remained at high levels in France from 1935 to Oct. 1940. In Oct. 1940 there were nearly twice as many unemployed receiving relief (750,000) as the average for the preceding ten years. The average number of applicants for work at the employment offices was 404,604 in 1939. The figure was 1,059,000 in Oct. 1940. It dropped gradually to July 1941, when the "provisional figure" was 310,000. The figures for 1941 are of doubtful accuracy.

High unemployment figures obtained in the Netherlands from 1933 continued until March 1939. The winter of 1938–39 was very bad. From April improvement was rapid. There were 405,927 registered at the employment exchanges in Jan. 1939 and 297,874 in Jan. 1940, then the registrations fell steadily to a low of 107,000 in May 1941. The percentage of insured workers drawing unemployment insurance benefits averaged 21·8% in 1939. In 1940 it approximated 18%, in Jan. and Feb. 1941, rose to 27·6% and 24·9% respectively, then dropped to 16·5% by April. Belgium experienced marked improvement in 1937, but with worse conditions in 1938. The average number unemployed increased from 125,929 in 1937 to 203,000 in 1938; then dropped to 173,000 in 1939 and 151,000 in 1940. Unemployment was much worse from Oct. 1940 through Feb. 1941 (more than 200,000); then declined to a low of 98,000 in July 1941. In 1937 the insured workers of Belgium lost 13·1% of their possible working time; in 1938, 17·6%; in 1939, 18·8%; in 1940, 18·5%. Figures for 1941 are not available.

Denmark, Norway and Sweden all experienced moderate improvement

during the first eight months of 1939 following slightly worse unemployment in 1938 than in 1937. Denmark's percentage of trade unionists unemployed was 21.4% for 1938 and 18.4% for 1939. It was 23.9% in 1940; approximated 35%, Dec. 1940–Feb. 1941; 26.8% in March 1941; then dropped rapidly to 4.6% in June 1941 and stood at 6.0% in Aug. 1941. Obviously, providing Germany with war supplies was benefiting Denmark. Norway's in 1938 was 22%; in 1939, 18.3% and in 1940, 23.1% and in the first quarter of 1941 averaged 17.6%. Sweden's percentage of unemployed union workers in 1938 was 11.8%; in 1939, 10.0% and in 1940, 12.2%. In 1941 the percentage started at 17.2% in Jan. and dropped gradually to 9.2% in June.

The German figures are of questionable value, partly because of changes in the bases of computation, partly because of the war situation and its effects upon their statistics. The average number of applicants at employment exchanges dropped from 912,312 in 1937 to an average of 429,461 in 1939. No 1940 or 1941 figures were available. Unemployment probably stood at the lowest figures in German history. Unemployment is not permitted.

Switzerland's employment exchange figures are unusually reliable measures of unemployment because both the relief act of 1919 and the unemployment insurance law require applicants to register at the employment exchanges. From 1927 to 1929, 2.2% of the employable population were wholly unemployed and 1.6% partially. For practical purposes, this is zero unemployment in any country. In 1929 an average of 8,131 applicants registered at the employment offices (out of about 2,000,000 employables). In 1939 the average was 40,324. In 1940 it was 16,374 and in 1941, starting with a winter seasonal figure of 22,853, dropped sharply in March to 9,514 and then fluctuated from 5,000 to 8,000 through Aug. 1941. These figures represent absolute minimums for unemployment—from 1.4% to 1.6% of the insured employable population.

The Italian index of employment (1929=100) was down to 78.5 in 1932 and back to 94.9 in 1936, 104.5 in 1937, 110.7 in 1938 and 113.3 in 1939. Statistics for Italy for 1940 and 1941 were not available.

Czechoslovakia had very low unemployment in 1939. Their employment office average registrations dropped from 335,518 in 1938 to 44,080 in 1939. No figures were available after that date.

Finland publishes only employment exchange statistics. Their registrations reached a peak of 17,351 in 1933. For 1939 they averaged 3,300; 1940, 4,121; and in 1941 ranged from 5,000 to 6,200 from January to May.

Yugoslavian employment exchange statistics record an average of 22,517 registrants for work in 1938; 24,223 in 1939 and 26,724 in 1940. In Jan. 1941 the figure was 49,073 and in Feb. 46,092.

The only Mexican figures on unemployment are "official estimates." The figure given for 1930 was 75,695; 1932, 339,378; 1938, 209,332; 1939, 198,593; 1940, 183,246; and the figures for the first four months of 1941 ranged from 181,813 to 197,000.

The general trend of employment in the United States and Canada was downward in the first half of 1938, with severe unemployment, particularly in the United States, until the spring of 1939. There was then steady improvement the balance of the year.

The Canadian employment index (1929=100) averaged 93.9 for 1938; 95.7 for 1939 and 104.4 for 1940. In Jan. 1941 it was 113.6 and rose steadily to 136.7 in Aug. 1941. The employment exchanges carried average registrations of 103,739 during 1939 and 100,417 in 1940. From then the registrations decreased steadily to 42,653 in July 1941.

The United States took a special census of unemployment, Nov. 20, 1937, which recorded 7,822,912 as unemployed (2,001,877 of whom were employed on government relief work). This census was a voluntary report of individual citizens on forms left at all homes by the postal service. Sample tests made on 1,455 mail routes indicated that a 100% return might have shown as many as 10,800,000 idle on Nov. 20. A half million workers were laid off in Nov.-Dec. 1937. Comparing these figures with the 13,500,000 to 14,500,000 idle in 1932–33, the 1937 unemployment figure was discouragingly large. But in 1939–41 the trend of unemployment was continuingly downward and by the end of 1941 approximated 3,500,000.

Previous to 1930 the United States economic system expanded each decade rapidly enough to absorb the growth of population. During the '30s economic growth failed to keep pace with the growth of labour supply. The unemployment of 1937 was in considerable measure due to this factor. The expansion of 1939–41 practically absorbed the growth in labour supply of the 1930s. If large numbers became unemployed in some subsequent year it would be because of other factors than retarded economic development.

The factory employment index of the U.S. stood in the census month (Nov. 1937) at 101.1 (1923–25 base). A year later it was 90.5 and from Jan. to Aug. 1939 ranged between 92.3 and 96.3. The low point for the '30s was in 1932, 66.3. The index rose rapidly after July 1940, and in Jan. 1941 stood at 115.4 (*see* Table) from which figure it rose steadily and rapidly to 135.3 in Oct. The rise in employment continued throughout the balance of the year but the later figures were not available.

Pay rolls always fluctuate more violently than employment because of overtime and part-time work. The monthly average of pay rolls (1923–25=100) was 110.4 in 1929; but 46.7 in 1932; 85.6 in 1936; 102.0 in 1937; 77.5 in 1938; 90.8 in 1939 and 105.4 in 1940. Starting at 120.7 in Jan. 1941, the index rose to 166.6 by Oct. The more rapid rise of the pay roll than of the employment index in 1941 was due in part to increases in wage rates and in part to the large amount of overtime paid for at time and a half and double time.

While employment exchange statistics are available for the U.S., the figures have been so profoundly influenced by relief, public works and other governmental policies that they cannot be used in comparisons with other nations. It should be noted that the 4,699,020 persons registered at U.S. public employment offices in Aug. 1941 included a considerable number of people who had jobs. It is not an unemployment figure.

Japan was one of the nations with high employment in 1937, a by-product, of course, of war. The employment index (1929=100) was 123.8 in 1937 and 131.2 in 1938. In 1939 it rose to 135.9. The government's official estimates of unemployment in 1932 estimated that but 6.8% of their employable population was idle, a figure hard to reconcile with an employment index of 82 that year. For 1938 their unemployment estimate was 237,371. The estimates were about 60,000 lower during 1939 than for the corresponding months of 1937. Japanese unemployment was low, 1937–39. No figures were available for 1940 or 1941.

New Zealand's are entirely employment exchange figures. They indicate a gradual improvement in employment after 1934, with 1937–38 distinctly better than any year since 1933. The numbers registered ranged between 1,000 and 9,000, Jan. to Dec. 1939. In 1941 they ranged from 1,924 to 2,626 per month.

The only unemployment figures for Australia are compiled from reports sent in by union secretaries—a not very satisfactory type of unemployment statistics. The Australian trade union returns showed 45,775 or 9.7% of the union workers unemployed (monthly average) in 1939; 39,116, or 8% in 1940; 27,289, 5.3% in Feb. 1941 and 3.6% in May 1941. No absolute figures were published after Feb. 1941. But unemployment in Australia was at a low figure throughout 1941, as the country was geared to wartime production efforts.

The employment exchange registrations in Chile jumped from an average of 29,345 in 1931 to 107,295 in 1932, and then gradually dropped to 30,055 in 1934. Since then, applications for work have been at low levels. Registrations averaged only 10,672 per month in 1935; 6,474 in 1936; 3,215 in 1937; 4,578 in 1938; 9,415 in 1939; 8,550 in 1940, and declined gradually in 1941 from 5,207 in January to 2,991 in April and up to 4,410 in August. (*See* also CENSUS, 1940: *Employment Figures;* SOCIAL SECURITY; UNITED STATES; WAGES AND HOURS.) (D. D. L.)

Unfederated Malay States.

One of the three principal subdivisions of British Malaya (*See* also STRAITS SETTLEMENTS and FEDERATED MALAY STATES). Area, 24,728 sq.mi.; pop. (1931) 1,600,895. There are five states on the Malay peninsula and Brunei, on the island of Borneo. These principalities are ruled by native sultans who have treaty relations with the British crown under which British advisers are appointed for the general supervision of administration. The largest, most populous and relatively advanced of the states is Johore, at the southern end of the Malay peninsula, opposite Singapore (*q.v.*). The area and population of the land states in 1939 were as follows: Johore, 7,330 sq.mi., pop. 778,990; Kedah, 3,660 sq.mi., pop. 484,933; Kelantan, 5,750 sq.mi.; pop. 393,983; Trengganu, 5,050 sq.mi., pop. 204,543; Perlis, 310 sq.mi., pop. 56,382. The population consists predominantly of Malays, except in Johore, where the Chinese outnumber the Malays. After rubber the most important products are rice and coconuts. Several of the states in northern Malaya, Kedah, Perlis and Kelantan,

were occupied by the Japanese in Dec. 1941. (*See* also JAPAN; WORLD WAR II.) (W. H. CH.)

Union Now. *Union Now* is the name of a book by Clarence K. Streit which proposed that a nucleus of the more experienced democracies form a federal union designed to grow gradually into a World United States. First published in New York in March 1939, it aroused discussion in many countries and immediately gave rise to an organized movement known as Federal Union, Inc. This nonprofit membership association with national headquarters at 10 East 40th street, New York city, is also popularly called "Union Now."

The two words of the title express the book's two major contributions to the problem of organizing world government: *Union:* World government, to be effective, should be organized with man instead of the nation as its supreme unit; it should constitute an interstate government of, by and for the people instead of a government of, by and for the states members, a federal union modelled on the U.S. constitution rather than a league as exemplified by the Geneva covenant. The union should have power in five main fields—citizenship, foreign relations and defense, interstate trade, money, postal and other interstate communications. All other powers should remain with the nation members to exercise independently.

Now: This union, far from being a Utopian project for the distant future, must be started at once in order to prevent the lack of effective democratic world government resulting in another world war. To get this end, the president of the United States should lead in getting the union started as a nucleus powerful enough to keep the peace from the outset and designed to grow gradually into a universal government by the admission of outside states and colonial peoples as states are admitted to the U.S.A. The nucleus should be formed on a political rather than a geographical basis, and composed of the democracies most experienced in this problem of constituting and maintaining interstate self-government. These 15 founders were suggested as having the necessary qualifications in political and material strength: the U.S.A., Britain, Canada, Eire, Union of South Africa, Australia, New Zealand, France, Switzerland, Belgium, Holland, Denmark, Norway, Sweden, Finland.

Within a few weeks of publication readers began spontaneously organizing themselves in local committees in the U.S. From these grew in July 1939 the national organization, of which Streit is president. Independently, Federal Union organization developed in Great Britain, France, Australia, New Zealand, South Africa, Canada, Eire, Argentina and elsewhere, the first two beginning before publication of *Union Now* in London and Paris.

The war began and the democracies fell one after another until finally, on June 16, 1940, the British government made the first offer of a democracy to unite on the "Union Now" basis—a vain, last-minute offer to France, which was rejected 13 to 10 (according to unofficial reports) by the French cabinet. With only the English-speaking members of the 15 free to unite, Streit published a full-page advertisement in the *New York Times* July 15, 1940, proposing that the U.S. invite the British commonwealth to form a provisional union with it at once. He expanded this idea in *Union Now With Britain*, published in March 1941. This sequel to *Union Now* applies its basic principles to the problem of winning the war.

Streit is of old American stock and was for ten years the *New York Times* correspondent in Geneva (1929–38). He wrote *Union Now* first in 1933–34 and, after five years of failure to find a publisher, printed at his own expense and gave away 300 copies of a private edition in Oct. 1938. World sales of each of his "Union" books totalled in 1941 more than 200,000 copies, including distribution of both by the Book-of-the-Month club as a 1941 dividend.

Federal Union, Inc., had 103 chapters scattered through many states when it held its first national convention in Cleveland, Ohio, in June 1941. Its policy is summed up in its slogan: "For American leadership in forming a federal union of free peoples as the nucleus of a world government—now." According to *Fortune* survey published Dec. 1941, 34.9% of the adult American population then favoured the U.S. joining a union of democracies in all parts of the world to keep order after the war.

(C. K. S.)

Union of South Africa: *see* SOUTH AFRICA, THE UNION OF.

Union of Soviet Socialist Republics. A state of eastern Europe and northern and central Asia. Area (Aug. 1939), 8,175,500 sq.mi., over one-fifth of which lies within the polar circle; pop. (Jan. 17, 1939, census), 170,467,186. The area added to the U.S.S.R. in 1939 and 1940 (eastern Poland, the Baltic states, the Finnish conquests and Bessarabia) was about 174,500 sq.mi. and brought the estimated total population in 1940 to 193,000,000. The general increase in the population of the U.S.S.R. for the period of 12 years to Jan. 1939 amounted to 23,439,271, or 15·9%, the rate of increase varying throughout the period. Sixty-four per cent of the population of the soviet union lived in the Russian Soviet Federated Socialist Republic (78% of the U.S.S.R. territory), the remaining 36% of the population being distributed almost in equal halves between the Ukrainian S.S.R. (2% of the territory) and the nine other union republics (total territory, 20%). In Jan. 1939, Great Russians constituted 58·4% of the population (as against 53% at the end of 1926); Ukrainians, 16·6% (21·2%); White Russians, 3·1% (3·2%); Uzbeks, 2·9% (2·7%); Kazaks, 1·8% (2·7%); Tatars, 2·5% (2%); Jews, 1·8% (1·8%); Azerbaijanis, 1·3% (1·2%); Georgians, 1·3% (1·2%); Armenians 1·3% (1·1%). Altogether some 60 different ethnic groups are comprised in the union. The 140-odd languages and dialects spoken in the U.S.S.R. belong to the following groups: Indo-European, Caucasian, Semitic, Ural-Altaic (Finno-Ugrian, Samoyede, Turkic, Mongolic, Tungusic), Palaeo-Asiatic and Far Eastern. Capital: Moscow (4,137,018). Ten other cities had a population of over 500,000 in 1939: Leningrad (3,191,304), Kiev (846,293), Kharkov (833,432), Baku (809,347), Gorki (644,116), Odessa (604,223), Tashkent (585,005), Tiflis (519,175); Rostov-on-Don (510,253), Dnepropetrovsk (500,253). Premier and dictator in 1941: Joseph Stalin (*q.v.*).

History.—The momentous year 1941 opened with what appeared to be an omen of continued friendly relations between the U.S.S.R. and Germany. On January 10 a series of four agreements was signed in Berlin and Moscow, extending the trade agreements of the previous year, fixing the new frontier between Lithuania and Germany and arranging for an exchange of nationals between the two countries; the object of the latter clause was to secure the repatriation of some 50,000 Germans dwelling in the Baltic states. On February 27 a two-year treaty of commerce and navigation between the U.S.S.R. and Rumania was signed.

It later became clear, however, that German-soviet relations had been growing increasingly strained following the visit of Foreign Minister Molotov (*q.v.*) to Berlin the previous November, a meeting which had resulted in the refusal of certain proposals made by Germany for closer collaboration. On April 19, indeed, *Pravda*, the organ of the Communist party, announced for the first time that during Molotov's Berlin visit "suggestions were made to the soviet government to adhere to the Tripartite Pact and to transform it into a Four-Power Pact" but that "the soviet government did not find it possible to accept this offer." Previous to the publication of this statement, an announcement by Andrey Vyshinsky, vice-commissar for foreign affairs, on the entry of German troops into Bulgaria made it clear that the soviet government viewed with disfavour Germany's expansion in southeastern Europe and was prepared to make public its attitude on this matter. "The soviet government cannot share the opinion of the Bulgarian government (Vyshinsky's statement ran) that the presence of German troops in Bulgaria will facilitate the preservation of peace. The soviet government take the view that this would lead to a widening of the theatre of war." A month later, on the overthrow of the pro-axis government in Yugoslavia, an editorial in *Pravda* paid tribute to "the Yugoslav nation (which) has so glorious a past" and which had shown itself "worthy of this past and deserving of congratulations." On April 6 a pact of friendship and nonaggression was signed in Moscow with the representative of the new Simovitch government, by which each contracting party pledged itself "to preserve its policy of friendship" in the event the other became the object of aggression by some third state. On April 30 two events occurred that were indicative

of growing tension. Anastas Mikoyan, commissar for trade, introduced a ban on the transit of all war supplies through the U.S.S.R.; and on the same day *Pravda* carried an announcement of the landing of 12,000 German troops in Finland four days previously. In his May day speech Marshal Timoshenko (*q.v.*), commissar for defense, stressed the need for preparedness in view of possible "surprises" in the international situation.

Meantime, in the far east, the new year had commenced with a trade agreement signed on January 13 between the U.S.S.R. and the Chinese government in Chungking, providing for the exchange of tea, wool and certain minerals from China against soviet military supplies. This agreement followed an official warning to Japan a month previously that the policy of the soviet government towards China remained unchanged. The visit of Matsuoka (*q.v.*) to Moscow and then to Berlin at the end of March, which included conversations both with Stalin and with Hitler, gave rise to speculation in some quarters as to the possibility of a new four-power agreement by which the U.S.S.R. might purchase security from attack both in the east and the west in return for participation in axis designs. These speculations were, however, to prove groundless. On his return journey through Moscow Matsuoka stayed several days to confer with Molotov concerning the possibility of an agreement between the two countries; and on April 13 a soviet-Japanese pact of friendship and neutrality was duly signed. This bound "both contracting parties to maintain peaceful and friendly relations," and provided that "if one of the contracting parties is the object of military action by one or more states, the other contracting party will observe neutrality throughout the whole duration of the conflict." Japan further agreed to recognize the territorial integrity of Outer Mongolia in return for soviet recognition of the territorial integrity of Manchoukuo. It seems clear, however, that the soviet government by this pact conceded less than the other party to it had desired. *Pravda* was quick to point out that it was a pact of neutrality and not a full treaty of nonaggression; and Chungking was informed that it would make no difference in soviet relations with China. In certain Japanese circles there was criticism of the agreement, and Matsuoka found it necessary to explain that while the pact was "advantageous to the soviet union" it was "also beneficial to Japan." *Pravda* on April 19 issued a denial that it was either "directed against Germany or dictated by German pressure."

Economic Developments.—About the same time there were significant developments in the spheres of economics and of administration. The budget estimates, which were approved by the Council of Nationalities on March 1, provided for a total expenditure of 216,000,000,000 roubles, of which 37% represented expenditure on defense purposes. This figure for defense expenditure represented a 50% increase over that of the previous year and was three times the 1938 figure. In the administrative sphere the principal changes were: in February, the dividing of the commissariat for internal affairs into the commissariat for internal affairs (which continued to control the G.P.U.) and a new commissariat of state security, with Beria continuing as head of the former and his former assistant, Merkulov, as head of the latter; the appointment of Stalin as chairman of the Council of People's Commissaries by decree of the praesidium of the supreme soviet on May 6, Molotov retaining his office as commissar for foreign affairs; and the replacing on June 11 of Vannikov by Ustimov as commissar for armaments. At the eighteenth party conference earlier in the year there were newly appointed to the central committee, either as full or as substitute members of it: the ambassadors in Berlin and London and Otto Kuusinen, president of the Karelian Finnish Soviet Republic.

In a report to the same conference on the economic plan for 1941 and the results of the plan for 1940 by the chairman of the State Planning commission, emphasis was laid on the need to increase the output of the metal and the oil industries, the progress of which "cannot be regarded as adequate." After 1937 (the final year of the second five-year plan) the daily output of pig iron was reported to have increased from 40,000 to nearly 47,000 tons, of steel from 50,000 to 58,000, of coal from 370,000 to 467,000, and of oil and oil-gas from about 85,000 to just under 98,000. After 1937 the output of aluminum had been increased 50%, of copper 65%, while that of nickel and tin had been quadrupled. The plan for 1941 provided for an increase in the gross output of industry by 17% or 18% over the previous year, of oil by 11%, coal by 16%, of iron and steel by more than 20%, of aluminum by 66%, of nickel by 99%, of machine-tools by 28%, and of railway locomotives by 42%. Cotton fabrics and leather footwear were to increase by 11% in each case, sugar by 27%, and the output of the food canning industry by 24%. As regards railway transport, the assignments for capital investment were to be increased by 55% over the previous year. Particularly large increases of capital investment were also designed for the iron and steel, engineering and oil industries and for electrification. Emphasis was to be placed on the development of river transport and on the elimination of irrational cross-hauls in freight transport between different industrial areas.

Toward the end of May and the first half of June there was an increasing number of reports of hostile German military preparations on the frontier. There were two events which at the time caused numerous observers in England and the United States to be sceptical of any impending rupture of German-soviet relations. First of these was the withdrawal of recognition by the Moscow government of the *émigré* governments of Norway, Yugoslavia and Belgium, and the closing of the legations of these governments

A MERE BOY, apparently, is this Russian prisoner (centre) photographed in the summer of 1941 in a German camp

in Moscow on the ground of "the loss of sovereignty by these governments." Secondly, there was an official denial, through the Tass agency, of the reports of hostile troop concentrations by Germany inside its eastern frontier—reports which were stigmatized as "absurd and hostile propaganda spread by forces hostile to Russia and Germany." It was further denied that Germany had presented any demands or had asked for closer collaboration with the soviet government. The dispatch of troops to northeast Germany was declared to be "apparently connected with purposes which have no connection with Russia," while the call-up of reservists and the commencement of manoeuvres by the red army was in accordance with normal procedure at that time of the year.

Beginning of the German Attack.—At 4 o'clock on the morning of June 22, without a declaration of war or any explicit warning, Hitler's attack on the U.S.S.R. was launched. German land forces advanced across the frontier on an 1,800-mile front from Finland to the Black sea. Contemporary estimates placed the German strength at between 150 and 180 divisions; while soviet strength was estimated at somewhere between 150 and 200 divisions. An hour later Goebbels read Hitler's proclamation, in which he accused the soviet government of breaking the German-soviet pact of 1939, intriguing with Britain against Germany and, in particular, of encouraging Yugoslavia to resist German plans in the Balkans. "In this very hour," he said, "a movement of troops is taking place which in its extent and magnitude is the greatest the world has ever seen." At 11.15 A.M. Molotov broadcast an official statement denouncing "this unheard-of attack on our country (which) is without example in the history of civilized nations." "This war," he said, "has been forced on us, not by the German people, not by the German workers or intelligentsia, whose problems we thoroughly understand, but by a clique of bloodthirsty fascist leaders of Germany who have oppressed the French, the Czechs, the Poles, the Serbs, the Norwegians, the Belgians, Denmark, Holland, Greece and other nations." On the same day, Italy declared war on the soviet union, and General Ion Antonescu (*q.v.*), in an order of the day to the Rumanian army, announced that his country was engaged in a "holy war" on Germany's side to recover Bessarabia. At 9 P.M. on the same fatal day, Churchill made his historic broadcast announcing that: "Any man or state who fights against naziism will have our aid. Any man or state who marches with Hitler is our foe."

Two days later Hungary broke off diplomatic relations with the U.S.S.R.; the government of Slovakia declared itself "on Germany's side"; while Finland issued the ingenuous statement that it intended to remain neutral. Before many days had elapsed, Italian, Finnish, Hungarian and Rumanian troops were taking part in the German operations against the soviet union; and later special contingents raised in Vichy France and in Spain were added to their number.

There can be little doubt that expert military opinion both in Britain and in the U.S. had been sceptical of soviet military efficiency and equipment, and that the resistance which the red army and air force presented to the carefully-prepared onslaught of the German *Wehrmacht* amazed the world. Equally surprising to those who had counted on internal political dissension were the morale and unity of the soviet people in face of attack, and the heroism and initiative of the ordinary soldier, guerrilla fighter or civilian. Clearly, soviet efficiency surprised even the German general staff, and deranged the Hitlerite plan of rapid penetration, encirclement and annihilation of the soviet armies. The earliest success of the Germans was the occupation of Brest-Litovsk, Lomza and Kolno on June 23. These places were held apparently only by frontier-guard forces, which had never been intended to be more than a screen to delay the initial onslaught, pending the assembly and deployment of the main forces of the red army farther east within the pre-1939 borders of the U.S.S.R. At the same time the initial German thrust into the Baltic states towards Siauliai was repulsed with the loss of 300 tanks, and the advance of German and Rumanian troops into Bessarabia was held at all points. On June 24 the soviet air force, which Germans had claimed was "annihilated on the ground" during the first two days, carried out bombing raids on Constanta and Sulina and later on Bucharest, Koenigsberg, Danzig, Lublin, Warsaw.

By the end of June the most successful of the three main German drives proved to be that towards Minsk, and on June 29 the Germans claimed to have by-passed that city. Russian withdrawals had also taken place in Lithuania, and the Germans had claimed as early as the 24th the capture of Vilna and Kaunas. Farther south, giant tank battles were reported to be taking place in the Luck area. The combined Finnish-German offensives towards Murmansk and the Karelian isthmus had made little progress, and the German-Rumanian penetration into Bessarabia had been frustrated. By July 1 the Germans claimed not only the possession of Libau, Minsk, Lvov, Riga and Ventspils and to have reached the Berezina and also the Dvina between Dvinsk and Riga, but the destruction of 4,000 Russian planes, 2,200 tanks and the capture of 40,000 prisoners; to which the Russians replied that their true losses were 900 tanks, 850 planes and 15,000 missing or prisoners, against German losses of 2,500 tanks, 1,500 planes and 30,000 prisoners. By the end of the second week, however, the Germans had been successful in occupying nearly all of what had formerly been Poland and the Baltic states with the exception of Estonia. They claimed that "the greatest battle of encirclement in world history" was in progress in the Minsk and Bialystok areas, and talked of 400,000 prisoners and the destruction of 7,600 tanks, 4,400 guns and 6,000 aircraft. Again, a week later, they were speaking of 9,000,000 soldiers engaged "in a battle which surpasses all historical precedent and conception," and were claiming the crossing of the Dniester in the south, a penetration beyond Smolensk in the centre and the capture of Novograd-Volynsk in the western Ukraine.

Foreign Relations after the Attack.—The German attack and the new war on the eastern front occasioned considerable diplomatic activity in Moscow, London and at Washington; and the new alignments which followed Churchill's declaration on June 22 were in some respects quite startling. On July 13 was signed the Anglo-Russian pact of mutual assistance. A week later the soviet government resumed diplomatic relations with the *émigré* governments of countries occupied by Germany, and on July 18 a soviet-Czech treaty of mutual assistance was signed by Ivan Maisky and Jan Masaryk, providing for "mutual aid and support in the war against Germany" and for Czech military units to be formed on soviet territory to operate under the soviet high command. On July 30 a soviet-Polish agreement was signed by Maisky and General Sikorski at the foreign office in London, by which the soviet government recognized that "the soviet-German treaties of 1939 as to territorial changes in Poland have lost their validity" and the Polish government declared that it was not bound by any agreement with a third power directed against the U.S.S.R. Arrangements were forthwith made for the raising of a Polish army on soviet soil to operate under its own commanders but operationally to be subordinated to the soviet high command.

On July 30 Harry Hopkins (*q.v.*) arrived in Moscow as the personal emissary of President Roosevelt to Stalin. On August 16 there followed an Anglo-Soviet trade agreement signed in Moscow by Sir Stafford Cripps and Mikoyan, under which Britain extended an initial credit of £10,000,000 to the U.S.S.R. at 3% for five years. On September 26 an exchange of letters took place between Maisky and General de Gaulle (*q.v.*) in which the soviet government extended recognition to the Free French government and

"AN UNEXPECTED GUEST" dropped into the bed of the democracies June 22, 1941, when Germany launched its attack on the U.S.S.R. Cartoon by Thomas of the *Detroit News*

promised the latter full aid and support. On August 10 the British and soviet ambassadors in Ankara presented identical declarations to the Turkish foreign office, confirming their fidelity to the Montreux convention and assuring the Turkish government that they cherished "no aggressive intentions or claims whatever with regard to the Straits," were "prepared scrupulously to observe the territorial integrity of the Turkish republic," and would "render Turkey every help and assistance in the event of her being attacked by a European power." In view of German intrigues in Iran, British and Russian forces jointly entered Iranian territory on August 25, and on September 17 entered Tehran, the capital. On September 28 Lord Beaverbrook (*q.v.*) and Averell Harriman, representing the British and U.S. governments respectively, arrived in Moscow for a three-power conference on supplies; and on October 3 it was announced that the U.S.A. and Great Britain had agreed to send large war supplies to the U.S.S.R.

At home, within a week of the German attack, the government in Moscow had announced the formation of a State Defense council (on June 30) consisting of Stalin, Molotov, Beria, Malenkov and Marshal Voroshilov. On July 11 this council appointed Marshals Voroshilov, Timoshenko and Budenny (*qq.v.*) commanders respectively of the northwestern, the central and the southwestern sectors of the front; while on July 20 a government decree appointed Stalin to the post of defense commissar in place of Marshal Timoshenko, who became an assistant commissar for defense together with Lieutenant-Generals Fedorenko, Zhigarev and Zhuliev, and M. Schadenko. Three days previously, the office of political commissar in the army (abolished in August 1940) was reintroduced by a decree signed by President Kalinin. In September the Defense council announced the introduction of compulsory military training for all male citizens between 16 and 50.

In view of past controversies, an official announcement made in Moscow on August 15 on the religious question attracted considerable attention from public opinion in other countries. This announcement stated that there existed in the soviet union as many as 8,338 churches, mosques and synagogues and 30,000 registered religious societies. Maisky, in an address to the American Chamber of Commerce in London on September 23, emphasized that freedom of religious belief and worship was guaranteed in the U.S.S.R. under Article 124 of the 1936 soviet constitution.

The Russian Retreat and Counterattack.—Despite the extravagant German claims during the early weeks of the campaign, soviet resistance continued to be of the most stubborn character; and although in face of the weight of German equipment the red army continued to yield ground, these withdrawals were generally in good order and were punctuated by periodic local counterattacks which showed that the initiative was far from being exclusively with the Germans. It soon became clear that the campaign was to bear an entirely different character from the previous Polish and French campaigns with their swift and devastating blitzkrieg. The red army, with its tactics of defense in depth and of cutting off the tank spearhead from its supporting infantry, was successful in furnishing the first effective reply to the blitzkrieg. In addition, the activity of guerrilla fighters, sometimes consisting of soldiers, sometimes of the civilian population in the occupied areas, in harassing the German lines of communication introduced a new element into warfare; as did also the "scorched earth" policy of destroying in retreat everything that could be of the least use to the invader, including factories and machinery, power stations, residential buildings and offices, crops and stores.

In the course of August and September the German advance in the centre, after penetrating beyond Smolensk, was halted. In the northwest, after overrunning Estonia and capturing Tallinn on August 29, the Germans advanced east of Lake Peipus towards Novgorod and the approaches to Leningrad; but repeated assaults against Leningrad itself were repulsed and the attackers were fought to a standstill. The most spectacular German penetration in these months was in the south against the army of General Budenny. In August a pincer move south of Kiev in the region of Uman forced a Russian withdrawal to the line of the Dnieper, resulting in the isolation of Odessa, the garrison of which continued to hold out heroically for more than two months. Eventually, on September 19, this pressure led to the fall of Kiev itself and a further drive in a northeastern direction towards Poltava. By the end of August the Russians had been forced to evacuate important industrial centres like Dnepropetrovsk on the west bank of the Dnieper, and to blow up the famous Dnieper dam at Zaporozhe. In October further German onslaughts in the centre and south resulted in a penetration beyond the Dnieper as far as Rostov and the line of the Don, the fall of Kharkov and an overrunning of the Crimea (except for Sevastopol) as far as the Kerch straits. In the centre the new German offensive, launched, it was said, with the aid of nearly 20,000 tanks, achieved an advance as far as Kalinin, Mozhaisk and Tula; but despite the claim of the chief of the German press department on October 9, that "the campaign against Russia has virtually been decided with the destruction of Timoshenko's army groups," the German advance was again halted within 50 miles of the capital, as it had been earlier halted outside the gates of Leningrad. A series of further heavy offensives against the capital in the course of October and November, while penetrating the outer defenses at certain points, failed to make substantial headway.

The failure of these attempts to take Moscow represented a major defeat for the German forces. Close on the heels of this defeat came a series of Russian counterblows. On the night of November 29–30 came the news that Marshal Timoshenko, by an astute piece of strategy, had recaptured Rostov in the south, and that the army group of General von Kleist had been "completely annihilated." The recapture of Rostov was followed in a few days by that of Taganrog 40 miles to the west. This proved to be the start of the first major soviet counteroffensive of the war. There followed the throwing back of the German forces before Moscow, and the re-

capture of a series of towns including Yelets, Kalinin, Klin and Volokolamsk, and in the north, to the east of Leningrad, the recapture of Tikhvin and Volkhov. Along the whole front, at the end of 1941, the initiative had passed to the red army.

In view of the gravity of the position on the central front in October, most of the government departments, together with the foreign embassies, moved on or about October 17 to Kuibyshev (*q.v.*) (formerly Samara) on the middle Volga. But Stalin and the Defense council remained in Moscow, where, on November 7, the anniversary of the revolution, the usual military parade was held in the Red square before the Kremlin as in previous years. In his speech on the previous day to a special session of the Moscow soviet, Stalin had said: "The German invaders want a war of extermination against the people of the U.S.S.R. Well, if the Germans want a war of extermination they shall have it. . . . We have not, and cannot have, such war aims as the seizure of foreign territories and the subjugation of foreign peoples. . . . Unlike Hitler Germany the soviet union and its allies are waging a war for the liberation of the enslaved peoples of Europe and of the U.S.S.R. from Hitler tyranny." (*See* also WORLD WAR II.)

Economic Planning.—*Third Five-Year Plan, 1937–42.* The number of workers and office employees engaged in national economy increased to 30,400,000 in 1940 as compared with 27,000,000 in 1937. According to the plan for 1941, the number of workers was to be increased to 31,600,000; 350,000 new students were to be enrolled in trade and railway schools and 537,000 in factory training schools. It was estimated that in 1941 industry would obtain 794,000 young skilled workers from factory training schools.

Results for 1940.—In the first three years of the third five-year plan, the industrial output of the U.S.S.R. increased from 95,500,000,000 roubles in 1937 to 137,500,000,000 roubles in 1940, or by 44%, including an increase in the output of the machine-building and metal-working industry by 76%.

In 1940, in spite of the continuation of military hostilities at the beginning of the year, the industrial output of the U.S.S.R. increased by 13,600,000,000 roubles, or by 11%, as compared with 1939, including an increase in the output of the machine-building and metal-working industry by 19%.

The output of means of production in 1940 increased by 13.8% as compared with 1939, and by 52% as compared with 1937. The output of articles of consumption increased in 1940 by 7% as compared with 1939, and by 33% as compared with 1937.

In the latter half of 1940 a distinct improvement began in the work of the iron and steel industry, which towards the end of the year achieved an average daily output of 46,000–47,000 tons of pig iron, as against 40,000 at the end of 1937, and an average daily output of 58,000–59,000 tons of steel, as compared with 50,000–51,000 tons. There was likewise an improvement in the work of the nonferrous metals industry. As compared with 1937, the output of aluminum in 1940 increased by 59%, copper by 65%, nickel by 280% and tin by 300%.

A distinct advance, especially in the latter half of 1940, was made by the coal industry of the U.S.S.R. Coal output in 1940 increased by 13%, or by nearly 19,000,000 tons, compared with 1939. In the latter half of 1940, an improvement began in the work of the oil industry, the average daily output rising by the end of the year to 97,000–98,000 tons, as compared with 84,000–86,000 tons towards the end of 1937. Nevertheless, the oil industry still continued to fall short of the program of the third five-year plan.

In 1940 railway freight carriage increased—from 392,000,000,000 ton-kilometres in 1939 to 409,000,000,000 ton-kilometres in 1940. River-borne freight increased to 36,000,000,000 ton-kilometres, as compared with 33,000,000,000 ton-kilometres in 1937 and 34,600,000,000 ton-kilometres in 1939.

There was an increase in the gross harvest of grain, sugar beets, sunflower-seed, potatoes and vegetables. The grain crop of the U.S.S.R. in 1940 amounted to about 7,300,000,000 poods (1 pood=36 lb.). In 1940 there was an increase in livestock in the collective farms; large horned cattle by 12%, pigs by 15%, sheep by 25% and goats by 34%.

There was a steady improvement in the material and cultural standards of the working people of the U.S.S.R. The aggregate pay roll of the workers and office employees of the U.S.S.R. increased in 1940 to 123,700,000,000 roubles, as compared with 82,200,000,000 roubles in 1937 and 116,500,000,000 in 1939. There was an increase in the incomes of the collective farms and in the personal incomes of the collective farmers.

The volume of capital investments in the construction of new plants amounted in 1940 to nearly 38,000,000,000 roubles (including about 6,000,000,000 roubles of decentralized capital investment). Aggregate capital investments for the first three years of the third five-year plan totalled 108,000,000,000 roubles (including 17,500,000,000 roubles of decentralized capital investment). During these three years, hundreds of new mills, factories, mines, power stations and other state industrial establishments were put into operation, the effect of which was to increase the capacity of the coal mines by 51,000,000 tons, the capacity of the power stations by approximately 2,400,000 kw., the capacity of the blast furnaces by 2,900,000 tons of pig iron, and the capacity of the cotton textile mills by about 1,000,000 spindles.

Aims in 1941.—The plan for 1941, the fourth year of the third five-year period was given as follows: (1) To increase the gross output of the industry of the U.S.S.R. to 162,000,000,000 roubles, representing an increase of 17% or 18% as compared with 1940, including an increase of 23.5% in the industries producing means of production, and of 9% in the industries producing articles of consumption; (2) to increase the output of pig iron to 18,000,000 tons, of steel to 22,400,000 tons, and of rolled steel to 15,800,000 tons; (3) to raise the output of coal to 191,000,000 tons, of oil and gas to 38,000,000 tons, and of peat to 39,000,000 tons; (4) to raise the output of the machine-building industry by 26% as compared with 1940; (5) to increase the capacity of the power stations by 1,750,000 kw.; (6) to increase the capacity of the cotton textile industry by 850,000 spindles; (7) to increase the gross grain crop by 8%; (8) to ensure the average daily loading of 103,000 cars on the railways and eliminate the discrepancy between the development of water-borne freight and the requirements of the national economy; (9) to increase the turnover of state and co-operative retail trade to 197,000,000,000 roubles; (10) to increase productivity of labour in industry and building construction by 12%; (11) to lower production costs in industry by 3.7% and thus ensure an additional accumulation in industry amounting to 7,300,000,000 roubles; (12) to increase the number of pupils in the elementary and secondary schools to 36,200,000, and of students in the higher educational establishments to 657,000 so that total expenditure on social and cultural measures should reach 48,000,000,000 roubles; (13) to fulfil the program of capital investment, amounting to 57,000,000,000 roubles (including 9,000,000,000 roubles of decentralized capital investment); (14) to secure a further increase in the state material and financial reserves.

Education.—Elementary and secondary school children in the educational year 1941–42 were estimated at approximately 36,200,000 (an increase of 3.4% over the 1940–41 total); the number of university students was estimated at 657,000 for 1941–42 (an increase of 13%); libraries (1940), 75,000, with 160,000,000 books; newspapers, 9,000 (in 70 languages), with a circulation of 38,000,000; printed books, 700,000,000 copies. Theatres, 790; cinemas, 30,461 in towns and 18,991 in villages.

Finance, Banking and Trade.—Estimates for 1940: capital investments in industry, agriculture and transport from the all-union budget and other sources, 36,100,000,000 roubles (15% increase over 1939). State revenue, 182,600,000,000 roubles (17.1% increase over 1939); state expenditure, 179,700,000,000 roubles (including defense services, 57,066,200,000; national economy, 57,117,500,000; cultural services, 42,875,400,000, of which education, 23,195,000,000). Banks: 37,120 branch banks and agencies; deposits in savings banks, *c.* 7,000,000,000 roubles. Subscription to third five-year plan loan, 9,310,800,000 roubles. Gross retail trade turnover in 1939, 163,456,000,000 roubles. Foreign trade figures were not available for 1939, 1940 and 1941. Merchant marine (vessels of 100 tons and over) (1939), 1,316,000 gross tons.

Agriculture, Manufacturing and Mineral Production.—(Metric tons) Grain crops (1938): wheat, 40,880,000; rye, 20,930,000; oats, 16,990,000; barley, 8,200,000; maize, 2,690,000; rice, 317,000; potatoes (1937), 65,630,000; beet sugar (1939), 2,400,000; tea (1939), 11,200; cotton (1939), 880,000; cotton-seed (1939), 1,900,000; wool (1938), 137,000; flax (1939), 633,000; hemp (1939), 110,000; raw silk (1938), 1,800; rayon (1939), 7,700; wood pulp (1938), 10,800,000; crude petroleum (1939), 29,500,000; natural gas (1938), 2,600,000,000 cu.ft.; coal (1938), 132,888,000; iron ore, metal content (1938), 14,600,000; pig iron and ferroalloys (1939), 15,600,000; steel ingots and castings (1939), 18,800,000; manganese ore, metal content (1938), 1,050,000; bauxite (1938), 250,000; aluminum (1939), 46,000; chrome ore (1937), 90,000; silver (1938), 218,000; gold (1937), *c.* 150,000 kilograms.

Industry and Labour.—While the total population of the U.S.S.R. increased by 16% between 1926 and 1939, skilled workers and intellectuals increased by the following number of times: mechanics, 3.7; turners, 6.8; millwrights, 13.0; locomotive drivers, 4.4; plasterers, 7.0; tractor drivers, 215.0; engineers, 7.7; agronomists, 5.0; scientists, 7.1; teachers, 3.5; physicians, 2.3.

(M. Do.)

Unitarian Church.

During 1941, two events of special significance took place within the organized life of the Unitarian denomination.

1. Beginning June 1, the editorial responsibility for the *Christian Register*, the oldest religious journal in America bearing its original title, was taken over by the board of directors of the American Unitarian association, which had previously assumed financial and publishing responsibility. The *Christian Register* was in 1941 issued under the direction of an editorial board, consisting of the principal executive officers of the association, with Miss Mildred Boie, formerly associate editor of the *Atlantic Monthly*, as editor. The *Christian Register* thus became the official organ of the Unitarian denomination, and appeared as a monthly magazine in a new format, with many illustrations, planned with special concern for the interests of the laity.

2. Five of the principal denominational agencies joined in the united Unitarian appeal, for the purpose of raising funds for the current operations of the American Unitarian association, the Unitarian Laymen's league, the Unitarian Pension society, the Unitarian Ministerial union and the Young People's Religious union. The success of the first campaign, under the direction of Henry D. Sharpe, of Providence, R.I., chairman, guaranteed the continuation of the plan into the future.

The work of the Unitarian Service committee, which was inaugurated in 1940, continued to grow and expand. Through its offices in Portugal and unoccupied France, hundreds of outstanding men and women were brought to safety. In addition, the committee carried on an extensive medical and educational project in internment camps in France. Dr. Charles Joy returned from Portugal in May 1941 to report to the annual meeting of the American Unitarian association on his nine months' work as European commissioner. Dr. Robert C. Dexter, executive director of the Unitarian Service committee, and Mrs. Dexter acted as representatives of the committee in Europe for six months, and reported at the general conference meeting of the association in Pittsburgh, Pa., in October. Dr. Joy returned to Lisbon early in October.

President Phillip C. Nash of the University of Toledo was nominated by the general conference as moderator of the denomination to succeed President Aurelia H. Reinhardt. (*See* also CHURCH MEMBERSHIP.) (J. H. L.)

United Church of Canada. The United Church of Canada, which in 1925 united the Presbyterian Church in Canada, the Methodist Church (Canada) and the Congregational Churches of Canada, reported for 1941 a membership of 716,064 with 1,756,634 persons under pastoral oversight; a Sunday school enrolment of 538,340 and 7,239 preaching places. The church owns property worth over $85,549,557 and raised a total of $11,547,037 for all purposes. Foreign mission work was disturbed throughout the Japanese empire and the occupied areas in China and in Free China.

Among the important features in the life of the United Church during 1941 were the raising of $50,000 to aid British churches overseas in carrying out their spiritual and social ministries in bombed-out areas; an invitation to the heads of other Canadian churches to appoint representatives to meet with representatives of the United Church relative to home missionary cooperation in Canada and the providing of religious education in the public schools and universities; the setting up of a commission on the church, the nation and the world order, whose findings were to be reported to the next general council; the appointment of a committee to study the problem created by the existing number of theological colleges and the advisability of closing some in the interests of economy and a more vital educational policy; the appointment of Rev. Elias Andrews, M.A., B.D., and Rev. Ian F. MacKinnon, Ph.D., to the faculty of Pine Hill Divinity hall, Halifax, N.S.; the appointment of a special financial agent to act under the direction of the board of pensions to solicit special gifts for the capital of the pension fund and the official recognition of a Dominion Woman's Association council and the adoption of a constitution to govern its activities.

During the year the United Church continued its effort to liquidate the deficit on its missionary and general work which had accumulated during the depression years. Already more than $500,000 not included in the above total had been underwritten.

More than one hundred ministers were serving in 1941 as chaplains to the Canadian armed forces or in connection with the auxiliary services of the Y.M.C.A. and the Canadian Legion. The war service units of the congregations furnished 1,250,000 articles of material aid to Canadian soldiers. (G. A. SI.)

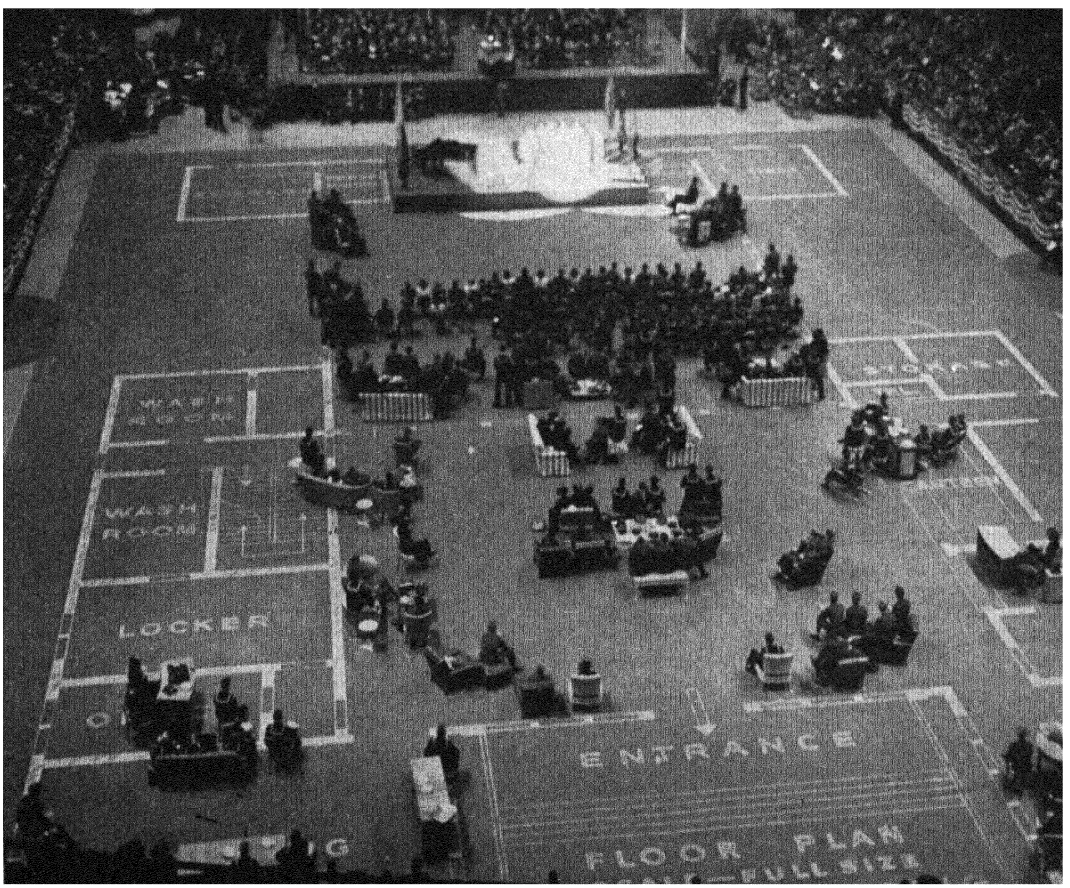
United Service Organizations. By the fall of 1940 a large military establishment was being developed in the United States. Civil and military leaders alike recognized a great need for recreational, welfare and spiritual service for the men of the army and navy.

While the responsibility for such activities within the camps and bases was undertaken by the government, there were substantially no facilities available in the communities adjacent to the great new defense areas. Since such facilities were to be used while the men were on leave, it was determined that they should be provided by the religiously sponsored private agencies with experience in such work.

To this end the United Service Organizations for National Defense, Inc., was formed, with Walter Hoving as president, to serve as a single fund-raising and supervising agency and to include the

A FULL-SIZE FLOOR PLAN of a typical club for U.S. service men was painted on the floor of Madison Square Garden, New York city, May 20, 1941 for a rally of the United Service Organizations



Young Men's Christian association, the Young Women's Christian association, the National Catholic Community service, the Jewish Welfare board, the Salvation Army and the National Travelers Aid association. A contract between the government and the U.S.O. provided that the government should construct the necessary service clubs in defense areas, approximately 220 in number. For operation of these buildings and rental and operation of some 200 other recreation centres, the U.S.O. agreed to raise, for the first year, $10,765,000.

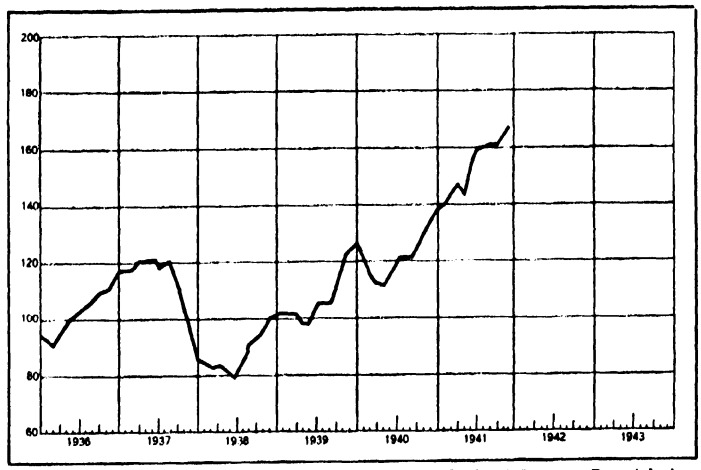
A national campaign for public subscriptions started on June 3, 1941, and before its conclusion 5,400 communities were organized. In view of the extension of the Selective Service act, the original goal of $10,765,000 was increased. The total amount contributed in 1941, including some local funds added to quotas, was more than $16,000,000.

U.S.O. activities in 1941 included (1) operation of clubs for army and navy personnel near camp areas, (2) social programs, comfort facilities and mobile motion picture trucks for the army while on manoeuvres, (3) service to communities in meeting special conditions in defense industrial areas, (4) entertainment in the army camps and naval stations.

The U.S.O. had the co-operation of the war department, the navy department, the recreational division of the Federal Security agency, the Federal Works administration, the joint army and navy committee on welfare and recreation and local communities throughout the United States. (T. E. D.)

United States. The population of the United States in 1940, as determined by the decennial federal census, was 131,669,275, not including possessions. This figure represented an increase of 8,894,229 over the census of 1930. With possessions included, the population was 150,621,231 in 1940. The area of continental U.S.A. is 3,022,387 sq.mi. For population figures of the individual states, *see* the articles on the separate states. *See* also the articles BIRTH STATISTICS; CENSUS, 1940; CHURCH MEMBERSHIP; DEATH STATISTICS; INDIANS, AMERICAN; NEGROES (AMERICAN). (X.)

History.—One topic, and one alone, controlled the policy of the government and absorbed the interest of the people of the United States during the year 1941. That was the attitude which should be taken toward the war waged on three continents between the totalitarian forces of aggression and the defenders of democracy. Every public agency and private activity was affected with this problem of the defense of democracy at home and the nature and extent of the aid which should be furnished to the hard-pressed democracies abroad. Industry, agriculture, transportation, finance, taxation, labour, foreign trade, domestic consumption, military and naval programs, diplomacy and a host of other interests all led to the focal consideration of their effect upon America's influence on the great battle between liberty and tyranny. The contentious issues of the new deal were relegated to oblivion (at least "for the duration" of the war) and Roosevelt's opponent in the presidential election of 1940, Wendell Willkie (*q.v.*), became his ardent collaborator in the policies of national defense and aid to the democracies. Much as the American government and people wished to avoid actual involvement in the war, every month of the year brought the catastrophe closer. Finally, on the morning of Dec. 7, Japanese planes made a surprise attack on Pearl Harbor in the Hawaiian Islands (at the very moment that Japanese envoys in Washington, D.C., were pretending to seek a way to preserve peace) and followed this act by almost simultaneous attacks on the Philippines and other island possessions in the Pacific. Congress with but one dissenting voice immediately declared war on Japan, and three days later also, by a unanimous vote, accepted the state of war thrust upon the United States by nazi Germany and fascist Italy. Thus, the year came to a close with the United States again, as in 1917, engaged in war with formidable powers abroad, and united far more solidly than in 1917 in the determination to prosecute that war with all the material and moral resources of the nation.



INDUSTRIAL PRODUCTION in the United States; Federal Reserve Board Index, with adjustment for seasonal variation (1935–39=100)

Congress.—The first session of the 77th congress opened on January 3 and sat through the entire year. Contrary to predictions that Republican gains in the mid-term election of 1938 would be increased, the Democrats held virtually the same strength in the new congress as they had in the 76th, with 66 senators (to the Republicans' 28) and 268 representatives (to the Republicans' 162). There were one Progressive and one Independent in the senate, and three Progressive, one Independent and four vacancies in the house. On Jan. 6 President Roosevelt delivered his annual message (carried over a network of 660 radio stations). He called for "all-out aid to the democracies" in ships, planes, tanks and guns. Such was not an act of war, he said; and anyway when the dictators should see fit to make war on us, they would not wait for any declaration on the part of the United States—a prophecy to be amply fulfilled. He warned that all should be prepared to "make the sacrifices that the emergency (as serious as war itself) demands," and declared that none should be allowed to get rich out of the program of stimulated industry: none should "clip the wings of the American eagle to feather their own nests." Although he averred that the United States must not lose its social gains under the new deal, the emphasis of his address was on its foreign obligations.

A week after the meeting of congress there was introduced into the house one of the most fateful bills in the history of the U.S., in that it was the beginning of the end of the policy of neutrality which the government had been trying to preserve since the summer of 1935. H.R. 1776, or the lend-lease bill, was a sweeping measure with the title "an act to promote the defense of the United States." It authorized the president to carry out his own recommendation to make the United States "the arsenal of democracy" by providing the anti-axis countries with all such aid as he deemed necessary for the interests of U.S. defense. There was no limit set on the amount of money or material to be furnished, no specification as to the geographical destination of the supplies, no provision as to the terms of payment, and no time limit for the expiration of the act. The bill provoked a bitter controversy in the hearings before the congressional committees and on the floor of the houses. Its opponents condemned it as a surrender of the power of congress, a "blank check" given to the president to give away materials needed for U.S. defense and a long step toward involving the United States in war. Herbert Hoover, Senator Hiram Johnson, Col. Charles A. Lindbergh (*q.v.*), Thomas E. Dewey and even Ambassador Joseph Ken-

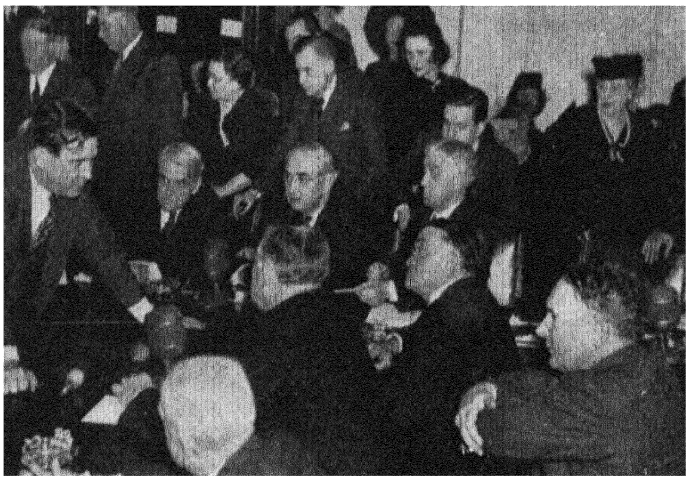
nedy returning from London spoke against the bill; while Secretaries Hull (*q.v.*) and Stimson (*q.v.*), Wendell Willkie and W. S. Knudsen (*qq.v.*) were among the prominent defenders of it. A Gallup poll of Feb. 1, 1941, registered 70% as believing that aid to Great Britain would help keep the United States out of war. The most that the opponents of the bill could accomplish was a set of amendments limiting the operation of the bill to June 30, 1943, prohibiting the convoying of material by American ships and requiring reports to congress every 90 days. On Feb. 8 the house passed the bill by a vote of 260 (236 Democrats) to 165 (135 Republicans), and on March 8 the senate, after another spirited debate, gave a favourable vote of 60 to 31. Three days later the house accepted the senate changes (317 to 71), and the president signed the bill immediately. On March 19 the house, by a vote of 337 to 55, approved a fund of $7,000,000,000 for the implementation of the act. Both the advocates and the opponents of the act were fully cognizant of its probable consequences: the demand for the right of American vessels to carry the materials provided by the lend-lease program, to be armed for the protection of their cargoes against the attack of German submarines, and to be allowed to enter the combat zones for the delivery of their cargoes—all of which was forbidden in the neutrality legislation then standing on U.S. statute books. The third quarterly report to congress (Dec. 1941) showed that, in spite of the nearly $13,000,000,000 authorized, only $585,000,000 had been actually drawn thus far from the lend-lease fund. When the lend-lease pact was signed by Ambassador Winant and Prime Minister Churchill on March 27, the latter remarked that he hoped it would be "Hitler's death warrant." Other important legislation of congress during the year, such as the creation of a National Defense Mediation board in March, the seizure of foreign ships in April, a greatly increased tax bill in September and the repeal of the remainder of the Neutrality act in November, will be treated in subsequent paragraphs.

In time of war or the near approach of war the executive naturally, as the responsible agent of diplomacy and the head of the military and naval forces of the country, assumes a larger share of direction than congress, which tends to become a ratifying body. On the whole, the 47 standing committees of the house and the 33 of the senate, which Woodrow Wilson once called "those little legislatures," offered no great opposition to the recommendations of President Roosevelt.

Budget.—On Jan. 8, 1941, the president submitted to congress a budget of $17,485,528,049 for the fiscal year, of which $10,811,000,000 was for national defense. He estimated the revenue at $8,971,000,000 (including $696,000,000 of social security taxes), leaving a deficit of $9,210,000,000, as against a deficit of $6,200,000,000 for the previous year. He also recommended the removal of the debt limit altogether, and early the next month it was raised at Secretary Morgenthau's request from $49,000,000,000 to $65,000,000,000. In April a 33⅓% rise in taxes was asked for by the secretary to furnish an additional income of $3,444,000,000 and at the same time the axis funds in the United States were frozen by presidential order. At the end of the fiscal year (June 30, 1941) the United States completed the eleventh year of unbalanced budgets, with the national debt increased from $16,185,000,000 in 1930 to $48,960,000,000. The new tax bill went to the house on July 27 and was passed on Aug. 4 by a vote of 369 to 40. With slightly raised figures it was passed (67 to 5) by the senate on Sept. 5. Not only were the surtax rates sharply increased, but the lowered exemptions rendered some 12,000,000 persons liable to income taxes as contrasted with 6,500,000 who would have paid under the house rates. On Sept. 20 President Roosevelt signed the bill. Three weeks later Secretary Morgenthau submitted a revised estimate of the budget needs for the fiscal year 1941–42, calling for an outlay of $24,500,000,000 as against an income set at $12,000,000,000. As a deterrent to inflation caused by the tremendous addition to the currency of the country, the treasury instituted in July the sale of "tax anticipation notes" to furnish corporations and individuals an investment of funds, at a small rate of interest, to provide for future tax payments. By October the sale of such notes had already reached more than $1,500,000,000, and it was anticipated that the sum would be raised to several billions before the close of the fiscal year on June 30, 1942. How much the "victory program" would demand from the people before the defeat of the axis powers is accomplished no one could say. On Christmas day the total war expenditures authorized were given out as $78,000,000,000, of which about one-sixth had been spent, and the president on Dec. 30 estimated that the costs for 1942 would run to half the national income, or more than $55,000,000,000. However, Great Britain was in 1941 spending more than 40% of her national income for the defeat of Hitler, and Hitler himself was spending more than half the German income in the effort to smash the democracies; whereas the United States spent only 15% of its $90,000,000,000 income in the fiscal year of 1940–41 for the defense of the democracies. (*See* also TAXATION.)

FRANKLIN ROOSEVELT telling Winston Churchill good-bye Aug. 12, 1941 aboard the U.S.S. "Augusta" at the close of their four-day conversations at sea

Industry.—The year showed a tremendous boom in industry, as was to be expected under war conditions and mounting profits, in spite of increases in wages and taxes. Steel production, generally regarded as the barometer of business, reached an output of 20,642,345 tons in the third quarter of the year, making a total of 61,550,000 tons for the nine months, a 30% increase over the 1940 figure. The mills were working at an average of 97% capacity, and the profits, despite a wage raise in April of 10 cents



WENDELL L. WILLKIE (left) testifying before the foreign relations committee of the U.S. senate Feb. 11, 1941 on behalf of the lend-lease bill

an hour for 600,000 workers, costing the companies $108,000,000, surpassed even those of the year 1929. Reports from nearly 500 major selected industries showed gains of more than 25% over the previous year. By the end of August the production index had advanced to 162 (taking the period 1935–39 as the basic 100), and dividend payments up to October exceeded those of 1940 by 10%. At the same time a 21% increase in salaries and wages brought income payments to individuals up to $72,609,000,000 in the first 10 months of the year, indicating a total national income for 1941 of more than $90,000,000,000. At the beginning of the year Knudsen of the OPM (Office of Production Management) (*q.v.*) asked the National Manufacturers association for accurate data on the productive capacity of every manufacturing plant in the United States, in preparation for an "all out" performance to supply defense materials. In 1941 no single man was given the power over industry that had been conferred on Bernard Baruch in 1918, but within the limits of the functions of their various boards individuals like Leon Henderson (Office of Price Administration) (*qq.v.*) and Donald Nelson (Supply Priorities and Allocations Board) (*qq.v.*) exercised wide authority. For example, price ceilings were put on a great number of commodities ranging from refrigerators to cigarettes, and the production of nondefense articles, such as pleasure automobiles, was sharply cut. The government, however, refrained from offending organized labour by putting a ceiling on wages, although economists insistently pointed out that it would be impossible to prevent inflation unless both wages and prices were controlled. (*See* also BUSINESS REVIEW; DEFENSE, NATIONAL [U.S.]; PRICES.)

Agriculture.—No such revolutionary farm legislation was enacted in 1941 as the AAA of 1933 or the great "ever normal granary" agricultural bill of 1938. Thanks largely to government payments to the farmers, which had totalled $3,881,000,000 since 1932, the farm income had been raised from $4,600,000,000 in 1932 to about $11,000,000,000 in 1941. Yet the fact remains that one-fourth of the agricultural population of 32,000,000 was on a bare subsistence level. Not only were there some seven or eight million "surplus" farmers competing for an agricultural income which was not sufficient to go round, but a loss of at least $500,000,000 in agricultural exports since the beginning of the European war (exports of wheat, for example, falling from 107,000,000 bu. in 1938–39 to an estimated 20,000,000 in 1940–41, and cotton from 6,000,000 bales to 1,500,000) resulted in a mountain of surplus farm commodities. The senate on April 4 voted by 61 to 9 a record farm appropriation of $1,340,000,000, and a month later by a vote of 75 to 2 increased the crop loans on wheat, cotton, corn, tobacco and rice from 75% to 85% of "parity prices" (of 1909 to 1914), although the president had recommended the 75% figure. The house approved the 85% by a vote of 275 to 63. The president signed the bill on May 25, but there was much criticism of this policy of assuring the farmers artificially high prices just at the time when a ceiling was being set for prices in manufacturing industries. It was denounced as an encouragement to inflation, likely to raise the cost of living by 10%. An editorial of May 27 in the *New York Times* called it "a blow at defense." On Sept. 24 Secretary of Agriculture Claude R. Wickard (*q.v.*) addressed 400 representatives of agricultural departments and farm groups from New England, urging a full output of farm products for 1942 and declaring that "food will win the war and write the peace." A "food-for-freedom" campaign was launched, and in consultations with the British on their probable requirements for the coming year schedules of greatly increased production of milk, eggs, soybeans, fruits, chickens, hogs and cattle were drafted. (Of wheat and cotton the United States had already stored a surplus sufficient for two years.) The U.S. undertook to furnish Great Britain up to June 1942 some 5,000,000,000 lb. of processed milk, 1,500,000,000 lb. of pork and lard, 500,000 dozen eggs, millions of pounds of poultry meat. Predictions of a $13,000,000,000 farm income for the year 1942 were made. (*See* also AGRICULTURE.)

Transportation.—The year 1941 was a banner year for the railroads. Toward the close of the year J. J. Pelley, president of the Association of American Railroads reported that, in spite of unprecedented taxes of $550,000,000 (they were $396,394,774 in 1940), the net income of the roads after the deduction of all charges was about $485,000,000 as compared with $189,000,000 in 1940. For the first nine months of the year the class I roads showed a return of 4·5% on investment as against 2·36% in 1940. In capital expenditure for equipment, in the amount of freight carried, in car loadings and in the types and numbers of locomotives and cars produced the roads set a 20-year peak. The improvement in facilities for handling the vast amount of freight to be moved in wartime had been striking since the days of World War I, when the government had to take over the roads and the congestion was so great that at one time 200,000 cars were on the sidings waiting to be unloaded—"serving as warehouses instead of carriers." Since that time there had been a 60% increase in the speed of trains, a 40% increase in the pulling power of locomotives and a 100% increase in the tons carried per train-hour. When a strike of 14 railroad unions involving some 750,000 men was threatened in February, the employees demanding a two weeks' vacation with pay, the president appointed a board of three (under the provisions of the Transportation act of 1940) to investigate the fitness of the railroads to meet the emergency of the war program. The board was transformed from a fact-finding body to a mediation board when serious labour controversy was threatened by the demand in June of the five railroad brotherhoods (comprising a third of the railroad employees) for a 30% increase in wages. In October the spokesmen for the roads offered a plan, patterned on the Canadian procedure, which they called "emergency compensation," and under which wage payments should be determined by "averaging" the full rise in the cost of living with half the increase in the revenues of the roads. The offer was rejected by the unions, and a nation-wide railroad strike was set for Dec. 7 (which was to prove a fateful day in U.S. history). To avert the crippling of the entire defense effort by such a strike, a settlement was reached at the beginning of December to extend to the close of 1942. It provided for a wage increase of 76 cents a day for 350,000 operating railroad employees and 10 cents an hour for some 800,000 nonoperating workers. The total cost to the roads was estimated at more than $300,000,000 a year, or one and a half times the amount of dividends distributed by the

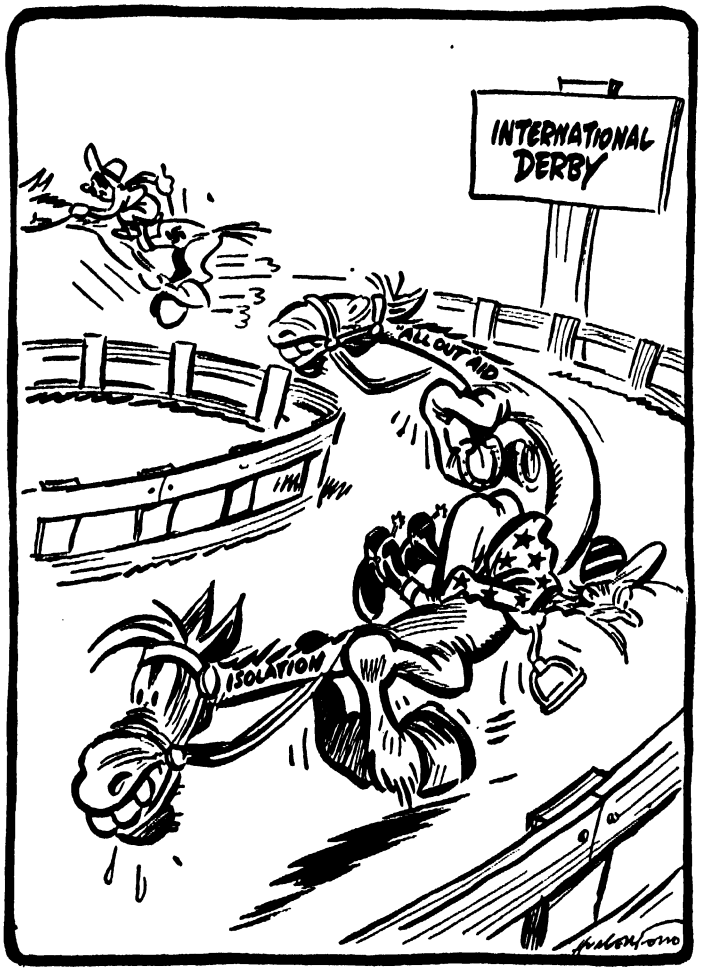
roads in 1940. To balance this additional cost it was certain that the roads would be allowed to increase their rates, since the chairman of the Interstate Commerce commission, Joseph B. Eastman, suggested that such an increase would be in order when the wage agreement was reached. (*See* also RAILROADS.)

Merchant Marine.—The year 1941 saw the United States, with its unrivalled facilities, forge ahead of every other nation in the construction of a merchant marine, which, when the war ended, might well dominate the world's trade routes. After World War I the United States neglected its merchant fleet, and in 1937 only 36% of U.S. imports and 22% of the exports were carried in vessels under the American flag. England, Germany, France, Italy and Japan furnished the carriers of most of our foreign commerce. But in 1941 production of tonnage was far ahead of that of any other country and bade fair to restore the days long ago when American ships carried 85% of U.S. foreign trade. For events of the year *see* SHIPBUILDING; and SHIPPING, MERCHANT MARINE.

Aviation.—Civil aviation (*q.v.*) made great strides in 1941 in the number of millions of passengers and tons of freight carried, the new lines opened, the improved types of planes and the high record of safety. Yet W. A. Patterson, president of the United Air Lines declared that not more than 15% of the potential flying "market" had been exploited. The most remarkable promoter of civil aviation was Juan Trippe, "the modern Magellan" (*see* the *Reader's Digest* of Oct. 1941), who extended the service of his Pan American Airways to 54 distant stations, and who controlled "twice as many route miles as all U.S. domestic airlines combined." New Zealand, Alaska and West Africa had been reached by the summer of the year. On Dec. 6 came the climax, when two Pan American clippers took off from Miami, Fla., for an 8,693-mi. flight from Miami to Leopoldville, Africa, via Puerto Rico, Trinidad, Belem (Pará), Brazil and across the Atlantic to Bathurst and Lagos, Africa. President Roosevelt declared that the importance of the route would be "difficult to overstate." He had already endorsed Trippe's statement that his line was "an instrument of national policy" by announcing on Aug. 18 that Pan American would ferry American bombers across the Atlantic to the British in Libya and the near east. There were some distressing accidents in 1941, although the loss in life was very small when compared with the number of passengers carried in safety. On Oct. 30 came the worst accident of 1941 in civil aviation, when a New York-Chicago plane of the American Airlines fell near St. Thomas, Can., and burst into flames which prevented the rescue of any of the 20 passengers and crew. It was the first fatal accident on that line since Jan. 1936, since when the line had carried 3,500,000 passengers over 1,340,000,000 mi. (*See* also DISASTERS.)

Army and Navy.—At the beginning of 1941 the U.S. army consisted of about 600,000 men and officers; and at the close of the year (after the attack of the Japanese on the Pacific islands) plans were on foot for an army of 7,500,000. On March 21 the house (329 to 0) and three days later the senate (67 to 9) voted a national defense appropriation of $4,000,000,000 to provide for an army of 4,000,000 and 3,600 heavy bombing planes. By June 15 nearly 1,500,000 men recruited under the Selective Service (*q.v.*) act of 1940 were in camps, and on July 10 President Roosevelt asked that the draftees be kept in service at the discretion of the government and that they be allowed to be sent overseas if necessary. Congress gave a grudging consent (the vote was 203 to 202 in the house) to the extension of army service to two and a half years. A new man-power bill was recommended by Secretary of War Stimson, backed by the generals, in December, calling for the registration of all men between the ages of 18 and 64 inclusive for general defense purposes, and of men between 19 and 44 inclusive for active military service. On Dec. 19 both houses agreed on the plan, with the change of 20 for 19 in the lower limit of the men liable for active service. The California senators Johnson and Downey cast the only negative votes. That American soldiers would be called upon to fight in Europe, Asia or Africa seemed little likely in 1941; but the U.S. navy expected to be on duty on the seven seas. Its preparation for the task went forward with vigour during 1941. On Jan. 8 it was organized into three fleets, the Atlantic, the Pacific and the Asiatic, under the command respectively of Admirals E. J. King, H. E. Kimmel and T. C. Hart (*qq.v.*). On Jan. 22, congress by almost unanimous vote approved a naval bill of $909,000,000, and on March 3 the naval committee of the house asked for an outlay of $3,446,311,000 for the fiscal year 1942 for the completion of a two-ocean navy. There were 213 vessels added to the navy during the first 10 months of 1941, and keels were laid down for 436, including 2 battleships, 13 cruisers, 18 submarines, 57 destroyers and various types of minor war vessels. The launching of the battleships "North Carolina" and "Washington" in August put the United States in the lead in that chief class of fighting ships. On April 9, 1941, the United States took the Danish island of Greenland under its protection and on July 7 occupied Iceland, thus extending the zone "necessary for the defense of the United States" far out into the Atlantic. The navy was ordered to patrol

AN EPIDEMIC OF STRIKES In strategic industries slowed U.S. defense efforts throughout 1941. The picture shows police battling strikers who closed the plant of Bethlehem Steel in Lackawanna, N.Y. Feb. 26, 1941



APPRAISAL OF THE DISPUTE between U.S. interventionists and noninterventionists in 1941. The cartoon, by Hungerford of the *Pittsburgh Post-Gazette*, is captioned "A Strange Race Horse"

the seas in this defense zone. Eight American freighters had already been sunk when the attack on U.S. war vessels began with the firing of a German torpedo at the destroyer "Greer" on Sept. 4. The torpedo missed, but on Oct. 17 the destroyer "Kearny" was hit and badly damaged and 11 of the crew killed. Again, on Oct. 30 the destroyer "Reuben James" was torpedoed off the coast of Ireland and sunk with the loss of 76 of her crew of 120. In his Navy day address of Oct. 27 the president reviewed the situation and declared that the order had gone out for the navy to "shoot at sight" on any submarine appearing in defense waters. "Our men are at their posts," he said. "The first shot has been fired; but the most important thing is not who fired the first shot, but who fires the last shot." In spite of many technical difficulties in converting plants and machinery, the production of army and navy planes made remarkable progress during 1941. T. P. Wright of the OPM, writing in *Aviation* for November, declared that the rate of aircraft production in the United States was "greater than for any other country in the world at any period." While Britain had increased its production from 1,600 to 1,800 planes a month, and Germany from 2,200 to 2,300, U.S. production had grown from less than 1,000 a month at the beginning of 1941 to more than 2,000 at its close. He estimated that the figure would rise to 3,500 by the end of 1942. Moreover, the great "flying fortresses," like the Douglas B-19 bomber, built to fly 7,750 mi. and carry 18 tons of bombs, appeared to be superior to any other fighting aircraft in the world. (*See* also AIR FORCES; ARMIES OF THE WORLD; NAVIES OF THE WORLD.)

Labour.—The most distressing chapter in the history of the year 1941 was the persistence of labour controversies which were a serious threat to the defense program. Merely to list the strikes and threatened strikes of the year would take columns of space, and hardly a day passed without editorial comment in the metropolitan press on the merits of the strikes, their progress, the efficiency of the machinery set up to deal with them and the attitude of the government toward them. Although Secretary Perkins, who was constantly accused of being too favourable to organized labour, declared that strikes in defense industries were not diminishing production to any serious degree, the figures showed that in the first seven months of the year strikes had increased fivefold over those of 1940, involving 1,327,000 workers and causing a loss of 15,750,000 man-days, as against 273,000 workers and 3,091,000 man-days in 1940. From July 1, 1940, to Oct. 1, 1941, the man-days lost (24,284,981) would have been sufficient to build 10,000 planes. The causes of this wave of strikes were partly the demand for higher wages to keep pace with rising cost of living, partly organized labour's fear of losing through increased governmental regulation some of the gains acquired in recent years, partly "jurisdictional" disputes between the two great and almost equally numerous rival organizations, the A.F. of L. and the C.I.O., as to what unions should be recognized as authoritative in collective bargaining and finally the issue with the employers over the closed or open shop. By mid-March strikes in the electrical, steel, copper, harvester, aircraft and other industries with defense contracts of more than $75,000,000 had made some 30,000 men idle for periods ranging from a few days to more than two months. By mid-June 24 strikes were going on, involving 40,000 workers. There were constant threats of drastic intervention by the government. On Jan. 29 Chairman Vinson of the house naval committee introduced a bill to bar the closed shop and strikes in plants working on naval contracts, and on March 31 Representative Ford of Washington proposed a bill making strikes in defense industries treason, punishable by 25 years imprisonment or by death in case fatalities occurred. On the other hand, Knudsen of the OPM and Secretary Perkins opposed legislation to curb strikes, although Knudsen would allow the government to take over plants which failed to fulfil their contracts. In three important cases that procedure was followed. On June 9 U.S. troops (2,500) opened the plant of the North American Aviation company at Inglewood, Calif., which had stopped work on $200,000,000 of military contracts, expelled the pickets and ended draft deferment for the strikers. On Aug. 23, at the request of President Korndorff of the Federal Shipyard plant in Kearny, N.J., where 16,000 men had struck on work estimated at $450,000,000, the navy took over the yard under the command of Admiral Bowen. And on Oct. 29 the army put an end to a strike in the Air Associates aeroplane factory at Bendix, N.J., placing Colonel R. M. Jones in charge.

Much of the turmoil in labour relations was laid to the uncertainty in the extent of authority and the confusion in procedure of the governmental agencies. To the existing machinery of conciliation in the department of labour was added on March 19 a National Defense Mediation board (*q.v.*) of 11 members headed by Clarence Dykstra (succeeded in June by William H. Davis) and consisting of representatives of employers, labour and the public. Then there was Sidney Hillman's labour division in the OPM and the National Labor Relations board (H. A. Millis chairman) created for the administration of the Wagner Labor Relations act of 1935. But the latter board was limited to jurisdiction within the terms of the Wagner act, while the new NDMB could not take final action, but was obliged to "certify" cases of dispute to Secretary Perkins. There was constant complaint from business that both the sympathy of the administration and the existing legislation were unduly favourable to labour, since only labour had the right to appeal for relief under the Wagner act. The president sent a letter to the A.F. of L. in convention at Seattle, Wash., on Oct. 8, asking that "organizational rivalries

and jurisdictional conflicts be discarded." The convention received his words with cheers—and within the next week the armament program was interrupted by a half a dozen jurisdictional disputes. It became clear that something more than exhortation was needed to guarantee the smooth working of the defense program: something like the war labour board of World War I, for example, which had "frozen" the status of the open and closed shops for the duration of the war, prohibited strikes and lock-outs, recognized the right of collective bargaining and forbidden employers to discharge employees in trade unions. It took two events of major importance, near the close of 1941, however, to bring the creation of an effective war labour board; first the most serious and defiant strike of the year, and second the actual outbreak of war with Japan, Germany and Italy.

At midnight, Oct. 25, in spite of President Roosevelt's request to John L. Lewis to stay the order, 53,000 workers in the "captive" coal mines (those owned by the steel companies) struck. The issue was Lewis' determination to force the union shop on the mines. And behind the strike was the veiled threat of the powerful president of the United Mine Workers to call out the 400,000 miners in the bituminous field. Lewis was denounced in biting editorials and cartoons for defying the president, whose re-election he had strenuously opposed, resigning from the presidency of the C.I.O. when the renomination of Roosevelt occurred. The general indignation at Lewis' stand (a Gallup poll showing 77% opposed to the closed shop) may have had a part in persuading him to meet on Oct. 29 with Myron Taylor and the chairman of the NDMB, Davis, and agree to the opening of the mines. But it was only a truce. Lewis declared that the strike would be resumed (and extended) on Nov. 15 unless the board made a ruling on the issue before that date. On Nov. 11 a lengthy conference took place at the White House between Lewis, Taylor and the president, and the next day the NDMB refused the demand for the union shop in the captive mines by a vote of 9 to 2. Lewis, still defiant, announced that the strike order stood; but on Nov. 22 (the day after 12 miners were shot in a Pennsylvania riot and an appeal was made to Governor James for the intervention of the state police) Lewis called off the strike and agreed to abide by the arbitration of a three-man board consisting of himself, Benjamin F. Fairless of the United States Steel corporation and John R. Steelman of the conciliation committee of the department of labour. Steelman voted with Lewis for the union shop. The second event which spurred the government to more effective action for the control of defense strikes was the declaration of war on Japan (Dec. 8) and on Germany and Italy (Dec. 11). On Dec. 5 (as noted in the section on transportation) a strike of 1,000,000 railroad workers had been narrowly averted. And on Dec. 10 the president decided to call a conference of industrialists and labour representatives at Washington to work out an agreement for peace in the labour field, consideration of antistrike bills pending in the senate to be sidetracked during the deliberations of the conference. The points on which the conference would be asked to agree were: (1) the suspension of all strikes and lock-outs in defense industries for the duration of the war; (2) a 24-hour day and a 7-day week for speeding up production in the arms factories; and (3) the establishment of arbitration machinery for the final settlement of disputes between employers and employees. On Dec. 13 the president announced the names of the conferees, consisting of 12 men prominent in industry and 6 each from the A.F. of L. and the C.I.O. The conference, while failing to pronounce on the closed shop issue, agreed on a three-point policy: namely, the prohibition of strikes and lock-outs, the settlement of disputes by peaceful means and the establishment by the president of a War Labor board. On Dec. 23 President Roosevelt wrote to William H. Davis, the moderator of the conference, accepting its recommendations. (*See* also STRIKES AND LOCK-OUTS.)

THE U.S. PUBLIC shunned unpleasant facts in 1941, thought Angelo of the *Philadelphia Inquirer*

Isolationism.—During the entire year of 1941, up to the fateful events of December, the noninterventionists fought a determined battle to keep the United States out of the war. They were not generally pacifists, for most of them advocated an armament program to make the United States impregnable to attack by any foreign nation or combination of nations. They were noninterventionists, ranging from persons who believed that it would make no difference to the U.S. whether Hitler won or not, to those who wished to see him defeated but thought that if the U.S. joined the

U.S. MARINES practising beach landings at Guantánamo, Cuba

war against him it would jeopardize democratic institutions, weaken U.S. home defenses and probably mean the sending of U.S. soldiers to fight across the sea. The "America First" committee, headed by General Robert E. Wood (*q.v.*), and the "No Foreign Wars" group were the chief opponents of intervention; and they were countered by the "Fight for Freedom" and the "Committee to Defend America by Aiding the Allies." The most conspicuous noninterventionists in congress were Representative Hamilton Fish of New York and Senators Wheeler of Montana, Nye of North Dakota, Clark of Missouri, Johnson of California and Walsh of Massachusetts. In the protracted hearings before the congressional committees and the bitter debates on the floor of both houses on the Lend-Lease bill (Jan.-March) all the arguments pro and con were aired—arguments which were only repeated again and again in the ensuing battles over the occupation of Greenland and Iceland, the proclamation of a zone of waters far from U.S. shores as necessary to the defense of the United States, the retention of the draftees beyond the time limit set in the Selective Service act of 1940, the convoying of American cargo ships by navy vessels, the repeal of the neutrality legislation of 1939 and other legislative and administrative measures which were condemned by the noninterventionists as steps leading inevitably to war. Charles A. Lindbergh's (*q.v.*) popularity was so great that he was put forward by the America First committee as one of the chief spokesmen for nonintervention. On April 28 Lindbergh resigned from the air corps after President Roosevelt had compared him to the Copperheads of the Civil War and others had called him a traitor. But he was not a traitor. He had no sympathy for the nazis and hoped that Hitler would be beaten. When the U.S. entered the war in December, he volunteered his services. On the other side, persons like Senator Glass of Virginia were urging that, since the U.S. must enter the war eventually, it should do it now. When Secretary of Navy Knox made a speech in Boston, Mass., to this effect on June 30, Senator Walsh of Massachusetts declared that the president should censure him, and Wheeler and Fish called for Knox's impeachment.

In spite of the efforts of the noninterventionists, however, the successive measures of the administration involving the United States in the great struggle between totalitarianism and democracy were endorsed by congress and approved by a growing majority of the public as expressed in the Gallup polls. The Lend-Lease act of March had already nullified that provision of the neutrality legislation which forbade the U.S. to furnish aid to belligerent powers, and on Nov. 17 the president signed the bill repealing the remaining prohibitions. American merchant vessels could now be armed and were free to enter the formerly closed "combat zones." U.S. war vessels had already received the order to "shoot at sight" on any submarines that menaced U.S. convoys. When therefore the declarations of war came in December, they were only the registration of an accomplished fact. The United States had been actually at war with Hitlerism for many months. The declaration, however, dispersed the last remnants of isolationism. The Wheelers and Lindberghs and Nyes and Fishes rallied as one man to the prosecution of the war to a victorious finish. Opposition was left to the "fifth columnists," the Bundists and other traitorous agents of the axis powers within the gates. Because the final repeal of the neutrality legislation had been carried by the narrow vote of 212 to 194 in the house (the opposition being largely a rebuke to the president for not taking more drastic measures against the strikers in defense industries), the nazis took it as a sign that the people of the U.S. were a fatally divided nation.

Latin-American Relations.—The "good neighbour" policy toward the Latin-American republics was strengthened by the consciousness of the need for closer co-operation for hemisphere defense against possible nazi aggression. Although German and to a lesser extent Italian propaganda was rife in these countries, their governments (even dictatorships like Brazil, Cuba and most of the Central American republics) inclined toward the United States, especially after a congressional resolution of April 1 gave legal sanction to the Monroe Doctrine by binding the United States to oppose any transfer of sovereignty in the western hemisphere to a foreign power. The increase of import trade with Latin America, offsetting their loss of foreign markets, also served to strengthen the bonds and was an effective answer to the nazi propaganda that the "good neighbour" policy was a failure because the United States could not absorb the Latin-American surpluses. Furthermore, the United States made considerable loans to Argentina, Brazil, Cuba, Peru, Bolivia, Chile and Nicaragua. Two pacts with countries with which it had had more or less political and economic friction were particularly significant for better relations. On Oct. 14 an agreement was signed at Buenos Aires which President Roosevelt called "an outstanding contribution" to the reconstruction of peaceful trade. It reduced duties on Argentine canned meats, hides, wool and certain dairy products (comprising 30% of its sales in 1940) and lowered the tariff on a large percentage of U.S. exports to Argentina. It was the first such treaty since

1853. Again, after months of negotiation, a pact was signed with Mexico on Nov. 19 providing for a settlement of the controversy over the seizure of U.S. oil and land properties in 1938. Mexico agreed to pay $37,000,000 for the land expropriations, while the U.S. promised to purchase $25,000,000 of Mexican silver annually and to loan Mexico $30,000,000 for highway construction. Earlier in the year Undersecrêtary Welles and Ambassador Najera had signed an agreement for the reciprocal use of U.S. and Mexican air bases, and Mexico had followed the U.S. lead in the seizure of German and Italian ships. On July 17 President Roosevelt blacklisted some 1,800 Latin-American firms (to which 519 were added in November) which had ties with the axis countries. Meanwhile Nelson A. Rockefeller's committee on the Cultural and Commercial Relations between the American Republics continued its work. Groups of American students visited Colombia, Peru and Brazil; and delegations of professors and students from more than a half dozen South American countries, as well as journalists from Chile, doctors from Cuba, social workers from various countries, aviation students from the five Central American states and other groups came to the United States. A conference of the foreign ministers of the American republics on hemispheric defense had been set for Jan. 15, 1942, at Rio de Janeiro, Brazil. (*See* also HISPANIC AMERICA AND WORLD WAR II.)

Foreign Relations.—The sense of the mission of the English-speaking peoples to form the bulwark against the attacks of the axis powers grew steadily clearer during the year 1941, and reached the point of a virtual alliance when President Roosevelt and Prime Minister Churchill met on a battleship in the Atlantic on Aug. 14 and drew up the eight points of the "Atlantic Charter," which set forth (somewhat in the language of Wilson's 14 points of 1918) the aims of the democracies in the war. On Nov. 10, when the threat of war in the far east loomed, Churchill declared that Great Britain would declare war on Japan "within the hour" if that power should attack the United States. The pledge was fulfilled and the close of 1941 saw not only Great Britain and the United States, but China and the Dutch Indies also fighting to prevent Japan from the conquest of the far east. Churchill spent

"STEADY DOES IT!" Sound advice from the pen of Little of the *Nashville Tennessean* after U.S. entry into World War II in Dec. 1941

Christmas in Washington, D.C., and on Dec. 26 he received an ovation when he addressed both houses of congress, before proceeding on a similar errand to Ottawa.

Relations with Germany during 1941, until the declaration of war on Dec. 11, were abnormal. Although President Roosevelt repeatedly denounced the nazis as the enemies of the United States and issued orders (Sept. 11) for U.S. destroyers to "shoot at sight" on German submarines, the German embassy at Washington under the charge of Herr Thomsen remained open—but virtually ignored. The president in his address to the nation on Sept. 11 declared that the German leaders were not concerned with what the U.S. government said, and that if they chose to attack us they would select their own time and method. Therefore he made no diplomatic move when the "Kearny" was hit and the "Reuben James" was sunk. Neither did the nazi declarations about the responsibility for such attacks affect him. In his Navy day address of Oct. 27 he asserted that he had documents to prove a nazi plan to divide Latin America into five vassal regions and to abolish Christianity by substituting *Mein Kampf* for the Bible and the swastika for the cross. Berlin dismissed these accusations as too ridiculous to notice; but Hitler's proclamation of the exclusive pagan nazi religion at the opening of the new year showed that the president was right. On June 6 all the nazi consulates in the United States were closed, and on July 15, 450 axis agents were deported.

Japan's insistence on the dominance over China and the extension of her program for the imposition of the "new order" upon the far east by the infiltration of Indo-China and Thailand led to increasing tension between the United States and the Mikado's empire. Although Ambassador Admiral Nomura's letter to President Roosevelt of Feb. 14 protested a desire for peace with the United States, the Japanese would not abate its policy of aggression. Great Britain and the United States froze the Japanese assets in their countries and halted the supply of aviation fuel to the island on July 25; but economic pressure deterred the Japanese no more than diplomatic persuasion. The war lords were in power in Japan, defiant and boastful—doubtless encouraged by the expectation of the rapid triumph of their axis partner Hitler. On Oct. 16 the director of naval intelligence in Tokyo declared in a public speech that the Japanese navy was "itching for action," and the news agency Domei flayed the United States for "double dealing" in persisting in an attitude of hostility to Japanese policy while carrying on insincere negotiations for peace. But it was Japan itself that played this role. Japan's special envoy Saburo Kurusu (*q.v.*) arrived at Washington on Nov. 15 with "last proposals" from Japan and the bland assurance to the reporters, "We must all pull together for peace." But even as he and Ambassador Nomura were politely discussing the situation with the president and Secretary Hull, Japanese planes swooped down on Pearl Harbor, U.S. naval base in Hawaii, on the morning of Sunday, Dec. 7, and in their surprise attack sank the battleship "Arizona," three destroyers, a minelayer and a training ship, and caused about 3,000 casualties in the combined U.S. and Filipino forces under General Douglas MacArthur (*q.v.*). This was followed immediately by attacks on the American islands of Wake, Guam and the Philippines, and the British possessions of Hongkong and the Malaya peninsula, with its great base at Singapore. For this "infamous" treachery, planned long weeks in advance, the president called for a declaration of a state of war with Japan (Dec. 8), which was voted with but one dissenting voice in congress. The United States was caught unprepared in the Pacific and suffered serious initial losses, including the fall of Manila at the beginning of 1942. But the crisis united the American people in the grim determination to spare no expense in men, money or material to put an end to the lawless power of the axis partners. Twenty-

six nations were at the close of 1941 bound together in that pledge. (*See* also ANTI-SEMITISM; CANADA; DEMOCRACY; HOUSING; INTERNATIONAL LAW; JAPAN; MEXICO; PROPAGANDA; PUERTO RICO; ROOSEVELT, FRANKLIN; SELECTIVE SERVICE; SUPREME COURT; VIRGIN ISLANDS.) (D. S. MU.)

Defense.—For information about the armed forces of the United States in 1941, *see* AIR FORCES OF THE WORLD; ARMIES OF THE WORLD; DEFENSE, NATIONAL (U.S.); MARINE CORPS; NATIONAL GUARD; NAVIES OF THE WORLD; WORLD WAR II. *See* also CIVILIAN DEFENSE, OFFICE OF.

Finance and Banking.—Statistics pertaining to the United States will be found in such articles as BANKING; BUDGETS, NATIONAL; BUSINESS REVIEW; NATIONAL DEBTS; NATIONAL INCOME; STOCKS AND BONDS; TAXATION; WEALTH AND INCOME, DISTRIBUTION OF.

Foreign Trade.—World War II continued to produce an abnormally large balance of trade in favour of the United States in 1941. This balance for the first nine months of the year amounted to $900,289,000. Imports from all continents except Europe, however, were greater in 1941 than in 1940. Exports to Europe, Asia and South America declined, while those to North America, Africa and Oceania increased. Exports to the United Kingdom in the first nine months of 1941 were $1,024,212,180, as compared with $698,151,708 in the like period of 1940.

The U.S. department of commerce announced in Jan. 1942 that it would cease publication of its monthly summaries of U.S. foreign commerce, as of Oct. 31, 1941, in order to prevent giving vital information to the enemy. (*See* also BUSINESS REVIEW; INTERNATIONAL TRADE; TRADE AGREEMENTS.)

Communication and Transportation.—For statistics, *see* the articles AVIATION, CIVIL; CANALS AND INLAND WATERWAYS; ELECTRIC TRANSPORTATION; MOTOR TRANSPORTATION; MOTOR VEHICLES; POST OFFICE; RADIO; RAILROADS; SHIPBUILDING; SHIPPING, MERCHANT MARINE; TELEPHONE.

Agriculture.—Stimulated by the government's program of "food for defense," the production of U.S. crops registered substantial increases in 1941 and were well above the averages for 1930–39. All grain crops except oats had larger production. The largest relative increase of all crops was shown by soybeans—from 79,837,000 bu. in 1940 to 111,300,000 bu. in 1941; the ten-year (1930–39) average for this crop was only 35,506,000 bu. Tobacco continued to decline, as did cotton. The total acreage harvested in 1941 was estimated at 325,224,000 ac., an increase of about

Table IV lists average prices received by farmers for important crops on selected dates (all in cents).

Manufacturing.—The preliminary report of the department of commerce's biennial census of manufactures for 1939, issued Jan. 15, 1941, estimated the number of establishments at 184,244; salaries and wages at $11,631,967,995 and value of products at $56,828,807,223. The comparable figures for 1937 were: 166,794; $12,829,748,927; $60,712,871,737. The leading industrial groups were as follows: food, iron and steel, motor cars, textiles, chemicals, apparel, and machinery except electrical.

Table III.—*Production Figures of Selected U.S. Crops, 1932–41*
(000s omitted)

Year	Corn bu.	Oats bu.	Wheat bu.	Cotton bales	Tame Hay tons	Rice bu.	Tobacco lb.	Potatoes bu.
1932	2,931,281	1,250,055	756,927	13,003	71,827	41,619	1,017,317	376,425
1933	2,399,632	733,100	551,683	13,049	66,530	37,651	1,371,131	342,306

Table IV.—*Farmers' Average Prices, Certain U.S. Crops, on Selected Dates*
(in cents per unit)

	Wheat per bu.	Corn per bu.	Oats per bu.	Barley per bu.	Rye per bu.	Buck-wheat per bu.	Pota-toes per bu.	Eggs per doz.	Cot-ton per lb.
Oct. average, 1909–13	88.1	64.8	38.4	60.5	72.0	71.1	65.0	23.8	12.10
Oct. 15, 1936	106.8	97.9	43.1	84.2	80.4	78.3	97.9	27.6	12.23
Oct. 15, 1937	88.7	58.9	28.8	52.0	63.8	62.4	48.5	25.2	8.10
Oct. 15, 1938	52.2	41.9	22.1	36.1	32.9	54.5	51.0	27.1	8.53
Oct. 15, 1939	70.3	47.6	30.3	42.2	45.1	62.7	66.4	22.9	8.73
Oct. 15, 1940	68.2	59.4	28.3	38.2	40.5	54.4	52.0	23.7	9.35
Oct. 15, 1941	91.0	64.9	38.9	49.1	51.3	64.3	67.2	31.8	16.55

Labour.—For data on labour in 1941, *see* the articles AMERICAN FEDERATION OF LABOR; CONGRESS OF INDUSTRIAL ORGANIZATIONS; LABOUR UNIONS; RELIEF; SOCIAL SECURITY; STRIKES AND LOCKOUTS; UNEMPLOYMENT; WAGES AND HOURS.

Mineral Production.—Statistical information concerning minerals which was released by the bureau of mines of the U.S. department of the interior in 1941 pertained to the calendar year 1940. According to the bureau's preliminary estimate, the total value of U.S. mineral production in the latter year was $5,582,500,000, an increase of $668,200,000 over the production of 1939. In only five other years—1920, 1923, 1925, 1926 and 1929—had the production of 1940 been exceeded in value. The record year was 1920: $6,981,340,000.

(*See* also the articles on individual minerals; also MINERAL AND METAL PRICES AND PRODUCTION; STRATEGIC MINERAL SUPPLIES.)

Table V.—*Principal Mineral Products of the U.S., 1940 and 1939*

Mineral	Value, 1940	Value, 1939
Petroleum	$1,352,000,000	$1,294,470,000
Bituminous coal	861,166,000	728,234,000
Pig iron	840,442,032	626,824,690
Natural gas	591,509,000	534,240,000
Coke	273,832,410	212,884,050
Gold	210,108,700	196,391,000
Pennsylvania anthracite	205,490,000	187,175,000
Copper	205,453,000	148,236,000
Cement	193,464,869	184,254,932
Iron ore	189,086,799	158,537,696
Stone	160,044,115	158,461,515

Updike, Daniel Berkeley (1860–1941), U.S. printer, was born Feb. 24 in Providence, R.I. A leader in the revival of classical typography, he established the Merrymount press in 1893 and was senior partner at the time of his death in Boston, Dec. 28. (See *Encyclopædia Britannica.*)

Uranium. When the radium refinery at Oolen, Belgium, fell into German hands, shipments of ores from the Belgian Congo were shifted from Belgium to the United States. Before the surrender of Belgium, much of the refinery stocks had been shipped to the United States, resulting in a rise in imports of uranium compounds from 376,708 lb. in 1938 to 1,439,324 lb. in 1939. With Belgium no longer a source of supply, imports declined in 1940 to 240,199 lb., largely from Canada, but imports of uranium ore, formerly purely nominal in amount, rose to 2,400,198 lb., all from the Congo. (*See* also RADIUM.) (G. A. Ro.)

Urology. Sulphathiazole, as expected, was found most efficacious in the treatment of infections of the urinary tract and also in combating gonorrhoea. One of the newer derivatives, sulphadiazine, was employed and some observers claimed that it would displace all other sulphonamide drugs. It apparently is somewhat less toxic than sulphathiazole and causes less discomfort to the patient. The uncontrolled administration of the sulphonamide drugs is not without danger.

Knowledge concerning carcinoma of the prostate gland was greatly enhanced. Bilateral orchiectomy will cause reduction in size of carcinoma of the prostate gland and in the majority of cases will temporarily control metastasis when it is present. Pain caused by metastasis of carcinoma of the prostate gland was eliminated almost immediately following castration. Roentgenograms of metastatic involvement of bone showed that the lesions regress and often apparently disappear. There is marked general improvement in the well-being of the patient, accompanied by increase in weight and appetite and improvement in the condition of the blood. Although the prostate gland will be reduced in size and in some cases evidence of metastasis seems to disappear, in other cases the obstruction to urinary drainage will persist and require surgical removal, preferably by trans-urethral resection.

The serum phosphatase, particularly in the acid form, becomes elevated in most cases of prostatic carcinoma in which metastasis has occurred. The serum phosphatase usually returns to normal following orchiectomy, but becomes elevated if metastasis recurs. Androgens, when administered, will cause hyperplasia of the prostatic carcinoma, together with elevation of the phosphatase, while subsequent administration of oestrogen will reduce the hyperplasia and cause a decrease in the amount of phosphatase. Correlation of the results indicated that carcinoma of the prostate gland is an adult form of carcinoma. The effect of sex hormones in the treatment of benign enlargement of the prostate gland, however, was under investigation. Stilbestrol was shown to cause a shrinkage of the gland and, in many cases, amelioration of the patient's symptoms. In most cases, however, any considerable amount of urinary obstruction is not relieved by the use of stilbestrol and other types of treatment are necessary. In some cases, it was found of value in controlling haematuria having its origin in the enlarged prostate gland. Stilbestrol was also found to be of benefit in cases of priapism. Although in many cases the ingestion of small doses will suffice to relieve the symptoms, in others large doses will be necessary. Attention should be called to the reactions which sometimes accompany the use of sex hormones. These reactions include nausea, vomiting, diarrhoea, fever and painful enlargement of the breasts. These hormones should not be used without supervision of an experienced physician.

Interstitial cystitis (Hunner ulcer; submucous fibrosis) has long offered a difficult therapeutic problem. The many methods of treatment suggested for this condition have been of temporary value in some cases but seldom have controlled the lesion. During 1941 it was shown that the instillation of a solution of silver nitrate into the bladder in increasing concentrations gave more relief than any other form of treatment yet suggested. It is best to use dilute solutions of silver nitrate when starting the treatment and gradually increase the strength until a concentration of 1:100 is reached.

In the treatment of renal tuberculosis the value of postoperative care, including improvement in nutrition, rest and solar therapy, was more fully appreciated. Contributions showed that while nephrectomy is sometimes indicated in cases of bilateral renal tuberculosis, the span of life in most cases without operation is much longer than is generally supposed. Duration of life with this condition as long as ten or 15 years is common and in a few cases clinical evidence would suggest a complete arrest of the disease.

In the field of urinary obstruction it was shown that malfunction of the neck of the bladder frequently results from moderate degrees of sphincteric hypertrophy, or contraction. These lesions frequently are erroneously regarded as being of neurogenic origin. Correction of these conditions is frequently possible by means of resecting a small amount of tissue from the neck of the bladder, permitting adequate relaxation. The differential diagnosis of neurogenous lesions and their classification may sometimes be aided by careful cystometrographic studies. (*See* also CHEMOTHERAPY.) (W. F. Br.)

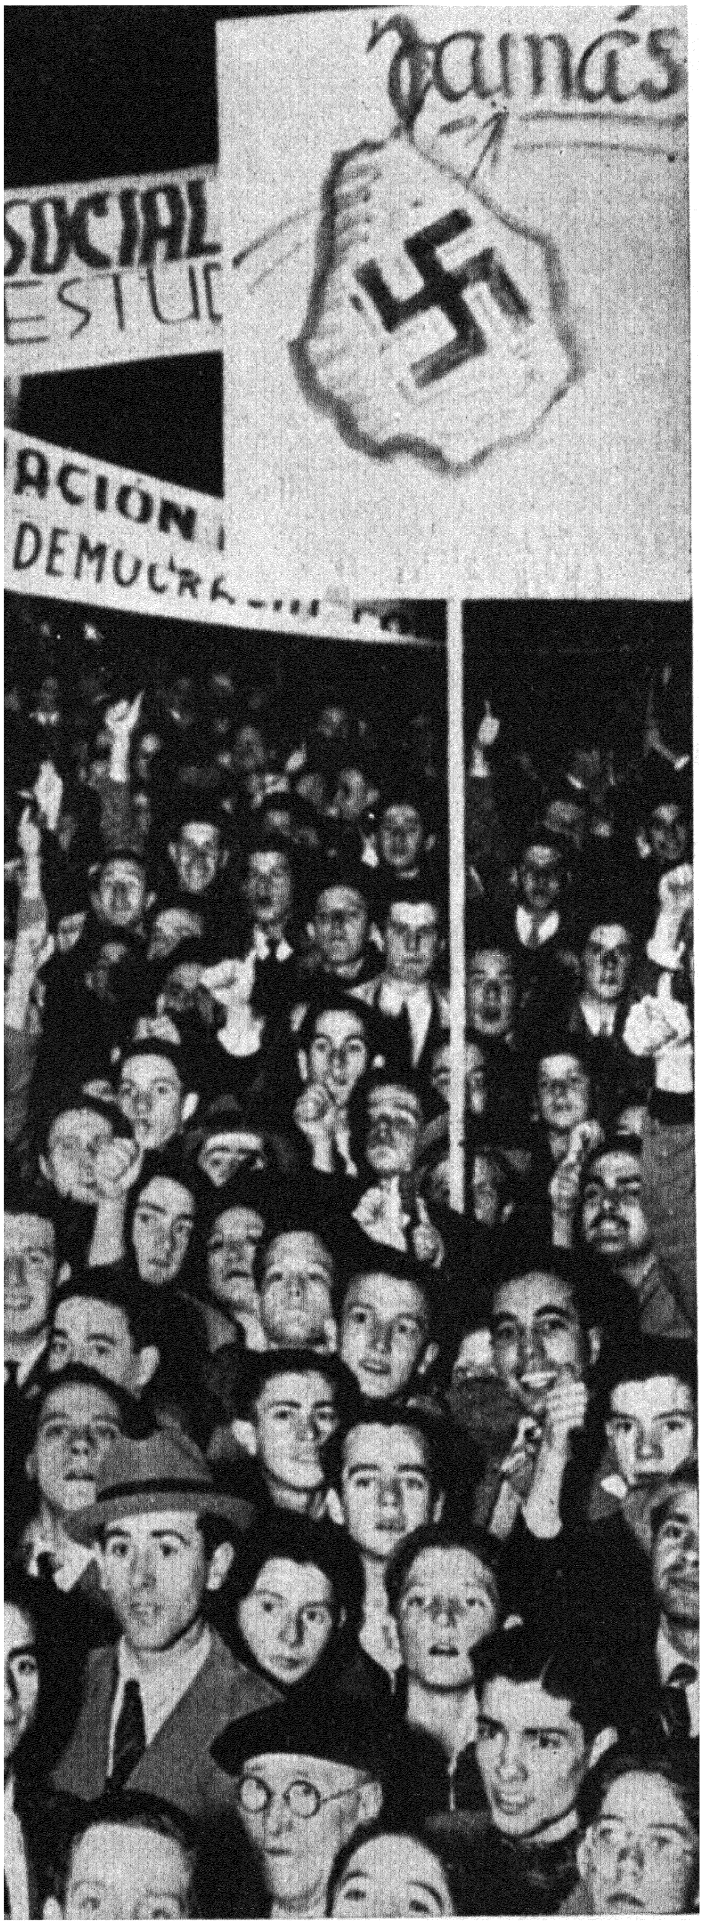
Uruguay. The smallest of the South American republics, on the Atlantic coast between Argentina and Brazil. Area, 72,153 sq.mi.; pop. (1939 official est.) 2,132,888. The percentage of whites is higher than in any American country except Argentina and Canada. Capital, Montevideo, pop. (1941 official est.) 770,000. President in 1941: General Alfredo Baldomir.

History.—Uruguayan developments throughout 1941 stemmed generally from World War II conditions. Several cabinet and congressional crises occurred during the year, with their origins usually in the peculiar constitutional provisions giving the Blanco Nationalist (minority) party, headed by Luis Alberto Herrera, a minimum of three cabinet posts and half the senate membership. To correct this situation, President Baldomir actively supported constitutional reforms. Herrera, strongly anti-United States and inclined to be pro-axis in his sympathies, steadily opposed the administration's foreign policy, the keystone of which was Pan-American co-operation. As early as June 9, President Baldomir formally reiterated Uruguay's traditional policy of granting bases and other facilities for defense of the American continent against external aggression, in line with the principles of American solidarity. Nationalist opposition and Argentine's protests prevented direct granting of bases to the United States; in September, however, a $17,500,000 "lend-lease" grant was made for construction of a huge naval-air base at Laguna Negra, close to the Brazilian border, with the reported understanding that the United States would be allowed full use of its facilities.

Nazi and fascist propaganda and other activity were pro-



STUDENTS IN MONTEVIDEO demonstrating in the Uruguayan capital June 6, 1941 against a pro-axis newspaper. On the placard with the swastika is the word "Never"

nounced throughout the year. Launching of a pro-axis propaganda journal caused riots in May; subsequently its editor, a member of the chamber of deputies, was suspended by that body. Meanwhile, several provocative incidents occurred, notably serious fascist rioting at Durazno on June 28, in which two persons were killed. Following disclosure of widespread nazi intrigue in Argentina, the chamber of deputies appointed a special committee (Oct. 8) to investigate anti-Uruguayan activities in the country.

The Japanese attack on the United States Dec. 7 was met by prompt Uruguayan declarations of American solidarity. Although diplomatic relations with axis countries continued, President Baldomir and Foreign Minister Alberto Guani formally expressed Uruguay's intention to follow its own 1917 precedent and regard any American countries at war as still possessing full nonbelligerent rights, and declared it Uruguay's determined policy to work with the United States at the Rio de Janeiro conference in Jan. 1942.

The Río de la Plata Conference.—In late January and early February, Uruguay was host to the Río de la Plata Regional conference at Montevideo. This meeting of representatives of the four Plata republics (Argentina, Bolivia, Paraguay and Uruguay) and Brazil was attended also by observers from Chile and Peru. As a result, Argentina and Uruguay granted special trade treatment for ten years to landlocked Bolivia and Paraguay, with provisions for reciprocal preferential treatment of each nation's products and freedom of transit, and generally laid the groundwork for possible eventual customs union of the whole area.

Education.—Education is free and compulsory. There were about 1,700 primary schools (enrolment over 200,000) in 1941, and the national university at Montevideo.

Defense.—The army of some 8,000 men (nominal war strength 50,000) was considerably strengthened during 1941.

Finance.—The monetary unit is the peso (value: approx. 52.6 cents U.S. on Dec. 27, 1941; 1940 average value: 37.55 cents U.S.).

Trade.—In 1940 exports were valued at 110,473,000 pesos (a 9.0% increase), and went chiefly to the United States, 25.8% (1939: 13.9%); Great Britain, 20.8% (18.5%); Netherlands, 6.5% (3.4%); Brazil, 5.5% (6.0%). They consisted largely of wool, 49.1% (1939: 36.2%); meats and extracts, 22.1% (21.5%); hides and skins, 9.1% (11.0%); linseed, 6.7% (7.3%); livestock, 4.6% (4.4%); cereals, 0.7% (6.6%). In 1940 imports (principally textiles, foodstuffs, fuel and miscellaneous manufactures) rose 14.4%, to 74,773,000 pesos, mainly from Great Britain, 18.5% (1939: 18.2%); United States 16.3% (5.2%); Argentina, 13.5% (6.7%); and Brazil 9.5% (8.3%).

Communication.—External communication is principally by water and by Pan American Airways, with supplementary rail and highway connections to Argentina and Brazil. There were more than 22,500 mi. of highways in 1941, and 1,683 mi. of railway, with considerable extension of both under construction.

Agriculture and Manufacturing.—Uruguay is primarily pastoral (sheep and cattle), with nearly 80% of the country in grazing land. There is important acreage in wheat, flax, maize and oats. Processing and packing of meat products is an important industry. (*See* also ARGENTINA; HISPANIC AMERICA AND WORLD WAR II.) (L. W. BE.)

U.S.O.: *see* UNITED SERVICE ORGANIZATIONS.

Ussishkin, Menahem (1863–1941), Zionist leader, was born Aug. 15 in Dubrovna, Russia. Interested in the Zionist movement at an early age, he came in close association with Theodor Herzl, founder of the modern political movement to resettle Jews in Palestine. In 1897 Ussishkin took a leading role in the first Zionist congress at Basle. He was president of the Jewish National fund, a Zionist land purchasing agency, and was instrumental in the establishment of Jewish settlements in the Holy Land. He was a militant foe of the British plan to partition Palestine and urged retention of the Biblical boundaries of the Holy Land "from Dan to Beersheba." Ussishkin was president of the Zionist general council and executive chairman of the Hebrew university in Palestine at the time of his death in Jerusalem, Oct. 2.

U.S.S.R.: *see* UNION OF SOVIET SOCIALIST REPUBLICS.

Utah. A Rocky Mountain state, admitted to the union in 1896, popularly known as the "Mormon state." Area 84,916 sq.mi.; pop. (1940) 550,310. The rural (nonfarm) population was 150,465, (farm) 94,352; urban 305,493, with the following origins: white (native) 510,662, (foreign born) 32,298; Negro (native) 1,225, (foreign born) 10. Capital, Salt Lake City (149,934). Other principal cities are Ogden (43,688), Provo (18,071) and Logan (11,868).

History.—In 1941 the 24th legislature adopted the sweeping governmental reorganization scheme recommended by the Democratic governor, Herbert B. Maw, in the regular and two special sessions. It created departments of finance and publicity and industrial development and effected greater executive control over finance. Greater co-ordination of boards and commissions was also effected.

In 1941 E. E. Monson was secretary of state, Reese M. Reese, auditor, Oliver G. Ellis, treasurer; Grover A. Giles, attorney-general and Charles H. Skidmore, superintendent of public instruction.

Education.—There were 137,437 children in the public schools in 1940. The total cost of education was $13,271,541.42, with $9,754,606 devoted to operating expenses. There were 4,102 teachers and 611 principals. The University of Utah had 4,000 students and 248 teachers; the Utah State Agricultural college had a net total resident enrolment of 3,641 and a teaching staff of 160. Brigham Young university, with a teaching staff of 155, issued institutional credit to 3,890 students.

Public Welfare, Charities, Correction.—Total state obligations of $8,208,960.03 incurred in 1941 for public assistance were distributed as follows: old-age assistance, $4,521,929.58; aid to dependent children, $1,985,749.69; aid to blind, $57,115.23; general (unemployables) $825,724.45, (employables) $672,401.62; miscellaneous $146,039.46. A total of 21,528 households were receiving state assistance in Dec. 1941 as compared with 21,037 in Dec. 1940.

Communication.—Highway mileage in 1941 was as follows: state, 5,106; county 14,584; city, 2,269. State expenditures in 1941 totalled $4,230,000; federal aid, $2,400,651.43. An additional $800,000 was available from the state licence tax to local areas. There were 2,157 mi. of steam railway in 1938. Utah had more than 30 airports and fields in 1941.

Banking and Finance.—Sixty banks, 47 state and 13 national, had total assets of $227,403,617.52 in 1941; and 15 building and loan associations had aggregate assets of $20,677,678.94. Total bank deposits reached $206,418,293.03. State receipts for the year ending June 30, 1941 were $30,706,852.57; expenditures were $29,183,472.51. The total of outstanding bonds in 1941 was $2,105,000.

Agriculture.—The farm cash income figure of $62,000,000 for the first nine months of 1941 brought Utah agriculture almost back to the peak year of 1925 as producers strove to increase the farm yield as part of the defense program. Stockyards in Ogden and Salt Lake alone handled $56,000,000 worth of cattle, hogs, sheep and calves. Farming gains were aided by new irrigation projects.

Table I.—*Principal Agricultural Products of Utah, 1941 and 1940*

Crop	1941	1940
Hay (tame and wild), tons	1,307,000	1,123,000
Potatoes, bu.	1,782,000	2,040,000
Sugar beets, short tons	570,000	504,000
Celery, crates	139,000	101,000
Tomatoes, tons	73,500	54,800
Onions, lb.	25,000,000	22,000,000
Peas, tons	19,170	13,520

Manufacturing.—The upward trend in manufacturing continued in 1941, with new industries enabling Utah not only to hold its population but to attract newcomers for defense industries. Workers numbered 20,275 at the close of 1941 as compared with 15,982 in the first quarter of the year. Manufacturing pay rolls increased from $23,322,670.16 in 1940 to $28,624,949.60 in 1941, with the final quarter estimated.

Mineral Production.—The United States defense program gave sharp impetus to the state's greatest industry. Production of the nonferrous metals for 1941 was valued at $95,383,057, compared with $86,585,499 in 1940.

Table II.—*Principal Metal Products of Utah, 1941 and 1940*

Metal	Value 1941	Value 1940
Gold	$12,172,460	$12,442,290
Silver	7,967,099	8,655,857
Copper	61,443,018	52,401,264
Lead	7,776,720	7,568,800
Zinc	6,023,760	5,517,288

Military necessity aroused the interest of federal and state authorities as well as private interests in Utah's potentialities with respect to the development of manganese, alunite and other minerals. (F. W. GA.)

Utilities, Public: *see* PUBLIC UTILITIES.

Vanadium. World production of vanadium in 1940 was increased slightly above the 3,000 metric tons estimated for 1939. Reported production was 1,254 tons in Peru, 948 tons in the United States, 428 tons in South-West Africa, and 57 tons in Mexico, while that of Northern Rhodesia is estimated at about 400 tons, making a total of 3,087 tons. Imports into the United States in 1940 were 20,135 long tons of ore, with a vanadium content of 2,574,951 lb., an increase of 21% over 1939, and of 86% over 1938, as compared with a vanadium content of 2,090,601 lb. in ores of domestic origin.

(G. A. Ro.)

Van Devanter, Willis (1859–1941), U.S. jurist, was born April 17 at Marion, Ind. The son of a well-to-do attorney, Van Devanter studied at De Pauw university, graduated from the Cincinnati law school in 1881, and later practised law with his father in Marion. In 1884 he left for Wyoming. Two years after his arrival, he was entrusted with the revision of the state's statutes. In rapid succession he became city attorney of Cheyenne, a member of the territorial legislature, and later chairman of its judiciary committee. In 1889 he became chief justice of the Wyoming supreme court, but left the next year to resume private practice. Active campaigning for McKinley brought him appointment as U.S. assistant attorney-general assigned to the interior department. He remained at this post from 1897 until 1903, when Theodore Roosevelt appointed him judge of the eighth circuit court of appeals; in this capacity he participated in many cases of national importance. In 1910 he was named to the supreme court by President Taft. Ten years later he wrote the unanimous opinion of the court upholding the Volstead act. Van Devanter was not a prolific writer of opinions. A conservative, he dissented frequently in decisions regarding New Deal legislation and he resigned in 1937. Van Devanter was dean of the supreme court after the resignation of Justice Oliver Wendell Holmes in 1932. After his retirement he occasionally sat in the New York federal court. He died in Washington, D.C., Feb. 8.

Van Mook, Hubertus J. (1894?–), Netherlands statesman, was born in Semarang, Java, and entered the Netherlands East Indies government service at the age of 25. He was chief of the bureau of general economics, 1934–37. Later he became director of the department of economic affairs and headed a trade mission to Japan. The Nipponese negotiators, strengthened by the cession of bases in French Indo-China, used "strong-arm" tactics in an attempt to frighten the Netherlands missions into yielding to Japanese demands for economic concessions. But Van Mook stubbornly refused to agree to any move that would imperil the economic and territorial integrity of the Dutch East Indies, and the negotiations ended in a stalemate. On Nov. 20, 1941, he was named minister of colonies in the Netherlands government-in-exile set up in London; this appointment was cancelled, however, on Jan. 2, 1942, and he was appointed lieutenant governor of the Netherlands East Indies at the request of the governor general.

Vassar College. A college for women at Poughkeepsie, N.Y. In 1941 the college announced revised admission requirements designed to give wider opportunity to students with pronounced interests and abilities in certain fields. The new plan, to become effective for entrance in Sept. 1944, maintains the requirements of four years' work in English,

two in mathematics and one in history, to be included in the total of 16 units. By reducing the foreign language minimum from five years to three, and making one year of science an alternative choice instead of a requirement, the college is able to require study beyond the minimum requirement in two of the four fields offered for entrance, still leaving two or three optional units to be chosen from these or other fields leading to the A.B. degree. The committee on admission, which recommended the plan to the faculty after several years' study, believed that the new requirements would equalize entrance opportunities for students from the more conservative private schools and the experimental schools, the large high schools and the small, and benefit rather than lower college standards through the increased vitality of student interest.

The Helen Gates Putnam endowment for conservation, the gift of Dr. Helen Clark Putnam, who graduated from Vassar in 1878, made possible the organization of a graduate division of conservation, in which advanced study in geology, plant science, psychology and zoology, leading to the degree of master of science, is applied to problems of conserving both physical and human resources. Another gift from Dr. Putnam provided a glass laboratory equipped for this work in plant science. (H. N. MacC.)

Vatican City State.

Unusual though it be in peacetime, the Vatican City state becomes unique during war. This tiny area of 108 ac., the residence of the pope and the centre of the world-wide Roman Catholic Church (*q.v.*), enjoys a sovereign and undisputed independence among the nations. Completely encircled by Italian territory, its territorial and other rights were guaranteed by the Lateran treaty, 1929, between the Holy See and Italy, and its integrity is internationally recognized.

It has no defense forces; the gendarmes, numbering about 100, perform police duties; the Swiss, Noble and Palatine guards are employed mostly for official and domestic routine duties. It enjoys free communication with all the nations. Accredited diplomats from 35 nations were attached to the Vatican in 1941.

Pope Pius XII (*q.v.*) continued ruler of the papal domain in 1941, with Luigi Cardinal Maglione as papal secretary of state, and Nicola Cardinal Canali as president of the government of Vatican City. The *Osservatore Romano* is a semi-official daily. The official documentary publication is the *Acta Apostolicae Sedis*. The Vatican radio station became increasingly important because of the war. The population was estimated at about 900 in 1941.

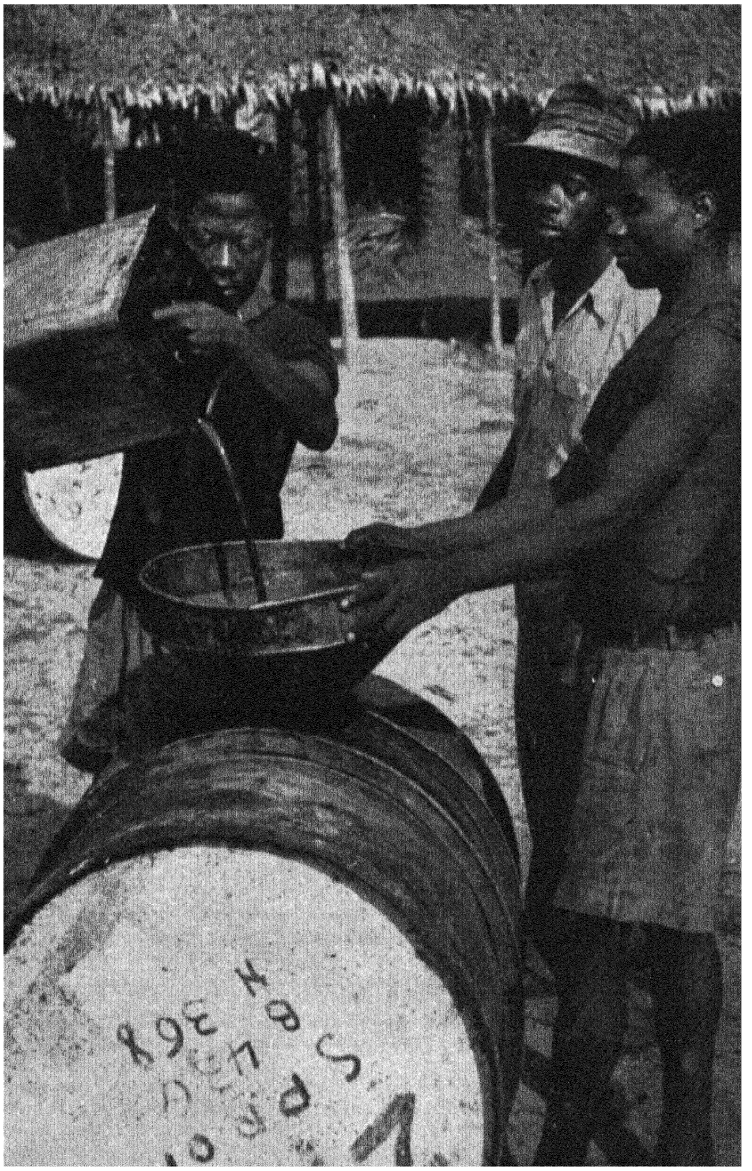
The aim of the Vatican throughout 1941 was the attainment of a just and lasting peace, and its policy was that of strict neutrality between the warring nations. Rigid censorship of news affecting military or political secrets was enforced. Residence was offered to diplomats accredited to Italy and other belligerents. An information bureau for the exchange of information about prisoners and refugees of all nations received, as of Sept. 1941, 364,409 requests; 147,862 replies were sent, mostly by radio. Extensive relief activities were accomplished in war-stricken countries.

The Vatican, through the pope, did not cease to denounce totalitarian principles, and through the radio and *Osservatore Romano* published revelations of persecution and injustice by the nazis and communists. Likewise, it championed the occupied countries of Europe, and expressed approval of democratic principles. In September, the pope held conferences with Myron C. Taylor, representative of President Roosevelt. In May, an agreement was reached with the Spanish government on disputed points, especially the appointment of bishops. An armistice was effected between Peru and Ecuador in the border conflict. (*See* also PIUS XII.) (F. X. T.)

Vegetable Oils and Animal Fats.

Production of oils and fats from domestic materials in the United States in the fiscal year ending June 30, 1941, was estimated by the department of agriculture as about 9,100,000,000 lb. For the year ending June 30, 1942, the same authority estimated that production would be 9,400,000,000 lb. Disappearance of fats and oils in the United States during the year ending June 30, 1941, was placed at 10,500,000,000 lb., with the volume of consumption for the year ending June 30, 1942, estimated at the same figure, including possibly 700,000,000 lb. of lard for export. While consumption outran production and scarcity of shipping handicapped imports in 1941, heavy stocks on hand in the United States prevented a shortage. It was estimated that imports of approximately 1,800,000,000 lb. of vegetable oils and oil seeds (in terms of oil) would be required by the United States for the year ending June 30, 1942. Such imports for the preceding year were 1,600,000,000 lb. The current decline in the production of cottonseed and peanut oils was offset by increases in the output of lard, soybean oil, tallow, greases, linseed, fish and corn oil. In 1941 the demand for vegetable oils and animal fats in the United States reached the highest point in 20 years, owing to the general rise in income that accompanied the expansion of industry in the national defense program and owing to the exports of lard, butter and other edible fats under the lend-lease act. The index number of prices for all fats and oils in Aug.

PALM OIL exported to England was an important source of revenue in 1941 to the Free French possessions of equatorial Africa



1941, in the United States was 91, in percentages of 1924–29 combined averages. This was an advance of 31 points or 52% above Aug. 1940, and 65% above Aug. 1939. Prices for many oils and fats, such as cottonseed and soybean oil and lard, advanced almost 100%. Butter and linseed oil advanced only about 30%. The demand for drying oils in paints and varnishes confronted greater uncertainty than did the demand for oils and fats used in edibles and soaps in 1941. Owing to possible restrictions on building in order to conserve materials and labour for national defense activities, it was believed the demand for drying oils would be limited. The year 1941, however, saw a large increase in the production of linseed oil, 3,400,000 ac. having been planted to flax in the United States in 1941, compared to an average of 2,200,000 ac. in the preceding five years. During the year the U.S. government took steps to increase the exports of butter and lard to Britain. Both of these products had tended to accumulate in the United States in surpluses that required government aid to distribute.

Cottonseed oil from the 1941 cotton crop in the United States was expected to equal 2,800,000 bbl. The carry-over from the preceding crop was 899,000 bbl. Consumption is about 3,000,000 bbl. annually.

Tung Oil.—Annual production of tung oil in the United States is about 5,000,000 lb. The bulk of the U. S. supply comes from China, such imports ranging from 175,000,000 lb. in 1937 to 79,000,000 lb. in 1939. Shipments from China to the United States in the first nine months in 1941 amounted to 26,000,000 lb. On Jan. 8, 1942, the OPM restricted use of tung oil to the following: defense orders with preference ratings of A2 or better; orders placed by the Defense Supplies corporation; orders for manufacturing outside can-coatings where tung oil is essential to withstand normal food processing; orders for uses to comply with underwriters, health, sanitary or safety regulations or laws issued to provide such regulations or laws specifically requiring tung oil. Venereal Diseases.

Protection of the armed and industrial forces of defense in the U.S. from losses due to syphilis and gonorrhoea became the immediate objective of federal, state and local agencies in 1941, the fifth year of their national venereal disease control program.

The selective service regulation requiring for the first time in the history of military medicine a blood test for syphilis on army candidates proved to be one of the greatest case-finding measures ever undertaken. Tabulation of serologic and clinical evidence of syphilis found among the first million drafted men appearing for physical examination showed 4·5% infected. The syphilis rates ranged by states from highs of 17% for Florida and 15.6% for South Carolina to lows of .56% and .63% for New Hampshire and Wisconsin, respectively. The high and low for white persons alone were 5% for Arizona and ·5% for Wisconsin; for Negroes, 40% Florida and 8% Massachusetts.

Table I.—*Prevalence of Syphilis in Drafted Men and General Population*

Region	Drafted Men Rate per 100*	General Population	
		Est. Rate per 100†	Est. No. Cases†
United States	4·5	2·4	3,171,861
16 South. States and D. C.	10.3	4.6	1,904,365
South Atlantic	11.3	5.3	952,651
East South Central	10.3	4.2	454,619
West South Central	9.2	3.8	497,095
32 Northern States	2.1	1.4	1,267,496
New England	1.1	0.6	53,471
Middle Atlantic	2.2	1.4	376,201
East North Central	2.3	1.6	415,971
West North Central	1.7	1.2	168,612
Mountain	2.8	2.0	81,406
Pacific	2.7	1.8	171,835

*Males, aged 21–35. †Males and females, all ages.

The table above shows regional and national conscript rates, and an estimate of 1941 prevalence of syphilis made from them. Statisticians of the U.S. public health service regarded the figures, 3,200,000 cases or 2·4%, as being "probably the closest estimate of the true prevalence of syphilis ever made for the United States," since never before had it been possible to sample so large a section of the population with comparable uniformity. It was hoped that continued study of such data will indicate the trend of syphilis. This trend was difficult to determine from cases reported to state health departments because of the unknown proportion under private medical care which were not reported.

Statistical study of early syphilis cases coming under the treatment of both public clinics and private physicians in certain surveyed areas, however, provided a new estimate that the national incidence had declined from 259,000 new admissions per year in 1936–37 to 173,000 in 1939–40. This 33% decline in the syphilis attack rate, which was supported by other evidence, paralleled the tremendous increase in diagnostic and treatment facilities for syphilis and gonorrhoea from 1937 to 1941.

Table II.—*Venereal Disease Control Activities of State Health Departments*

Fiscal Year	No. of Clinics	Clinic Admissions		Serologic Tests†	Drugs Distributed	
		Syphilis Cases	Gonorrhoea Cases		Doses of Arsenicals†	Sulfonamide Tablets†
1938 . .	1,746*	149,434	44,752	3.6	2.8	‡

1940 . .	2,887*	288,778	66,811	10.2	6.9	5.3
1941 . .	3,245	340,615	84,418	16.5	8.2	7.2

*End of calendar year. ‡No data. §Estimate. †In millions.

Expansion of these facilities continued in 1941 as shown in the table of activities reported by state health departments. The figures reflect the 24% increase over 1940 in the budgets of federal ($6,400,000), state ($3,000,000) and local funds ($3,800,000) for 1941, the third year of activity under the Venereal Disease Control Act of 1938. In addition, a $5,000,000 program of local assistance in defense areas was begun by the WPA.

The 1941 venereal disease control program emphasis may be epitomized as (1) rehabilitation of deferred infected selective service men, (2) expansion of gonorrhoea control facilities to match those for syphilis, (3) reinforcement of local clinic and field personnel in boomtown and cantonment areas, and (4) contact-tracing of patients with new infections.

The last point was the public health *modus operandi* against prostitutes, who are the chief sources of military infection. Meanwhile social hygiene leaders sought the police suppression of prostitution as the most effective method of preventing transmission of venereal disease to soldiers. To this end, congress passed the May act (Public Law 163), effective July 11, 1941, prohibiting prostitution in designated civilian areas adjacent to military or naval concentrations.

Usilton, "Syphilis among Selectees and Volunteers," *J.A.M.A.* (Oct. 18, 1941); "Estimated Prevalence of Syphilis in the United States, 1941" and "The Chance of Acquiring Syphilis," (studies to be published by the U.S. Public Health Service). (R. A. V.)

Venezuela.

A federal republic in northeast South America. Area, 393,976 sq.mi.; pop. (1936 census) 3,491,159, including 103,492 Indians. Capital, Caracas (203,432; 1941 est. 265,000). Other cities (with 1936 figures): Maracaibo (110,010); Valencia (49,214); Barquisimeto (36,429); Nirgua (30,706); Cárupano (30,163); Maracay (29,759); Río Caribe (29,696); Boconó (25,315); Ciudad Bolívar (25,134).

Venezuela is a federal union of 20 states, a federal district, 2 federal territories and one "federal dependency." The congress is bicameral and is elected indirectly. The president is elected by the congress for a term of five years and is ineligible for the succeeding term. President: Gen. Isaías Medina Angarita (succeeded President Eleázar López Contreras May 9, 1941).

History.—Venezuelan history in 1941 was marked by continued progress toward democracy, and by a peaceful and orderly transfer of presidential power. Under war conditions the country's economic position was on the whole improved and strengthened. Internationally, Venezuelan policy was one of furthering hemispheric solidarity.

On Jan. 30, half the membership of the national Chamber of Deputies was renewed in a nationwide election, of more than usual importance because the new congress was to elect a successor to President López Contreras. The new congress was overwhelmingly in support of the president. He, however, already had rejected earlier suggestions that, owing to world uncertainties, he avail himself of legal loopholes to accept a new term. On April 5

President López formally reiterated his determination not to accept re-election. Congress, therefore, on April 28, by a vote of 120 out of 137, chose General Isaías Medina Angarita, the incumbent minister of war, as the new president. On May 9, President Medina took office, in the first free and open transfer of presidential power from one constitutional president to another in the nation's history. The new president, in his inaugural address, declared his intention to continue the liberal program of his predecessor and to co-operate with the United States. Evidence of his sincerity was seen in September when his opponent for the presidency, the novelist Rómulo Gallegos, was allowed to form without government opposition a new party, the Acción Democrática, a group with slightly leftist leanings.

Closer co-operation with the United States remained a definite part of Venezuelan foreign policy in 1941. Former President López Contreras himself made an extended visit to the United States in September. With the outbreak of war between the United States and axis powers in December, Venezuela hastened to support the program of American solidarity. Increased military precautions were taken, ports were opened to all American powers at war with the axis, and radio communication was restricted to the Americas only. On the last day of the year diplomatic relations with Germany, Italy and Japan were formally severed.

Improved relations with immediate neighbours also characterized Venezuelan foreign policy in 1941. In January, a treaty with Brazil providing for peaceful settlement of all controversial issues was ratified. In April, a hundred-year-old boundary dispute with Colombia was ended through negotiation. The latter agreement called for improved commercial relations between the two countries.

Education.—Primary education is compulsory and under federal control. There were, in 1941, nearly 7,000 schools, with some 250,000 students; also 74 normal and secondary schools (24 private), and two national universities (at Caracas and Mérida).

Finance.—The monetary unit is the bolívar (value in 1941: approx. 27 cents U.S.). Venezuela had no external debt and the internal debt was nominal in 1941. The 1940–41 budget amounted to 344,515,000 bolivares, 17,000,000 less than in 1939–40. About 35% of government receipts was derived from oil royalties and land taxes, and petroleum produced more than 90% of the foreign-exchange income.

Trade.—In 1940 imports, largely foodstuffs, machinery, textiles and other manufactures, were valued at 326,393,000 bolivares (a 4.7% decline), mainly from the United States, 73.7% (1939: 61.1%), Great Britain 7.6% (6.2%), Japan 3.2% (1.9%). Exports totalled 860,909,000 bolivares (a 9.7% decline), with petroleum and its products aggregating 94.0% (1939: 93.9%). Non-petroleum exports in 1940, mostly coffee (36%), gold (32.4%), cacao (16.4%), hides (3.4%) and cattle (2.3%) went principally to the United States, 77.5% (1939: 52.1%), Trinidad 4.3% (2.8%), Italy 3.7% (2%) and Japan 2.8% (0.3%). Germany took 28.8%, mainly coffee, in 1939 and supplied 9.5% of imports.

Communication.—External communication is by frequent steamship service, and by Pan American Airways and Royal Dutch Airways (to Curaçao and Colombia). There were 640 mi. of railway in 1941. Highways are inadequate (less than 6,000 mi. improved in 1941), but the number of automobiles is relatively large (33,016 in 1941). Internal air transport is by a domestic line.

Agriculture.—Coffee is the main agricultural export, and until 1939 more than half was taken by Germany. The Inter American quota allotment (revised) for 1940–41 export to the United States was 438,757 bags, but actual export was some 200,000 bags in excess (deductible from 1941–42 total). The 1941–42 crop was estimated at 800,000 bags, and the quota for export to the United States 465,970 bags.

Mineral Production.—Venezuela is the third largest petroleum producer, with an estimated 1941 production of 227,000,000 bbl. (1940: 184,761,000), almost equal to the U.S.S.R's 242,000,000 bbl. (1942 est.). The main fields lie in the extreme west, but newer fields in the east (Anzoátegui state and the Orinoco valley), first exploited in 1936, contributed much of the 1941 increased output. There are, however, only ten refineries in the country, with a maximum capacity of 40,000,000 bbl. annually. Most of the production goes to refineries in Curaçao, which took 70.8% of 1940 production (1939: 76.3%), the remainder going largely to the United States (1940: 19%; 1939: 13.4%).

A miscellany of other minerals, including gold, diamonds, iron and coal is found, but only gold is exploited to any degree. (L. W. Be.)

Vermiculite. Sales of vermiculite in the United States increased 5% in 1940, to 22,209 short tons, but value decreased 15%. The production is mainly from Montana, with smaller amounts from North Carolina, Colorado, and Wyoming. Attempts were being made to develop a deposit in the Palabora district of the Transvaal. (G. A. Ro.)

Vermont. A north Atlantic state, first to be added to the original thirteen of the United States; popularly known as the "Green Mountain State"; area, 9,718 sq.mi., of which 440 sq.mi. are water. The population in 1940 was 359,231, including 235,992 rural, 123,239 urban. There were 327,079 native whites, 31,727 foreign-born, 384 Negro, 41 of other races. Montpelier is the capital, with a population of 8,006. The two largest cities are Burlington on Lake Champlain (27,686), and Rutland (17,082).

History.—Vermont gained the reputation of being the first state to declare war on the axis powers when in a special legislative session it granted a bonus of $10 a month to its men in service, a sum which had been voted by a previous session in case the United States went to war. During 1941 former Governor George D. Aiken took his seat as U.S. senator from Vermont. Provision was made for a referendum on women jury service to be decided at the general elections in 1942. William H. Wills was governor in 1941; Warren R. Austin and George D. Aiken, U.S. senators; Mortimer R. Proctor, lieutenant governor; Thomas H. Cave, state treasurer; Rawson C. Myrick, secretary of state.

Education.—There were 1,180 elementary schools in Vermont, with an enrolment in 1941 of 44,524 and a teaching staff of 1,954. The secondary schools numbered 92, with an enrolment of 16,637 and a teaching staff of 698. Three normal (teacher-training) schools had an enrolment of 377 and a teaching staff of 29. The University of Vermont had a regular enrolment in 1941 of 1,332 and a faculty of 250.

Public Welfare.—As the town is the unit of government in Vermont, general relief is distributed through the towns by the overseers of the poor. General relief thus distributed in 1941 totalled approximately $640,000. The state department of public welfare, which has under its jurisdiction eight institutions, had an appropriation of $1,099,000. The department also has federal funds for blind assistance and aid to the dependent. Unemployment insurance commanded $2,716,751.59 in 1941; WPA employment from Jan. 1 through Nov. 30, 1941 was given to 2,845 persons. During the same period expenditures for labour amounted to $1,871,156.41 and other expenditures $519,192.79, a total of $2,390,349.20.

Communication.—State highways in 1941 totalled 1,780 mi.; state-aid highways, 2,726 mi.; town highways, 9,653 mi., a total of 14,159 mi. Highway expenditures from July 1, 1940 to June 30, 1941 totalled $5,856,365.95. There were 917 mi. of railroads in the state in 1941. Airways mileage, 145, with 11 airports and 3 seaplane ports. Telephones numbered approximately 64,000 in 1941.

Banking and Finance.—There were 41 state banks in Vermont and 40 national banks in 1941. The deposits in the state banks as of June 30, 1941 were $116,837,463.65, with resources of $136,711,860. National bank deposits were $60,074,000, with resources of $70,524,000. There were 11 savings and loan associations, with resources of $2,634,936.65, a figure which does not include the resources of federal savings and loan associations in the state. The total state expenditures in 1941 stood at $25,178,423.19, the revenues at $18,237,261.55, leaving a net deficit of $6,941,161.64, an improvement of $522,656.06 over the financial condition of the preceding year. The gross debt was $11,402,968.82, a decrease of $322,758 from 1940.

Agriculture.—The total crop land harvested in 1940 was approximately 1,093,230 ac., with a value estimated at $18,381,000 for principal crops. The aggregate value of all livestock, poultry and related products was between $38,000,000 and $39,000,000, with milk accounting for more than three-fourths of the total value. The production of maple syrup was 1,080,000 gal.; of maple sugar, 268,000 lbs. Deep snows and lack of deep frost were unfavourable factors in the 1940 maple season, and the cool growing weather hindered most crops. The dry season of 1941 was also unfavourable to crops.

Leading Agricultural Products of Vermont, 1940 and 1939

Crop	1940	1939	Crop	1940	1939
Corn, bu. . . .	2,627,000	3,040,000	Oats, bu. . . .	1,760,000	1,881,000
Potatoes, bu. .	2,142,000	1,950,000	Hay, tons . . .	1,123,000	1,143,000

Manufactures.—The annual value of manufactures is approximately $50,000,000; there are about 57,000 wage earners, to whom $56,000,000 is paid annually in wages. The granite and marble industries are two of the most important, the business valuation of the former being about $8,000,000 and of the latter $2,000,000. High-grade machine tools are manufactured in Springfield, Windsor and other points, giving employment to 8,000 people before the war expansion of 1941.

Mineral Production.—The total value of mineral products in the state for 1939–40 was $12,283,886. Granite products were valued at $7,304,356; slate at $1,948,315; marble at $1,533,824. (L. W. D.)

Veterans Administration.

Insurance.—As of June 30, 1941, there were 613,320 United States government life insurance policies in force, representing $2,567,154,350 of insurance. Monthly payments were being made to 10,626 policyholders for permanent and total disabilities. Disbursements for this type of insurance during the fiscal year 1941 totalled $55,826,658. As of June 30, 1941, monthly payments on yearly renewable term insurance policies were being made to 10,205 permanently and totally disabled veterans and to the beneficiaries of 8,586 deceased veterans. Monthly payments on automatic insurance policies were being made to 240 veterans and the beneficiaries of 45 deceased veterans. Disbursements for term and automatic insurance during the fiscal year 1941 totalled $15,390,560. During the period Oct. 8, 1940 to June 30, 1941, 367,923 applications for national service life insurance, aggregating $1,193,665,500, were approved. A total of 102 death claims were filed during the same period and awards made in 43 of these cases, representing $237,500 of insurance.

Public 861, 76th congress, Oct. 17, 1940, provides for suspension of enforcement of certain civil liabilities of persons serving in the armed forces of the United States. Article IV of the act provides that the government will, on application by the insured, guarantee to commercial insurance companies premiums on insurance carried with such companies by policyholders while in active service. Through June 30, 1941, 10,135 applications for this benefit had been received, of which 6,718, representing $20,015,076 of insurance, had been approved. Certificates issued to insurers guaranteeing premiums totalled 188, aggregating $163,240 of insurance.

Adjusted Compensation.—Work under the World War Adjusted Compensation act, approved May 19, 1924, has been practically completed. As of June 30, 1941, benefits had been extended to 4,121,543 veterans of World War I or the dependents of deceased veterans, approximating $3,766,840,087 in value. In 3,792,509 cases the veterans received adjusted service certificates equivalent to 20-year endowment policies, aggregating $3,709,991,577 in value. Cash payments had been made in 329,034 cases in the sum of $55,067,180. Awards had been made on 242,414 adjusted service certificates which had matured by the subsequent death of the veteran. The face value of these awards approximated $238,871,780. As of June 30, 1941, 3,513,248 applications had been certified for payment under the Adjusted Compensation Payment act, approved Jan. 27, 1936. The amount certified for payment totalled $1,922,574,962. The maturity value of these certificates approximated $3,437,770,885.

Guardianships.—The guardianship load of the veterans administration, June 30, 1941, was 83,439 wards, of whom 43,476 were incompetents and 39,963 minors. The value of estates of these wards approximated $159,370,982.

Army and Navy Pensions.—Table I shows the number of cases on the rolls as of June 30, 1941, and the net disbursements during the fiscal year 1941 from the appropriations "Army and Navy Pensions."

Medical Care and Treatment.—On June 30, 1941, the hospital load of the veterans administration was 58,417 patients, of whom 58,160 were United States veterans, 38 were Allied veterans of World War I, 99 were employees of the Civilian Conservation corps and Work Projects administration, and 120 were miscellaneous beneficiaries. Of the United States veterans, 54,598 were in veterans administration facilities, 2,531 in other government hospitals and 1,031 in state or civil institutions. Approximately 78.53% of these United States veterans were receiving treatment for disabilities not of service origin. During the fiscal year 1941, 9,716 United States veterans were admitted for observation and treatment of tuberculosis, 9,723 for psychotic or mental diseases, 14,124 for other neurological disorders and 153,811 for general medical and surgical conditions. The veteran population in domiciliary status in veterans administration facilities, June 30, 1941, totalled 13,978. Of this number, 9,151 veterans were disabled by general medical and surgical conditions, 4,588 by neuropsychiatric diseases and 239 by tubercular ailments. During the fiscal year 1941 an average of 5,966 veterans eligible for care in veterans administration facilities was cared for in state or territorial homes. These homes are reimbursed by the federal government at the rate of $240 a year for each of such veterans domiciled therein. During the fiscal year 1941 dental care was provided for 32,300 hospital patients, 11,011 domiciliary members and 3,584 out-patients in clinics maintained by the veterans administration. In these clinics, 35,227 new dentures were made and 8,660 repaired. Dental treatment was authorized to private practitioners for 1,876 veterans. During the fiscal period 1,111,589 examinations were made and 1,176,658 treatments were furnished for out-patient purposes in field facilities. Of the examinations, 98% were medical and 2% were dental. Treatments were 91% medical and 9% dental.

Civilian Conservation Corps.—The total authorized strength of the veterans contingent of the Civilian Conservation corps is 27,200, which represents approximately 9% of the corps strength. As of June 30, 1941, there were 20,200 veterans in enrolment status. There have been approximately 213,000 enrolments in the veterans contingent of the corps since the spring of 1933. The total number of veterans and their dependents who have received direct monetary benefits through allotments approximates 550,000.

Co-operative Employment Activities.—The veterans administration maintains personal contact with local representatives of the United States employment service of the Social Security board and other government agencies with regard to employment of veterans. Employment service reports show that on June 30, 1941, the number of unemployed veterans registered for employment was 212,984, as compared with 239,872 June 30, 1940.

Finance.—Table II shows the net disbursements made by the veterans administration during the fiscal year 1941 from all appropriations and trust funds (including adjustments on lapsed appropriations). (F. T. Hi.)

Table I.—*Number of Cases and Disbursements, Fiscal Year 1941*

War	On roll, June 30, 1941	Disbursements, fiscal year 1941

Veterans of Foreign Wars.

"One Nation Indivisible" provided the theme for the nation-wide program of activities sponsored in 1940–41 by 3,500 local posts and 2,500 ladies' auxiliary units of the Veterans of Foreign Wars of the United States. As the keynote of the 42nd annual national V.F.W. encampment, Aug. 24–29, 1941, at Philadelphia, Pa., the slogan of "Unity for Victory" for 1941–42 won the endorsement of guest speakers Undersecretary of War Robert P. Patterson; the Honourable Joseph E. Davies, former ambassador to Russia and Belgium; Fiorello H. La Guardia, mayor of New York city and United States director of civilian defense; Brigadier General Frank T. Hines, veterans administrator; Brigadier General Lewis B. Hershey, director of selective service; and L. B. Nichols, assistant director of the Federal Bureau of Investigation. Surveying the world situation, the encampment went on record as "wholeheartedly endorsing and supporting those measures taken by the government of the United States of America to defend and perpetuate the American way of life from any and all aggressors."

One of the V.F.W.'s important achievements of the year was the

inauguration and maintenance of a monthly series of radio programs on the general theme "Speak Up for Democracy." Beginning Dec. 11, 1940, on a network of 50 local radio stations, this program gained momentum and popularity until on Oct. 11, 1941 it was broadcast over a total of 434 stations.

Other major V.F.W. programs throughout the year included the sponsorship of the sixth annual high school Americanism essay contest in which approximately 150,000 boys and girls throughout the United States were entered. A series of preliminary elimination contests in schools, cities and states resulted in the selection of winners in each of 48 states, the territory of Hawaii and Alaska, from among whom were selected the essayists to whom a total of $2,000 in cash prizes was awarded. Miss Barbara Maurin, Fergus Falls, Minn., was presented with a gold medal and $1,000 in cash as first prize.

A 42-point Americanism program, also adopted by the Philadelphia encampment, was formulated on the basis of activities sponsored by the local units in their respective communities. These include thousands of welfare projects such as summer camps for underprivileged children, health clinics, instruction classes for adult aliens, observance of patriotic occasions, supervised playgrounds, sponsorship of Boy and Girl Scout troops and hundreds of junior musical units, rifle clubs, bicycle safety clubs, athletic teams and school programs.

Legislative achievements of the year, in behalf of disabled veterans and their dependents, and the widows and orphans of veterans, included public law no. 775 which provides for the entire personnel of the naval reserve or marine corps reserve pensions and other benefits as provided for the personnel of the regular navy or marine corps, in case of disability or death in line of duty. The V.F.W. also supported an amendment to the Selective Service and Training act, which granted the same pay and allowances to enlisted men of the navy as were provided for enlisted men in similar grades in the army and marine corps. Largely to the efforts of the V.F.W. also was credit for enactment of public law no. 801, which, among other provisions, extended credit for military service rendered during time of any war, for railroad employees' retirement purposes. Public law no. 142, also supported by the V.F.W., eliminated the former "relative needs test" and granted veterans preference on WPA projects. It further provided that receipt of small pensions or compensations would no longer bar veterans from WPA work preference.

Officers elected for 1941–42 include Max Singer, Boston, Mass., commander-in-chief; Robert T. Merrill, Havre, Mont., senior vice commander-in-chief; Carl J. Schoeninger, Detroit, Mich., junior vice commander-in-chief; R. B. Handy, Jr., Kansas City, Mo., adjutant quartermaster general; Philip O. Solon, Oakland, Calif., judge advocate general; the Rev. Hugh Leo Collins, Youngstown, O., national chaplain; Dr. Meredith I. Samuel, Wilmington, Del., surgeon general; Jean A. Brunner, Brooklyn, N.Y., chief of staff; C. R. Christie, Seattle, Wash., inspector general; R. E. Kernodle, Kansas City, Mo., national historian; Teller Ammons, Denver, Colo., national patriotic instructor. (B. Y.)

Veterinary Medicine.

Bovine Tuberculosis.—Livestock sanitary officials in the U.S. found it imperative to warn the people that tuberculosis of farm animals still exists and therefore requires continuous vigilance to prevent the infection from flaring up and reassuming its predaceous character.

In 1941 the secretary of agriculture forbade officers and employees of the U.S. department of agriculture to participate in recruiting members for and organizing general farm societies. Since 1920, county farm advisers have been acting as promotional, financial and business agents for local farm bureaus, functions which have led to the selling of remedies for livestock on a large scale in some states, to the practice of veterinary medicine in violation of state licensure laws in some instances and in violation of the federal law under which the extension service was created. The veterinary profession interpreted the memorandum as a step toward a more scientific control of the farm-animal diseases which threatened to diminish the United States food supply.

Military Service.—The college-trained veterinarians of the United States were well deployed for protecting the nation's food-producing animals against panzootics in times of peace. The number required to guard animal health in the vast farm-animal population would be too few if many of the United States 12,500 veterinarians were inducted into the army from the rural districts. The interruption of animal disease control and food inspection by drafting soldiers from the veterinary service was therefore disapproved by the Selective Service system. The drafting of veterinarians engaged in the treatment of dogs and of those unnecessary in rural districts was left to the discretion of the local draft boards.

Bovine Brucellosis.—The control of brucellosis of cattle (contagious abortion) by vaccination with an attenuated strain of Brucella abortus worked out in the research laboratory of the U.S. bureau of animal industry, was among the new steps in force to lower the incidence of abortion in farm animals.

The vaccination of prepubescent cattle (calfhood vaccination) in addition to the test-and-slaughter method which was so effective in controlling bovine tuberculosis was being slowly introduced under official supervision. The situation, however, was complicated by serological reactions in vaccinated cattle. Since vaccinated cattle cannot be differentiated from spontaneously infected ones, vaccination obstructed free exchange of cattle between states having laws prohibiting the importation of brucella-infected animals. Healthy, but vaccinated cattle, and naturally infected ones were in the same category in interstate trade.

Veterinary Education.—The shortage of veterinarians caused by the closing of the proprietary veterinary colleges in the 1920s and the expansion of the federal and states livestock sanitary services, including extension of municipal milk inspection under the standard milk ordinance of the U.S. public health service, was being gradually overcome by enlarging the capacity of the publicly supported departments of veterinary medicine and the founding of new ones.

The University of California established a division of veterinary medicine which opened with the college year of 1941. The course is six collegiate years, two preveterinary and four professional, an increment of one year over the other ten American veterinary colleges. A wholesome trend was the disapproval of new veterinary colleges which did not comply with the dogmatic standards set down by the U.S. bureau of animal industry, the U.S. civil service commission and the American Veterinary Medical association in regard to financial support, physical equipment and sufficient full-time instructors.

Argentine Beef.—A heated controversy arose among cattlemen and veterinarians of the middle west and intermountain regions over the danger of bringing foot-and-mouth disease and certain tropical infections into the U.S.A. through the importation of South American beef and other meat products. Livestock producers were concerned over the competition as well as the sanitary problem involved, and the veterinary service remained girded to prevent the introduction of foreign plagues into the United States' relatively disease-free animal industry. The question is one of great national and international significance and difficult to handle because it involves the welfare of an important industry, the good neighbour policy of the administration and the price of food for the American people.

Equine Encephalomyelitis.—Although statistical data for 1941 were incomplete, the prevalence of this disease was comparatively low. Spreading was promptly checked by vaccination with the chick-embryo vaccine of Wyckoff wherever the infection broke out.

New reservoirs of the virus were discovered and its relation to so-called St. Louis encephalitis was signalized by the U.S. public health service. Natural summer infection in horses occurs concurrently with outbreaks in man. Although the eastern strain of the virus was isolated in 1938 and 1939 in pheasants and pigeons, the western strain, except in man and horses, was found for the first time in other animals, when isolated from the brain of a prairie chicken in North Dakota during an epidemic of encephalitis (human) in the same neighbourhood.

Artificial Ensemination.—A noteworthy development in animal production is the increasing resort to artificial ensemination, particularly in cows. Breeding societies organized for that purpose have become numerous and methods of determining the virility of bulls and of preserving the viability of semen have been greatly improved. Sires of known potency can be purchased and technicians trained in the art can be employed at low per capita cost to the members, and since several cows can be bred from one mating, the sexual life of bulls can be prolonged. The percentage of conceptions obtained is practically the same as from natural coition. Better offspring for owners of small herds who cannot afford to keep bulls of the best types through the year is one of the strikingly apparent advantages of artificial ensemination.

Military Horses and Mules.—Although the exact proportion of transport animals to soldiers is not yet available, facts collected from press reports and veterinary literature indicated that horses and mules were being employed in sizeable numbers for cavalry, artillery and the service of supply. Procurements by the remount service for the U.S. army in training indicated that the animal transportation had a prominent place in modern military organization.

Chronic Streptococcic Mastitis of Cows.—Mastitis of dairy cows affects the quality and quantity of market milk and being located in the depth of the lactating udder safely encased against systemic remedies, local treatment instilled by way of the milk channels was held out as the only hope

of restoring health to the affected glands. Diagnosis is no deterrent. The infected quarters can be quickly detected by simple tests of the milk, but when the percentage of affected cows runs high, sacrificing them for slaughter is out of the question. The very milk supply of the people would be reduced materially. The discovery of effective local, antiseptic treatment during 1941 was therefore an eventful achievement. Three products came into use: gramicidin, an alcohol-soluble substance isolated from a sporulating anaerobic bacillus; a solution of silver oxide, an acridine dye named entozon and iodized mineral oil. These liquids when instilled and kneaded into the recesses of the affected quarter stop the shedding of streptococci in a large percentage of the cases treated and tend to effect permanent cures.

Sulphanilamide.—The "sulpha" compounds have been found to have many uses in animal medicine but they have been declared useless in chronic infections (tuberculosis, brucellosis, actinomycosis, streptococcic mastitis, endometritis). In acute wound infections, surgical peritonitis, puerperal metritis, they are regarded as a near panacea in veterinary practice. Many an erstwhile fatal infection has been conquered by the proper local and internal use of these drugs.

(L. A. M.)

Vichy. A town of central France, department of Allier, on the right bank of the Allier, 33 mi. southeast of Moulins; pop. (1939) 20,000. Vichy has been well known as a medicinal spa since the latter part of the 17th century; its alkaline waters are especially recommended for diseases of the stomach and the liver, including diabetes and gout. "Vichy" was one of the most popular French table waters.

RESIDENTS OF VICHY lined up in 1941 to get their daily ration of tobacco

The town acquired political significance in the summer of 1940, when the French government, headed by Chief of State Marshal Henri Philippe Pétain (*q.v.*) took up residence there, after Paris had been occupied by the Germans. It was convenient as a seat of government because of the many hotels which could be converted into government buildings or used as residences by officials. What was originally thought of as a makeshift arrangement remained in force during 1941, since the war did not come to an end and the Vichy government did not arrive at any understanding with Hitler which would have made possible the substitution of a permanent peace for the armistice. A considerable amount of "collaboration" was forced on the Vichy regime in 1941; its forces resisted the British in Syria and yielded without a struggle to the Japanese in Indo-China. But a complete passing into the German camp, although often rumoured, had not taken place by the end of 1941. (*See* also FRANCE.) (W. H. CH.)

Victoria. A state of the Australian commonwealth; area 87,884 sq.mi.; pop. (est. Dec. 31, 1940), 1,918,774. Chief towns (pop. Dec. 31, 1939): Melbourne (1,046,750); Geelong (40,100); Ballarat (38,590); Bendigo (30,150). Governor, Maj. Gen. Sir W. J. Dugan.

History.—The Country party government, under the premiership of Albert A. Dunstan, remained in office throughout 1941. Precedence was given to matters concerning the prosecution of war, legislation of a contentious nature being avoided.

Owing to the shortage of refrigerated shipping space, the government decided to increase the capacity of the government cool stores by 400,000 cu.ft., and 150,000 cu.ft. had been completed by Sept. 1941.

Following a severe drought in agricultural areas in 1940, the wheat crop was the lowest since 1914. Conditions improved during the year and dairy production was well maintained. An area of 28,000 acres of flax was planted, and three additional retting mills were erected. The work of salvaging fire-killed timber was continued by the government, and over 400,000,000 feet were recovered.

Industry was working at high pressure on government orders and a new ordnance factory was being built at Bendigo. The dockyard and shipbuilding facilities at Williamstown were being enlarged to enable merchant ships of 10,000 tons to be constructed. Six anti-submarine and mine sweeping vessels were under construction.

Under commonwealth regulations rents were pegged at Dec. 1940 levels, but the state rents board was given power to reduce such rents in cases where they might have risen unreasonably before that date.

Finance.—In 1940–41: revenue £A29,183,000; expenditure £A29,041,000; debt outstanding (June 30, 1941) £A181,219,000.

Communication.—Roads and streets fit for motor traffic (Sept. 30, 1939) 103,929 mi. Railways (1939–40) 4,767 mi. Motor vehicles licensed (1939–40): cars, trucks, etc., 240,912; cycles 25,765. Wireless receiving set licences (March 31, 1941) 360,115. Telephones (June 30, 1939) 208,230.

Agriculture, Manufacturing, Mineral Production.—Production in 1940–41: wheat 13,521,000 bushels; wool 185,000,000 lb.; coal, brown (1939) 3,651,014 tons; gold (1939) 156,522 fine ounces. Industry and labour, 1939–40: factories 9,250; employees 204,494; gross value of output £A174,300,000; unemployment (trade union returns) (March 1941), 3.2%.

(W. D. MA.)

Vincent, George Edgar (1864–1941), U.S. educator, was born March 21 at Rockford, Ill. After his retirement as president of the Rockefeller foundation in 1929, he served in 1931 on President Hoover's Public Works committee which planned a broader federal program to aid employment. In 1935 the Carnegie corporation appointed him chairman of a survey designed to undertake a study of New York hospitals in relation to public health. He died in New York city, Feb. 1. (*See* also *Encyclopædia Britannica.*)

Vincent, Henry Bethuel (1872–1941), U.S. composer, was born Dec. 28 in Denver, Colo. Founder and director of the Erie playhouse, Vincent was composer of more than 100 musical works for piano, organ and orchestra. He wrote an opera and two operettas. He was a well known organist and lecturer at the Chautauqua institute in New York. His musical compositions include *The Prodigal Son*, an oratorio (1902); *The Garden of Kama*, an oriental song cycle (1905); *Indian Days* and *Savageland*, operettas; and *Esperanza*, an opera presented in 1906 in Washington. He was conductor of the Federal Music Project orchestra in 1936–37. He died Jan. 7 at Erie, Pa.

Virginia. The most southerly of the middle Atlantic group of states and one of the original states of the United States; popularly known as "The Old Dominion"; first settled permanently in 1607. Area, 40,815 sq.mi.; pop. (1940) 2,677,773. Of the population, 35·3% were urban and 64·7% rural; an estimate based upon 5% of the census showed a white population of 2,013,723, nonwhite of 664,050. Capital, Richmond (193,042). Other cities include Norfolk (144,332) and Roanoke (69,287).

History.—The general assembly did not meet in 1941. As usual, Democratic nominees for Virginia's three elective offices won in the general election of 1941, with Colgate W. Darden, Jr., as candidate for governor; William M. Tuck for lieutenant governor, and Abram P. Staples for attorney-general for the third successive term. Democrats won 17 contests out of 25 in the house of delegates and three out of the four special elections for vacancies in the state senate. James H. Price was governor in 1941; Saxon W. Holt, lieutenant governor, died in 1940.

COLGATE W. DARDEN, JR. (Dem.), elected governor of Virginia in Nov. 1941

Education.—In 1940–41, elementary school enrolment was 438,738; teaching staff, 11,894; secondary school enrolment, 135,701; teaching staff, 5,660; 299 additional teachers divided their services between the two systems. In the regular 1940–41 session, 3,151 students attended and 267 faculty taught at the University of Virginia, while nine other state-owned institutions of higher learning had enrolment of 12,376 and teaching staff of 1,064.

Public Welfare, Charities, Correction.—For the year ending June 30, 1941, 22,681 persons received $907,555.49 in general relief; a monthly average of 22,767 persons received $10,793,742.73 in WPA funds; 23,424 persons received $2,313,234.02 in old-age assistance; 5,433 dependent children, $947,904.09; 1,218 blind, $155,199.86; and in 1941, 374,325 unemployment compensation cheques were written for $2,961,650. An average daily population of 4,790 were in six penal institutions for adults and 838 were in four industrial schools for juveniles.

Communication.—On Jan. 1, 1941, there were 9,632 mi. in Virginia's primary highway system and 36,745 mi. in the secondary system. Expenditures of the state highway department for the fiscal year ending June 30, 1941, were $24,795,885.29. On Dec. 31, 1941, Virginia had 4,261 mi. of railroad.

Banking and Finance.—On Jan. 1, 1941, Virginia had 184 licensed state banks and 130 national banks. Deposits of the former totalled $276,551,000; of the latter, $423,503,000; assets of state banks, $317,956,000; of national banks, $478,002,000. Resources of 22 industrial loan associations, 58 building and loan associations and 32 credit unions were $42,789,013.89. The state budget for the fiscal year ending June 30, 1941, showed receipts of $96,772,092.47; expenditures of $88,514,494.43; gross debt was $19,214,003.86; net debt, $13,917,054.60.

Agriculture.—The value of principal Virginia crops in 1941 was estimated at $115,668,000, an increase of 14% over 1940, although the total acreage harvested, estimated at 3,744,000 ac., was a decrease of 4% under 1940. The estimated farm income in 1941 was 18% higher than in 1940, when the total income was $127,289,000 (crops, $63,534,000; livestock, $59,031,000; government payments, $4,724,000). The extensive drought in 1941 caused a damage of approximately $8,650,000 to Virginia crops.

Table I.—*Leading Agricultural Products of Virginia, 1941 and 1940*

Crop	1941 estimated	1940
Cotton, lint, bales	28,000	25,000
Corn, all, bu.	32,942,000	36,396,000
Apples, commercial, bu.	11,505,000	10,660,000
Wheat, all, bu.	7,665,000	8,168,000
Potatoes, bu.	6,916,000	10,286,000
Sweet potatoes, bu.	2,970,000	3,875,000
Oats, bu.	2,625,000	2,619,000
Peaches, bu.	2,017,000	1,392,000
Barley, bu.	1,800,000	2,160,000
Peanuts for nuts, lbs.	169,200,000	215,670,000
Tobacco, lbs.	91,122,000	100,509,000
Hay, all tame, tons	1,250,000	1,492,000

Manufacturing.—The total value of manufactures in 1940 was $1,255,354,533; 194,662 wage earners were paid $184,506,965.

Table II.—*Principal Industries of Virginia, 1940 and 1938*

Industry	Value of products	
	1940	1938
Tobacco products	$424,198,041	$377,124,411
Transportation equipment	183,784,622	92,149,029
Textiles and their products	179,711,490	119,512,362
Food and kindred products	135,308,438	114,798,308
Paper and printing	96,924,436	68,170,599
Wood products	79,869,851	53,876,609
Chemical products	73,131,229	60,905,257
Metals and machinery	38,787,922	24,748,367
Stone, clay and glass products	20,081,586	13,766,843
Leather and its products	17,611,003	15,901,358

Mineral Production.—The total value of mineral production in 1940 was $37,670,935; 19,057 wage earners were paid $20,382,889.

Table III.—*Principal Mineral Products of Virginia, 1940 and 1938*

Mineral	Value of products	
	1940	1938
Coal	$27,103,764	$22,578,035
Coke	928,239	664,550

(J.S.Bk.)

Virginia, University of. A state institution for higher education at Charlottesville, Va. The original university was designed and built by Thomas Jefferson. There are six departments: two academic— the college and department of graduate studies; and four professional— law, medicine, engineering and education. The institution has a productive endowment fund amounting to $11,512,570, and received from the state an annual appropriation of $565,938 (1940–41).

The total budget for 1941–42 was $2,845,347. The corporate name of the university is "The Rector and Visitors of the University of Virginia."

In 1941 the faculty and officers numbered 366 (professors and instructors); the students 2,992 (103 women; 2,889 men). Number of books in the library, 360,000, July 1941.

(J. L. N.)

Virgin Islands. A United States dependency in the West Indies, east of Puerto Rico, comprising St. Croix (pop. 12,902), St. Thomas (11,265) and St. John (722) islands. Area: 133 sq.mi. The population by the 1940 census was 24,889, a 13·1% increase from 1930, reversing a half-century steady decline, with whites 9%, Negroes 69% (1930: 78·3%), "mixed and other races" 22% (1930: 12½%). The chief cities are: Charlotte Amalie, the capital, on St. Thomas, 9,801 (1930: 7,036); Christiansted, 4,495 (3,767) and Frederiksted, 2,498 (2,698) on St. Croix.

Legislative functions are vested in the municipal councils of St. Croix and St. Thomas; the governor is appointed by the president of the United States. On Jan. 6, 1941, Charles Harwood was named governor.

History.—The dominant feature in the Virgin Islands' history in 1941 continued to be the dependency's development as a major

link in U.S. Caribbean defenses. Economically, the islands were strongly affected by general war conditions. Withdrawal of cruise ships and consequent loss of tourist trade was offset by enhanced U.S. army and navy spending and by increased ship bunkering and freight transshipment, especially of bauxite. Similarly, effects of the rehabilitation program of the 1930s were felt, especially in greater demand for handwork.

Education.—In 1940–41, 26 elementary schools had 3,281 enrolment (including 1,471 in eight accredited private schools), and three high schools 750. In 1940 (United States census), illiteracy of persons 10 years of age and over was 13.4% (1930: 16.1%), with whites 12.6% (17.9%), Negroes 14.8% (17%), mixed and others 9.2% (8.9%).

Finance.—The monetary unit is the United States dollar. An annual United States government subsidy is made to assist in defraying government expenses.

Trade.—Official policy, enunciated in 1941, was to withhold complete trade statistics. Virgin Islands imports from the United States (normally 60–75% of the total) in 1940 were valued at $3,023,979 (1939: $2,487,805); exports (normally around 95% of the total) $1,448,020 (1939: $1,558,523), and in the first nine months of 1941, $3,003,200 (Jan.–Sept. 1940: $1,958,993) and $1,725,053 ($1,029,950), respectively. Rum and sugar provide most of the export values.

Communication.—External communication is by steamer and Pan American Airways, through Charlotte Amalie. In 1940–41, 1,220 vessels called at Charlotte Amalie (1939–40: 985; 1931–40 average: 659).

Agriculture.—St. Thomas depends on both shipping and agriculture (fruits and vegetables), St. Croix and St. John on agriculture. In 1940 (census report) 828 "farms" of 3 ac. or more totalled 55,228 ac. (1930: 329, totalling 68,322 ac.). St. Croix had 610 farms (38,953 ac.), St. Thomas 188 (10,419 ac.), St. John 30 (5,855 ac.). St. Croix (1938: 4,078 ac.: 1929: 5,820 ac.) produces practically the entire sugar crop. Other crops are diversified vegetables and tree crops (guava, cacao, coconuts, limes, lemons, oranges).

Manufacturing.—Under federal government stimulus, handwork and other local manufactures increased greatly. Handwork production rose 42% from 1940 to 1941.

Vitamins.

A number of years ago the interesting observation was made that the feeding of large amounts of raw egg white to experimental rats resulted in a severe nutritional deficiency, analogous in many respects to acrodynia of infants. This condition in animals could be prevented by heating the egg white, thus coagulating the proteins, or by feeding large amounts of yeast. Further work by Parsons and by György led to the view that egg-white injury, as it came to be called, was a vitamin deficiency. It was not until 1941, however, that three groups of investigators, led by György, Williams and du Vigneaud were able to explain the phenomenon. It now appears that there is in egg white a protein called avidalbumin or avidin, which unites with biotin to form a complex that cannot be absorbed from the intestinal tract. Hence, animals fed uncoagulated egg white may suffer from a deficiency of biotin. Heating the egg white presumably decomposes the biotin-avidin complex. Biotin, which is a member of the vitamin B complex, was prepared in crystalline form and was found to have a composition that corresponds to the empirical formula $C_{10}H_{16}O_3N_2S$. The titration curve indicated that the substance is a mono-carboxylic acid. The functions of this substance in human nutrition were in 1941 unknown.

It is of interest that the biotin content of egg yolk was great enough to more than compensate for the avidin content of the white.

It is well known that animals on deficient diets frequently exhibit abnormal conditions of their fur. Black-coated rats fed a milk diet turn gray, and the normal color is restored by administration of iron and copper, elements which are present in deficient amounts in milk. Another type of graying was observed by Agnes Fay Morgan as a result of maintaining black-coated animals on a diet that did not contain all of the members of the vitamin B complex. The pantothenic acid was known in 1941 to be the factor primarily concerned in this condition—nutritional achromotrichia. Animals fed on diets lacking in pantothenic acid, but otherwise complete, developed graying of the hair in about six weeks or less and the normal colour could be restored by administration of suitable amounts of the missing vitamin. Some interest was aroused by reports that para-aminobenzoic acid is a factor involved in the maintenance of normal colour in animals with pigmented fur. This substance was shown to be the material in yeast which counteracts the bacteriostatic action of sulphanilamide. Ansbacher reported that para-aminobenzoic acid, which others have isolated in pure form from yeast, is a growth factor for the chicken and a factor which prevents graying of the hair in black rats. Several investigators were unable to confirm Ansbacher's observations about the relationship of this substance to the prevention or cure of gray hair in animals. There was therefore little rationale to the report by Sieve that the administration of comparatively large amounts of para-aminobenzoic acid to persons with gray hair would result in darkening of the hair. It was hardly likely that persons whose hair was gray were necessarily suffering from any vitamin deficiency. If para-aminobenzoic acid darkens the hair, the explanation of its action was in 1941 unknown.

Inositol is a water soluble substance found in muscle tissue, especially in the muscle of the heart, and elsewhere in the body. It had long been known that this substance was of importance in the growth of yeast cells. Woolley found that white mice fed on synthetic diets containing all of the known vitamins lost much of their hair unless inositol was added to their diets. Other workers, however, showed that other strains of mice, such as the Rockland strain of black mice used by Martin, did not develop alopecia on a diet lacking inositol.

It was apparent that much more work needed to be done on the biochemistry and physiology of the various factors of the vitamin B complex. One interesting contribution was made by Elvehjem and his collaborators, who showed that the riboflavin requirements of experimental animals increased as the fat content of the diet was increased. It might be that riboflavin is involved in the intermediary metabolism of fat. These investigators, however, pointed out that it was also possible that increasing the fat produced a change in the bacterial flora of the intestinal tract, which might synthesize or consume riboflavin, or produce an adverse effect on the absorption of riboflavin.

Vitamin Deficiency.—Important work continued to be done on the detection of mild degrees of vitamin deficiency in man. A most significant contribution in this connection was that by H. D. Kruse who, by means of biomicroscopic examination combined with gross examination was able to detect in the eye early pathological changes that were indicative of vitamin A deficiency. These included drying of the conjunctiva, the appearance of Bitôt's spots and corneal changes leading to ulceration and definite kerotomalacia. It was especially significant that in examining 143 persons in a low income group, he found 45% to have gross lesions and another 54% to have the microscopic ocular lesions which he believed were caused by lack of sufficient vitamin A. Administration of vitamin A led to a recession or disappearance of the conjunctival lesions. A long period of time was required for complete recovery, a matter of months even with large amounts of vitamin A. If these observations would be confirmed, it would mean that vitamin A deficiency is much more extensive than had been supposed hitherto.

Other studies of vitamin A deficiency by use of the biophotometer, the Hecht adaptometer, and chemical determinations of the carotene and vitamin A content of the blood were continued and showed that the inclusion of adequate amounts of vitamin A in the diet doubtless is a major nutritional problem. No uniformity of opinion resulted, however, as to the best method for assessing the vitamin A status of persons. Jeans, who pioneered in these efforts to find a measure of the vitamin A nutrition of human beings, carefully re-evaluated the biophotometer method and reported that about one-fifth of the school children examined by him in Iowa had poor adaptation to dim light of such a degree that they could be considered as being deficient in vitamin A. Recovery following the administration of vitamin A was slow.

Lund and Crandon reported further observations on induced vitamin C deficiency in man. In addition to low values for the ascorbic acid content of the blood, the appearance of petechial haemorrhages in the skin and some of the other signs of vitamin C deficiency, they found an extraordinary retardation of the rate of healing of wounds.

Vitamins in Foods.—Improvements continued to be made in the development of rapid methods for the determination of vitamins in foods. Except for a few specific items which were fairly well studied, it was generally conceded that this work had not yet progressed to the point where it could replace the more tedious bioassays with animals. In the case of nicotinic acid, however, there was in 1941 no suitable and convenient bioassay method and it was important therefore that shorter methods of precision had been developed for the accurate determination of this dietary essential. By these newer methods, Elvehjem showed that white flour contained more nicotinic acid than had been supposed hitherto. Even without the addition of nicotinic acid, most ordinary white flour contained nearly as much nicotinic acid as the minimum level of enriched flour, according to the specifications of the Food and Drug administration of the United States. As a result, it was likely that new standards for the amount of nicotinic acid to be added to flour would have to be formulated. At the end of the year, a committee of the National Research Council, Washington, D.C., acting at the request of numerous persons, suggested the adoption of the terms "niacin" and "niacin amide" in place of nicotinic acid and nicotinic acid amide, respectively. These shorter synonyms undoubtedly would be used to a large extent by food manufacturers in place of the longer terms which frequently proved confusing to the public because of the seeming relationship to nicotine.

In the United States flour, to be entitled to the designation "enriched," had to contain added thiamin, nicotinic acid and iron. Later, riboflavin would be required. In Great Britain, specifications for national flour required that the flour consist of about 85% of the wheat grain, instead of the usual 70%. Bread made from such flour had a darker colour than ordinary white bread, but it supplied more of the important dietary essentials found in whole grains. The enriched bread of the United States was almost equal nutritionally to whole wheat bread. Voroshilov, Klementiy E.

(1881–), Russian army officer, was born Feb. 4 in Verkhnyi, Ukraine. In 1903, he joined the Social-Democratic party. He was exiled to Archangel in 1907 for revolutionary activities but escaped to Baku. During World War I, he was a revolutionary organizer, but after the Bolsheviks seized power he entered active military life. In 1917, he was made defense chairman of Petrograd and helped Dzerzhinsky organize the Cheka, forerunner of the G.P.U. (Russian secret police). He led guerrilla detachments against German armies in the Ukraine in 1918. He was people's commissar of the army and navy in 1925 and has been a member of the communist party central committee since 1921. On May 8, 1940, Voroshilov was named vice-premier and Marshal Timoshenko (*q.v.*) succeeded him as defense commissar. In Aug. 1941, Marshal Voroshilov was in command of the northwestern front which included Leningrad and in Oct. 1941, he was charged with formation of new Russian armies. A Berne dispatch dated Dec. 23, 1941, said Voroshilov had been appointed commander of the red army in eastern Asia.

Wages and Hours.

During 1941 employment and pay rolls in manufacturing and non-manufacturing industries improved substantially as a result of European war orders and the U.S. defense program. The improvement was particularly noticeable during the latter part of 1940 and proceeded continuously to higher and higher levels in 1941. Advance newspaper releases from the bureau of labour statistics gave an employment index for San Diego of 467·5 for Nov. 1941 (1937=100). Wichita, Kan. was 271·9 and Seattle 215·2. Sixteen cities had employment indexes above 150, though seven cities had lower employment indexes than in Sept. 1937. Table I shows the employment indexes for 1940 and the first nine months of 1941. Table I and Table II show improved employment and higher average weekly earnings during the first half of 1941 as compared with the first half of 1939. Figures for the latter half of 1941 were expected to show improvement.

Employment during the first nine months of 1941 was about 20% better than during the corresponding months of 1940 (Table I). This was caused principally by the improvement in employment in the durable goods industries where employment increased more than 25% over the corresponding months in 1940. This rise in durable goods employment continued during the latter half of 1941.

During the period 1937–39 average hourly earnings increased. This was an unusual event. In periods of increased unemployment, such as prevailed from late 1937 through 1938, labour ordinarily experiences reductions rather than increases in average hourly earnings. The contra-cyclical rise in hourly earnings 1937–39 appears to have been the result principally of the upsurge

Table I.—*Employment, Pay Rolls and Earnings in Manufacturing Industries in the U.S.*

(Indexes are based on 3-year average, 1923–25=100, and are adjusted to preliminary 1939 census of manufacturers. Not comparable to indexes published by the U.S. Bureau of Labor Statistics prior to August 1939.)

This table compiled from tables published monthly in the *Monthly Labor Review*, United States Bureau of Labor Statistics.

of unionism which began in 1933–34. By 1937 a large number of the new unions had become sufficiently consolidated and effective, and the older unions sufficiently strengthened, so that their increased bargaining power more than counterbalanced the temporarily adverse business trend of late 1937 and 1938 and enabled them, both in union and nonunion industries, to push the wage level higher. In the first half of 1940 the higher hourly earnings were maintained but not increased in the majority of industries. Table II shows that hourly earnings rose gradually and with increasing rapidity in late 1940 and in 1941, both because of increases in rates and because of overtime.

The bureau of labour statistics figures show a downward trend of hours in most industries, from 1937 to 1939 because of reduction in hours-standards effected by union agreements. But in 1940 and 1941 average hours increased, particularly in the heavy industries, because so much overtime was worked as a result of the war.

The much higher hourly earnings in some industries are due to one or more of the following factors: (1) character of the labour supply employed, as to sex, age and skill, (2) productivity of the industry, principally determined by its degree of modernization, technical equipment and proportion of skilled workers, (3) degree to which union working conditions prevail, (4) necessity of paying high wages to attract labour supply.

Weekly earnings are really of greater significance than hourly rates, from the point of view of living standards. There were only eight industries of the 24 studied in which average weekly earnings exceeded $30 per week in July 1940, and the maximum was $34.75 in electric light and power industries. The lowest weekly earnings were in hotels: $15.54. In July 1941, there were 15 industries in which average weekly earnings exceeded $30. Three of these were: $40.51 in transportation equipment; $37.51 in machinery; and $36.05 in crude petroleum. The lowest, hotels, were but $16.03. The average weekly earnings of durable goods manufacturers were $35·83 in July 1941 compared with $28.52 a year earlier and $26.40 in 1939.

Five industries fell between $20 and $25 per week and four between $25 and $30; two below $20 in July 1941.

The wages of farm labour were higher in 1941 than in 1940, judging by the reports of the U.S. bureau of agricultural economics.

Monthly wages, with board, averaged $28.77 on Oct. 1, 1940, and $37.45 on Oct. 1, 1941; daily wages, with board, $1.39 on Oct. 1, 1940 and $1.88 on Oct. 1, 1941. (*See* also AGRICULTURE; BUSINESS REVIEW; CANADA: *War Price and Wage Control;* LAW: *Labour.*) (D. D. L.)

Great Britain.—The latest available detailed figures of earnings relate to July 1940 and covered 15 industries. In these industries, weekly earnings averaged, for all workers, 53/3*d.* in Oct. 1938 and 69/2*d.* in July 1940—a rise of nearly 30%. But employment, and therewith weekly earnings, improved between Oct. 1938 and the outbreak of war (though wage *rates*, as distinct from earnings, rose by less than 1% over this period); and July 1940 was a period of abnormally heavy overtime, following upon the disaster in France, so that earnings were larger then than a few months later, when the uneconomic character of much of this overtime work had been realized. Therefore, wage *rates*, as distinct from earnings, rose on the average by only about 10% at most between Sept. 1939 and July 1940; and 20% would be a better guess than 30% for the rise in earnings, apart from the abnormal overtime.

The 30% average rise in earnings up to July 1940 shown by the crude figures was unevenly distributed both between industries and between men and women. Men's earnings rose by 29% or 30% and women's by less than 20%. Boys and youths showed the biggest rise—one of 34½%. Earnings naturally increased most in the metal and engineering trades (men 37%, women 31½%, boys and youths over 40%). At the other extreme, men's earnings in the printing and kindred trades actually fell, owing to slackness of work, and earnings in the clothing industry rose by only 12% for men and 10½% for women. The building trades and the government factories showed the largest increases, after the metal and engineering group.

The only available method of bringing up these figures to the end of 1941 is by using the published monthly statements of changes in *rates* of wages —not earnings—in the principal industries. During the first eight months of 1941 there was in the industries covered by the available statistics a total net increase of about £1,500,000 a week in the wages of about 7,300,000 workers. This compares with an increase of about £1,700,000 a week in the wages of about 7,450,000 workers during the corresponding months of 1940. In other words, wage rates continued to advance in 1941 at about the same moderate pace as in 1940.

These increases have to be considered against the background of a rising cost of living. In August 1939 the cost of living index stood at 155 (August 1914=100). By July 1940 it had advanced to 187, and by August 1941 to 199.

The advance was retarded, especially during 1941, by government subsidies designed to stabilize the cost of some of the principal articles of working-class diet, as well as by more general measures of price control.

There was considerable controversy over wage policy. In June the government issued a White Paper explaining that the policy of stabilizing the prices of certain necessaries had been deliberately adopted to avoid inflation, that the shortage of supplies called for reduced consumption, not only of rationed but of unrationed goods, and urging that, save in exceptional cases, wages should be increased further only when the increase was linked with a rise in output, to avoid higher costs. The recognized exceptions were readjustments in the wages of "comparatively low-paid grades" or changes "owing to changes in the form, method or volume of production." The government's policy, however, was to leave the regulation of wages to be dealt with by the traditional and well-tried practices of collective bargaining, under which advances in wages had in fact been reasonable.

The Trades Union congress, in reply, argued that the government was endeavouring to influence wage-fixing bodies against granting increases, while pretending to leave wages unregulated by the state. The danger of inflation was admitted; but it was contended that the provision made for increases to the worse-paid workers was quite inadequate, and that, by the government's own admission, wage advances had been "reasonable"; the trade unions held that there was no reason for a change in the government's policy of nonintervention. They refused to join the government in any public statement based on the White Paper, and reserved their freedom of action.

The remaining significant development was the grant of the "guaranteed week" to a number of classes of workers who were subjected to special disciplinary conditions of war work. The dockers who were formed into special squads for work at any port were the most important of these groups.

There was much dissatisfaction over agricultural wages, especially since agricultural labourers were tied to the land as essential workers. In most counties weekly rates were advanced by a few shillings above the 48/— national minimum rates granted in 1940. But the claim for a minimum of 60/— was rejected. In other trades in which wages are statutorily regulated there were moderate advances.

Normal hours of labour were left unchanged in nearly all trades. (*See* also LABOUR UNIONS.) (G. D. H. C.)

Table III.—*Rise in Hourly Earnings Rates in U.S.A., 1939–41*

Wakefield, Charles Cheers Wakefield,

1ST VISCOUNT, of Hythe (1859–1941), British philanthropist and business executive, was born in December in Liverpool. His father, a civil servant, wanted the boy to follow in his footsteps, but the son entered a business career and became one of the richest oil magnates in England. In 1915 he became lord mayor of London, and two years later he received a baronetcy. He was a patron of the arts and a generous contributor to hospitals and charities. Known as the "father of English aviation," he was associated with nearly every important event in flying from 1905. He backed many flights, including several record-breaking air voyages by Sir Alan Cobham and Amy Johnson. He also financed efforts by Sir Henry Segrave, Sir Malcolm Campbell, Capt. George Eyston and Kaye Don to set new records for racing cars and speedboats. Elevated to the peerage in 1929, he was made a viscount in 1934. He died Jan. 15 at his home in Beaconsfield, England.

Wake Island.

A mid-Pacific atoll some 2,600 acres in area, owned by the United States of America since 1899, Wake Island lies in latitude 19° 15′ N., longitude 166° 38′ E. It is about 2,104 miles west of Honolulu, Hawaii and 1,334 miles from Port Apra, Guam. By executive order dated Dec. 29, 1934, Wake island was placed under control and jurisdiction of the navy department. Prior to establishment of the Pan American Airways base, under license from the navy department, Wake had no regular inhabitants.

Wake island was attacked by air and sea Dec. 8, 1941, almost simultaneously with the Japanese attack on Hawaii (the atoll lies west of the international date line). During the next two weeks a small garrison of 385 U.S. marines repulsed a number of separate attacks and, according to a report of the U.S. navy, knocked three Japanese destroyers, a cruiser and a submarine out of action. On Dec. 22, after the last U.S. marine plane had been forced down, the Japanese effected a landing and subdued the remainder of the defending garrison. (G. L. WF.; X.)

Wales: *see* GREAT BRITAIN AND NORTHERN IRELAND, UNITED KINGDOM OF.

Wallace, Henry Agard

(1888–), vice-president of the United States. (See *Encyclopædia Britannica.*) Wallace was secretary of agriculture in the cabinet of Franklin D. Roosevelt from March 4, 1933 until Sept. 5, 1940, when he resigned to campaign for the vice-presidency to which he had been nominated by the Democratic convention in Chicago, Ill., July 19, 1940. After his election Nov. 5 he was named official representative at the inauguration of President Manuel Avila Camacho of Mexico at Mexico City Dec. 1.

Wallace was inaugurated with President Roosevelt Jan. 20, 1941. In the summer of 1941 he became an important figure in the U.S.

defense program.

President Roosevelt appointed him head of the Economic Defense board (later the Economic Warfare board, *q.v.*) on July 31, and chairman of the Supply Priorities and Allocations board (*q.v.*) on Aug. 28.

Walpole, Sir Hugh Seymour (1884–1941), British novelist, was born in Auckland, N.Z., the son of a clergyman. He attended King's school at Canterbury and Emmanuel college, Cambridge. Destined for the clergy, he preached for a time at a water-front mission in Liverpool, but soon discovered he was not cast in the mould of a preacher. He turned to writing and his first novel, *The Wooden Horse,* was published in 1909. His literary career was temporarily interrupted by the war of 1914–18, at the outbreak of which he joined the Russian Red Cross.

After the war, Walpole established his success as a novelist with *The Secret City* (1919), which won him the James Tait Black prize. In addition to turning out novels at the rate of one a year, Walpole also wrote short stories, children's tales and plays.

He was knighted in 1937. Among his books are *Maradick at Forty* (1910); *Mr. Perrin and Mr. Traill* (1911); *The Prelude to Adventure* (1912); *The Duchess of Wrexe* (1914); *The Young Enchanted* (1922); *The Cathedral* (1922); the Jeremy series, which includes *Jeremy* (1919), *Jeremy and Hamlet* (1923) and *Jeremy at Crale* (1927); the Herries series, which was adapted to screen, stage and radio, includes *Rogue Herries* (1930), *Judith Paris* (1931), *The Fortress* (1932), *Vanessa* (1933) and *Bright Pavilions* (1940); *Wintersmoon* (1928); *The Inquisitor* (1935); and *Blind Man's House* (1941). His plays were *The Cathedral* (1932); *The Young Huntress* (1933); and *The Haxtons* (1939). He died at his home, Brackenburn, near Keswick, in the lake district, England, June 1.

War Debts. A statement follows showing the indebtedness of foreign governments to the United States as of June 30, 1941:

Country	Principal	Accrued Interest	Total Indebtedness
Funded debts:			
Belgium	$ 400,680,000.00	$ 69,524,713.74	$ 470,204,713.74
Czechoslovakia	165,241,108.90	614,608.97	165,855,717.87
Estonia	16,466,012.87	5,727,233.41	22,193,246.28
Finland	8,039,601.83	373,442.70	8,413,044.53
France	3,863,650,000.00	434,108,632.70	4,297,758,632.70
Germany (Austrian indebtedness)[1]	25,980,480.66	40,098.78	26,020,579.44
Great Britain	4,368,000,000.00	1,437,850,288.81	5,805,850,288.81
Greece	31,516,000.00	3,598,880.32	35,114,880.32
Hungary	1,908,560.00	585,591.10	2,494,151.10
Italy	2,004,900,000.00	27,182,255.48	2,032,082,255.48
Latvia	6,879,464.20	2,275,164.25	9,154,628.45
Lithuania	6,197,682.00	2,001,072.04	8,198,754.04
Poland	206,057,000.00	71,674,410.31	277,731,410.31
Rumania	63,860,560.43	3,794,134.96	67,654,695.39
Yugoslavia	61,625,000.00	539.21 .78	62,164,218.78
Total	$11,231,001,470.89	$2,050,889 746.35	$13,290,891,217.24
Unfunded debts:			
Armenia	11,959,917.49	13,030,178.36	24,999,095.85
Russia	192,601,297.37	216,957,681.08	400,558,978.45
Total	$ 204,561,214.86	$ 230,996,859. 4	$ 434,558,074.30
Total of above	$11,435,562,685.75	$2,289,886,605.79	$13,725,449,291.54
Germany[2]			
Army costs (reichsmarks)	997,500,000.00	31,431,405.40	1,028,931,405.40
Awards of Mixed Claims Commission (reichsmarks)	2,040,000,000.00	91,290,000.00	2,131,290,000.00
Total (reichsmarks)	3,037,500,000.00	122,721,405.40	3,160,221,405.40
Total (in dollars at 40.33 cents to the reichsmark)	$ 1,225,023,750.00	$ 49,493,542.80	$ 1,274,517,292.80

[1] The German government had been notified that the government of the United States would look to the German government for the discharge of this indebtedness of the government of Austria to the government of the United States.

[2] Indebtedness to the United States under agreements of June 23, 1930 and May 26, 1932.

War Relief Contributions. Private organizations in the United States engaged in soliciting contributions for war relief in other countries in 1941 were divided into two categories: (1) Those having as their purpose the supply of relief to countries which had been designated "belligerents" in presidential proclamations issued pursuant to the neutrality act and hence subject to supervision and control by the department of state; and (2) organizations having as their purpose relief activities in "nonbelligerent countries," for example, China and Japan (prior to Dec. 7–8, 1941), the soviet union and Finland, subject to no supervision by any agency of the federal government. The need for some supervision over activities of organizations in the second category was definitely recognized in 1941, prior even to the opening of hostilities in the Pacific.

The American National Red Cross (*see* RED CROSS) is specifically exempted from the requirement of registration with the department of state because it is required, by the terms of its charter, to submit to the secretary of war "a full, complete and itemized report of receipts and expenditures of whatever kind."

Hence unnecessary duplication would result if the Red Cross were required to submit additional reports to the department of state.

In March 1941, at the suggestion of the secretary of state, the president set up the President's Committee on War Relief Agencies to conduct a survey of relief activities, both foreign and domestic, with a view to making suggestions regarding co-ordination of such activities.

The committee released on Oct. 4, 1941, an interim report of its findings. In foreign relief, the committee recommended additional supervision by the department of state to minimize conflict in the timing of various drives.

Circumstances in 1941 prevented extensive relief activities in the countries occupied by the axis forces. It is contrary to the German policy to permit relief agencies other than their own to operate in territory controlled by them, and in each instance where a country was conquered, U.S. and other relief agencies were requested to leave.

No satisfactory supervision over distribution could, therefore, be maintained. In addition, the U.S. government in 1940–41 pursued a policy that paralleled that of Great Britain regarding relaxation of the British blockade to permit passage of food to the conquered countries. Consequently, most relief efforts were directed toward Great Britain. The grand total of funds received by the 326 agencies registered with the department of state (plus several agencies whose licences were revoked) for this period was $48,399,563.44. Of this amount, $37,093,682.22 had been disbursed for relief in various countries. Unexpended balances on Dec. 31, 1941, amounted to $5,546,498.02. The estimated value of contributions in kind sent to the various countries was $14,201,362.31; value of such contributions on hand, $536,241.61. Funds spent for administration, publicity, etc., were $5,761,158.89. Six agencies had received more than $1,000,000 apiece by Dec. 31, 1941, as follows: British War Relief society, $12,285,081.25; Greek War Relief association, $5,373,245.25; American Jewish Joint Distribution committee, $5,117,458.96; Bundles for Britain, $2,809,102; British American Ambulance corps, $1,950,849; and Hadassah, Inc., $1,695,162. (*See* also RELIEF.) (E. D. K.; X.)

Washington. A state in the extreme northwest United States, popularly known as the "Evergreen state," admitted to the union Nov. 11, 1889. Area, 68,192 sq.mi.; pop. (1940) 1,736,191. Capital, Olympia (13,254). The three largest cities are Seattle (368,302); Spokane (122,001); and Tacoma (109,408). The urban population in 1940 was 921,969 or 53·1%.

History.—Although the governor was a Republican and the legislature was preponderantly Democratic in 1941, the 27th session of the latter was remarkably free from partisanship. To meet the substantially increased old-age pensions voted in Nov. 1940, the sales and use taxes were increased from 2% to 3%, and a gift tax was enacted. Defense legislation gave the governor authority to designate defense areas, authorized the transfer of state property to the United States, protected the interests of residents who entered the military or naval services, and made provision for housing those engaged in defense activity. Other reactions to the crisis were an amendment to the criminal anarchy law of 1909 and the requirement that U.S. and Washington history and government be taught in the schools.

The chief state officers in 1941 were as follows: Arthur B. Langlie, governor; Victor A. Meyers, lieutenant governor; Mrs. Belle Reeves, secretary of state; Cliff Yelle, state auditor; Otto A. Case, state treasurer; Smith Troy, attorney-general.

Education.—During the school year 1939–40, average daily attendance in elementary and secondary schools was 274,565; the number of teachers was 10,583. Total instructional cost was $29,442,858.32, and the cost per pupil in daily attendance was $107.23. Salaries of teachers, exclusive of superintendents, averaged $1,641.17. The University of Washington at Seattle and the State College of Washington at Pullman had enrolments of 12,130 and 4,577, respectively, in 1940–41. The three state colleges of education, at Bellingham, Ellensburg and Cheney, had a total enrolment of 3,410.

Public Welfare, Charities, Correction.—The total amount spent upon public assistance in the state, including federal direct expenditures and state-aid, was $47,815,000 for the year Aug. 1940 to July 1941. An average number of 13,049 cases on relief received subsidies totalling $2,418,000. The average number of persons on WPA was 21,103, and the total expenditure was $16,900,000. Old persons averaging 46,174 in number received a total of $15,196,000. An average of 12,014 dependent children received a total of $2,004,000. An average number of 1,044 blind people received aid totalling $398,000. During the period from Sept. 1940 through Aug. 1941, unemployment claims averaging 45,690 per month required an outlay of $6,592,265. In 1940 there were 11 state charitable institutions with a total of 9,068 patients, and four correctional institutions with 2,442 inmates.

Communication.—On Dec. 31, 1938 there were 6,341 mi. of highways in the state. During 1939, $24,289,000 was spent on highways. Railroad mileage was 5,281 mi. and water-borne commerce amounted to 1,845,189 tons in 1938.

Banking and Finance.—State revenue receipts for the fiscal year 1941 were $137,742,561.45; expenditures, $130,737,591. Bonds outstanding to the amount of $10,461,000 represented the indebtedness in 1941. One hundred and thirty-nine banks in the state reported total capital of $30,433,000; capital surpluses and undivided profits of $54,633,000; deposits of $745,962,000 and resources of $812,910,000. On June 30, 1940, there were 31 savings and loan associations with total resources of $25,179,175.

Agriculture.—The total value of 66 farm crops increased from $88,468,000 in 1939 to $95,416,000 in 1940. Acreage harvested in 1940 was 3,547,800 ac. Income from crops in 1940 was $83,444,000; from livestock, $61,898,000; from government payments, $6,443,000.

Leading Agricultural Products of Washington, 1941 and 1940

Crop	1941 (est.)	1940
Wheat, bu.	59,360,000	41,808,000
Apples, bu.	28,350,000	27,469,000
Hay (wild and tame), tons	2,107,000	1,900,000
Potatoes, bu.	8,170,000	8,325,000
Oats, bu.	9,900,000	8,658,000
Pears, bu.	6,099,000	6,100,000

Manufacturing.—In 1937 the total value of manufactured products was $675,640,000; 114,268 salaried persons and wage earners earned a total of $155,061,000. Lumber and saw-mill products, paper and pulp were the chief industries. The defense program dominated the economy of the Puget sound area completely during 1940 and 1941.

Mineral Production.—Production of minerals, valued at $31,590,023 in 1941, reached a postdepression high. Copper was profitable in 1941 largely because of the use of the flotation process at the Howe Sound company in Chelan county. The construction of a new plant to apply this process to magnesite for production of magnesium was completed at Chewelah.

(H. J. De.)

Washington, District of Columbia, national capital of the U.S.A., and 11th largest of U.S. cities, with a population of 663,091 by federal census of 1940. Washington continued to grow after the census of 1940, both within the District of Columbia and in the near-by Maryland and Virginia districts; the growth was due in part to the influx of population in connection with defense activities. In March 1940, about the time of the census-taking, there were 65,437 federal employees. On Dec. 31, 1941 more than 200,000 federal employees were reported, with a probable peak of at least 250,000. The peak of World War I federal employees, on Nov. 11, 1918, was 117,760.

During 1941 a number of monumental public buildings was completed, notably the National Gallery of Art, designed by John Russell Pope, to house the Mellon and other collections of art. The Municipal Center building was erected according to plan for the District of Columbia but was temporarily assigned to federal defense activities. The armory, long projected, was built in 1941 at the end of East Capitol street, overlooking the Anacostia river. A new naval medical centre was erected near Bethesda, Md. The Thomas Jefferson memorial, located on a compromise site on the south axis of the White House, projecting into the Tidal basin, was completed during the year. A first unit for the war department was erected in the northwest triangle, according to the plan of the National Capital Park and Planning commission. Not conforming to the plan, a huge war department building was located in Arlington county, on the understanding that it could be used after the emergency for minor offices, files and storage records. During the year the public buildings plan for Washington was made public by the National Capital Park and Planning commission. Under this comprehensive plan, the principal public buildings were to be located on a four-mile-long belt on the axis of the historic Mall, stretching from the Potomac to the Anacostia river. The congestion in the sector immediately south of the downtown district would be lessened, and the street-and-avenue system would provide a wide choice of routes for traffic to and from government buildings.

In 1941, 23,524 homes and about 1,000 dormitory units were erected or were in course of erection at the end of the year, in the District of Columbia. The new housing program was to provide 22,000 dwellings to be erected by private enterprise and public funds, and 1,500 new dormitory units. In many locations temporary war buildings were erected, but an effort was made to keep the public parks free from unnecessary encroachments.

In 1941 three stream valley parks were completed. Along the Anacostia the additions included the site for the national stadium and lands near the Shaw Lily gardens acquired by the government. The last important gap in the 23½-mi. Fort drive was acquired. Six outlying recreation centres and playgrounds were purchased. Within the congested city, the National Capital Park and Planning commission, which is charged with the duty of purchasing and developing all parks and playgrounds, completed four play areas. Recreational facilities were developed in 18 areas previously acquired by the commission.

During 1941, Washington, planned and developed as the seat of the federal government of the United States, became an increasingly important world capital, and added substantially to the public and private buildings needed to care for its rapidly growing permanent and transient population. (H. Js.)

Water-Borne Commerce of the United States.

Since 1866 the corps of engineers, U.S. army, has been charged with the duty of collecting and compiling statistics showing the water-borne commerce of the United States. Table I shows the commerce at Atlantic, Gulf, Pacific and Great Lakes ports and on the rivers, canals and connecting channels of the United States for each year

Water Power.

Increase of installed capacity of water wheels in the world reported in 1941 was: 2,313,500 h.p. The total reported capacity as of Jan. 1, 1942, was nearly 72,000,000 h.p. on the basis of the report of the United States Geological survey. These capacities which are known to be incomplete, especially from the countries of Europe and Asia, were reported at that time in totals by countries and not in detail by plants because of the world-wide war conditions, the relation of the supply of mechanical and electric energy to the production of military necessities, and the consequent danger of aerial attacks. The increase included 602,800 h.p. completed in 1940. The 1940 increases are distributed by countries in horsepower of plants as shown in the following table:

Brazil	910	Manchoukuo	294,800
Ceylon	670	Norway	33,320
India	18,100	Sweden	121,000
Japan	134,000		

The increase in horsepower capacity of plants completed, 1,710,727 h.p., and the capacity of plants under construction in 1941 is shown by countries in Table I.

In the utilization of water power, the United States, with about 19,800,000 h.p. in installed water wheels, continued to lead the nations of the world in the generation of energy from falling water; and the North American continent, with nearly 30,000,000 h.p. in water wheels, was surpassed only slightly by the European continent. The United States had about 27% in 1941, North America had about 42%, and North America and Europe combined had about 84% of the installed water wheels of the world.

Those two continents, each with about 11% of the world's water-power resources, had, therefore, the major part of the world's installed water wheels in 1941.

The other large continents, Asia, Africa and South America, lag far behind in utilization, although the water-power resources of each equalled or exceeded those of Europe or North America. Japan, including Chosen (Korea) and Manchoukuo, was the only country outside of those continents that had comparable water-power developments, and it had 10% of the world's water-wheel capacity. Asia with 22% of the world's water-power resources had, including Japan's 10%, only about 11% of the installed water wheels; Africa, with 41% of the resources, had only a third of 1% of the water wheels; and South America, with 11% of the resources, had 2·4% of the water wheels.

Table I.—*World Statistics Showing the Increase of Horsepower Capacity of Plants in 1940*

Country	Completed	Under Construction

Switzerland	48,000	348,000
United States	948,000	6,785,000

The industrial capacity of North America is not dependent primarily on water power, however, and statistics on water-power utilization indicate only a small part of the industrial development on that continent. Such development rests more largely, in the ratio of about 20 to 1, on power derived from the fuels, coal, oil and gas, of which it has great resources of excellent quality. Although the water-power installations in North America are essentially equal to those of Europe, the fuel resources of the former far exceed those of the latter continent. The elimination of all developed water power in North America would remove only about 5% of its developed power, but similar elimination in Europe would have a far greater relative effect on the industrial situation of that continent which must transport overseas a large part of its fuels. (*See* also DAMS; ELECTRICAL INDUSTRIES; TENNESSEE VALLEY AUTHORITY.) (N. C. G.)

Watson, John Christian (1867–1941), Australian politician, born April 9 at Valparaiso, Chile, was the first Labour party member to sit in the commonwealth parliament and the party's first prime minister (1904). He died in Melbourne, Nov. 18. (See *Encyclopædia Britannica.*)

Wavell, Sir Archibald Percival (1883–), British soldier, born in May, was the son of Maj. Gen. A. G. Wavell. Following his father's career, he enlisted in the Black Watch in 1901 after studying at the royal military college and the staff college and saw action in the Boer war, in India and in World War I. He then served with the Egyptian expeditionary force until 1920. In 1938 he was promoted to lieutenant general. From 1937 to 1938 he commanded the British troops in Palestine and Trans-Jordan, and in 1940 he became commander in chief of the British forces in the middle east. In this command he became, late in 1940 and early in 1941, the most famous British general of World War II and, in fact, the only successful allied general of the war to that time. His small force of empire soldiers swept the Italians out of Cyrenaica in Libya, and he supervised the operations in East Africa which recaptured British Somaliland and took Italian Somaliland, Eritrea and Ethiopia from the Italians. Wavell also directed the successful campaigns in Iraq and (in part) in Syria. He suffered serious reverses at the hands of the Germans, however, in Libya, Greece and Crete, and on July 1, 1941, he was succeeded as middle east commander by Gen. Sir Claude Auchinleck (*q.v.*), whose post as commander of the British forces in India Wavell thereupon took over. In August, Wavell directed the British campaign which resulted in the joint British-Russian occupation of Iran. On Nov. 2, 1941, as tension mounted in the far east, he arrived at Singapore for staff talks. After the Japanese declaration of war Dec. 7, Wavell met at Chungking with U.S. Gen. George H. Brett and Chiang Kai-shek (*qq.v.*) to discuss measures for common prosecution of the war against Japan. On Jan. 3, 1942, Wavell was named supreme commander of the allied forces in the far east, with Gen. Brett as his deputy.

Wealth and Income, U. S. Distribution of,

One method of analyzing flow of income is that of its size distribution; *i.e.*, a study of the number of individuals or consumer units receiving incomes of different amounts. Historically, interest in this subject grew out of the social and economic reform movement, with its emphasis on the abolition of poverty. Information on the size distribution of income has many other uses, however, both for government and business economic policy. Such data are used extensively by the marketing research organizations of business in planning sales campaigns, determining advertising media and even production schedules, since the character of the market for any particular product is in part determined by the number of persons with income sufficient to purchase the product. The distribution of income is an important category of information for determining possible yields of various sorts of taxes and tax rates, and the need for such social legislation as Social Security. Inasmuch as the bulk of society's savings is made by the higher income groups, data on the size distribution of income are basic for examination of under-investment theories of the business cycle which have come to the fore in recent years.

Despite the wide interest in this subject, very few attempts have been made to provide quantitative information on the size distribution of income because of the difficulty of the task and the lack of basic data.

A study for the year 1918 in the United States was made by the National Bureau of Economic Research and one for 1929 was provided by the Brookings institution in its report on *America's Capacity to Consume.* The most extensive and most recent study is that issued by the National Resources committee. It provides a wide variety of data on both the distribution of income and the disposition of income for the year 1935–36. Three reports have been published: *Consumer Incomes in the United States, Consumer Expenditures in the United States* and *Family Expenditures in the United States.* These studies were developed from income data for some 300,000 consumer units (augmented by income tax data for the higher incomes) and expenditures data for about 60,000 units. Some of the basic information in these reports is presented in Tables I and III.

The relatively high degree of concentration of income is evident from the data in Table I. It may be calculated that the average income per consumer unit for the year 1935–36, that obtained by dividing the aggregate income by the total number of consumer units, was $1,502. Yet half of the consumer units had incomes below $1,070 because of the large incomes received by a relatively small number of consumer units at the upper end of the income scale. The largest number of consumer units was in the group receiving incomes from $500 to $1,000. This group contained almost 30% of all consumer units and received a little less than 15% of aggregate income. Slightly more than 17% of the consumer units received income of less than $500 and, as a group, received less than 3½% of aggregate income. At the upper end of the income scale it may be noted that the number of individuals included in the various groups fell off sharply after the $3,000 level was reached. Altogether, less than 7% of the consumer units had incomes of over $3,000. This group received over 30% of total income.

The disparity of incomes is strikingly revealed by grouping the total number of consumer units by tenths. The poorest tenth of the consumer units received incomes up to $340 and in the aggregate accounted for less than 2% of total income. The second tenth had incomes ranging from $340 to $545 and received 3% of the total. On the other hand, the tenth of consumer units with the highest incomes included those receiving $2,600 and over and in the aggregate accounted for 36% of the total income. This highest tenth received about the same total income as the 70% at the bottom of the income scale.

As much public discussion has been concerned with the lower third of the population, it is interesting to compare the size distribution of income on the basis of the three thirds of consumer units. Each of these thirds contains 13,000,000 families and single individuals. During 1935–36 the

Table I.—*Size-Distribution and Utilization of Consumer Incomes in the U.S., 1935–36*

(In millions)

Income Level (Dollars per Year)	Consumer Units		Aggregate Income		Income Utilization

*Personal income taxes, poll taxes and certain personal property taxes.

lower third of the nation received incomes of less than $780, with an average income for the group of $471. The share of the aggregate income received by this lower third of the nation was just over 10% of the total of $59,000,000,000. It should not be thought that these 13,000,000 families and single individuals constitute a distinct and unusual group. All types of consumer units, from single individuals to large families, are included in the group; they live in all types of communities; and they work in all the major types of occupations. Apart from receiving less incomes, they differ from the other two thirds of the nation principally in that a larger proportion received relief for some part of the year; a larger number lived on farms; and a smaller number had occupations in the professional, business and clerical fields. Although the proportion receiving relief in this group for some part of the year was relatively large, it was not essentially a group dependent upon relief since 70% of the total number were completely nonrelief families and individuals.

In the middle third of the nation were the 13,000,000 consumer units receiving from $780 to $1,450 during the year. They had an average income of $1,076. As contrasted with the lower third, only 13% were at all dependent upon relief; twice as many lived in large cities; and twice as many worked at professional, business and clerical occupations.

The upper third of the consumer units contained all those with incomes above $1,450, reaching, of course, to over $1,000,000. In total, this group received about two-thirds of the aggregate income of all consumer units.

In interpreting the above data on the distribution of income, it should be kept in mind that the figures refer to dollar income. As the cost of living and the mode of living differ widely from community to community, the dollar incomes do not accurately measure the differences in real income or economic well-being. An obvious illustration of this is the fact that any given income, say $1,000, will provide a higher standard of living in rural communities than in urban centres. On the other hand, the average rural family is larger than the average urban family, and this means a smaller amount of per capita income. It is concluded in the report on *Consumer Incomes in the United States* that the advantages in living costs accruing to farm families are probably insufficient to fully offset differences between their incomes and those of other groups.

With the data and studies available at this time, it is not feasible to compare changes in the entire income distribution over time. However, a study prepared for the Temporary National Economic committee, *Concentration and Composition of Individual Incomes, 1918–37*, provides information on the changing proportion of total income received by those in the highest brackets.

This information is derived from income tax returns.

It would appear from this data, shown in Table II, that the concentration of income in the higher brackets increases with the cyclical expansion of total income and decreases in the downward phase of the business cycle. This tendency is due largely to the fact that the incomes in the higher brackets reflect changes in business profits, which fluctuate more violently with changes in business activity than other forms of income. Over the period covered by this study, there is little evidence of a drastic change in the degree of concentration at the highest income levels.

Disposition of Income.—It may be seen in Table I that more than two-thirds of the nation's consumer units spent considerably more than their aggregate income in 1935–36 for all purposes. In other words, as a group they had negative savings. The proportion of savings to aggregate income became relatively large with those receiving above $5,000 during the year and in the income group above $20,000 approximately half of the aggregate income was saved.

Table II.—*Shares of Total Income Received by Selected Proportions of Income Recipients in the U.S., 1926–37

(Aggregate Income in Millions)

Year	Aggregate Income	Percent of Aggregate Income Received by		
		Highest 2%	Highest ½ of 1%	Highest 1/100 of 1%
1926	$74,484	20.52	12.60	2.70
1927	74,654	21.54	13.51	3.02

1936	63,943	18.83	10.17	1.97
1937	69,387	17.37	10.14	1.77

Source: *Concentration and Composition of Individual Incomes, 1918-1937*, Temporary Economic Committee.

*Income defined as total income less business expenses. Second figure for 1934 and data for 1935–37 slightly overstated relative to earlier years due to change in income concept.

The average expenditures of each third of the nation for various categories of consumption are shown in Table III. These data reveal the very high proportion of income expended on the necessities of life by the lower third of the nation, as well as the low dollar expenditure totals of this group.

Almost 75% of its income goes for food and housing, and the addition of household operation and clothing brings this to more than 95%. On the other hand, the upper third of the nation spent only a little more than half of its income for these purposes.

The data in Table III give some indication of the vast market for consumer goods which remains to be tapped, even though the standard of living in the United States is the highest in the world.

For example, it may be calculated that in the lower third of the nation the per capita expenditure on food was about $82 for the year, or $1.60 per week. The middle and upper thirds average $125 and $186 per capita or an expenditure of $2.40 and $3.60 per week, respectively.

Table III.—*Average Disbursements of Consumer Units* in Each Third of Nation, 1935–36*

Category of Disbursement	Average disbursements of families and single individuals in:			Percentage of Income		
	Lower third, incomes under $780	Middle third, incomes of $780 to $1,450	Upper third, incomes of $1,450 and over	Lower third	Middle third	Upper third

†Taxes shown here include only personal income taxes, poll taxes and certain personal property taxes.

State Distribution of Income Payments.—Additional information on the geographic distribution of income in the United States is provided by the department of commerce annual estimates of income payments to individuals in the various states. It may be seen from Table IV that the variations in both total and per capita income are substantial. These data relate to dollar income and consequently do not take account of geographic differences in the cost of living. The variations, however, are too large to be explained by this factor. The data bring out the lower levels prevailing in predominantly agricultural states, and the comparatively lower per capita income in the south as against the rest of the nation.

The importance of the prevalence of agricultural activity in an area in determining the level of per capita income is strikingly illustrated by the District of Columbia. This area stands highest in the table of per capita income because it is entirely a metropolitan area, without an agricultural industry. It is known that other metropolitan areas would show an even higher per capita income level if adequate data were available, particularly those dominated by manufacturing industries. As previously mentioned of course, the high per capita income figure shown for the District of Columbia does not take account of the high cost of living in that area and the fact that there are many types of expenses required in urban communities which do not materially add to the standard of living.

Table IV.—*Income Payments to Individuals in the Various States, U.S., 1940*

State	Aggregate ($000,000)	Per Capita* ($)	State	Aggregate ($000,000)	Per Capita* ($)

*Before computing per capita incomes, salaries and wages and total income were reduced in the District of Columbia and New York and increased in Maryland, Virginia and New Jersey to account for residents of the latter states employed by establishments located in the District of Columbia and New York.

Distribution of Wealth.—No official estimates of national wealth or of its distribution have been made since the Federal Trade commission issued a report entitled *National Wealth and Income*, giving figures for the year 1926. The estimated value of national wealth there reported was $353,000,000,000. This figure compares with an estimate of $205,000,000,000 for 1912, but the increase over the ten-year period was influenced heavily by price advances, as well as by quantity additions to physical assets.

The Federal Trade commission also reported data on the values of 43,512 decedents' estates during the 1912–23 period. This study showed that 1% of the estates held 59% of the total wealth of all of the estates analyzed and that more than 90% of the assets of all estates was accounted for by about 13% of the estates. The data also tended to demonstrate a declining degree of wealth concentration over the period and a greater concentration in cities than in towns and rural areas. The sample of estates was very small, however, and it is unlikely that decedents' estates are entirely representative of the asset holdings of living persons, so the wealth-distribution significance of these figures is somewhat limited.

In the June 1927 issue of the *Journal of the American Statistical Association*, Dr. Wilford I. King gave estimates of the distribution of wealth among all property owners in the United States in 1921. He found that approximately half of the 41,000,000 property owners in that year (total population 108,000,000) owned assets worth less than $2,500 each, and, in the aggregate, accounted for less than 10% of the total national wealth. The 10% of property owners who held assets worth more than $10,000 possessed more than two-thirds of the total national wealth. The highest 2% of property owners claimed 40% of the total, and the highest 1% owned approximately one-third. (*See* also BUDGETS, NATIONAL; NATIONAL INCOME.)

Weather: *see* METEOROLOGY.

Welles, Sumner (1892–), U.S. undersecretary of state, was born Oct. 14 at New York city and was educated at Groton (Mass.) school and at Harvard. He was secretary of the U.S. embassy at Tokyo from 1915 to 1917, was stationed at Buenos Aires during the next two years, and in 1921 became chief of the Latin-American affairs division of the state department in Washington. In 1922 he was U.S. commissioner to the Dominican Republic, and in 1924 he was President Coolidge's personal representative in Honduras, then in the throes of revolution.

Welles was appointed assistant secretary of state April 6, 1933, and except for a short period as ambassador to Cuba in 1933 held this office until his appointment May 21, 1937, as undersecretary of state.

In the spring of 1940 he undertook a "fact-finding mission" to Germany, Italy, France and Great Britain. During 1941 he held innumerable interviews with various European and Asiatic diplomats, with particular attention to the status of unoccupied France in its relationship to Germany. He also initiated moves to settle the clash between Ecuador and Peru in the summer of 1941, and on July 25 sent identical pleas to both countries to cease hostilities. In August Welles was present at the meeting between Churchill and Roosevelt which produced the Atlantic charter.

Welles headed the U.S. delegation to the Pan-American conference which opened at Rio de Janeiro Jan. 15, 1942.

Wellesley College. A women's college in Wellesley, Mass., founded in 1870 by Henry Fowle Durant, Wellesley occupies 400 ac. bordering on Lake Waban. A four-year liberal arts college enrolling approximately 1,500, Wellesley is pre-eminently for candidates for the B.A. degree, but offers also the degrees of master of arts, master of science, master of arts in education and a certificate in hygiene and physical education. In 1941, 201 faculty members offered instruction in 27 departments.

Extracurricular courses to prepare students for defense work were offered in 1941, and the college opened dormitories for six weeks in the summer to provide housing and recreation for 124 British children in co-operation with the national board of the English Speaking union.

Trust funds in 1941 were $10,790,690.68; the value of the plant was $11,064,229.30. (M. H. McA.)

West Africa, British: *see* BRITISH WEST AFRICA.

Western Australia. A state of the Australian commonwealth; area 975,920 sq.mi.; pop. (est. Dec. 31, 1940) 468,311. Chief town: Perth (pop. Dec. 31, 1940—including Fremantle) 228,000. Governor: (vacant); lieutenant governor: Sir James Mitchell.

History.—The state government, under the premiership of J. C. Willcock, remained in office throughout the year.

The state's water-supply position was greatly improved by the completion of the pipe linking the Canning and Mundaring reservoirs, thereby increasing the capacity by 730,000,000 gal. a year. Work was also begun on a new 25,000,000 gal. reservoir 18 mi. west of Coolgardie.

Agricultural conditions were favourable. Efforts were made to establish the growing of linseed for grain. It was expected that the state would become self-supporting in linseed oil production, and linseed cake would be a valuable stock food. In 1941, 8,000 ac. were sown to flax and the area under tobacco was extended. Existing factories worked to full capacity on government orders and a small-arms factory was being erected.

Finance.—Revenue (1940–41), £A11,432,000; expenditure, £A11,421,000; debt outstanding (June 30, 1941), £A97,792,000.

Communication.—Rapid progress was made on the construction of an 800-mi. strategic east-west road between Norseman (W.A.) and Port Pirie in South Australia. The work was authorized in June 1941, and by the end of August the state main roads authority had cleared 195 mi. and completed 105 mi. of the 450-mi. section within the state. It was planned to be completed by the end of 1941.

Roads (June 30, 1939) 29,722 mi. fit for motor traffic; railways (1938–39), government 4,378 mi.; motor vehicles licensed (Dec. 31, 1939): cars 36,058; trucks 22,172; cycles 6,015. Wireless receiving set licences (June 30, 1939) 79,262.

Agriculture and Manufacturing.—Production: wheat (1940–41) 21,600,000 bu.; wool (1940) 81,000,000 lb.; gold (1940) 1,191,481 fine oz. Industry and labour (1939): factories 2,129; employees 23,211; gross value of output £A19,548,511; unemployment (trade union returns) (March 1941) 4.3%. (W. D. MA.)

West Indies. An archipelago lying between Florida and South America, embracing the Greater Antilles (Cuba, Hispaniola, Puerto Rico and Jamaica, with lesser dependent islands) and the Lesser Antilles (extending from the Virgin islands to Trinidad). The area is approximately 99,000 sq.mi. The population (estimated at roughly 12,500,000 at the end of 1941) is three-fourths white and one-fourth Negroid in Cuba and Puerto Rico and 80% to 99% Negroid elsewhere, except in Trinidad, where it is 40% East Indian. Languages: Spanish, English, French and Dutch. Religion: generally Roman Catholic. The West Indies includes three republics, one Netherlands, two French and six British colonies, and two U.S. dependencies.

During 1941, World War II and its effects dominated West Indian history. By the year's end the entire archipelago, with the technical exception of the French colonies, was at war. Normally, trade is mainly with the United States and, in the European colonies, with their respective metropolises. But, under war conditions, difficulty of access to customary markets and sources of supply turned trade toward the United States, especially, and Canada, and caused heavy surpluses to accumulate. By 1941, however, and especially after spread of the war to the Pacific, sugar (the most important product), long under restriction because of world overproduction, came into heavy demand. Piled-up stocks were generally cleared, and 1942 crops were contracted for in advance. Cacao and other tropical agricultural products, including spices, are also grown. These products, with sugar, constitute practically the sole exports, except in Trinidad and Curaçao, and to some extent in Cuba, where mineral exploitation is under way. Petroleum and asphalt are important in Trinidad, and some metals are found in Cuba and Hispaniola. Curaçao is a major world oil-refining centre. External communication is by sea, with Pan American airways linking the main centres with all parts of America. (See CUBA; CURAÇAO; DOMINICAN REPUBLIC; FRENCH COLONIAL EMPIRE: *French Colonies*

West Indies, British.

The several British islands in the West Indies have an area of 8,240 sq.mi. The population is approximately 2,300,000 (see Table I for latest available official estimates). Racially the population ranges from 75% to 99% Negro and Negroid, except in Trinidad, where some 40% is East Indian and 1% Chinese. The chief cities are the capitals (see table). Only Kingston, Port of Spain, and to some extent Bridgetown are important in the West Indies as a whole. Politically, the islands are administered separately or in groups as British crown colonies: Jamaica, with its dependencies; the Leeward islands, a loose federation of the "presidencies," or colonies, of Antigua, Montserrat, St. Kitts-Nevis and Virgin islands (British); Barbados; Trinidad and Tobago; Dominica; Grenada; St. Lucia; and St. Vincent. The four last-named, collectively called the Windward islands, have a common governor, who usually resides at St. George's, Grenada, and with the Leeward colonies form a single judicial system, but are otherwise separate colonies. As an outgrowth of the recommendations of the 1938–39 West India Royal commission (headed by Lord Moyne), the post of comptroller for development and welfare was created in 1940. The comptroller supervises and directs plans for social and economic rehabilitation and development of the island colonies and of British Guiana and British Honduras. At the same time the courts of the Leeward and Windward colonies were placed under a single chief justice. These steps were regarded as tentative moves toward eventual political federation of the West Indian colonies.

Each colony has a governor or other chief executive appointed by the crown (for names of governors, *see* BRITISH EMPIRE), an appointed executive council and a partially elected legislative council or assembly. Barbados has a representative legislature (the third oldest in the British Empire), but not full responsible government and until 1941 was the only West Indian colony electing a majority of its legislative body. In 1941 Jamaica and Trinidad and Tobago were both granted new constitutions providing universal suffrage and a majority-elected lower house (in Jamaica for the first time since 1866), checked, however, by an increased gubernatorial veto power. Suffrage and officeholding are generally restricted by property and other qualifications.

History.—During 1941, as in 1940, the British West Indies were profoundly influenced by World War conditions. The colonies continued to send recruits and to make colonial and private gifts toward the war effort on a large scale, along with interest-free colonial loans for the duration of the war. Thus, the government of Trinidad and Tobago alone made gifts and loans in excess of £1,000,000. Trinidad, too, served as a censorship and trade control station.

In January, difficulties with the United States over locations of new bases in Trinidad were adjusted, and on Mar. 27 a definitive agreement was signed at London replacing the tentative arrangements concluded in Sept. 1940. Specific grants were made of five areas in Jamaica aggregating some 55 sq.mi., including Portland Bight, the Portland Ridge peninsula shoreline, Manatee Bay shoreline and adjacent areas, and Pigeon island; six in St. Lucia, around 1,300 ac., including Gros Islet bay, along with other privileges; two tracts on Antigua, at Parham harbour and on Judge's bay (about 700 ac.); and four air and naval base areas on the west coast of Trinidad, 32 sq.mi. in extent, special anchorage rights in the Gulf of Paria, and wharfage facilities at Port of Spain.

During the course of the year construction of the main facilities at the United States bases was rushed and occupation was effected. Economic effects of the construction work were felt in some instances, notably in Trinidad, with labour shortage, rising wage scales, and stimulated buying power. Labour shortage in Trinidad, the greatest single centre of base development, with an expenditure of over $17,000,000, necessitated relaxing of immigration restrictions to permit entry of Barbadian and other agricultural labour. The local expenditure alone in Jamaica was estimated at in excess of £1,000,000.

Continued attention to problems of the West Indian colonies was noted in the granting of new constitutions to Jamaica and Trinidad. Although the changes did not entirely meet the demands of Jamaica's socialistic "People's National Party," they generally met qualified approval. On the economic side, inter-

Table I.—*Areas and Population of British West Indies*

Colony	Area (sq. mi.)	Pop. (1939 est.)	Capital (with est. pop.)
Barbados	167	195,548	Bridgetown (70,500)
Jamaica and dependencies			
Jamaica	4,573	1,186,017	Kingston (76,986)
Cayman Islands	104	6,850	Georgetown
Turks and Caicos	169	5,522

Antigua (including Barbuda, 62 sq.mi. and Redonda)	171	35,527	St. John's (10,000)
Montserrat	32	13,541	Plymouth (2,000)
St. Kitts-Nevis (St. Christopher, 68 sq.mi.; Nevis, 50 sq. mi.; Anguilla, 34 sq.mi.)	152	37,579	Basse-Terre (8,000)
Virgin Islands (British)	67	6,288	Road Town (400)
Trinidad and Tobago (Tobago, 116 sq.mi., pop. 29,082)	1,980	473,455	Port of Spain (89,550)
Windward Islands			
Dominica	304	52,738	Roseau (8,000)
Grenada (including Carriacou, 13 sq.mi., pop. 9,358)	133	90,586	St. George's (6,500)
St. Lucia	238	69,787	Castries (9,000)
St. Vincent (including the Lesser Grenadines)	150	59,683	Kingstown
	8,240	2,233,121	

colonial conferences were held to discuss sugar and import control problems. During the year the comptroller of development and welfare announced tentative development plans involving outlays of £20,000 in Montserrat and £39,000 in Antigua over a five-year period. Meanwhile, concerted efforts to extend homesteading and small landholdings were continued. Some consideration, too, was given to the practicability of a special census (none having been taken in Jamaica and some other colonies since 1921) as a guide and aid to social and economic development.

The economic situation was confused. Living costs rose sharply with price levels in Jamaica 37·72% over those of Sept. 1939 and 34·36% in Barbados. British embargo on fresh fruits, including bananas, was partly offset by purchases of surpluses. Toward the end of 1941, especially, increased Empire and other demand for sugar (long under export quota, owing to world overproduction) had cleared practically all the islands' stocks, and export trade was generally in a definitely superior condition to that of 1940.

Education.—In 1940 there were 1,338 elementary schools, with approximately 326,054 pupils, as well as secondary schools. Higher education is provided at Codrington college, near Bridgetown, Barbados, and at the Imperial College of Tropical Agriculture at St. Augustine, Trinidad. The latter, supported by British West Indian and West African colonies and the imperial government, is one of the world's leading institutions of its kind.

Finance.—The monetary unit is the pound sterling, except in Trinidad. The Trinidad dollar, officially valued at $4.80 to the pound sterling, and normally equal to the United States dollar (1941 value: approx. 84 cents) is legal tender in both Trinidad and Grenada.

Trade.—Under war conditions detailed statistics of external trade were not generally available. In 1939 imports and exports were: Trinidad and Tobago, $34,762,954; $37,481,438; Jamaica, £6,506,659 (1940: approx. £6,000,000); £4,764,746 (1940: approx. £3,000,000); Barbados, £2,445,753; £2,028,991; Grenada, £292,829; £310,687; St. Kitts-Nevis £293,264; £433,824; Antigua, £230,874; £220,460; St. Vincent £198,786; £210,642; St. Lucia, £161,823; £117,201; Dominica, £109,594; £65,077; Montserrat, £49,301; £54,540; Virgin Islands, £14,125; £9,898. Trade of the Leeward islands as a whole in 1940 was: imports, £688,905; exports, £760,655.

In general, 1941 witnessed an improved trade stability, owing in part to readjustments after the initial impact of the war on the colonies, and in part to increased demands for colonial products, notably sugar, cotton and Trinidadian petroleum. Consequently, volume and value of external trade generally expanded, especially in the sugar colonies. Until 1939 Great Britain supplied from 20% to 45% of imports and took from 25% to 40% (except in Dominica), Canada 15% to 20%, and up to 50% of Barbados exports; the United States supplied from 12% to 25% of imports except in the smaller colonies and took nominal amounts to as high as 35% (St. Vincent).

The 1941 trend was marked by sharp declines in supplies from Great Britain and corresponding rises in imports from Canada and the United States. Imports from outside of sterling areas were under strong restrictions. In 1940 the United States supplied $18,309,472 of imports (1939: $17,659,829), with $657,856 to Barbados (a 53% decline), $3,544,909 to Jamaica (40% decline), Trinidad, and Tobago, $10,279,152 (48% increase), other colonies $3,827,555 (12% increase). In the first nine months of 1941, the same trends continued, although with somewhat less sharpness.

Exports to the United States in 1940 totalled $3,824,759 (1939: $4,610,107), Barbados $342,385, a 30% rise; Jamaica $1,501,264, a 2% decline; Trinidad and Tobago $1,754,422, a 26.3% advance, other colonies $1,226,688, a 17% decline. In the first nine months of 1941, total exports to the United States almost doubled, Barbados increasing 10%, Jamaica 165%, Trinidad and Tobago 75%, the other colonies 55% over corresponding 1940 figures. Canadian trade in the first six months of 1941 increased 98% over 1940. All Jamaican exports in the first ten months of 1941 totalled £3,369,307 value (1940: £2,622,126), or more than all export values in 1940 (offic. est.: £3,000,000). Imports in the first nine months were £4,400,285 value (1940 offic. est.: £6,000,000). Increased volume and price of sugar and other commodities contributed heavily to the swollen figures.

Communication.—External communication is by steamship and by air, with similar inter-island communication. Pan American Airways serves Jamaica, Antigua, Barbados and Trinidad; the British West Indies Airways links Barbados, Tobago and Trinidad. During 1941 "KLM" (Royal Dutch Air Lines), already connecting Trinidad with Surinam, Venezuela and Colombia, was extended to Jamaica. Inter-island communication is generally poor. Kingston, Bridgetown, and Port of Spain are the chief ports of call. Only Jamaica (210 mi. in 1941) and Trinidad (123 mi.) have extensive railways. The Leeward colonies had 78 mi. in 1941. Roads are adequate for local needs.

Agriculture.—Except in Trinidad, where petroleum (1941 est. 21,100,000 bbl.; 1940: 20,300,000 bbl.) and asphalt dominate economic life, and in Barbados, where some slight petroleum deposits exist, the British West Indies lack mineral resources. Agriculture, along with the processing of its principal products (notably sugar), is almost the sole basis of economy. A wide diversity of agricultural commodities is produced, but sugar, bananas, cacao and cotton are the most important.

Nearly all the islands are heavy producers of sugar, with Barbados, Antigua, St. Kitts-Nevis and the Virgin islands depending primarily on it. In 1941, the eight leading islands produced some 457,965 tons: Jamaica 156,591 (1942 est. 168,830); Trinidad 131,608 (1942 est. 150,000); Barbados 100,373; St. Kitts 37,186; Antigua 17,584 (1942 est. 25,000); St. Lucia 10,166; Nevis 4,357; St. Vincent 100 tons (approx.). The entire 1940 and 1941 export crops were generally purchased by the British government and contracts were made for the 1942 export. A large portion of the sugar output is processed into rum and molasses.

More than 97% of the banana acreage (1940: 76,022 ac.) is in Jamaica, normally the world's leading exporter, nearly 90% to Europe. In 1940 Jamaica exported 7,500,000 stems (1939: 18,771,628; 1938: 23,811,337). Losses through the British embargo of fresh fruits (to conserve shipping space) were modified by a British compensation payment system.

Cacao (1940: 237,014 ac.) leads in Trinidad and Tobago (210,000 ac.) and Grenada (20,500 ac.). Grenada's 1940–41 crop was 39,573 bags (1939–40: 33,653 bags). Trinidadian export declined sharply in 1941, because of drouth. World overproduction necessitated an international export quota.

In 1940–41, 19,030 ac. were planted in sea island cotton, with an estimated production of 3,083,500 lb.: Montserrat, 4,500 ac., 900,000 lb.; Antigua, 3,500 ac., 640,000 lb.; St. Vincent, 5,200 ac., 570,000 lb.; Nevis, 3,500 ac., 500,000 lb.; St. Kitts, 1,500 ac., 400,000 lb.; Barbados, 450 ac., 46,000 lb.; Anguilla, 200 ac., 15,000 lb.; Virgin islands, 140 ac., 7,400 lb.; St. Lucia, 40 ac., 5,100 lb. Grenada (5,000 ac., 30,000 lb. est.) and St. Vincent (450 ac., 54,800 lb.) produce Marie Galante (ordinary strain) cotton.

Citrus fruits, especially oranges, limes and grapefruit, are grown in most of the colonies, with 10,780 ac. in citrus groves (1940) and make up over half of Dominica's exports. Dominica, St. Lucia, Trinidad and Montserrat account for most of the world's lime juice production. Under war conditions most of the 1941 citrus export was processed. Spices are important, especially in Grenada, where nutmeg (1940–41: 33,279 cwt.; 1939–40: 30,004 cwt.), mace (1940–41: 6,329 cwt.; 1939–40: 5,841 cwt.), and other spices comprise over a third of exports; and in Jamaica, the sole source of pimento ("allspice"), and an important producer of ginger. Arrowroot accounts for two-thirds of exports in St. Vincent, the dominant world producer (1940: over 11,000,000 lb.).

British West Indian coffee is generally of a low grade. Jamaica "Blue Mountain" coffee, however, is one of the world's finest.

The Leeward and Windward colonies produce fresh vegetables, notably tomatoes, for export to Canada. In addition a wide variety of vegetables for local consumption was being grown in increasing volume in 1941.

(L. W. Be.)

West Virginia.

A state in the Appalachian mountain region in the eastern part of the United States, sometimes called the "Panhandle state" and sometimes the "Mountain state." West Virginia was formed from Virginia during the Civil War and admitted to the union June 20, 1863. Area, 24,282 sq.mi.; population (1940) 1,901,974, of which 1,742,320 were white (41,782 foreign born). Its total urban population was 534,292. Its capital is Charleston (pop. 67,914). Its other chief cities are Huntington (78,836) and Wheeling (61,099).

History.—The chief state officers in 1941 were: governor, Mansfield M. Neely; secretary of state, William S. O'Brien; treasurer, R. E. Talbott; auditor, Edgar B. Sims; attorney general, Clarence W. Meadows. All except the governor were re-elected in Nov. 1940. For governor, Neely received 496,028 and D. Boone Dawson, 383,698.

Education.—Education is free in the public schools for all children between 6 and 20 years of age and is compulsory for all between 7 and 16. The pupil enrolment (net) in the 4,849 state elementary schools for 1940–41 was 306,942. In the 413 state high schools it was 144,111. The number of teachers was 10,842 in the elementary schools and 5,359 in the high schools. The total state appropriation for elementary and secondary education in 1940–41 was $13,300,000 (the general school fund, $946,918).

The state supports seven teacher-training colleges which in 1940–41 had a total student enrolment of 4,672 and a total instructional membership of 355, and received state appropriations amounting to $1,225,550. It also supports the West Virginia university, which in 1940–41 had an enrolment of 4,369 (including summer), a total faculty membership of 270 and 68 assistants, and a total income of $3,275,885.

Public Welfare, Charities, Correction.—In Jan. 1941, a more extensive program of public assistance and relief was begun. The number of old-age, blind and dependent children assistance cases rose from 18,000 in July 1940, to 29,500 in July 1941. The relief load grew from 12,775 to 14,347. The average grants of aid were also increased. The total expenditure for old-age assistance was $3,206,885; for the blind, $179,180; for dependent children, $2,450,464. Including the cost of administration, the total cost was $6,337,748. The total general relief fund was $3,145,116.

Communication.—In 1941 the state had about 4,175 mi. of steam railway (about 6,920 mi. including all sidings), 130 mi. of electric railway and an extensive system of improved highways (approximately 16,700 mi., of which 4,600 mi. comprised the primary system and 12,100 the secondary system). The total mileage of airlines in the state was 510; there were 15 improved airports and nine partially-improved landing fields. The total number of telephones was 218,820.

Banking and Finance.—On July 1, 1941, the total deposits of the 104 state banks and trust companies were $161,259,278.21. The total deposits of the 77 national banks in the state were $189,778,000. Resources of 22 federal savings and loan associations were $18,768,807.76. Resources of 38 state building and loan associations were $11,837,794.06.

The summarized financial statement of the state treasurer for the fiscal year 1940–41 is shown in Table I.

Table I.—*West Virginia Financial Statement for Fiscal Year 1940–41*

Balance July 1, 1940	(all funds)		$ 16,470,897.80
Receipts for 1940–41	(all funds)		114,333,278.66
	(transfers)		44,815,196.98
Total			$175,619,373.44
Disbursements, 1940–41			
(all funds)		$108,470,005.11	
(transfers)		44,815,196.98	
			153,286,192.09
Balance, July 30, 1941			$ 22,333,181.35

On July 1, 1941, the total state funded indebtedness was $76,085,000; the total amount of outstanding state road bonds was $73,985,000. Total state debt, gross and net, was $70,917,804.

Agriculture.—Total cash income from farm crops and livestock in 1940 was $41,052,000; income from government payments was $1,920,000.

The number of farms by census of 1940 was 99,282 (acreage 8,908,803), valued at $269,827,285.

Manufacturing.—In 1940, the state had 3,188 reporting industrial establishments, which employed 230,726 persons and paid $396,884,878.99 in wages. These plants had a total production of about $898,722,285.80. The chief industries were steel, glass, chemicals, petroleum refining, stone, potteries and porcelain, cement, lumbering, woodworking and flour.

Table II.—*Acreage, Yield and Value of West Virginia Farm Crops, 1940*

	Acreage	Yield	Value
Corn	476,000	12,852,000 bu.	$10,025,000
Wheat	139,000	2,016,000 bu.	1,774,000
Oats	68,000	1,462,000 bu.	702,000
Buckwheat	14,000	245,000 bu.	191,000
Hay (Tame)	726,000	833,000 tons	8,252,000
Apples	..	4,808,000 bu.	3,408,000
Potatoes (Irish)	33,000	3,630,000 bu.	3,049,000
Barley	13,000	306,000 bu.	171,000

Mineral Production.—In 1939 the oil production was 3,587,000 bbl. and the natural gas production was about 150,000,000,000 cu.ft., which increased to 160,000,000,000 in 1940. In 1939 coal production was 108,515,665 short tons, in 1940, 126,619,825 tons. Coke production (bee hive only) increased from 80,310 tons in 1939 to 216,943 in 1940.

BIBLIOGRAPHY.—*West Virginia Bluebook* and various official departmental reports. (J. M. CA.)

Weygand, Maxime (1867–), French soldier. For his biography, see *Encyclopædia Britannica*. On May 19, 1940 Weygand was appointed commander in chief of the Allied armies to succeed Gen. Maurice Gamelin, at the moment when the defeat of France was imminent. Dismissing 15 generals, Weygand planned a "defense in depth" in a vain attempt to halt the German onrush after the invaders had routed the Allied troops from Flanders. When Pétain replaced Reynaud as premier, Weygand was named minister of defense in the cabinet. Here he remained through the armistice negotiations until Sept. 6, when he was "relieved" of his cabinet post and sent to Africa to deal with the defection of various French colonies to Gen. Charles de Gaulle (*q.v.*). His failure to return to Vichy in the succeeding months gave rise to speculation that he himself had decided to aid the Free French, but he vehemently denied the allegation.

During 1941, Weygand remained loyal to Vichy and Marshal Pétain, but at the same time he would not consent to German occupation of Bizerte in Tunisia. He conferred with Pétain at Vichy in March 1941 and again in June, when he was reported to have disagreed violently with Vice-Premier Darlan (*q.v.*) upon the extent to which French-axis collaboration in North Africa should go. Weygand apparently won his point with Pétain, at least temporarily, for he was made French proconsul in Africa shortly thereafter, and governor general of Algeria July 17. Then Vichy opinion reversed itself once more, and on Aug. 5 Weygand was ordered to submit all questions of colonial policy to Darlan. On Nov. 20 he was retired as African proconsul and was succeeded by Alphonse Juin.

The United States, maintaining that Weygand had been removed at the express demands of Hitler, immediately stopped all economic aid to French North Africa.

Wheat. Larger wheat crops were reported generally throughout the world in 1941, in the United States, Europe, Argentina and China. Only Canada, among the large producing countries, reported reduced production. The International Wheat conference meeting in Washington, D.C., July 10–Aug. 3, representing the United States, the United Kingdom, Argentina, Canada and Australia, reported that as of July 31, 1941, export stocks of wheat were sufficient to meet the normal requirements of importing countries for two years. The 1941 United States crop was reported by the department of agriculture in November as 961,194,000 bu., compared with 816,698,000 bu. in 1940; ten-year (1930–39) average was 747,507,000 bu. Excepting the U.S.S.R., for which no figures were available, the 1941 wheat crop in Europe was estimated by Broomhall in October at 1,480,000,000 bu., compared with 1,325,000,000 bu. in 1940 and a five-year (1930–34) average of 1,516,000,000 bu. The first official estimate in Canada placed the 1941 crop at 306,459,000 bu., a reduction of 44·4% from the 551,390,000 bu. of 1940. Canada, the world's largest wheat exporter, adopted a program of drastically reduced acreage in 1941 in an effort to counteract a mounting surplus that had become burdensome. In addition to a bonus to wheat growers, the Canadian government paid transportation charges on wheat and wheat products shipped in carload lots from Fort William, Port Arthur and Armstrong, Ont., to eastern Canada for livestock and poultry feed. The extra subsidy served a double purpose; it helped prairie province farmers reduce the surplus and enabled eastern provinces to increase meat production. The quota of Canadian wheat exports to the United States for the year beginning May 28, 1941 (795,000 bu.) was filled by Sept. 21, 1941.

Although Broomhall and other authorities in the trade gave an over-all estimate for Europe, official estimates from many countries were lacking because of the war. Table I is, therefore, an incomplete list of other wheat-producing countries and their 1941 and 1940 crops.

Table I.—*Wheat Production in Certain Countries, 1941 and 1940*

Country	1941 bu.	1940 bu.
China	720,000,000	700,000,000
Argentina	271,173,000	119,453,000
Italy	262,944,000	261,252,000
Spain	108,944,000	79,412,000
Australia	83,848,000	210,277,000
Japan	53,000,000	66,134,000
Manchoukuo	29,800,000	27,558,000
Union of South Africa	16,163,000	15,310,000
Portugal	14,882,000	9,921,000
Sweden	12,403,000	15,450,000
New Zealand	8,400,000	8,010,000
Finland	6,224,000	6,908,000

The 1941 wheat crop in the United States produced the highest per-acre yield on record, 16·9 bu., compared with 11·1 bu. in 1941

Table II.—*U.S. Wheat Production by States, 1941 and 1940*

State	1941 bu.	1940 bu.	State	1941 bu.	1940 bu.
Kansas	170,849,000	123,848,000	Virginia	7,950,000	8,463,000
North Dakota	146,230,000	97,054,000	Kentucky	7,215,000	5,625,000
Montana	79,402,000	56,070,000	North Carolina	6,594,000	6,132,000
Washington	59,360,000	41,808,000	New York	6,592,000	7,996,000
Oklahoma	50,353,000	56,332,000	Utah	6,227,000	4,861,000
Ohio	49,724,000	42,137,000	Wyoming	5,598,000	3,410,000
Illinois	37,852,000	40,155,000	Tennessee	5,438,000	5,116,000
Indiana	37,344,000	30,147,000	Iowa	3,135,000	8,121,000
Texas	35,420,000	29,355,000	South Carolina	2,900,000	2,688,000
Nebraska	35,394,000	34,821,000	New Mexico	2,243,000	1,720,000
South Dakota	35,024,000	26,221,000	West Virginia	2,030,000	2,016,000
Idaho	28,038,000	24,383,000	Georgia	2,024,000	1,880,000
Oregon	22,507,000	17,184,000	Wisconsin	1,490,000	1,743,000
Colorado	22,180,000	13,560,000	Delaware	1,480,000	1,406,000
Minnesota	21,268,000	32,069,000	New Jersey	1,232,000	1,316,000
Pennsylvania	18,325,000	18,780,000	Nevada	484,000	483,000
Missouri	17,580,000	31,707,000	Arizona	465,000	819,000
Michigan	16,352,000	17,812,000	Arkansas	332,000	352,000
California	11,415,000	11,370,000	Alabama	91,000	75,000
Maryland	7,980,000	7,566,000	Maine	68,000	88,000

and a ten-year average of 9.3 bu. to the acre. The 1941 acreage was 56,783,000 as against 53,503,000 ac. in 1940 and a ten-year average of 55,884,000 ac. The 1941 crop consisted of 684,966,000 bu. of winter wheat and 276,228,000 bu. of spring wheat. In 1940 winter wheat production was 589,151,000 bu., spring wheat 227,547,000 bu. The ten-year average of winter wheat was 569,417,000 bu.; spring wheat, 178,090,000 bu. Of the varieties of spring wheat, that of Durum, the macaroni wheat, produced 44,490,000 bu. in 1941, compared to 34,776,000 bu. in 1940; the ten-year average, 27,598,000 bu. (*See* also CEREALS; FLOUR AND FLOUR MILLING.) (S. O. R.)

Wheeler, Burton Kendall (1882–), U.S. politician, was born Feb. 27 in Hudson, Mass. He was graduated from the University of Michigan law school in 1905, and was admitted to the bar in Montana the following year. In 1911–13 he was a member of the Montana house of representatives. He was U.S. district attorney for Montana, 1913–18. In 1920 he ran unsuccessfully for governor of Montana on the Non-Partisan league ticket. In 1922 he was elected to the U.S. senate and was re-elected three times. Although generally a member of the Democratic party, he ran for vice-president of the United States on the Progressive ticket in 1924. In 1937 he led the fight against the supreme court "packing" bill. He became an active leader of the U.S. noninterventionist group during 1941, devoting much of his time to speaking throughout the country against President Roosevelt's foreign policies. But with the Japanese attack on Pearl Harbor, Senator Wheeler declared on Dec. 7, 1941: "In view of the vicious and uncalled-for attack upon the United States by the Japanese government, congress must declare war upon that government. . . . The only thing now is to do our best to lick hell out of them."

Whorf, Benjamin Lee (1897–1941), U.S. expert on Aztec and Mayan civilizations, was born April 24 in Winthrop, Mass. After graduating from the Massachusetts Institute of Technology in 1918, he joined an insurance company, but spent most of his leisure hours studying Aztec and Mayan cultures. In 1928 he won the attention of the scientific world with his report on a transcription of Aztec records before the International Congress of Americanists in New York city. In 1930 the Social Research Council of New York sent Whorf to central Mexico, where he lived in Indian villages and transcribed Aztec folk songs and legends. Yale university awarded him an honorary fellowship in anthropology in 1936 and the Sterling fellowship in 1937. He died in Wethersfield, Conn., July 26.

Wickard, Claude Raymond (1893–), U.S. secretary of agriculture, was born near Delphi, Ind. on Feb. 28. After his graduation from Purdue university in 1915 he took over management of a farm near his birthplace. In 1933 he was appointed to the staff of the Agricultural Adjustment administration as assistant chief of the corn-hog division. He advanced to chief of the division in 1935 and later became director of the AAA's conservation program for the north central states. On Feb. 1, 1940 he was appointed undersecretary of agriculture, and on Aug. 19, after the resignation of Henry A. Wallace (*q.v.*), President Roosevelt nominated him secretary of agriculture. Wickard declared after his nomination that he intended "to carry out the policies of Henry A. Wallace," his predecessor in the cabinet.

In March 1941 Wickard took charge of the production and distribution of food to Britain and her allies under provision of the lend-lease act. He pressed the "food for freedom" program with vigour and urged U.S. farmers to multiply their output of eggs, milk, tomatoes, beans, pork and other products. Food, he said, would be a prime factor in victory; on Sept. 23 he told a house of representatives committee that the U.S. should send Britain $1,000,000,000 in food before Feb. 1942 to prevent a British defeat.

Wild Life Conservation: *see* FISH AND WILD LIFE SERVICE.

Willcox, Sir William Henry (1870–1941), British expert on poisons, was born on Jan. 18. He received his M.D. degree from London university and was a lecturer on chemical pathology at St. Mary's hospital, 1900–30; he also lectured on forensic medicine at the same institution, 1906–35. He served in World War I as a colonel, and after 1919 he was a medical adviser to the British home office. In 1917 he became a companion of the bath, and he was knighted in 1921. Sir William was a fellow of the Royal Society of Medicine and president of the Medical Society of London, 1936–37. He died in London, July 8.

William II (1859–1941), German emperor, was born Jan. 27 in Berlin. The kaiser fled to the Netherlands on Nov. 10, 1918 and lived in lonely exile at his estate in Doorn after renouncing his throne at the close of World War I. He spent his days chopping wood, and after the death of Empress Augusta Victoria he was married to Princess Hermine of Schönaich-Carolath in 1922. When German troops invaded the Netherlands in May 1940, they detoured around Doorn in deference to their former kaiser, and a guard of honour was placed at the gates of his estate. In his last years William II dictated chapters of a book in which he hoped to disprove the Allied thesis that Germany was solely responsible for World War I. He died at Doorn on June 4 and was buried with military honours. (See *Encyclopædia Britannica.*)

Willingdon, Freeman Freeman-Thomas, MARQUESS OF (1866–1941), British diplomat, was born Sept. 12 in Sussex, England. He entered the diplomatic service in 1895 as an aid to an Australian official and served in the house of commons from 1900 to 1910 as a liberal M.P. In 1910 he was raised to the peerage as first baron of Ratton. He was governor of Bombay, 1913–19, governor of Madras, 1919–24, governor general of Canada, 1926–31 and viceroy of India, 1931–36. He took over the viceroyship at the height of the civil disobedience campaign in India and after negotiations with Gandhi failed to halt the tide of rebellion, Lord Willingdon set out to crush the congress party, driving it underground for a period. In 1936 Lord Willingdon was made a marquess, one of the few commoners ever to achieve this distinction. He died in London Aug. 12.

Willkie, Wendell Lewis (1892–), U.S. attorney, business executive and politician, was born Feb. 18 in Elwood, Ind. After being graduated from the University of Indiana with an A.B. degree in 1913, he taught history in the high school at Coffeyville, Kan., then became a laboratory assistant in a Puerto Rican sugar plant. In 1916 he received his law degree from the University of Indiana and joined his father's law firm in Elwood. During World War I he was a captain in the 325th field artillery in France. In 1929 he joined the legal staff of Commonwealth and Southern, a large utilities holding company. Four years later he was president of the company.

His nomination for the presidency by the Republican convention June 28, 1940, was described as a political "miracle." He was defeated by a substantial margin in the election of Nov. 5, 1940, although he received 22,333,801 votes.

Willkie went to England in Jan. 1941 and was received with great enthusiasm. Upon his return to the U.S. he testified on behalf of the lend-lease bill. He advocated U.S. convoys and establishment of U.S. bases in Northern Ireland and Scotland. These views caused considerable resentment among large sectors of the Republican party. Willkie joined a law firm in New York city in April, and in September he was retained as counsel for various motion picture companies at a senate inquiry into alleged prowar propaganda in U.S. films.

Winant, John Gilbert (1889–), U.S. diplomat, was born Feb. 23 in New York city. He attended Princeton university and in 1912 became a teacher of English and assistant rector at St. Paul's school. In 1917 he entered the United States air service, becoming captain of the 8th observation squadron in France. After the war he was elected to the New Hampshire legislature, serving in both the house and the senate between 1917 and 1923. In 1925 he received his M.A. degree from Princeton for graduate study in government problems. The same year, at the age of 35, Winant was elected governor of New Hampshire; he served three terms, 1925–27, 1931–33 and 1933–35. His administration was marked by numerous social reforms, including enactment of old-age assistance, emergency relief and prevention of foreclosures on farms and factory workers' homes. He was the first chairman of the social security board, 1935–37; president of the World Textile conference, 1937; assistant director of the International Labour office, 1935–38 and director, 1939–41. A wealthy New England aristocrat, a liberal Republican and a supporter of the New Deal program, Winant was named ambassador to Great Britain by Pres. Roosevelt, Feb. 6, 1941.

Windward Islands: *see* WEST INDIES, BRITISH.

Wines. The war in Europe made it impossible to report satisfactorily on the wine vintages of 1940. The extension of the war, which included nearly every country in Europe in 1941, and spread to every continent, made it even more difficult to give any definite information on the wine vintages of 1941.

The principal wine-growing countries of the world—France, Italy, Germany and the Balkans—were in a state of military and political disorder, which relegated their wine harvests to a matter of minor importance, except insofar as the wines could be utilized for the production of alcohol for military and industrial purposes. Very little information was allowed to be made public regarding the wine harvest of any of the European countries actually involved in the war. Only meagre details, therefore, can be given regarding the 1941 vintage in any of these countries.

Information regarding wines in France came chiefly from the Midi, from which it was reported that the vintage was delayed on account of insufficient heat during the summer. The total quantity produced in France would be approximately the same as the 1938 harvest, viz.: something over 1,500,000,000 American gal., a large part of which was of course destined to become alcohol. The older and finer wines of France, which of course also include the choice vintages of champagnes, were forcibly taken by the Germans and shipped to Germany. Old wines were therefore nonexistent and new stocks would be fully requisitioned for home use, leaving none for export.

The wine harvest of Algeria was expected to show a large deficit. The crop was about 250,000,000 gal., much of which would be absorbed by compulsory distillation.

Wine Production of the Principal Wine-Growing Countries of the World

In thousands of American Wine Gallons

1,000 American Gallons Equal 833⅓ British (Imperial) Gallons

*Including Austria 22,391,200 gal. and the Sudeten 2,362,500 gal.
†Estimated production.

From Italy no information regarding wines was obtainable.

From Spain it was learned that in the Jerez district the vintage was concluded much earlier than usual and was blighted by rain during the vintage period. The quantity was down to less than 50% of the amount normally produced, and the strength of the wine suffered as a result of the heavy rains during the spring and up to the end of July. The increasing difficulties which the Spanish government imposed upon the export trade through its currency regulations reduced the exportation of sherries to a minimum.

In Portugal the 1941 quality of wines promised to be satisfactory. The Wine Farmers association, in view of the falling off in the export trade, limited the quantity of port wine to be produced to 25,000 pipes as against the 40,000 pipes of which the production was authorized in 1939 and 1940. The export business from Oporto suffered greatly because of restrictions placed upon the importation of these wines by Great Britain, which had for many decades been the principal market for port wines.

From Germany no wine reports were obtainable. Inquiries regarding the wine harvests in Hungary, Greece, Rumania and other European wine-growing countries were equally fruitless.

Western Hemisphere.—The picture in the western hemisphere was more pleasing. While the quantities of grapes raised in the United States were somewhat smaller than the 1940 figures, the quality of the wines, as a result of favourable weather conditions and improved methods of production, promised to be of a high standard. The harvest was favoured by good prices to the growers and an active market for all varieties of grapes. Wine and brandy prices strengthened in keeping with the higher grape levels. While the quality was considerably above average, the quantity produced on the Pacific slope was estimated at about 10% less than the 1940 harvest. The wine harvest of the Atlantic seaboard was only 60% of the normal quantity but with a promise of good qualities.

The demand for North American wines was greatly stimulated by the interruption to the importation of European table wines, as a result of the war, and by a judicious and generous advertising campaign. The increase in the consumption of American wines resulted also in a better appreciation of the qualities of wines which had in the past seldom come to the attention of the discriminating consumer but, because of constantly improving methods of production and fuller maturity, were entitled to more favourable consideration than had heretofore been given to them. There was no doubt that North American wines would to a substantial extent, even after the war, replace the district wines which were formerly imported from France, Italy, Germany and other European wine-growing countries.

From South America it was reported that the Argentine wine crop was very successful in respect to quantity, amounting to over 200,000,000 American gal., whereas Chile reported that the harvest was smaller than that of 1940, the unofficial estimate being approximately 61,000,000 American gal. However, both countries suffered largely through the fact that the greatest market for these wines in former years was Germany, with which all commercial relations had of course ceased.

No report of the 1941 vintage in South Africa or Australia had been received up to Jan. 1, 1942, but it was known that there was a large overproduction in both of these countries owing to the lack of facilities for transporting their wines to Great Britain, which had always been their chief export market.

To sum up, 1941 from a vinicultural standpoint must be recorded as a year of uncertainty in most of the countries of production, with an almost complete disruption of normal conditions in the European vineyards and in the export and import trade.

A table of the approximate production in the principal wine-growing countries of the world is to be seen above. (A. WI.)

Wisconsin. One of the north-central states, Wisconsin, popularly known as the "Badger state," was admitted to the union in 1848. The state comprises an area of 56,154 sq.mi., of which 54,715 sq.mi. are land. Its population, according to the 1940 census, was 3,137,587, an increase of 6·8% over 1930. Of this population, 1,679,144 was urban and 1,458,443

rural. The male population was 1,603,806 as compared with 1,533,781 female. Of the entire population only 24,327 were not white. The capital is Madison (pop. 1940, 67,447). The largest city is Milwaukee with a population in 1940 of 587,472. Other large cities are Racine (67,195), Kenosha (48,765), Green Bay (46,235), La Crosse (42,707) and Sheboygan (40,638).

History.—Upon the death of Stephen Bolles, congressional representative from the first district, a special election was held in 1941. The Republican candidate, Lawrence H. Smith, was pitted against a Progressive, Thomas R. Amlie, who ran on the Democratic ticket. Amlie, who stressed support of Roosevelt's foreign policy, was defeated by a 2-to-1 vote.

The legislature passed a number of important measures. The Model Sabotage Prevention act prohibited and penalized intentional interference with the defense program. The State Guard act created a militia in the absence of the national guard. Communists were barred from the ballot. Military training at the state university was made compulsory. Various civil service laws were passed to protect the rights of those in military service. Safety and traffic regulations included a law under which all drivers must renew their licences every four years. An amendment to the constitution permitting instalment payment of real estate taxes was submitted to the electors and ratified. The Unfair Sales act was clarified and strengthened. The teachers' tenure law of 1937 was repealed.

The chief officers of the state in 1941 were United States Senators Robert M. La Follette and Alexander Wiley and Representatives (Republican) J. L. Johns, L. H. Smith, W. H. Stevenson, L. D. Thill, F. B Keefe, R. F. Murray, (Progressives) Merlin Hull, B. J. Gehrmann, Harry Sauthoff, and (Democrat) T. F. B. Wąsielewski. The state officers were J. P. Heil, governor; W. S. Goodland, lieutenant governor; F. R. Zimmerman, secretary of state; J. M. Smith, treasurer; J. E. Martin, attorney-general; and John Callahan, superintendent of schools. The chief justice of the supreme court was M. B. Rosenberry.

Education.—There were 7,442 elementary schools, 464 secondary schools, and 9 teachers' colleges in September 1941. The number of students enrolled was 374,854 in the elementary schools, 160,311 in the secondary schools and 5,976 in the teachers' colleges. The number of teachers in these was 15,415, 6,162 and 470 respectively. The number of students enrolled in the state university was 10,545, the number of faculty members, approximately 1,736.

Public Welfare, Charities, Correction.—The number of cases receiving public assistance as of August 1941 was as follows: general relief, 22,598; WPA, 22,200; old-age assistance, 54,202; aid to dependent children, 12,236; aid to blind, 1,977—a total of 99,891. Expenditures for public assistance in 1940 were as follows: general relief, $14,907,974; WPA (July 1939–June 1940), $37,885,000; old-age assistance, $13,920,405; aid to dependent children, $5,726,585; aid to blind, $563,270; a total of $87,132,436. The amount spent for public assistance from January through March 1941 was $21,085,388. Wisconsin's unemployment compensation law was passed in January 1932. By the close of 1940, nearly $20,000,000 had been paid in benefits. More than $55,000,000 was held in trust. The benefit payments in 1940 were $4,584,529 as against $3,663,572 in 1939. The contributions in 1940 were $11,666,453; in 1939, $13,419,778. Wisconsin's 17 charitable penal and allied institutions were operated during July 1939–June 1940 at a cost of $4,980,797.41 (less repairs, etc.). The average daily population in 1940 was 79.35.

Communication.—The number of miles of highways as of Jan. 1, 1940 was: 83,881 (towns), 2,469 (villages), and 5,767 (cities). The total was 92,117. The expenditure on highways during July 1939–June 1940 was $33,659,374. The total railway mileage was 6,667. The number of airports was 47. In January 1941, there were 557,200 telephones.

Banking and Finance.—At the end of 1940 there were 469 state and 99 national banks. The number of credit unions was 592. The deposits in state banks totalled $446,244,273; the assets were $509,194,172. National banks had on deposit $613,422,000; their assets were $676,835,000. The credit unions had assets listed at $11,238,678. There were 124 building and loan associations with assets of $116,747,368.

The state receipts during the fiscal year ending June 30, 1941 were $147,784,514. The disbursements were $139,557,201. The state had no outstanding bonded indebtedness in 1941 but its General Fund was indebted to the common and normal school funds ($1,183,700). The state budget for the biennium 1941–43 was $73,868,278, greater by $2,656,302 than the 1939–41 budget. The principal increases were for pensions, the University of Wisconsin and teachers' colleges. The principal decreases were related to relief and governmental expenses.

Agriculture.—The total value of agricultural products in 1940 was $175,584,000. The total acreage harvested was 9,815,964. The gross farm income was $334,000,000, an increase of 15% over 1939. The year 1940 was a very good crop year except for potatoes, usually one of the leading cash crops. The land used in the production of cash crops was small compared with land used for feed crops—the result of the state's great dairy industry. Principal crops are shown in Table I.

Table I.—*Agricultural Production, 1940 and 1939*

	1940	1939
Oats (bu.)	96,793,000	71,012,000
Corn (bu.)	93,582,000	85,970,000
Canning peas (lb.)	182,700,000	100,400,000
Tobacco (lb.)	36,532,000	31,406,000
All tame hay (tons)	7,416,000	5,829,000
All clover and timothy (tons)	3,644,000	3,143,000
Alfalfa (tons)	2,928,000	1,072,000

Manufacturing.—The total value of Wisconsin's manufactured products in 1939 was $1,604,507,356, placing it 11th in rank among the states. The wages paid were $251,946,993. The number of wage-earners was 200,897 (average for the year). Wisconsin, with an extremely diversified industry, ranked first in the manufacture of cheese, milk products, malt and canned peas in 1939. Principal industries, with value of products in dollars, are shown in Table II.

Table II.—*Industrial Production, 1939 and 1937*

	1939	1937
Motor vehicles	$162,080,952	$90,700,733
Paper and paperboard mills	101,302,409	97,933,597
Meat packing, wholesale	80,234,982	72,387,364
Tractors	68,493,028	(not given separately)
Malt liquors	53,445,756	42,710,425
Dairy products		
Cheese	52,900,812	54,252,393
Condensed and evaporated milk	54,510,935	57,354,882
Creamery butter	48,217,531	63,032,363

Mineral production.—In 1939 the total value of mineral production was $12,704,942 as against $10,636,741 in 1938. Leading mineral products, in dollars, are shown in Table III.

Table III.—*Value of Mineral Products, 1940 and 1939*

	1940	1939
Stone	$5,030,263	$3,564,045
Iron ore	3,290,389	3,526,980
Sand and gravel	2,304,197	2,616,204

(L. Kn.)

Wisconsin, University of.

An institution of higher education at Madison, Wis. Regular session enrolment (1941–42) totalled 10,545, a slight decrease from that of the preceding year. Total enrolment, including both regular and summer session, extension and short course registrations, reached a total of more than 45,000 in the year. The university continued its work to help the United States' defense efforts during the year.

The university's president, C. A. Dykstra, served as first director of selective service and, later in the year, as chairman of the National Defense Mediation board. In addition, 160 scientists of the faculty were engaged in science research in Dec. 1941, either in their university laboratories or in laboratories provided by the federal government for investigation of various phases of national defense problems.

The university also continued to show progress in its science work during 1941. Another science symposium was held on the campus in the fall, and the National Academy of Sciences held its fall meeting at the university in October. These two science meetings brought to Wisconsin many of the leading scientists of the U.S. in various fields. The science symposium on "Respiratory Enzymes and the Biological Action of Vitamins" drew the attention of 350 leading U.S. biochemists and medical men, while more than 300 of the nation's top-ranking scientists, representing all the physical and biological sciences, attended the sessions of the National Academy. More than 2,000 students received degrees at Wisconsin's June commencement, the 88th in the university's 92-year history. (R. Fs.)

Woman's Christian Temperance Union.

The fact that more than 25,800 women joined the organization in the first nine months of 1941, that similar increases were made in the two branches, the Youth's Temperance council and the Loyal Temperance legion, is warrant that there was increasing interest in the organization's work. More than 1,000 new organizations were formed, which meant many new centres to work out the objectives sought: total abstinence from alcoholic beverages, and the abolition of the liquor traffic. The six seminars on alcohol education sent 50 trained specialists into teachers' colleges. The course on alcohol education offered in these seminars has been accepted by seven colleges for academic credit. The acceptance of brief courses for summer schools is increasing. Three motion pictures were in circulation. These dealt with the scientific, social and economic effects of alcohol. They were on high school and adult levels. Film strips for classroom use in the grades, dealing with health, safety and economics, were available. Exhibits and many varieties of visual demonstrations were but a few of the special features of the year. The weekly magazine, the *Union Signal*, a journal of social welfare, and the *Young Crusader*, a children's paper, were increasingly added to libraries, both public and school.

The national officers in 1941 were: Mrs. Ida B. Wise Smith, president; Mrs. D. Leigh Colvin, vice-president; Mrs. Anna Marden DeYo, corresponding secretary; Mrs. Margaret C. Munns, treasurer; and Mrs. Nelle G. Burger, recording secretary. National headquarters, Evanston, Ill. (I. B. W. S.)

Women's Clubs, General Federation of.

The General Federation of Women's Clubs is an international federation of 16,000 clubs and organizations, representing a total membership of more than 2,000,000 women. Clubs were in 1941 in more than three-fourths of the counties of the United States, in four territories, and in 26 other countries. Headquarters in 1941 were at 1734 N street, Northwest, Washington, D.C.

The General Federation began with the 21st birthday celebration of Sorosis club of New York city, when women from 61 clubs, representing 18 states, decided to draft a constitution and plan of organization for a federation of women's clubs. The plan was ratified in New York city, April 1890. In 1901 the organization was granted a charter by the United States government.

The golden jubilee convention, in Atlantic City, May 1941, climaxed a year of nation-wide celebration. At this convention Mrs. John L. Whitehurst of Baltimore was elected 15th president.

The new administration immediately established a national defense department with 14 committees to promote a defense program and co-operate with the United States Office of Civilian Defense. Clubs and clubwomen responded immediately by purchasing defense bonds, registering for emergency service, conducting nutrition classes, promoting Americanism forums, sponsoring the recruiting of air pilots, conserving defense products, promoting adequate defense housing, providing recreation for men in camp, promoting home nursing and first-aid classes, assisting through scholarship funds enrolment for professional nurses' training, encouraging Pan-American friendship through establishment of additional Pan-American fellowships and the sponsoring of Spanish classes.

In June 1941, Mrs. Whitehurst called a national defense conference in New York city which was attended by women leaders of 100 national organizations. During 1941 plans were completed for a national defense forum of 1,000 club leaders, to be held in Washington, D.C. early in 1942. With the Sept. 1941 issue, the General Federation changed the policy of its official organ, the *General Federation Clubwoman*, to a magazine devoted entirely to the promotion of national defense. (S. A. W.)

Wood, Robert E. (1879–), U.S. soldier and business executive. He was born June 13 at Kansas City, Mo., graduated from West Point in 1900 and saw active service in the Philippines during the next two years. From 1905 to 1915 he was assistant chief quartermaster and chief quartermaster and director of the Panama Railroad company during the construction of the Panama canal. He left the army to engage in private business in 1915 but returned upon the United States' entry into World War I and was promoted to brigadier general. In 1918 and 1919 he was acting U.S. quartermaster general, and in the latter year he re-entered business as vice-president of Montgomery Ward & Co. in Chicago. He was vice-president of Sears, Roebuck and Co. in Chicago from 1924 to 1928, president from 1928 to 1939, chairman of the board since Feb. 1939.

General Wood, who supported Roosevelt in 1932 and 1936, parted ways with the New Deal in 1940 because of the administration's foreign policy. Believing that "all-out" aid to Britain would weaken U.S. defenses and threaten to involve the nation in war, he organized the America First committee to oppose intervention in the European conflict. Through 1940 and 1941 he continued his opposition to such intervention and to the measures (lend-lease bill, U.S. occupation of Iceland, request for use of U.S. forces overseas, etc.) which he believed would bring it about.

With the Japanese attack on Pearl Harbor Dec. 7, 1941, General Wood declared his unqualified support of the national government in its prosecution of the war.

Wool. Estimates of sheep in the world during 1941 were figured at 767,300,000, growing 3,900,000,000 lb. of wool. The Australian clip was computed at 1,099,000,000 lb.; South America, 600,000,000 lb.; United States, 399,941,000 lb.; New Zealand, 330,000,000 lb.; Union of South Africa, 200,000,000 lb. United States imports of apparel wool totalled 688,000,000 lb. in the first ten months of 1941 compared with 158,500,000 lb. during the same period in 1940. As of Nov. 30, 1941 the U.S. domestic mill consumption of wool amounted to 833,000,000 lb. compared with 605,000,000 lb. for the 11 months in 1940.

It was estimated that 300,000,000 lb. of grease wool would be required solely for U.S. government orders placed during the calendar year of 1941. This amount approximated 174,000,000 lb. of domestic grown wool and 126,000,000 lb. of foreign. Invitations for bids on these contracts were on three bases: all domestic wool; part domestic, part foreign; all foreign.

The closing of many outlets for wool, brought on by World War II, left but the markets of Great Britain and the United States, with possibly Sweden, open for the large producers in Australia, South America and South Africa. During 1941 the United States purchased approximately 250,000,000 lb. of the Australian clip, 32,500,000 lb. of the South African clip and 500,000,000 lb. from South America. The British Wool Control board, having purchased the Australian and South African wool clips at relative figures, established market prices for these wools. Comparative grades of domestic wools commanded a premium of about ten cents a pound clean basis, because of the fact that a differential was considered when awarding government orders, to compensate the wool growers in the United States for increased cost of production. On July 17 a list known as "The Proclaimed List of Certain Blocked Nationals" was authorized by President Roosevelt. This list included many large wool exporters to the United States, principally in South America.

On Oct. 1 the new method of determining the clean content in wool and hair by the treasury department was put into effect.

This method consists of boring wool bales, thus obtaining samples which are afterward laboratory tested for clean content. Previously, the visual method was used by customs appraisers. On Oct. 14 a trade agreement between the United States and Argentina was signed. Under the most-favoured-nations treatment, concessions by the United States apply to all nations except Germany. The agreement went into effect Nov. 15. The duty on wools, not finer than 40s, was reduced by 11 cents per lb., of clean content; not finer than 44s, by 12 cents. On Oct. 22 an official announcement was made, stating that the United States government purchased all the Australian wool in store or on the water, destined for the British reserve storage, amounting to approximately 125,000,000 lb., plus any additional quantity that could be shipped before Dec. 31, provided grades were within the standards specified, namely: nothing lower in quality than 60/64s. This wool was bought at 10% less than the export issue price list, f.o.b. Australian port. In conjunction with this transaction, the British government agreed to ship to the U.S. for storage in their name 125,000,000 lb. of South African wool, provided it were shipped before Dec. 31.

The Office of Price Administration established ceiling prices on wools, both foreign and domestic grown, in Jan. 1942. These prices were based on the highest prices contracted for or received by the seller for the sale or delivery of wools during the period between Oct. 1, 1941 and Dec. 15, 1941. Requests were made from Washington of total stocks of wool on hand or afloat, according to grade and condition. (*See* also SHEEP; TEXTILE INDUSTRY.)

(C. M. AN.)

Woolf, Virginia (1882–1941), British novelist and essayist, the daughter of Sir Leslie Stephen, English philosopher and man of letters, was related to the Darwins, Symondses and Stracheys and was a granddaughter of Thackeray. The famous writers of that period, Stevenson, Ruskin, Lowell, Hardy and Meredith, frequently visited her father's home, and as the wife of Leonard Sidney Woolf, editor and writer, she was surrounded by a coterie of literary lights in her own home. For more than 20 years the Woolfs controlled the Hogarth Press, but in 1938 Mrs. Woolf retired to devote more of her time to writing. Among her later works were *The Waves* (1931); *The Common Reader, Second Series* (1932); *Flush* (1933); *The Years* (1937); *Three Guineas* (1938), *Roger Fry, a Biography* (1940) and *Between the Acts*, a novel published posthumously in Oct. 1941. Twice bombed from her home by German air raiders, Mrs. Woolf, who had been ill and depressed, disappeared from her weekend house at Lewes, Sussex, March 28, leaving behind a suicide note to her husband. 1. Objectives
2. Plans
3. Forces
Operations (including maps)
Summary

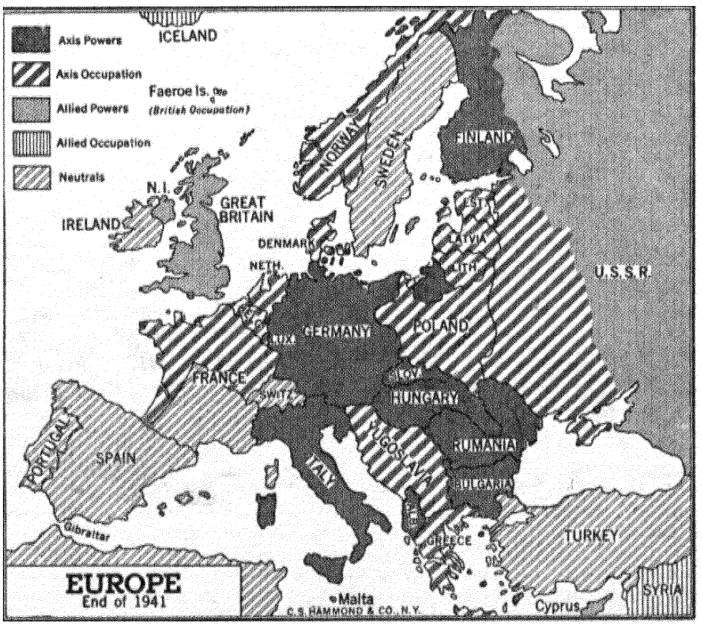
Section III—The War at Sea	729
Section IV—The War in the Air	730

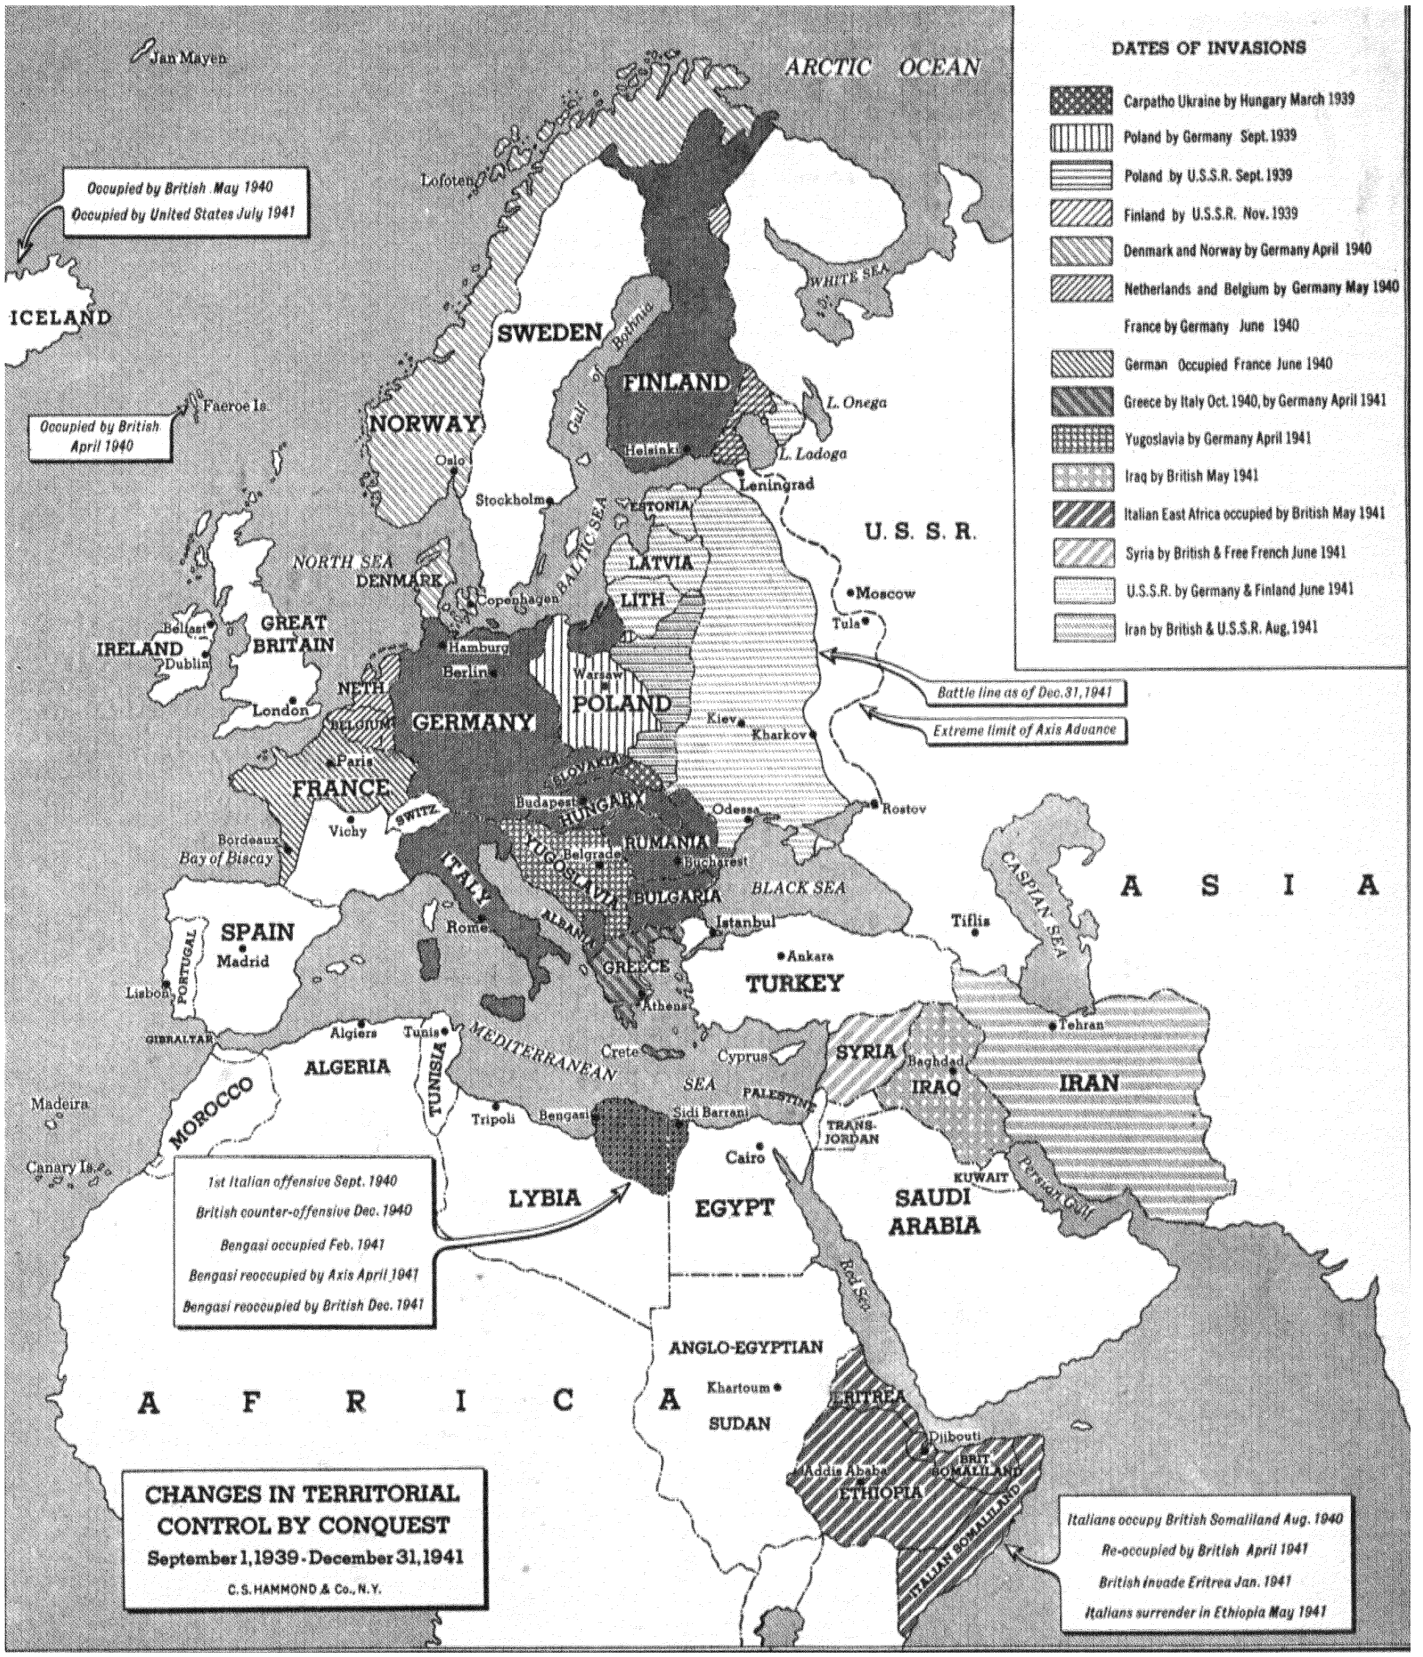
I. Introduction.—On Sept. 1, 1939 two nations were engaged in war when Germany invaded Poland. In the succeeding 28 months a grand total of 31 nations had become involved in warfare. What began as a European war confined principally to the western European area, became in 1941 a world war with the conflict spreading around the globe bringing war on land or sea or in the air to most of the small and great nations of the world. During 1940 the German armies had swept across western Europe, eliminated the major organized forces of Britain and France from the continent, overrun smaller European nations, and rapidly organized most of the continent within or subject to the threat of German control. During 1941, Germany completed military operations securing control of the Balkans, maintained overseas forces operating with Italian allies in North Africa, threatened the Suez and the Dardanelles by the capture of Crete, extended the air and naval warfare in the Battle of Britain, opened a major offensive war against Russia, gained a new ally by supporting the resumption of war by Finland, and in December joined Japan and Italy in a declaration of war against the United States.

The distance in time appeared tragically short between Munich and Hawaii. The speed with which the conflagration spread changed the character of the original European war of 1939 and posed grave military issues for all nations in the future. The scale of all of these events defies accurate analysis within a single study. The military events alone can be examined solely within the limitations of available information secured under the restrictions of war-time censorship.

II. Military Operations.—A. The Balkan Campaign.—The nations engaged in the Balkan campaign during 1941 included Italy, Germany, Hungary, Rumania, Yugoslavia, Bulgaria, Greece and the British empire. For the most part all operations were confined to air and ground activities with the exception of initial naval escort and convoy duty by units of the British fleet and the later naval and air engagements at the close of the campaign. The decisive actions were the result of air and ground combat.

1. **Objectives:** The German objective in this campaign was to deny the land area of the Balkan peninsula to British forces and to secure a route leading to the area occupied by main British armies in the eastern Mediterranean. This action no doubt included future steps for the capture of the strategic island of Crete. Secondary objectives included the rescue of Italian forces engaged in cumbersome combat with Greece, the elimination of Greece as a British ally, the reduction of potential opposition in Yugo-





slavia, the extension of the German political and military control in Rumania and Bulgaria, and the addition of all available supplies and sources of supplies for future German war needs.

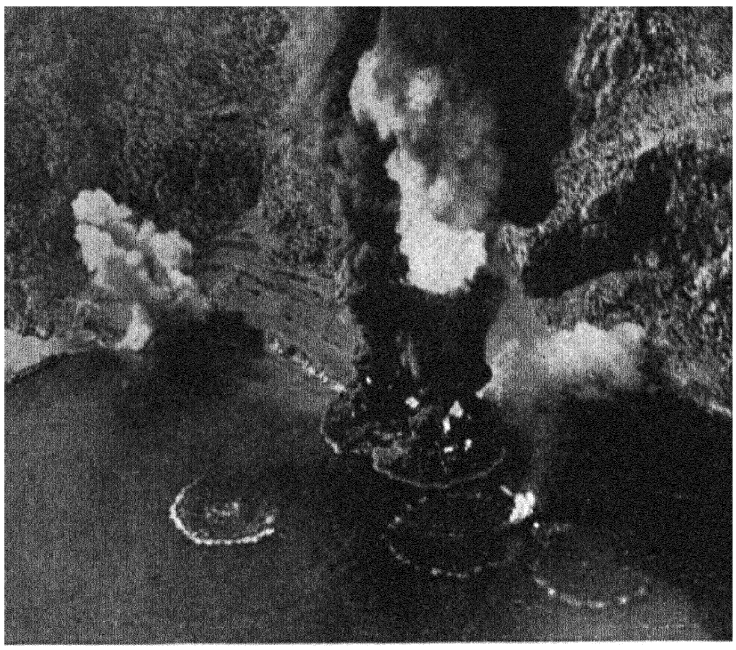
The Greek forces already engaged in major warfare with Italian forces sought to defend their home front and to secure an area for future attack in company with British allies.

The British objective in compliance with treaty guarantees was to support the Greek efiorts against Italian aggression, and to secure a European land base for future use in resuming an offensive against Germany.

2. **Plans:** The German plan of operations appeared to have been a simple advance to the southeast and south seeking to strike the main British and Greek forces and destroy them. In detail this basic plan included the political control of Rumania and Bulgaria to secure an advance base of operations, the separation of Yugoslavia from Greece and the destruction of the Slav forces. In addition, Germany sought to unite her forces with Italian forces in Albania by an advance west from Bulgaria.

Italian campaign, and in the other because of necessary requirements for African defenses, adopted a purely defensive plan. Only limited British air and ground forces were available. The whole British effort appeared to be more a compliance with treaty provisions than a determined attempt to seek decisive results. The number of British troops engaged suggested a token force. The plan included a defense along the Bulgarian border coupled with renewed attacks to the west against Italy and the addition of strong resistance in the north by Yugoslavia. The Yugoslavian forces were committed to adoption of the defense of the frontier, but could not be counted upon to join in any co-ordinated plan of joint British and Greek campaign.

3. **Forces:** The forces involved are estimated approximately as follows: Yugoslavia, 550,000 including 15–20 divisions, 500–700 planes, and without adequate reserves of trained manpower or modern supplies; Greece approximately 300,000 including 15 divisions with less than 100 planes operated by British and some Greek aviators. For the most part, the bulk



NAZI BOMBERS harried the British expeditionary force as it evacuated Greece in the last days of April 1941

pected to assist the British during the German campaign; British troops were estimated at 6 divisions, approximately 100,000, including about 150 planes and small naval craft in support. These actual and potential allies combined, presented approximately 1,000,000, with more than 50% of the total represented by the Yugoslavian forces as yet untried in battle and subject to the serious danger of national disorders within the home front.

The German forces in the Balkan area since early in January had been increased to approximately 550,000.

The German system of assigning specially designed task forces had been carefully carried out in the creation of this Balkan army. Air and ground forces were placed under responsible commanders charged with specific missions under a single supreme commander responsible for the whole campaign.

In addition, the Germans could count upon increased assistance as soon as the Italian forces in Albania resumed the offensive and a union of forces could be made.

Operations: The initial moves made by Germany were launched from Bulgaria against Yugoslavia. These forces sought to separate the Yugoslav forces in the southeast from those to the north. One German column overran the small Croatian divisions along the frontier and reached the valley of the Vardar river. At this point the German column split into two parts, one part continuing to the west and southwest to join Italian forces in Albania, the other part turning south through the Vardar valley in the direction of Salonika. Other German columns invaded Yugoslavia from the Struma valley west towards Skoplje, through the Dragoman pass towards Nish, southwest from Rumania toward Belgrade, and in the north across the frontier towards the cities of Ljubljana and Zagreb. Along the Bulgarian-Greek border, German forces invaded southward toward Salonika.

Success in northern Yugoslavia was assured by the capture of the principal cities of Ljubljana, Zagreb and Belgrade. Political dissension resulted in the establishment of a separate Croat state, and weakened the potential strength of Yugoslavian resistance. In the southeastern part of Yugoslavia strong resistance was overcome in the Vardar valley, and Serbian forces were separated from the Greeks. In Greece, Salonika was captured and eastern Thrace cut off from the remaining Greek and British forces. Junction was made between German and Italian columns on the sixth day of the invasion when advance elements met in the vicinity of Struga.

Specially trained and equipped mountain troops were used by Germany. In all cases, German armoured forces operating with close and continuous air support, drove Allied forces to the south, overran defensive positions all along the British-Greek front, and meanwhile threatened rear area installations by heavy air bombing attacks.

Between April 6 and April 8, the initial German attacks succeeded in separating the Yugoslav forces from the Greek forces along the Bulgarian frontiers. This defeat resulted in opening an approach for German columns directly to the Monastir gap at the approximate junction of the Albanian, Yugoslavian and Greek frontiers, and also at the centre of the first British-Greek defensive position. It appears that this gap at Monastir was lightly defended by small Greek forces. Main Greek forces were engaged with Italian troops to the west in Albania. Main British forces were engaged with German columns to the east in Thrace. This disposition of Allied forces had been made dependent upon the ability of the Yugoslavs to delay the initial advances of the German columns operating in the direction of the Vardar river.

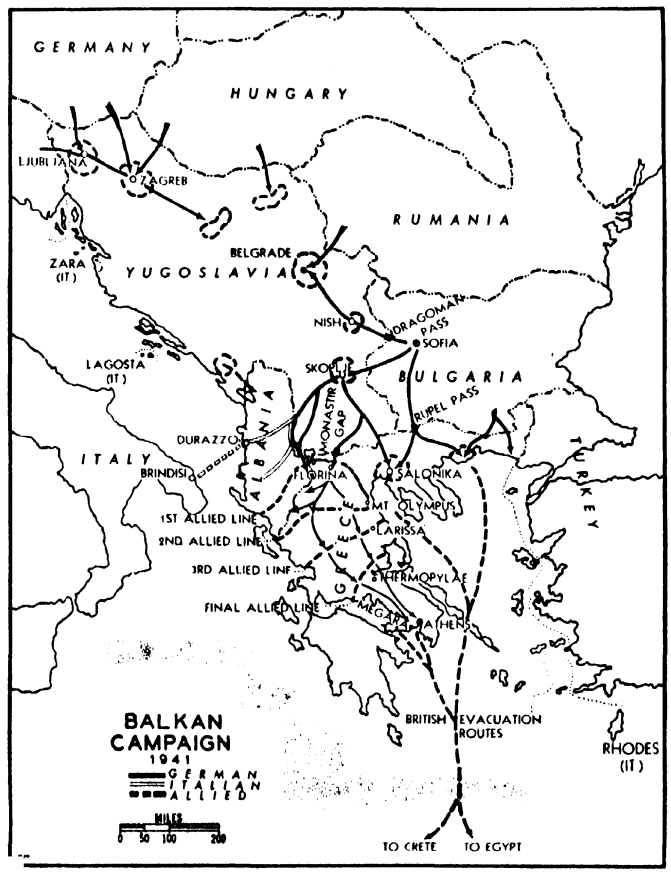
On April 9 the British forces, principally made up of Australians, reinforced the Greek garrisons in the Monastir gap area. By April 11 it was evident that this position was untenable and during the period April 11–14 the defensive action was withdrawn first to a line running to the west from Mt. Olympus. When the flank and rear of this line was threatened, a second withdrawal was made to an area around Thermopylae. Here the New Zealand forces held the right (east) and the north of the line, while the Australians held the left (west) flank. For a period of about one week, British forces had been required to fight without substantial assistance from the Greeks. On April 21 the Greek forces capitulated in the west. The result was that large German forces were released for attack against the British position.

During the period April 22 to April 24, the British forces fought a stubborn defense in the vicinity of Thermopylae. The German control of the air and the constantly increasing strength of armoured and mechanized forces made the British position hopeless. The British plan for evacuation was carried out successfully but with considerable losses. During the hours of darkness on April 24–26, the British reported that 19,000 troops had been evacuated from the port of Megara west of Athens. On the third night, 16,000 were evacuated. Further evacuation was less successful, although small forces were cleared near Peloponnesus where more than 700 were rescued. At the close of the campaign, British claims indicated that from all sources about 45,000 had been evacuated from the area. By May 1 the major hostilities had ended and minor actions consisting of local guerrilla warfare in remote Albanian and Yugoslavian mountain districts, and mopping up actions along beaches and within scattered villages, were continuing.

Summary: The Balkan campaign began on April 6, 1941 and major operations were completed in about three weeks ending with the British evacuation by May 1, 1941. Results indicate that the German objectives were achieved in all particulars, while the British and Greek forces, as well as the Yugoslav troops, suffered complete defeat. For Yugoslavia the results of two-day combat found the effective defensive power of the nation scattered and the organized forces rapidly disappearing. Political weakness had prevented unified action, and revolts within the state precluded the adoption of a strong defense. The military operations were brief, but according to nazi reports more than 300,000 Serbian prisoners had been captured. It is difficult to estimate results alone in the light of military values. The Yugoslav capacity to resist had disappeared. No organized army existed to defend the country. The area occupied afforded Germany not only strategic security, but also specific if limited supplies of raw materials, control over all available industrial potentials, and considerable booty in the form of modern war equipment. Yugoslavia lost control of the Adriatic coast line to Italy, and faced the necessity of supporting both Italian and German occupation forces controlling all military objectives within the state. On all fronts, military, political and economic, the Yugoslavs lost national identity.

Greece lost heavily in the Balkan campaign. After months of valiant defense against Italy, and at times approaching the possibility of victory over this invader, Greece was overrun by strong German invasion forces. Germany claimed more than 200,000 Greek prisoners and considerable war equipment. Along with Yugoslavia, bewildered within and rapidly defeated from without; Bulgaria, overrun without resistance and weakened by failure to achieve unity; and Rumania, long since subject to nazi control; the small, unified, defiant Greek nation, whose brave struggle had won the praise of democratic peoples and the support of the British, fell before superior force despite valiant efforts to resist.

The British lost the great opportunity to secure a base on the continent from which future attacks might be launched against Italy and Germany. The loss of an ally, Greece, was secondary in military importance so far as strength in numbers and equipment was concerned. This loss was of primary importance so far as the strategic value of the Greek land and sea areas was concerned. In addition, the unstable character of the governments in Rumania, Bulgaria and in Yugoslavia, all subject to the control of the most powerful invader, might have been swung to the side of the Allies if the British had been able to repulse and eventually advance north-



ward against Germany.

The official British reports on the campaign claimed no more than 60,000 as a total for the forces involved in the campaign. The British claimed about 45,000 had been evacuated, indicating over-all losses of about 25% in manpower. Of this potential loss, the German claims indicated approximately 9,000 British had been taken as prisoners.

British naval losses were admitted to include a destroyer, an escort vessel and four transports. This indicates about 30,000 tons. Considerable armoured equipment was lost, and although claimed to be destroyed before falling into German hands, all abandoned equipment was lost for British use. British available air forces had been small and the relatively few planes in action had been destroyed or withdrawn.

Germany claimed over 500,000 prisoners, 500,000 rifles, 1,000 guns, thousands of machine guns, vehicles and large amounts of ammunition. More than 300,000 tons of shipping constituted the German report of Allied losses in naval and air warfare. Germany admitted losses of 300 officers and 5,000 men killed, wounded or missing in action.

The military action appears to indicate the following factors contributing to German success:

a. Concentration of well-balanced task forces—even including specially prepared mountain troops—adequate in strength and equipment, trained and organized for a particular mission and operating under a single commander.

b. Close and continuous co-ordination of all air-ground operations.

c. Battlefield mobility and the rigid adherence to the single over-all mission—the relentless pursuit, encirclement and ruthless destruction of the main forces of the enemy.

British failure is indicated by:

a. Lack of adequate strength and subsequent inability to organize a co-ordinated defense.

b. Lack of equipment, particularly in air forces.

c. Inadequate naval strength, preventing replacements of men and materials.

The final results of the Balkan campaign indicated a strong advance by still victorious German armies, the acquisition of valuable territory for supplies, the denial of any land-base area to Britain and her allies on the continent and the German approach to the Suez and eastern Mediterranean. As for the British, it might be said that when faced with a difficult choice, they exercised wisdom in sending a token force to aid Greece and at the same time to gamble for bases for future operations. As it turned out, the gamble was lost and the token force was of no value, except to give a semblance of honouring treaty obligations.

B. Crete.—The German conquest of Crete was accomplished during the period May 20–June 1, 1941. A military analysis of the campaign indicates that the outstanding military development was the employment of air forces in this operation. Reports indicate that this was the first occasion in military history of the transportation, supply and support of an expeditionary force by air against a position defended by superior naval and land forces. The nations involved in this campaign include Germany, Italy, the British empire and Greece.

1. Objectives: The German army sought to secure a land base in the Mediterranean for air operations against Allied fleet operations, against land bases and sea bases in North Africa and the Suez canal, and in support of axis land operations in Libya. Secondary objectives included the denial of a land base to the British for air operation against German-controlled oil fields in the Balkans, against axis fleet operations along the island route from the Black sea to the Adriatic, the opportunity to further political pressure on Turkey to join the axis powers and the establishment of a base for any future military operations in the near east. The British objectives in this campaign appear to have been the defense of the island of Crete in order to deny the site to the axis powers, and to retain the military advantages which the island afforded the British and their allies.

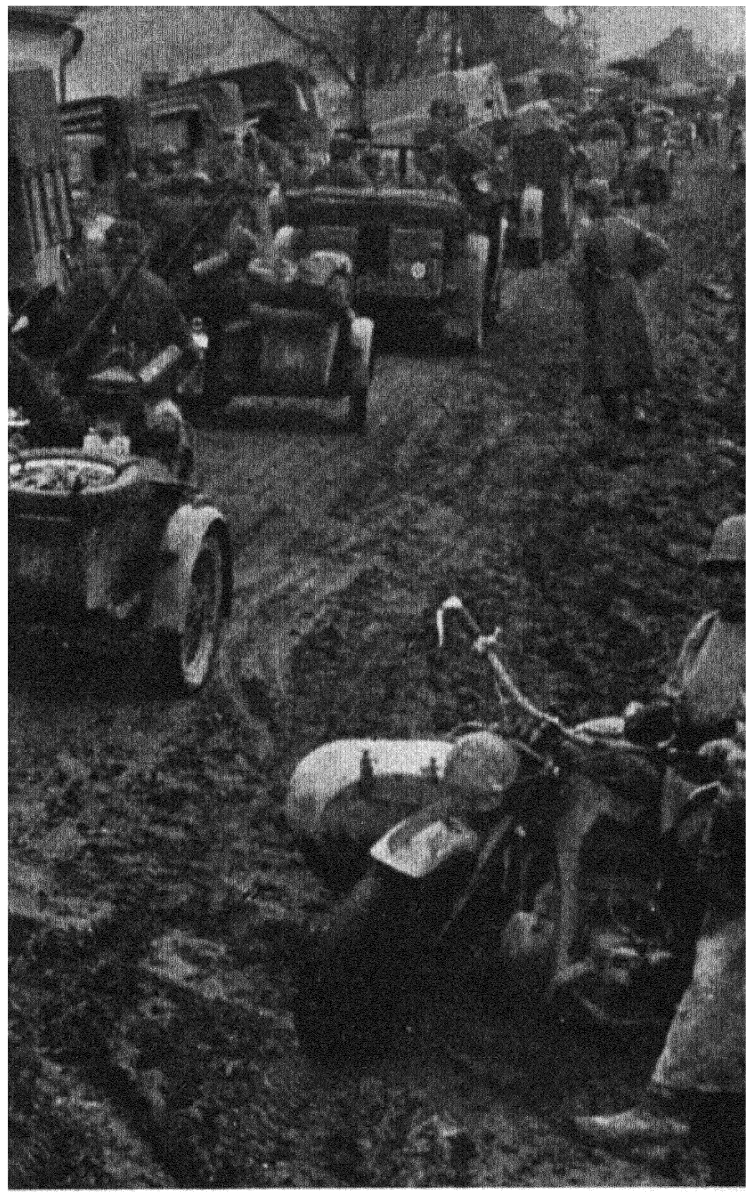
2. Plans: The German plans were based upon a principal reliance on their air forces to accomplish the objectives of this campaign. Early in May the German armies had completed the conquest of the Balkans. Adequate ground forces existed and supplies were considered ample for an attack against Crete. Naval forces were entirely inadequate. The final plan included an air attack against the royal air force to establish air superiority, the air operations against the royal navy to overcome naval superiority, air transportation of land forces to the theatre of operations, air support for landing forces and an air combat force to secure success for land operations. The outstanding element of this German plan was that all operations were placed under a single responsible commander. This meant that air, land and naval forces were to be employed as one man decided. This contrasts somewhat with the absence of a unified command in the British plan described below.

The British plans for the defense of the island of Crete included the disposition of ground forces to protect the airfields, and to protect the naval base at Suda bay. The British plan indicates that the defense was based upon maximum dispersion of available ground forces to defend likely areas of German attack, coupled with some reliance on small air forces and the limited employment of superior naval strength when operations permitted such use. It must be emphasized that all British plans were subject to the independent actions of the three separate and separated British land, air and naval commanders. These commanders were located in Cairo in Egypt. The naval commander during a part of the operations was in command of naval units with the fleet in the Mediterranean. The air force commander was in Cairo reorganizing air forces and taking instructions from the air ministry in London. The ground force commander was similarly in Cairo, reorganizing the British army in North Africa, and his higher headquarters directing his operations was also located in London.

Table I.—*List of Nations Engaged in War at the Close of 1941

The United Nations		The Axis
Australia	India	Albania
Belgium	Luxembourg	Bulgaria
Canada	The Netherlands	Finland
China	Netherlands East Indies	Germany
Costa Rica	New Zealand	Hungary
Cuba	Nicaragua	Italy
Czechoslovakia	Norway	Japan
Dominican Republic	Panama	Rumania
El Salvador	Poland	Slovakia
Ethiopia	Union of South Africa	
Free France	United Kingdom	
Greece	United States	
Guatemala	U.S.S.R. (Not at war with Japan)	
Haiti	Yugoslavia	
Honduras		

*Corrections have been made to Dec. 31, 1941.



NEITHER TORRENTIAL RAINS nor poor roads halted the southward roll of German panzer units through Greece in April 1941

3. Forces.—German forces have been estimated as follows from various British reports covering the operations:

	Approximately
Parachute division	5,000
Air infantry troops	5,500
Mountain division	5,000
	15,500

An over-all estimate of the German strength indicates a grand total of approximately 18,000. The equipment of these forces is reported to have included light artillery and some motorcycle transportation. Reports of operations by German light tanks were not confirmed. It is likely that the Germans employed commandeered transportation secured after making successful landings. The outstanding characteristic of the German forces was the number of aircraft employed. Various estimates have been based upon published reports of the operations. An approximate figure indicates that the Germans used about 1,500 planes of all classes including gliders. About 50% of this total represented transports. The balance included fighters and bombers in about equal proportions. This composition of the German forces and the organization of the air equipment represented an advantage over the British defense organization and equipment.

The British reports of the operations indicate that the original garrison was approximately one brigade of around 3,500. In addition, there were

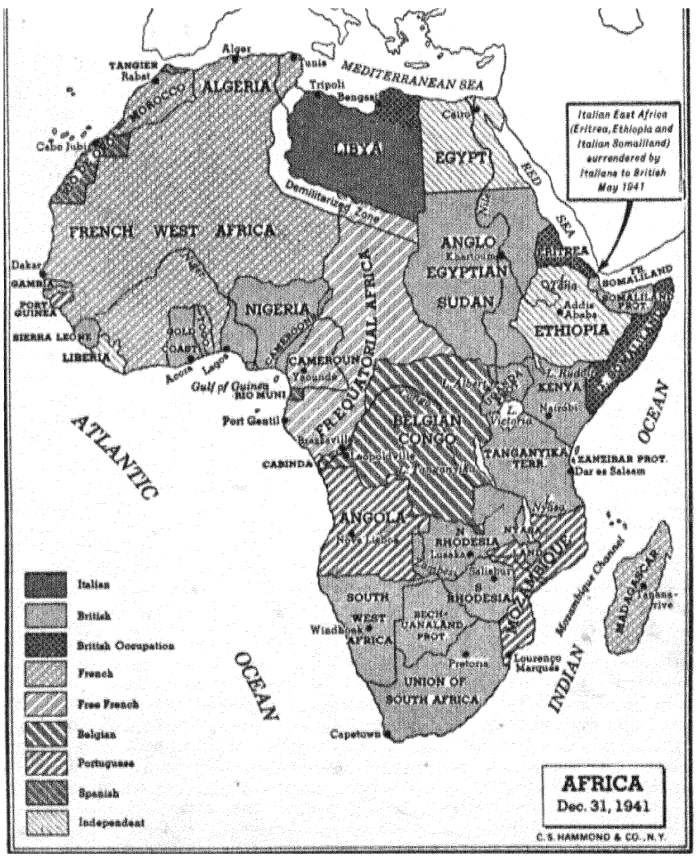
some Greek detachments of smaller size. Following the evacuation of Allied forces from Greece, large numbers were added to the original garrison. These troops included the Australian, New Zealand, British and Greek forces which had been engaged in that campaign and some marine and naval units which had successfully evacuated these troops. From various sources the size of the defense forces at the opening of the Crete campaign are estimated as follows:

British forces, including New Zealand, Australian and marine troops	23,000
Colonial troops, including Crete and near east	4,000
Greek forces	10,000
Approximate total	37,000

It must be remembered in any consideration of this estimate that these forces did not represent organized combat troops. The total does represent components of all classes, the bulk of forces recently arrived from participation in the Balkan campaign, and all hastily organized into position defenses along the north coast. In equipment these forces were sadly lacking essential items required for defense. Heavy artillery, tanks, transportation, barbed wire, tools for hasty fortifications, harbour defense installations, all were limited in amount. The outstanding contrast between the British forces in Crete and the German forces was the size of the air forces. No authorized statement of totals was available but from reliable sources it is believed that the British had less than 50 planes in Crete during the operations. Some of these planes had been in the Balkan campaign, some were stationed in Crete and a few were reported to have operated from British airfields in Egypt. Reports of operations clearly indicate great inferiority in air forces. Naval forces were superior in strength to German and Italian naval units. Reports indicate that during operations, the British fleet lost six vessels and suffered damage to several more naval units. No totals were given, but in effect the relative naval strengths of the opponents show far greater superiority for the British.

Operations: The initial phases of the German operations included the concentration of German men and matériel at selected sites along the Greek coast, and on Italian-controlled bases. Bomber and fighter planes were assembled at Greek airfields at Menеidi, Eleusis, Argos, Attica, the Peloponnesus, Italian Rhodes and the Aegean islands. The actual full-scale combat operations were preceded by extensive air reconnaissance and two or three days of heavy bombing against Crete anti-aircraft defenses. The result of this initial phase was that the Germans established air superiority, discovered the size of resistance in Crete, and reduced naval resistance in Suda bay. The actual objectives on the island of Crete were the airfields in Maleme, Retimo and Herakleion. In addition to these objectives, the marine base at Suda bay was another important target.

The German landing attack was reported as beginning early in the morning on May 20, 1941. The actual landing of parachute troops was preceded by several hours of intensive air bombing attack and machine-gun attack by low-flying planes. These attacks succeeded in forcing defenders inside defensive positions and opened the way for parachute landings. About 2,000 parachute troops were dropped near airfields in the vicinity of Maleme. In addition to parachute troops, air-borne infantry was landed from towed gliders. These gliders, carrying 12 men each, were towed by transport planes. Each transport plane towed two or sometimes three loaded gliders. Gliders were landed on level stretches of ground along beaches or near airport sites. They were reported to be about 50 ft. in length with a wing span of 80 ft. It appears that none was equipped with a motor although there were reports of outboard motors for use after making landings in harbours. Armament consisted of one machine gun mounted on the wing. All men carried in the glider landed with full equipment, and small infantry supporting weapons (light mortars, machine guns) were carried with them.



Parachute troops appeared to follow the normal procedure observed in other German actions of this type. Personnel and supplies were dropped in chutes of varying colours. The release of parachutes was begun close to the ground, reported heights averaged about 300 ft. Casualties were reported to be heavy when landings were attempted close to defensive positions. Other landings, more distant from prepared defenses, were more successful. By morning of the first day, the parachute and glider troops had landed and succeeded in capturing the Maleme airfield. The result of this success was that larger forces were landed by transport planes on the captured airport. Thus the first objective, capture of a landing site, had been accomplished in daylight hours. Late in the afternoon of the first day (May 20) additional parachute landings were made near airfields in the vicinity of Retimo and Herakleion. Estimates indicate that about 4,000 such troops were dropped in these actions. These operations were not successful and British defenses succeeded in retaining the airfield objectives. The principal result of the German action here was that without actually capturing air landing sites, the German forces prevented British troops from moving to the east to the aid of the garrison at Maleme. Later German action of ground forces moving eastward from Suda bay resulted in the loss of Retimo and Herakleion by the British.

On May 21 and 22, continued German action at Maleme succeeded in driving the British to prepared positions near Galatas. Overhead, both day and night, the air combat forces continued relentless bombing attacks on known defenses. Meanwhile the parachute forces discovered and notified air forces of the location of other land and air defenses. Superiority in the air and the capture of the air landing site permitted the landing of mountain division forces. The objective was to clean up British defenses in the western part of the island and then drive to the east in the direction of Suda bay. Reports on these air landings indicated that motorcycle detachments were included in the air-borne troops and also that light anti-aircraft and anti-tank batteries were landed at this time. All German operations were successful, the western end of the island was cleared of opposition and preparations were made to begin a strong offensive from the Maleme area to the east in the direction of Suda bay.

On May 23 and May 24, German operations began along the western coast against the British fleet. The objective of the British fleet was to prevent naval landings by the Germans. The results of the German and Italian attempts to land by water-borne transport were disastrous. No official figures are available, but the British reported success in preventing the landings and achieved the principal objective of the British fleet. It followed, of course, that the British fleet had taken a decided risk by exposing naval units without adequate air protection to attack by superior German air forces. The result of the inevitable German-British air-naval engagement was disastrous for the British. Six naval vessels were admitted to have been lost and a great percentage of the British fleet engaged in these operations was severely damaged. The decision was finally reached that the naval forces could not continue to operate against the superior air force, and the fleet was withdrawn on May 23.

These air and naval operations permitted the Germans to continue land operations against defense forces unable to secure naval or air combat assistance. Meanwhile, German action alone had resulted in the destruction of nearly all the British air forces available. Another decision to withdraw was made, and the few remaining British planes were ordered to return to Egyptian bases. Complete isolation resulted for the besieged British forces in Crete. On May 27, Canea fell. On the same day a small Italian force, estimated as a regiment, landed by boat at Sitia in the eastern end of the island. The next day this force began to move in the direction of Herakleion. All the British defense was now at the mercy of superior forces. Around Canea, the British began to withdraw to the south coast to effect an evacuation from Sphakia. German forces pushed to the east to Suda bay, and to Retimo. Junction was made at Retimo, and later at Herakleion, with the parachute forces landed in these areas earlier. Pursuit of the British forces continued to the south, and considerable fighting took place in the mountains north of Sphakia. The main British forces succeeded in retreating from the island, although air attacks on naval units resulted in the loss of several transports. By June 1, 1941, the loss of Crete was conceded, and German and Italian forces continued to consolidate gains and mop up the remaining isolated and weak resistance on the island.

Summary: German losses reported by the government admit a total of 5,893. British forces lost 12,920 while successfully evacuating 14,580. Germany claimed over 12,000 British prisoners. The brief operations secured for Germany all of the objectives of the campaign. A land base had been secured in the Mediterranean for operations against the British fleet and in North Africa. The oil fields of the Balkans were made more secure against Allied air attacks, and axis shipping from the Black sea to the Adriatic was less vulnerable to both air and naval attack. Turkey was forced to reconsider political action in relation to the axis, and Germany had secured a potential base of operations for future military action in the near east. In the tactical field, Germany had attempted and succeeded in organizing and launching the first all-air-controlled invasion of a land base defended by superior land and naval forces.

The British had lost a valuable position in the Mediterranean, from which her fleet and land bases in Egypt were vulnerable to attack. British air forces were denied desirable sites for air attack against axis-controlled shipping. Political prestige was lost, insofar as the near east and Turkey were concerned.

The air invasion consisted principally of air-borne ground forces prepared to fight on land, with the co-ordination of air support. Most important was the element of surprise, both as to the time of attack and the method employed. A military analysis cannot fail to emphasize that a paramount lesson of this campaign was the German organization of a task force equipped with adequate means to accomplish a specific job, all forces within it being under a single responsible commander.

C. East Africa.—The campaign in East Africa involved the British empire forces and the Italian armies. The scene of the operations included

BRITISH TROOPS charging through a smoke screen during the second Libyan campaign, which began Nov. 18, 1941

Eritrea, British Somaliland, French Somaliland, Italian Somaliland, Ethiopia, the Anglo-Egyptian Sudan and Kenya Colony.

1. Objectives: For the British, the principal objective in this campaign was the elimination of the Italian armies in East Africa. Other objectives included the protection of the Suez canal, the recapture of British Somaliland, the invasion and capture of Eritrea and Italian Somaliland, the restoration of Ethiopia, and the control of French Somaliland. The realization of these objectives would in turn present additional objectives which concerned the release of empire forces for duty in the northern African theatre and on other fronts. The Italian objective was to retain control of all Italian possessions in East Africa and to adopt an offensive against the British, wherever and whenever the situation would permit. A desirable objective for offensive action was the Suez canal.

2. Plans: The result of the operations indicated that the general plan adopted by the British was to cut off the western area of Eritrea, cut off the southern area of Italian Somaliland, then converge forces within Ethiopia, find the main opposition and destroy it.

The Italian general plan included the defense in strength of positions in Eritrea, principally in the vicinity of Cheren, combined with defense along the Juba river in Italian Somaliland, the protection of the railroad from Addis Ababa to the coast and the defense of the capital, if that became necessary. Apparently no Italian naval action could be planned. It also appears that no definite plan of operations was made for the resumption of offensive action outside of the area under Italian control.

3. Forces: The British forces included large numbers of Indian troops, described as Moslems, in addition to colonial forces from Egypt, the Anglo-Egyptian Sudan and Kenya Colony. Some Australian, New Zealand and South African forces participated; and in addition to British ground and air forces, units of the royal air force and the British fleet took part in operations. No reports were available as to the total number of all forces. It appears that the British were superior in numbers to the Italians in Eritrea, and it is estimated that the total of British strength was approximately 40,000. In other theatres, principally in the Kenya, Italian Somaliland and southern Ethiopian operations, the British forces were smaller and an estimate of total strength approximated 30,000. Equipment appears to have been excellent. Motor transportation operating in rugged terrain had to be in good condition, and a considerable quantity had to be available for replacement of losses. Mountain artillery was employed, and some motorized guns and weapon carriers, as well as armoured scout-car units were used. Air action for observation and bombing was reasonably superior to the Italian.

Italian forces in all operations varied in strength depending upon the location of the action. In the north, in Eritrea, it is estimated that Italian strength did not exceed 35,000 of all arms. In Ethiopia larger forces of approximately 50,000 were known to be engaged. Outpost garrisons near Lake Tana, west of Addis Ababa, and near the Kenya border were estimated at 15,000 total. In Italian Somaliland, reports indicate that about 10,000 organized troops were engaged in defense. An estimate of total Italian strength indicates approximately 110,000 total, although it is believed that not all forces took part in the operations. A considerable percentage of Italian strength was represented by the native Ethiopian forces. Some 30,000 to 40,000 of these had been organized and trained by the Italians. These are considered as additional forces to the estimated total for Italian troops. Equipment appeared to be excellent in artillery and in motor transportation. During operations no replacements could be secured, and both supplies and equipment suffered as a result. Large numbers of captured weapons indicated that old equipment had been put into use and that the modern equipment had been lost or worn out. Some Italian air forces operated, but no information was available on the condition of equipment used or the numbers involved.

Operations: During the last week of January, 1941, British forces operating out of Kassala in the Anglo-Egyptian Sudan invaded Eritrea and advanced to the town of Biscia, at the western end of the railroad leading to Massawa on the seacoast. Italian defense lines were outflanked and the British captured the railway terminus. This invasion was combined with simultaneous patrol action from several points along the Anglo-Egyptian Sudan frontier into Ethiopia. Patrol action also was begun from Kenya Colony into Ethiopia and Italian Somaliland. During the first week in February, the British forces in the north advanced from Biscia to Agordat, an important city at the junction of the Addis Ababa highway with the railroad to the seaport of Massawa. The Italian defense was light and after a short engagement, the main forces retreated into the mountains and the British captured the town. About 1,500 prisoners were taken and some animals. It became apparent at this time that the British plan to use native Indian troops had been wise. The Indian forces fought well against the Italians and it appeared that their advance was welcomed by the natives. Meanwhile in the south a small force from Kenya embarked in small schooners and motor boats and made a successful naval attack against Ras Chiamboni on the coast of Italian Somaliland. Some Nigerian troops were reported in this action. Border raids continued on all fronts. Late in February, the action in the north had continued and the British had besieged a large Italian force in the city of Cheren. The British plan to cut off Eritrea was dependent upon the capture of this important centre. Elaborate plans were made to surround the defenses, and a stiff engagement was anticipated. In the south, South African troops pushed along the coastal roads in Italian Somaliland and captured Chisimaio on the Indian ocean. In this operation, small naval units, including air forces, lent assistance. The result of this operation gave these forces an opportunity to prepare for further action against the capital, Mogadishu. Before the end of the month, a crossing had been made over the Juba river and the road to the capital was open to the invaders. After two days of extended marching, the British forces reached and captured Mogadishu and Italian Somaliland was lost to Italy. The British claimed about 9,000 prisoners. Small forces secured the capital and columns were sent to the north to join other forces invading Ethiopia from the southeast. The result of these operations realized one of the British objectives, the separation of the southern Italian colony from Ethiopia. Considerable satisfaction was evident because of the fact that British Somaliland, still in Italian control, was less than half the size of the most recent British capture of Italian Somaliland.

During the first three weeks of March, invading British columns from Kenya joined forces with British troops operating north from Dòlo in Italian Somaliland and captured Neghelli in southern Ethiopia. These columns prepared to move to the north against the capital, Addis Ababa. Larger British forces which had invaded Ethiopia from Italian Somaliland succeeded in reaching Jijiga about 50 mi. east of Harar. This operation opened the way to attack against the important capital-to-the-sea railroad which joins the highway running north from Harar. In the north Cheren still held out against strong British pressure. It became evident that ground forces alone could not succeed against stubborn Italian defenses. Plans were made to secure co-operation from the royal air force. In the Gulf of Aden, British naval units succeeded in attacking and recapturing the capital of British Somaliland, Berbera. While the main area of this colony was still under Italian control this action assisted ground forces operating in Ethiopia by keeping Italian troops engaged to the east.

In the last week of March the city of Cheren in Eritrea fell. The British plan to secure air co-operation had proved to be successful. The air operations broke the defense strength of the Italians and ground forces were able to move forward and capture the city. It was estimated that 30,000 Italians had been engaged in this operation. The bulk of the main forces retreated to the vicinity of the capital, Asmara, and to the south into Ethiopia. The British continued to advance with the object of completing the operation and securing control over all of Eritrea. Naval forces moved in closer from the Red sea and tightened the blockade around Massawa on the coast. In Ethiopia, the city of Harar fell on the same day Cheren was captured in the north. Italian resistance at Marda pass near Harar had been light and the British forces moved rapidly to Diredawa on the railroad. The capture of Diredawa broke the rail connection between the capital and the coast, and forced the Italian troops to move to the west toward Addis Ababa.

Early in April, the main Italian resistance collapsed on all fronts. In the north the British captured Asmara and occupied the port of Massawa. The control of Eritrea was completed and large British forces had invaded Ethiopia, moving south through Aduwa. The capture of Aduwa, scene of the Italian debacle in 1896, was accomplished by British forces, hurrying to complete the operations to the south around Addis Ababa. British forces moving west from Diredawa along the railroad had met little resistance at the Awash river and without any serious resistance took the capital, Addis Ababa. These forces had advanced rapidly and reports

indicate that the movement was made at the rate of 25 mi. per day. The bulk of the main Italian forces retreated to the mountains. The Italian commander, the duke of Aosta, with a force of about 40,000, including some 30,000 native Ethiopian troops, took up a defensive position near Amba-Alagi. Peace terms were offered by the British but were refused and the converging British forces joined at Addis Ababa and completed the main operations. The principal objectives of the campaign had been accomplished and complete control was won when the remaining Italian forces surrendered during the second week of May.

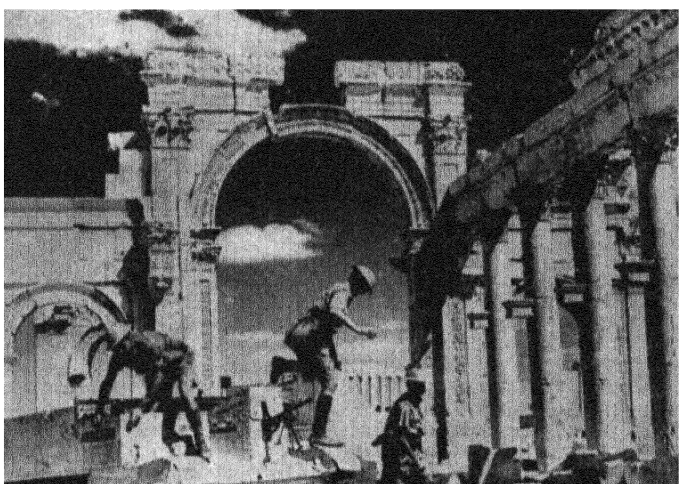
Summary: The successful conclusion of the East African campaign resulted in considerable gains for the Allies. The principal objective, the elimination of the main Italian armies in East Africa, had been accomplished. Eritrea, Ethiopia and Italian Somaliland had been won from Italy. British Somaliland had been recaptured. Along the Red sea, the Gulf of Aden and the East African coast Britain had secured the ports of Massawa, Berbera and Mogadishu and controlled the port at Jibuti in French Somaliland. The Suez canal was secured from southern attack. The British naval operations from the Indian ocean to the Suez were rendered secure from Italian attack. Large British forces in Kenya and the Anglo-Egyptian Sudan could be released for duty in other theatres. A considerable number of prisoners had been taken and some useful supplies of ammunition, guns and other weapons secured. Politically, the British gained considerable prestige and the return of the emperor, Haile Selassie, to the control of Ethiopia, augured well for the future. British naval and air units had managed to get and give co-ordinated aid when and where needed. Although unity of command had not been tried, the results had been satisfactory and the operations successful.

On the Italian side the results had been disastrous. Large forces had been captured and considerable supplies destroyed or lost. The colonies had passed out of Italian control and practically all Italian identity in East Africa seemed to disappear. The success won by Italian arms against Ethiopia and the dream of African empire appeared to vanish with the defeats suffered at the hands of the Allies. The axis cause had lost a valuable area of operations and now faced Allied forces in Africa, refreshed by victory and strengthened by the release of forces from East Africa.

D. The North African Campaign: (a) First Phase—British (*Jan. 1-March 31, 1941*).—The nations engaged in the North African campaign during these months included Italy, Britain and Germany. In addition to the British force from England, other Allied forces included Moslem Indian troops, New Zealand and Australian forces, and the native and colonial troops from French Equatorial Africa, under control of the Free French government. The action during the first three months was confined principally to the Egyptian and Libyan coastal area and the operations were mainly the result of air and ground forces, assisted by some naval activity along the Mediterranean shores.

1. Objectives: The British objective was to drive the Italian forces out of western Egypt, to continue the attack to the west along the Libyan coast, and to destroy the Italian Libyan army. Secondary objectives included the capture of additional port facilities for the British Mediterranean fleet, the extension of British air bases in northern Africa for use against axis naval supply lines and against the Italian mainland, the removal of any threat by Italian forces to the British forces in the Anglo-Egyptian Sudan, and the union of British and Free French forces operating from the Lake Chad area in French Equatorial Africa. Aside from these military and territorial objectives the British also sought to secure the left flank of their land forces along the northern African coast and thus establish security for the Suez. The British initiated operations in North Africa in Dec. 1940. These activities continued through the early months of 1941.

The Italian objective appeared to be the logical assumption of the defense of all gains made within the Egyptian area, plus the defense of the colony of Libya, and maintenance of the effective strength of the Italian Libyan army. Secondary objectives appeared to include the resumption of the offensive against the weaker British forces whenever opportunity permitted, and the opportunity for hardening the newly acquired increased manpower of the Italian army. Italian success would strengthen the home front support of the Italian efforts in North Africa, hearten the Italian forces engaged in Ethiopia, establish increased prestige for the Italian forces in the view of the nazi military leaders and in the eyes of the native populations of Africa and the near east. The principal objective of defense was of course paramount, but the possibilities of success offered the secondary objectives as rewards.



BRITISH TROOPS scouting the ancient ruins of Palmyra during the Syrian campaign of June–July 1941

General military comment on the individual objectives of the opposing forces appears to agree that the British high command had initiated the early action beginning in Dec. 1940 with a vision of testing the strength of the Italian defenses near Sidi Barrani in Egypt. The rapid disintegration of these forces in the face of the first British attacks suggested the prompt assumption of a full-scale offensive.

2. Plans: The British plan of operations appears to have been a straightforward advance to discover the principal Italian opposition followed by a rapid "pincer" or encircling manoeuvre and the swift destruction of the enemy forces. The plans included the co-ordinated action of all arms in the air and on the ground, combined with naval action from coastal waters by units of the British Mediterranean fleet. Considerable attention had been given to Italian defensive works, and elaborate plans existed for the siege and reduction of any extensive defensive positions.

The Italian plans do not appear to have been either well prepared, or if prepared, followed in sufficient detail to warrant extensive examination. Plans for the preparation of defensive works appear to have been elaborate and well executed insofar as the actual locating and construction of works were concerned. No general plan for wide-scale defensive operations along the whole Italian position appears to have existed.

3. Forces: In Dec. 1940, it was estimated that the Italian forces in North Africa numbered close to 250,000. In addition, the Italian army had a minimum of 300–350 planes. Armoured forces included both medium and light tanks, while other mechanized equipment included light-weapons carriers. All arms were represented and the bulk of the combat ground forces were reported to be light and heavy artillery, with anti-aircraft, some anti-tank defenses and considerable ground infantry divisions with extensive motor transportation. It is estimated that only small Italian naval forces were considered available for operations along the coastal waters of the Mediterranean during this part of the North African campaign.

British forces, consisting of Australian and New Zealand troops, Indian troops and British colonial forces, numbered approximately 100,000. No official figures indicate the total planes available but it is calculated that not more than 100 planes were later reported in action during the campaign. These forces were not supplied with modern equipment and while not considered numerically a match for the larger Italian forces, were fully capable of launching an initial attack of great strength against advance Italian positions in Egypt. Adequate service troops were available to maintain engineer and water-supply needs. In the Mediterranean, the British fleet was well prepared to offer protection along the coast against naval attack, to assist in the protection of reserves advancing along the coastal highway, and to join in surface and air supporting action co-ordinated with ground operations.

Operations: The early part of the complete British operation began in December when initial offensives resulted in easy victories and the capture of Matruh and Sidi Barrani. On Jan. 3, 1941 the British launched the first attack of the new year against the Italian stronghold at Bardia. This Italian defensive position was estimated as a formidable obstacle to attack. It was estimated that about 45,000 Italian troops were engaged in active defensive preparations. Outside the stronghold more than 50 strong points had been constructed along a 17-mi. semicircle. Concrete tank traps had been built, carefully laid barbed-wire entanglements had been built, and large numbers of guns of all calibres had been placed in tactical defense positions. Within gaps, extensive land mines crossed likely areas of tank approach to the main positions. The operation began with severe British air attacks ranging as far to the west as Castel Benito and Tripoli. The Australians began land operations by making an initial feint attack 4 mi. south of the city and then launched a principal attack from the southwest. Immediately on breaching the outer circle, the attacking troops swept to the right and left and attacked the remaining positions from the flank and from the rear. On the first day, British reports claimed 5,000 prisoners. During the first night, naval vessels moved into coastal waters and subjected the Italian defenses to severe naval bombardment. At dawn, these vessels moved to the west of the town and from close-in positions bombed the highways and routes of possible retreat available to the Italian garrison. On Jan. 4, the second day, a fresh land attack was launched by the British from positions north of the city and by nightfall an additional 3,000 prisoners had been taken and no real obstacle stood in the way before the attacking troops. At sunset, the Italian flag was lowered and by 1.30 P.M. on Jan. 5, 1941 the Italian forces in Bardia surrendered.

Summary: In 2½ days British forces had advanced from Matruh and Sidi Barrani, launched an attack against a formidable defensive position, defeated a superior Italian garrison, and captured the city of Bardia. About 40,000 prisoners had been taken in the early campaigns east of Bardia. About 45,000 more were added at Bardia to the growing list of Italians in British hands. The Italian forces had apparently underestimated the full strength of the British attack and when this was realized, only a partial defense of Bardia had been made.

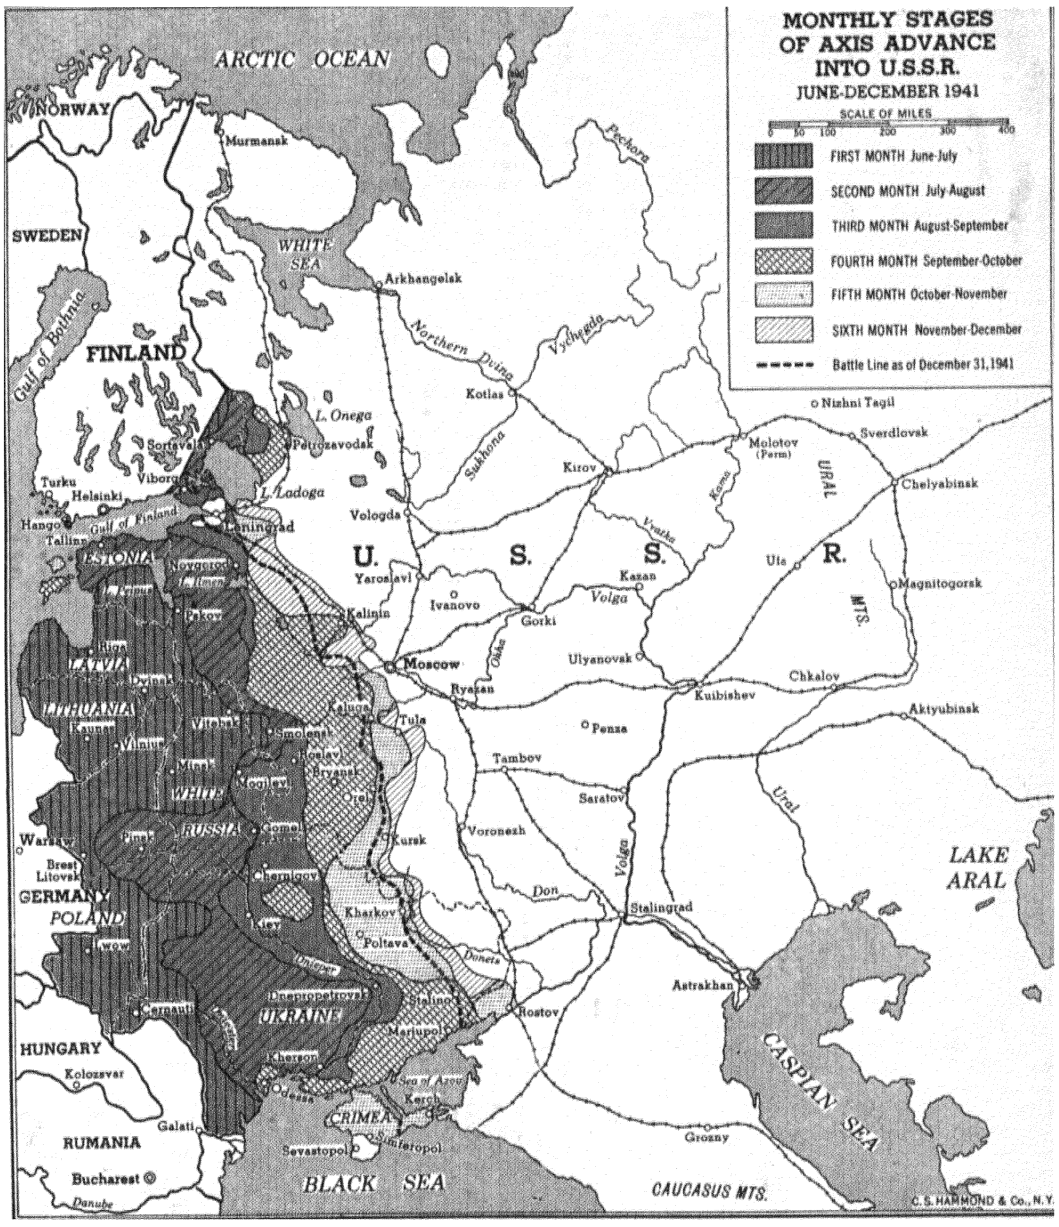
The final Italian action appears to have been an attempt to cover the withdrawal of forces to the west in the direction of Tobruk, coupled with some attempts to destroy stores and to delay early British pursuit.

(*a*) *Tobruk:* The next British objective was the defended Italian position at Tobruk, about 70 mi. west of Bardia. Ground operations began with prompt organization and dispatch of columns west and south from Bardia to take up encircling positions around the city of Tobruk. Overhead the air forces undertook the bombardment of Gazala, Derna, Tobruk, and Tripoli on the African coastline, while long-range bombing missions were carried out against Taranto, Palermo and Naples. The objectives were twofold: first to reduce Italian counterattacks by air and to weaken ground defenses, and second, to harass supply points and to delay waterborne transportation from Italy to the armies in Libya. British naval units meanwhile had moved to the west and continued to bomb coastal roads leading to Tobruk and to engage Italian naval units engaged in protecting

supply routes.

For a period of about two weeks the British forces continued to move into advanced positions, preparing for the final assault. Ground forces took up positions all around the outer defenses of the city. Meanwhile some advance units slipped by the position and reached Bomba, 60 mi. to the west of the city. Overhead the air forces continued to carry out bombing missions, while the fleet stood by to render co-ordinated support. The main British forces were massed east of the town to launch the principal attack. As at Bardia, the attack on Tobruk opened with a feint assault, followed by a principal assault. This time the feint attack was delivered from the east where the British had taken up positions near the seacoast. The principal attack was launched from positions near the Bardia-Tobruk road at dawn. The attack was successful, and several gaps were opened in the outer circle of fortified defenses. Troops poured through these openings and turned at once to roll up the flanks and capture several additional positions from the rear. The same process was repeated against the inner circle of fortified positions. By sunset on the day of the attack, an advance of 8 mi. had been made and British forces had penetrated at all points and occupied the high ground overlooking the city. Overhead since dawn the combat aviation had co-operated with the ground forces. Planes were destroyed on the ground in attacks upon Italian air bases at El Adem, El Gubbi and El Gazala. Other air attacks were made at Benina near Bengasi. Naval craft in the harbour at Bengasi were attacked from the air. The British reported that Italian air bases as far west as Derna appeared to have been abandoned. The combined British efforts resulted in the fall of the city of Tobruk within 24 hours.

Summary: About 25,000 prisoners were added at Tobruk to the large numbers of the Italian Libyan army already captured. The result of the British victory added a third large Italian base and port along the African coast for future British use.



(*b*) *Derna:* This Italian position some miles west of Tobruk was not a heavily fortified city. No rigid defense lines had been constructed similar to those which had characterized the defenses at Bardia and at Tobruk. However, the terrain at Derna afforded excellent advantages to the defender and made the position very difficult for any attacking force. It is estimated that the Italian garrison consisted of about 10,000 troops with air forces and with mechanized columns and considerable artillery. The main Italian decision appeared to depend upon a choice of making a defense at Derna, where the Gebelel Achdar mountains rendered the position difficult to assault, or to withdraw without delay to Bengasi. Defense at Derna might result in a British drive across the Cyrenaica peninsula toward Bengasi, 250 mi. to the west, leaving the forces at Derna cut off. Any retreat from Derna to Bengasi, followed by a defense at Bengasi, posed the difficult problem of successful withdrawal over 500 mi. to Tripoli if the defenses at Bengasi fell to the British.

The British expected that the town of Derna would be deserted. Reports indicate that the British plan was to continue the westward push and that the Derna action was to be a secondary assignment to a small force. In fact, Derna was well defended. To the natural defenses around the town, the Italian force of 10,000 had added considerable artillery and were well equipped with tanks and small air support. The battle was short but intense. British forces, which were increased in numbers as the full extent of the Italian resistance became known, found considerable difficulty in capturing the main entrances to the city. Italian air forces were active. Italian tanks fought stubbornly. The defensive artillery was severe. Despite these handicaps, superior British forces succeeded and overran the Italian positions. On Jan. 30, the last defenses were silenced and the town was captured. A few thousand prisoners were added to the already staggering total in British hands. The balance of the Italian garrison withdrew in the direction of Bengasi.

(*c*) *Bengasi:* British forces quickly consolidated the position in the town of Derna and the British columns resumed the push toward Bengasi. The British plan of operations included the concentration of forces for the main pressure from the east, combined with a pincer movement from the south. The southern force moved to the vicinity of Soluch and southwest of Bengasi. It succeeded in cutting the Bengasi-Tripoli highway and then took up a position in readiness. Meanwhile the main forces concentrated for the drive from the east, opened operations with a heavy attack. The plan worked, and without meeting serious resistance the British managed to capture the town. On Feb. 9, 1941, the British reported, "Bengasi is in our hands." The action had included the pursuit of Italian forces from Derna to Barce, eastern terminus of the rail line to Bengasi. Italian forces had reached Bengasi over this line, but in insufficient time to organize and defend the town against the main British attack from the east. Retreating Italian forces from Bengasi met heavy resistance from the British pincer column moving up from the south and west. About 20,000 prisoners were taken. After the fall of Bengasi small British forces continued the drive as far as El-Agheila, a distance of 170 mi., and more than half way to Sirte on the road to Tripoli.

Meanwhile, in the southern Libya area, Free French forces had assembled secretly and joined small British forces. These units had overrun the axis refueling centre for planes at Cufra and captured the axis outpost and airport at Murzuk. Other raiding parties moved north from the airport along the Algerian frontier. Later reports claimed the capture of Ghadames about 300 mi. southwest of Tripoli and along a principal highway.

Summary: In two months since the campaign had opened on Dec. 9, 1940, the British had overrun the axis forces in Libya. Matruh fell on Dec. 9, 1940, and Sidi Barrani on Dec. 11, 1940. In 1941 the British, continuing the same operations, captured Bardia on Jan. 5, Tobruk on Jan. 21, Derna on Jan. 30 and Bengasi on Feb. 9. Over 100,000 prisoners had been taken and a considerable number of weapons of all classes. Large amounts of other supplies, including transportation, had been secured. The British plan of operations had been simple and effective. It could be summed up in one word—pursuit. The objective, the defeat of the Italian army in Libya, appeared to be realized, although despite losses the Italians still had large forces near Tripoli.

The results of the successful British operations indicated several gains for the Allied position in North Africa. The Suez canal had been temporarily insured from a large ground attack from the west. New naval bases had been secured along the Libyan coast and new air bases were now available for attacks against Italian ground forces as well as joint naval and air operations against axis naval units. The principal tactical development appeared to be the development of unified command within

the British forces. All operations on land and the bulk of air and naval assistance appeared to be under the control of a single commander. Where more than one commander was concerned, a high degree of co-ordination was evident. The completion of this early action in North Africa increased the prestige of the British forces and resulted in prompt need for reorganization and support for the Italian armies in Africa.

(b) **Second Phase—Axis** (*March 30-April 30, 1941*).—The same nations engaged in the first British campaign in North Africa were engaged in the second campaign. Germany played a small role in the early campaign but assumed command of axis operations during the second campaign.

1. **Objectives:** The principal axis objective was to regain the ground lost during the first British campaign and secure a favourable area for future operations to the east.

The British objective appeared to be wholly defensive: the protection of gains already made and the protection of the west flank of the Suez.

2. **Plans:** The axis plan appeared to be the concentration of mechanized forces including armoured scout cars, motorcycle troops, reduced size panzer or armoured forces, with tanks and motorized infantry. These ground forces were supported by adequate combat aviation. Following the transportation to and concentration of these forces in the theatre of operations, the plan included a rapid advance to the east to overrun the British garrison. It appeared that the axis plan was to avoid moving forces along the coastal areas where they would be subject to British naval attacks. The full extent of the proposed operations is not known. The results of the action indicate that the plan contemplated a drive across the Egyptian-Libyan frontier and the occupation of new defensive positions there as a base for future operations to the east. All plans included unity of command and continuous co-ordination of all air and ground forces. The British plans included a stubborn defense of all areas gained in the first British campaign. Reduced forces were to defend fortified positions, with naval assistance from coastal waters and such air assistance as was available. The extent of the plan appeared to include increase in existing forces by the addition of units released from operations in Ethiopia, and the prompt creation of a strong defensive position immediately within or along the Egyptian-Libyan frontier. In all cases, the British plan was to protect the west flank of the Suez canal. Apparently the plan did not include unified command of all forces available for operations.

3. **Forces:** Various estimates were made of the size of the German and Italian forces engaged in the campaign. Early estimates indicated German strength at 20,000 including small Italian forces. In addition, an estimated reserve of an equal number was reported in the vicinity of Tripoli. No final figures were available but it appeared unlikely that the combined axis forces, exclusive of reserves, numbered more than 25,000 during actual operations. British forces were far inferior in numbers to the axis forces. The commanding general in Africa at a later date attributed axis gains to the reduced numbers of the British in Libya and Egypt. Demands made upon the British for the campaign in the Balkans were announced as the reasons for the reduction of the North African forces.

Operations: The campaign opened with lightning speed when axis mechanized forces struck to the east against the most advanced British stronghold at El-Agheila. On March 24 this position fell and the axis columns pushed on to the east. On April 1, Marsa-el-Brega and Agedabia were captured, and on April 4 Bengasi was evacuated by the British and occupied by the axis forces. British reports claimed that there were no losses in completing the successful withdrawal from Bengasi. Three days later it appeared that the British plan was to withdraw to the east, perhaps to Egypt. On April 7 Derna was captured and valuable water supplies lost. On the same day an axis raiding party captured three general officers and some 2,000 retreating British forces near Mechili, about 50 mi. southwest of Derna. It was not clear at this time that the axis forces were moving on a broad front, but the extent of the raids made south of the coast jeopardized the British withdrawal. By April 8, axis forces were continuing to advance toward Tobruk and on the 9th it appeared that Tobruk was in danger. By the 13th the fortified position at Tobruk had been encircled and the British positions to the east were in difficulties. Axis columns swept beyond Tobruk and captured the post and Bardia, Ft. Capuzzo near the Libyan frontier and Sollum across the Egyptian border. It is estimated that one Australian division and one mechanized brigade, both reduced in numbers, were holding the fortified position at Tobruk. It was apparent that the British could still provision or withdraw this garrison by naval forces controlling the water route to the port. The factor of risk in regard to relative strength of air forces made the position difficult to defend. By April 15 it became apparent that the force of the axis drive had been expended, and the British forces were holding east of Sollum. British naval and air forces launched attacks against axis columns along the coast. Axis reports indicated that these attacks were repulsed. Around April 16 British reinforcements began to arrive from Ethiopia and defensive positions east of Sollum were strengthened. During the next ten days, British naval and air units attacked the axis base at Tripoli, and numerous air attacks were made along the coast. By April 22 it appeared that Germany had consolidated areas gained and adopted defensive positions west of Sollum while continuing to besiege Tobruk. On April 26 the axis forces launched a sudden raid east of Sollum and advanced as far as Bugbug. British forces withdrew in the direction of Sidi Barrani and appeared prepared to fall back to prepared positions as far to the east as Matruh. When axis forces suddenly withdrew to the west, the British counterattacked in that direction. A second axis raid met this counterattack and pushed the British some 25 mi. east of Sollum. By April 30 the situation appeared to have stabilized. The axis defensive positions were east and south of Sollum in Egypt. The British forward defenses were west and south of Sidi Barrani, with stronger defenses west and south of Matruh.

After April 30, action appeared to be confined to sporadic raids between the defensive positions and scattered air and naval action along coastal bases.

Summary: The conclusion of this campaign indicated that within two weeks axis forces had forced the British from positions gained during earlier British operations of eight weeks. The combined German and Italian forces had recaptured the ports of Bengasi, Derna and Bardia and encircled the British garrison at Tobruk. Defensive positions had been established within western Egypt and offered suitable areas for future operations to the east. In addition, considerable equipment had been captured, both British and some supplies recently lost by Italy. Axis bases in Sicily, as well as axis naval operations in the Mediterranean, were made more secure from Allied air and naval attacks. The British had suffered defeat within a brief campaign. Valuable port facilities were lost to the fleet. Air-base sites along the Libyan coast had been captured. Reduced forces in western Egypt were faced with apparently superior axis forces. In the final analysis, the west flank of the Suez appeared to be in serious danger. Some satisfaction existed in the consideration that the Tobruk garrison was still holding out and that British naval units still operated along the water routes to this port. In addition, axis naval units were obviously inferior to the British Mediterranean fleet. The British position in North Africa and in the eastern Mediterranean was in danger but still capable of strong defense.

General Sir Archibald P. Wavell (*q.v.*), British commander in North Africa, was quoted by the press in the following comment regarding these operations:

"Our conquests in Cyrenaica were left to be held by a garrison of partly trained and partly equipped troops. I made a miscalculation there.

"I didn't expect the enemy to counterattack until the end of April at the earliest, by which time I hoped to have back at least part of a seasoned Indian division from Italian East Africa and to have completed the equipment of troops left in Cyrenaica, which consisted of a British armoured brigade, an Australian division and an Indian motor brigade. All of these were short of equipment, transport and training.

"Unfortunately, the enemy attacked at least a month before I had expected it possible."

(c) **Third Phase—British** (*Nov. 18-Dec. 31, 1941*).—The nations engaged in the third North African campaign were the same as those which took part in the second campaign of March 30 to April 30, 1941. The British empire forces, consisting of troops from Great Britain, Australia, New Zealand and India, plus Free French and Polish units, faced Italian troops, strengthened by the German Afrika Korps of General Erwin Rommel (*q.v.*). The details of this campaign, which was not completed at the end of the year, will be covered only through Dec. 31, 1941.

1. **Objectives:** The immediate British objective was to destroy the axis forces in North Africa, remove the threat to the Suez canal and the near east and by securing the whole of Libya, establish new bases for further attacks against the axis in Europe. In all, the long-range objectives were essentially the same as those which guided the first British drive into Libya in Jan. 1941.

The axis objective was fundamentally one of defense—to fight a delaying action against the superior enemy forces until sufficient reinforcements arrived from Europe to allow resumption of the offensive against the British.

2. **Plans:** The British plan of action appears to have been an attempt to utilize superior numbers of troops, superior air power and an equality in mechanized equipment, to smash the enemy in a series of encircling movements and head-on tank battles. Instead of driving along the seacoast, as in the first North African campaign, the British struck in strength from several points farther south, sending out advanced mechanized columns in an effort to split the enemy forces into smaller groups for eventual destruction in frontal battles. An important part of the plan of action was the use of the royal navy to prevent any sea-borne reinforcement of the axis units and to attack axis-held ports from adjoining coastal waters. Thus, this was to be a land-sea-air offensive, with co-ordination of all three arms of the service.

The axis plan of action was to exact as heavy a toll as possible from the British personnel and mechanized equipment, and then, upon the addition of axis reinforcements, to launch a counteroffensive into western Egypt.

3. **Forces:** It was estimated that in Nov. 1941, the British forces in North Africa numbered approximately 85,000 troops. These included three armoured divisions of approximately 3,000 tanks, many of them of U.S. manufacture. The British air strength numbered not more than 150 planes at any one time.

The axis forces numbered approximately 55,000, with three reduced size panzer divisions. The axis had no naval support, and the total of axis planes engaged never numbered more than 90 to 100.

Operations: The operations in this phase of the war began on Nov. 18, 1941, when the British after long months of preparation attacked in force across the Egyptian-Libyan frontier. Contrary to expectations, the attack came from five points, well to the south of the coastal towns of Bardia and Sollum. The first of these columns curved around to invest the axis stronghold of Sidi Omar, just across the border. Another struck out southward through the desert. The main columns, however, swung north after crossing the border, in an attempt to reach the sea and trap large axis forces in Sollum, Bardia, Gambut, Fort Capuzzo and Rezegh. At the same time empire forces in Tobruk, consisting principally of Indians, Australians and Poles, launched an attack from that besieged town, with the object of smashing through the rear of the enemy lines and re-establishing contact with their own troops. The royal air force struck heavily against axis airdromes and fortifications, as well as the Italian ports of Naples, Brindisi, Messina and Tripoli; while the royal navy carried out bombardments of enemy land installations all along the Libyan coast.

The advance was rapid. On Nov. 24, 1941, the British claimed the capture of Fort Capuzzo, Bardia and Gambut. The driving empire forces pushed westward toward besieged Tobruk, and a great tank battle developed at Sidi Rezegh. The British claimed control of the air in the middle eastern theatre, and German attempts to bring in reinforcements from Europe by towed glider planes, as in the Cretan campaign, were smashed.

For three days heavy fighting continued in the Rezegh area. On Nov. 27, 1941, the British announced that contact had been made with the Tobruk garrison. The bulk of the axis forces was caught in a pocket between Rezegh, Tobruk and the sea. The only axis offensive action, a diversion raid across the Egyptian border, had in the meantime been driven back. The British capture of Gialo oasis, far to the south, was also

confirmed.

On Nov. 28, 1941, the second phase of the battle of Rezegh began. The axis forces, trapped by the thin British line between Rezegh and Tobruk, launched a strong attack in an attempt to break free. Heavy fighting continued for several days, with German reinforcements moving up to join the battle from the west. On Dec. 3, 1941, by taking Rezegh, Zaafran and Bir el Hamad, the axis forces once again assumed control of the corridor south of Tobruk. Tobruk itself was again isolated. The British were compelled to withdraw to a defense line extending from south of Rezegh to Fort Capuzzo. Bardia and Gambut were retaken by the axis, and the Sollum area remained firmly in axis hands. The initiative was with the axis during this period. The British appeared to be in the process of reorganization.

On Dec. 6, 1941, the British began the third phase of the battle of Rezegh with an attack in the vicinity of El Duda. Again the battle raged. Heavy losses in men and equipment were reported on both sides. On Dec. 10, 1941, it became evident that the British had won a victory, when the axis announced a general withdrawal of its units to the west of Tobruk. Except for scattered pockets of axis resistance, the area between Tobruk and Bardia was now under British control. Gambut and El Adem were reoccupied by the British.

Then began a systematic pursuit by the empire forces of the retreating axis units. On Dec. 11, 1941, the German high command admitted defeat in North Africa. Bardia and Sollum were still in axis hands, but they were isolated, miles behind the rapidly moving fighting front.

The axis withdrawal to the west continued, with the British maintaining contact in close pursuit. Axis losses were severe, as the retreating columns split into two bodies and fought unsuccessful rear-guard actions at Mechili and in the area southeast of Derna. On Dec. 20, 1941, Derna fell. The pursuit continued along the coast. On Dec. 25, 1941, the British took Bengasi without a fight. The main axis forces had destroyed the town and retreated to the south. British units, in the meantime, had driven across Cyrenaica and reached the Gulf of Sirte southwest of Agedabia, thus cutting off the main route of axis retreat into Tripolitania. As the year drew to its close, the main bodies of the British and axis forces were engaged in battle in the region of Agedabia. It appeared as if the British were to attain their principal objective, *i.e.* the destruction of axis military power in North Africa. The final issue, however, remained to be determined.

Summary: It is apparent that British forces had been reorganized and re-equipped to conduct open mechanized warfare in this theatre. The addition of modern mechanized and motorized equipment and other supplies received from the United States counted heavily in the British success. It must be remembered that the bulk of the German mechanized and air forces were engaged in the eastern theatre against Russia. This factor meant that the axis units in Libya could expect little reinforcement. Taking advantage of these circumstances, the British opened and conducted a skilful campaign.

E. The Near East.—The nations involved in the campaign in the near east included Vichy France, Free France, the British, Germany, Italy and Russia. In addition to these nations, the states of Palestine, Trans-Jordan, Syria, Iraq and Iran were the scenes of the operations and participated in the action.

1. Objectives: (*a*) *General.*—The British principal objectives in any military operations in this area included the denial of the area to any axis forces. This objective included the security of the east flank of the Suez canal and the whole British position in the eastern Mediterranean. Additional objectives included the control of the Vichy-dominated government and armed forces in Syria; the control of the governments in Iraq and Iran; the security of oil supplies in this area; the control of the Trans-Iranian railway from the Persian gulf to the Caspian sea; the protection of the area across the routes to the Suez and to India; the extension of political pressure toward Turkey in regard to the Allied cause; and the extension of British prestige generally in the near east.

The axis objectives were principally concerned with securing control of the governments in Syria, Iraq and Iran in order to facilitate further moves toward Suez or to the east.

Syria sought to retain its form of government operating under an agreement made between Vichy France and Germany signed in May 1941. Iraq and Iran hoped to retain independence and to maintain a neutral status in regard to the axis and the Allies. Iran particularly hoped to be free from Russian intervention. Both states resented Allied or other control of the oil and other resources within their borders.

(*b*) *Iraq:* The Iraqi government was unstable during the early months of 1941. As a result of a revolt within the state a pro-axis premier took charge of the principal government powers, including control of the armed forces. An early British agreement with Iraq permitted British forces to occupy certain sections of Iraq. The change in government leadership rendered the agreement void and increased the risk of essential German control. Despite attempts to reconcile political disagreements and reach a peaceful solution, hostilities began in May 1941.

2. Plans: The axis plan apparently included the establishment of rear bases in Greece, the Aegean sea and the Italian island of Rhodes, while establishing advance bases in Syria and if possible in Iraq. Air transportation seemed to be the principal means relied upon for all movements to the near east. Action in Iraq appeared to be a prelude to action in Syria.

The British plan included attack upon all axis bases by air from Egypt and the near east, combined with fleet action along the Syrian coast and ground action in Iraq. The Iraq action was considered a necessary preliminary to operations in Syria.

The Iraqi plan was not immediately clear. It appeared to include the defeat of British forces within the border, coupled with joint action with German forces whenever the new Iraqi government secured control over sizeable groups of Iraqi armed forces.

Operations: Axis forces established rear bases for air operations in Greece, the islands of the Aegean sea and in Italian Rhodes. Advance bases were established within Syria at Aleppo, Palmyra and Damascus. Air and naval forces mined the eastern and southern coastal waters off Cyprus. The British royal air force began operations by bombing the rear bases and the forward bases of the axis forces. Germany replied by bombing Alexandria and the Suez canal, and followed up these attacks by bombing British forces at the Iraqi airport of Habbaniya and establishing an advanced airbase in the vicinity of Mosul. The British had already sent forces from Libya and Egypt to Palestine and Trans-Jordan. A large British column was formed and Iraq was invaded in the direction of Habbaniya. At this airport British forces, already in possession by virtue of the earlier but disputed Iraq-British agreement, had been surrounded by Iraq troops and bombed by German air forces. The British column succeeded in making the relief of the besieged troops and drove the Iraqi forces eastward to Feluja. The Iraqi troops had resisted stubbornly at this point and flooded the area between the Euphrates and Tigris rivers, preventing the uninterrupted advance of the British on the city of Baghdad. Meanwhile German officers were organizing Iraqi troops for an attack on Basra in the south, while German air forces continued to hold Mosul and continued air attacks on all British forces. The British royal air force attacked motor convoys of ground forces moving from Syria in the direction of Iraq. The British fleet occupied bases at the head of the Persian gulf and moved north and attacked Basra. After three weeks of scattered air and ground action the Iraqi rebel government fled to Iran. The collapse of all Iraqi resistance followed promptly. German forces withdrew from Mosul and Basra while Iraqi troops surrendered at Baghdad. The operations closed with the British forces in complete control of all Iraq.

RUSSIAN TANK CREW photographed near the front after the soviet armies had launched their great counteroffensive against the Germans in Dec. 1941

Summary: Within three weeks British forces had succeeded in defeating a rebellious army in the neighbouring state of Iraq, denied the area to the axis powers and secured the land area and the natural resources of the country. Iraq lost complete control of her own future, at least for the duration of the war, and suffered slight but apparently unnecessary casualties.

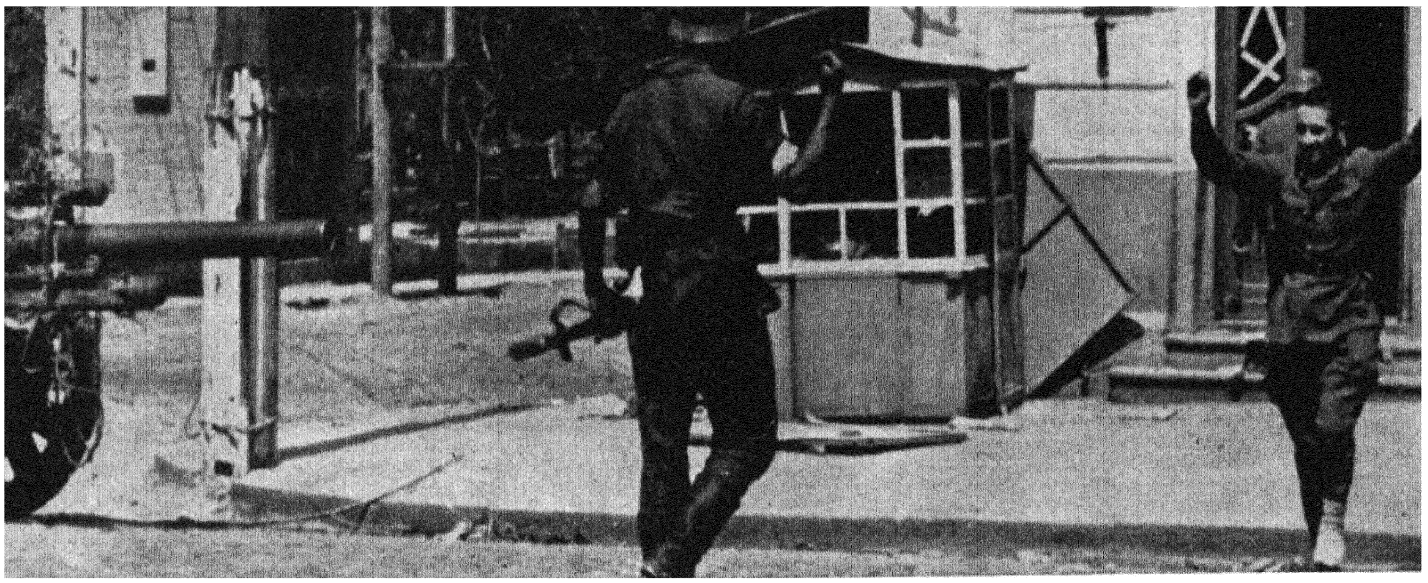
(*c*) *Syria:* The existence of axis officials in Syria, particularly those members of the armistice commission, resulted in a growing control by Germany over the Syrian government, the armed forces and the productive wealth of the state. Within the armed forces the majority appeared to favour the Vichy French government and opposed the Free French organization. Axis activities within the state established the risk to the Allied positions in the near east. Operations resulting from the military actions in Iraq led to the opening of hostilities in Syria.

The British plan of operations included a land invasion of Syria from Palestine, Trans-Jordan and Iraq. In addition, the royal air force was to attack axis air forces and French garrisons resisting the invasion. Meanwhile, the British fleet operating in the eastern Mediterranean was to be employed against the seaports to assist the land attacks.

The axis plan of operations appeared to be limited to air action plus the activities of many German nationals who were already in the country co-operating with the French army of the Levant.

British forces included Arabs, British, Scots, Anzacs, Canadians, Sikhs and Gurkha Indians and the Free French forces under General de Gaulle. The Vichy forces of the French army of the Levant included Senegalese, Annamites, Algerians, Moroccans, Lebanese and regular French troops. The total of British forces was variously estimated as three to five divisions plus native troops and Free French forces. British equipment was considered excellent and included considerable artillery, tanks, armoured vehicles and about 400 planes. Axis air forces were inferior in numbers and the number of troops appeared small and were apparently unorganized. Within the British forces, consideration had to be given to the Arabian tribal feelings in regard to the holy city of Damascus and additional consideration to the possible loss of Vichy-controlled naval units to Germany if the French army of the Levant was too severely handled. All forces were mixed and this factor affected the conduct of the operations.

Operations: On June 8, British forces invaded Syria from Palestine in the direction of Beirut on the coast, from Trans-Jordan through the mountains in the direction of Damascus and from Iraq in the direction of Deir-ez-Zor and toward Aleppo. In the southwest the columns moving north toward Beirut joined at the ancient city of Tyre. Australian forces led the attack to Sidon from Tyre and succeeded in capturing the city. Strong French resistance resulted in the recapture of Sidon, and not until the British fleet bombed French positions from coastal waters, could the British counteroffensive succeed in taking Sidon a second time. As these columns moved to the north the fleet continued to operate against French ports and against French columns moving along the coastal highways. Beirut fell



THIS RUSSIAN SNIPER smiled broadly as he surrendered to Germans in the summer of 1941, possibly because he had already picked off his quota of the enemy

after combined action by the ground forces moving north from Sidon and from the vicinity of Kisswe south of Damascus.

Farther to the east, British forces moved to the capture of the town of Kisswe and after four days of strenuous resistance captured the stronghold and moved north to besiege Damascus.

In the north, two columns separated by about 100 mi. moved simultaneously from the Iraq frontier toward the objectives of Aleppo and Palmyra. The northern column of Arabian troops continued to push toward Aleppo and toward the coastal city of Latakia. The southern column moving through Deir-ez-Zor swung to the south to capture Palmyra. Success at Latakia in the north would assist the fleet in the defense of Cyprus. Success at Palmyra would open the route to Tripoli through the city of Homs.

As the ground operations continued, the royal air force continued operations against obstacles holding up the advance. That action continued to effect necessary co-operation. It must be recorded that the limited axis intervention in these operations, the division of loyalties within the French army of the Levant, the precarious loyalties and tribal customs of some of the native forces and the mixed character of the Allied forces, all contributed to the final results of the military action. After 33 days of combat, the campaign ended on July 10 when an armistice was declared and hostilities ceased. Four days later, on Bastille Day, the formal treaties were signed.

Summary: In less than five weeks the British had succeeded in the invasion of Syria and the defeat of armed resistance within that territory. Reports indicated that the Syrian losses were about 9,000 casualties while the Allied losses totalled about 1,500. By terms of the treaty, French prisoners were released and repatriation granted to those requesting it. Of a total of about 33,000 French forces it was reported that approximately 14,000 were repatriated to France. The British secured rights to occupy Syria for the duration of the war and this permission included control of war materials and public utilities.

(*d*) *Iran:* In April 1941 the state of Iran made an agreement with Germany which permitted large numbers of German specialists to enter the country to assist in the operation of oil wells and the operation of pipe lines. This country produced an estimated 78,000,000 barrels of oil annually. Pipe lines ran to the Persian gulf and extensive oil wells were in operation near the Caspian sea and the Iraq border. Just to the west of the Iranian border pipe lines from Kirkuk in Iraq ran to Syria and Palestine. To the east are Afghanistan and Baluchistan, doorways to the British empire in India. The Trans-Iranian railroad connects the Caspian sea with the Persian gulf. To the north are Russia and Turkey. Late in August, Russia was engaged in war with Germany, and Turkey was still a doubtful neutral. German infiltration into Iran had continued despite frequent protest by the Allies. The British decided to take action and opened hostilities at the end of the month. The nations involved in this campaign included Germany, Iran, Russia and the British.

The axis objective appeared to be the maintenance and extension of growing controls over the Iran government and the natural resources of the country. The British objective was to further Allied control in the near east and deny the axis access to oil and to a position for future attack. The Iranian government apparently wanted to retain its independence, be free from both Russian and British interference and continue friendly relations with Germany.

No organized axis forces participated in the campaign. Apparently all axis action was confined to the operations of axis representatives in control of oil industries and possibly control of railroads. The Iranian army had an estimated strength of about 200,000 including reserves. Equipment was not complete and in some cases far from modern. Operations were so limited that it is doubtful if more than a few hundred men were in action. Small naval patrol boats comprised the navy.

British forces were smaller in numbers than the Iranian forces. But here again operations were limited and only small British land forces were required. British naval forces were far superior to the Iranian naval units.

The Russian forces outnumbered all other contestants. Apparently three to four divisions were assembled for operations. Air forces appeared numerous but few were actually engaged in operations.

Operations: Russian forces in the north moved south on either side of the Caspian sea. In the northwest one column captured Tabriz, as a second column moved south along the seacoast toward Pahlavi. To the east of the Caspian another column captured Bandar Shah, the northern terminus of the Trans-Iranian railroad.

On the first day of hostilities, Red bombers flew over the capital city Tehran, dropped bombs, and within a few hours orders had been issued by the Iranian government to cease firing. In the west the British invaded Iran from Iraq, captured an oil field near the border and drove toward Kermanshah. British naval forces defeated the tiny Iranian navy, sank several axis merchantmen and landed forces at Bandar Shahpur, the southern terminus of the Trans-Iranian railroad at the head of the Persian gulf. These forces moved rapidly to the north and captured oil refineries at Abadan. British forces concentrated in Baluchistan were not required for operations. Hostilities ceased within an estimated 80 hours after they began. Iranian resistance was easily overcome.

Summary: Within a few hours the Allies had established control over Iran. For the British the victory provided a controlled route for supplies to Russia and brought Russia closer to the Allied camp. German infiltration into Iran had been eliminated and the way was open to establish an Allied line south of the Caspian if the Germans crossed the Dnieper. Germany lost an opportunity to secure a base for future operations against Russia and the British and realized that axis intervention in the near east had been progressively eliminated. Iran lost her independence and faced occupation by Russian and British forces for the duration of the war.

Russia secured a valuable supply route to the south and the Persian gulf. In addition the ties were strengthened between Russia and the Allies, and an area was secured for possible resistance against the axis if operations to the north required a new defense.

Summary on Near East: The Allies, operating with mixed forces, had secured Iran, Syria and Iraq from the axis or axis-controlled governments. Large areas rich in oil, and affording valuable sources of raw materials for war, were occupied. Allied prestige was increased in the east. The route to India was secure. The Russian left flank was supported and a supply route assured to the Persian gulf. The right flank of the Suez had been secured and Britain's position in the eastern Mediterranean strengthened.

F. The Russian Campaign.—The nations involved in this campaign included Germany, Finland, Hungary, Rumania, Italy and Russia. The areas of the countries of Latvia, Lithuania, Estonia and Poland were included in the war zone. The period of time covered by this analysis of the campaign begins on June 22, 1941 and covers the six months to the end of the calendar year.

1. Objectives: The principal objective of the Germans and their allies appears to have been the elimination of the Russian armed forces. The German nation sought security in the east, to permit freedom of action to the southeast, the south, the southwest or the west. Success for Germany would result in the acquisition of the industrial areas of Russia west of the Urals, insure vast additional stores of grains and foodstuffs, open the way to the oil supplies in the near east and Russia, encompass the rich agricultural areas of the Ukraine and the Donetz basin and furnish materials for continuing the war for an indefinite period. Strategically, the elimination of the Russian forces and the occupation of large areas of Russia would result in surrounding China with axis forces both to the east and to the west. Also this success would bring the axis closer to the near east and to the road to India. It appears that Finland sought the return of the areas lost to Russia in the recently completed war. Other German allies had individual motives which looked toward the acquisition of territory lost to Russia or the gain of new territories to extend the power of the invaders. Adolf Hitler claimed that the security of the German state and of all Europe depended upon the defeat of Russia and the elimination of the threat by Russia to extend the system of Bolshevism throughout the world.

The Russian objective appears to have been the defense of the homeland. It followed that the objective included the defeat of the German and other invading forces and the eventual destruction of the nazi and axis system in Europe.

2. Plans: Terrain, geography, racial hatreds, time and the weather were considerations included within the German plans for the conduct of operations in this campaign. Germany was familiar with the terrain on which the operations would take place. The areas in Latvia, Lithuania, Estonia and Poland were areas in which both Germany and Russia had manoeuvred on former occasions. The large plains to the east; the area covered by the Pripet marshes; the river systems; the road nets leading to the north to Leningrad, to the east to Moscow, to the southeast to Rostov; the supplementary rail nets leading to these centres and to the ports in the Baltic and on the Black and Caspian seas: these were terrain features and features controlled by the terrain which were the subject of continuous examination

by the German high command. The geography of the area of the campaign found Russia far removed from outside sources of supply.

So far as the geography is concerned, the factor of great distances marked this campaign distinctly. On the initial combat front, the opposing forces faced each other along a line equal in length to the entire United States-Canadian border. On the north flank, racial hatreds smouldered within Latvia, Lithuania, Estonia and Finland, each a nation which had recently lost territory to Russia. In the south, Rumania had lost a valuable area to the Russian state. Within Russia the nucleus of a revolt existed in the disaffected group representing and supporting the Ukrainian republic. All these groups could be counted upon to fight against the Russian national objectives. The time factor demanded that the German objectives be accomplished at the earliest possible date and at the expense of the minimum effort. The weather forecast indicated that the Germans could count on approximately three months of reasonably good weather.

All these considerations undoubtedly were weighed carefully by the German high command before the opening of hostilities. It appears that the estimate made by Germany as to the duration of the campaign was a maximum of four months, with some reasonable expectations that success might be secured in three months or even less. It appears that the tactical plan was to include the familiar pattern of the "keil" and "kessel" method of attack, in which a wedge is driven into the enemy line to create a gap which allows large motorized and mechanized forces to rush through and to cut off and encircle and destroy the armed forces trapped by this operation. All operations on the ground were to be preceded by large-scale air attacks to gain air superiority over the Russians. The first objectives of the attacks were to be Leningrad on the north and the port facilities on the Baltic, Moscow in the centre, Rostov and the Ukraine in the south. The Finnish plans appear to have been a deliberate ground attack across the frontier over the areas recently lost to Russia, and the assistance to German forces to the south of Finland with the possible acquisition of control of the Russian ports on the Baltic.

The Russian plans for the campaign included a defense in depth along the frontiers facing Finland and Germany as well as Rumania in the south. This plan of defense was adopted with a view of the assumption of the offensive whenever the situation would permit. The Russian form of defense included a strong resistance around large, as well as small, centres of population. In addition, the Russians developed the plan of the destruction of supplies and the deliberate burning and blowing up of buildings and utilities whenever the German advance threatened these installations. As the campaign progressed over the first six months, the Russians in December adopted a strong offensive plan which included the pursuit of the retreating Germans and the initiation of relentless attacks whenever the opportunities were available. In all plans made by the Russian forces, the assistance of the civilian population was considered as a military factor. Russia has always classified the armed forces as the People's army, and for defense purposes has considered the civilian population available for guerrilla warfare and for siege defense.

3. Forces: The potential strength of the Russian army has been estimated as 10,000,000 men. This figure does not indicate clearly the maximum total initially available for front line use, or the final total engaged during the period covered by this analysis. Russia has considerable manpower, and under the demands of a long war could probably organize, train and equip for combat, several million men. It is not known definitely how many men were engaged at the opening of the campaign. The total was likely below 2,000,000.

As the campaign continued over several months, it is likely that the Russian forces increased in numbers, and it is possible that at the close of the year Russia had some 4,000,000 men in uniform at the front. In equipment, the Russian forces appeared to have ample supplies of moderately good types of modern design. In the air, Russian planes were not superior to the German planes but there were large numbers of these and they continued to engage in operations despite admittedly high losses. In mechanized equipment the Russians appeared to have large amounts of vehicles of all classes although it was admitted that they did not compare with the superior German types in operation. In artillery and in smaller field guns, the Russians were well equipped and most of the equipment appeared to be excellent. Small arms and supplies of ammunition appeared to be excellent. In organization the Russians were unwieldy and lacked the flexibility of modern armies in combat. After the Russian-Finnish campaign there was an attempt to reorganize the forces to approach the modern balance between artillery and infantry in the combat forces. However, in defensive warfare, the larger Russian organizations in the field were considered to have adequate strength to offer continued resistance to attack by the modern German columns. In addition, the Russian plan for active defense called for heavy counterattacks limited in extent and suited to the larger Russian type of organization. All Russian forces were well equipped to conduct protracted resistance in isolated groups against German advances. In addition, the Russian civilian population was armed in many instances and prepared to engage in guerrilla warfare.

German forces were estimated to have been around 3,000,000 at the opening of the campaign. It is very likely that these German forces outnumbered the Russians in the first few weeks of the operations. Later estimates of both forces are extremely unreliable due to the conflicting claims made by each side as to the losses suffered as the result of action. It appears that the Russians gradually increased the numbers engaged while the Germans maintained around 3,000,000 total during the first six months of combat. German equipment was considered generally superior in all respects at the opening of the campaign. In the air, Germany had the finest combat aviation seen in operation during any of the campaigns of this war. Mechanized equipment was far superior to the opponent's. Late reports had it that the German government sought clothing for men at the front, but these reports indicate a failure to plan for a long campaign rather than indicate a basic fault in the type of armament available for combat.

A comparison of forces indicates that the Russians had less than 100 divisions available along the front at the opening of the campaign. This total was probably increased to around 175–180 divisions during the first six months. Germany probably had 120 divisions at the start of operations, and the Finns, with German assistance, had another 16–20 divisions in the north. To these totals of German and allied strength must be added the size of several air fleets, and the accompanying supply and administrative services. All totals shown are subject to considerable doubt, as figures were not available to neutral observers during the early months.

Operations: The campaign opened when German forces crossed the frontier and German planes bombed Russian defenses early (3.00 A.M.) on the morning of June 22, 1941. First reports were incomplete. It appears that the operations to the close of June involved three principal areas of attack. On the north, German columns advanced through East Prussia in the direction of Vilna and Leningrad. In the centre, German columns advanced on a broad front in the direction of Bialystok, Minsk, Smolensk and Moscow. On the south, the direction of advance was toward Kiev in the Ukraine. On June 23, Brest-Litovsk was captured. In a few days, the advance along the centre resulted in a German manoeuvre which surrounded large Russian forces in the Bialystok and Minsk areas. Meanwhile German and Finnish forces crossed the Finnish frontier and launched attacks along the Karelian isthmus and in the direction of Murmansk and Kandalaksha. Smaller forces were concentrated along the frontier opposite Petrozavodsk and north of Lake Ladoga. On the Russian-Rumanian frontier, Russian forces attacked to the southwest, the German-Rumanian forces succeeded in crossing to the east bank of the Pruth river. The German attacks along the entire front were made along the familiar pattern of large-scale air attacks, followed by large mechanized attacks combined with motorized units. The German advance was rapid and the fighting around Bialystok and Minsk severe. Russian forces appeared to be offering strong resistance, despite the success of German columns in breaking through and surrounding large groups along the extended Russian front.

During the month of July the German forces continued to advance against strong Russian resistance on all sectors of the front. On the Finnish front General von Falkenhorst, in command of German and Finnish forces, advanced on Kandalaksha and captured Salla on July 10. Farther south on the Finnish front, combined German and Finnish columns drove

FERRETED OUT of a wheat field by German troops in the summer of 1941, these Russian guerrillas were promptly executed

GERMAN RESERVES moving up to Russian positions in the summer of 1941

forward toward Petrozavodsk and to the southeast along the Karelian isthmus. The capture of Petrozavodsk would result in cutting the Murmansk-Leningrad railroad. During the month, the reports of these operations were obscure, but it appeared that the Finns advanced steadily against growing Russian resistance. This advance seriously threatened the Russian right, north flank. On the north central front, German columns continued to advance in the direction of Leningrad and the Gulf of Riga. Large Russian forces were trapped in the vicinity of Tallinn. Other Russian forces were heavily engaged in the defense of the islands of Oesel and Dagoe in the Gulf of Riga. At the end of the month, Russian forces were engaged in bitter defensives against combined German-Finnish-Rumanian-Italian and Hungarian arms all along the extended front lines. In the centre, the Germans had advanced from Bialystok, in the direction of Smolensk, and captured the city on the 14th. Russian forces had withdrawn to the Vyazma area, and also were concentrated in the Rogachev area, and near Gomel. In this area, fighting had been severe during the entire month, and several counterattacks had been launched by the Russians against the southern flanks of the German columns advancing toward Smolensk, and after its capture advancing to the east. By Aug. 1, Germany had reached a line generally along the Vitebsk-Orsha and Mogilev sector while the Russian forces had in many cases remained behind to fight heavy rearguard actions which proved costly to the German armies. On the south, the Germans penetrated deeply into the Ukraine from the northwest in the direction of Kiev, and from the southwest in the direction of Balta and Odessa. During the period July 14 to July 17 in this sector, German columns approached closely to Kiev while Hungarian and German forces advanced more than 60 mi. across the former Russian-Polish frontier. Rumanian forces captured Kishinev, the capital city of Bessarabia. In the south, German columns were north and south of Kiev at the close of the month as the other allied forces continued to make advances through Bessarabia. Reports of large air and tank battles were made regularly by both sides and it is likely that these were of considerable importance. During the month of August, reports continued to indicate German advances all along the front. On the Finnish front it was reported that two large Finnish-German forces under the command of General von Falkenhorst had been increased in size and received additional equipment including planes. These forces continued a steady and deliberate advance to the east and on Aug. 15 captured Sortavala. On the south General Mannerheim was in command, and his forces continued their attacks along the Karelian isthmus and to the southeast around Lake Ladoga. Viipuri was captured toward the close of the month, and the front apparently became stabilized temporarily about 100 mi. northeast of Leningrad. In the Leningrad area, German forces under General von Leeb (*q.v.*) continued to push forward to clear up the situation around this city, and to reduce Russian resistance in the Tallinn area. Novgorod was captured on Aug. 16, and a few days later the German motorized columns cut the Leningrad-Moscow railroad, about 75 mi. southeast of the city. Throughout the month, heavy fighting took place around the suburbs of the city of Leningrad. On the central front, generally described as the Moscow front, German forces were commanded by General von Bock (*q.v.*). In this area the German forces met strong resistance east of Smolensk and to the south in the Gomel area. Strong German attacks drove the Russians out of Gomel toward the close of the month and the central German columns advanced to the east. Russian counterattacks were reported throughout the entire month against these German forces, and it appeared that the German advances were appreciably slowed down. On the southern front, the German forces under General von Rundstedt (*q.v.*), and the Rumanian forces under Antonescu (*q.v.*), continued the advance into the Ukraine and along the shores of the Black sea. Early in August the Odessa-Cherkasy railroad was cut by German armoured forces operating in this area. As a result of this action, large Russian forces were compelled to withdraw in the direction of the Crimean peninsula. German columns drove to the east in the direction of Kirvoi Rog, and to the south between Odessa and Nikolayev. On Aug. 15, Germany claimed the capture of Kirvoi Rog and also announced that German forces had advanced north of Nikolayev. Late in the month Odessa was surrounded and the Russians suffered heavy losses as a result of German attacks on convoys trying to evacuate forces from the city. On the 26th Dnepropetrovsk was captured and it appeared that the Crimean peninsula would be cut off from the mainland. All along the extended front from Murmansk to the Crimea, the Germans and their allies had advanced to the east during this month of August. Russian resistance had increased and Russian forces which had been encircled by German columns had refused to surrender and were continuing to offer serious resistance to capture or destruction. The Finnish front was not completely quiet but it appeared to be stabilized temporarily. Leningrad was under heavy and persistent attack and the Germans claimed that Tallinn had been evacuated by Russia with heavy losses. The German claims were indicative of complete assurance that the final victory was a matter of a short delay. It remains true, however, that throughout the month the claims of both sides were considered exaggerated and it was difficult to be convinced that a final outcome of the struggle was imminent. September proved to be a costly month for all forces engaged. Russia had serious losses, not alone in manpower, but also in vital areas. Viipuri was lost to General Mannerheim, and it appeared that continued advances would be made by the German and Finnish forces in the southern Finnish theatre. Such an advance would threaten Moscow from the northwest. There were some signs that a separate peace might be made with Finland, but these indications never became the subject of report from official sources. Leningrad had been completely surrounded, and to the west, Russia had lost Tallinn in Estonia. On the central front, strong German drives pushed the Russians to the east despite spirited defense. Some German forces on the right flank of the central group turned to the south to assist in the encirclement of Kiev in the Ukraine. Farther south, strong German columns attacked Kiev from the south and the southeast and besieged the city, the third largest in Russia. It appeared at first that the capture of this important centre would result in extensive losses of men and equipment, but the Russians claimed that they were able to withdraw large forces to the east. East of the city, the retiring Russian forces were engaged by the Germans, and severe losses were inflicted. The new direction of the German drive threatened Kharkov. Meanwhile, along the Black sea and the Sea of Azov, Odessa was still besieged and the Crimean peninsula cut off from the mainland. German attacks continued on this area and particularly upon the naval base at Sevastopol, and the eastern exit leading to Rostov. It was expected that the Germans would increase the tempo of the attacks in order to seek a decision before the advent of full winter weather.

In October, the German government announced a final drive on Moscow to end the war before the close of the year. Early in the month, Russian counterattacks began in the Leningrad area. Throughout the entire month, the German forces before this city appeared to be on the defensive frequently, and appeared to be unable to successfully attack and capture the city. In the Moscow area, Vyazma fell on Oct. 13, and within a few days the Russian government announced a state of siege in Moscow. German columns approached within 60 mi. of the city. On the Finnish front, strong attacks were launched in the Lake Ladoga region, and both the Russians and the invaders suffered severe losses. On the southern front, Odessa was captured, and in the Ukraine Stalino and Taganrog fell. The German advance on the central front continued and on Oct. 24 the leading elements were reported within 37 mi. of the capital city. On Oct. 25, Kharkov was taken and German columns moved forward rapidly to Rostov. By Nov. 1, it became apparent that despite these advances the speed of the German drives had slowed down. It was also expected that renewed drives would be initiated. In the Crimea, the capital city, Simferopol, was captured and the naval base at Sevastopol besieged. Air attacks upon Russian shipping in the Black sea continued to take heavy toll of lives and continued to disrupt the Russian plans for the defense of this area. German columns moved to the east toward Rostov and claimed the capture of that city. On the Moscow front, furious engagements with large losses on both sides found the Germans along the line Kalinin-Klin-Moshaisk-Maloyaroslavetz-Tula on Nov. 25. Moscow was in serious danger of capture. In the south, at the close of November, the Germans had withdrawn from Rostov to the west, and it appeared that they would go on the defensive in this area. Late in November the attacks on the city of Moscow were resumed.

December marked the limit of the eastern advance of the German forces.

Russia rallied, and with the aid of reserves of both men and supplies stopped the German assault. Some German attacks were made along all fronts during the month, but the principal German action was defensive and at times the Russian attacks took on the character of a pursuit. Around Dec. 15 the German forces began a general withdrawal to the west. This may have been an action which had been the result of a previously made plan to occupy a selected defensive position. It was not clear as the year closed whether the withdrawal was such a strategic decision or the result of spirited Russian attacks. Along the entire Moscow front, the Russian forces continued to launch heavy attacks at the close of the year. On the 29th, the Russians claimed the recapture of Kerch and Theodosia. On all fronts the Russians appeared to have adopted an extensive offensive which promised to be serious for the safety of the German position if it remained unchecked. The year ended on a hopeful note for the Russian nation; the greatest armed force on the continent had launched a determined attack lasting some six months and had failed to take the principal objectives of that attack. In addition, the Russians had not only stopped this attack, but had adopted the offensive and it appeared that unless the Germans built up a heavy defensive without delay, the Russians would be able to drive the invaders out of the country.

Summary: It appears that the German armies and their allies employed all known modern means to overcome the Russian armed forces. The announced plans of the German armies contemplated an early decision. The results of the first six months indicate that these plans were not accomplished. It appears that the method of mass defense used by the Russians, the enormous distances involved, the quantity of Russian arms available during this period, and above all the willingness on the part of all Russians, both in and out of uniform, to resist, combined to prevent the German success. Russia still remained a potent force in the east. Germany was not free to engage in any adventure of great consequence elsewhere on the continent so long as Russia remained undefeated. The strength of German forces available for another operation was decreased as a result of the Russian campaign. The spread of the war in December brought other powers into the conflict and made more serious the failure of the German armies to attain their Russian objectives.

G. The Far East.—During the greater portion of 1941, the undeclared far eastern war between Japan and the Nationalist Government of China continued, apparently apart from the European conflict. The Japanese, with the concurrence of the Vichy government of France, took over important bases in French Indo-China, and later, to all intents and purposes, completed the investment and occupation of that rich dominion. In China itself, Japanese operations were limited to minor campaigns in Hunan province, and to extensive aerial activity. Continuous heavy bombing attacks were made on Chungking, the capital of Nationalist China, and on the Burma road, which was becoming increasingly important as a supply route from the United States and Great Britain.

Then, on Dec. 7, 1941, in the midst of peace discussions with the United States, Japan struck at widely separated vital points. Japanese bombing planes scored heavily in a surprise attack on Pearl Harbor, the great United States base, nearly 4,000 mi. to the east of Japan. At the same time, Japanese naval forces attacked Guam, Midway and Wake—U.S. island stepping stones in the line of communications to the far east; and Japanese troops launched a series of invasion moves against Hongkong, Thailand, Malaya and the Philippine islands of Luzon and Mindanao.

In one day, the European and far eastern conflicts had merged into one world war. The United States, Great Britain, the Netherlands East Indies, the British dominions, and several Latin-American nations entered the war against Japan. A few days later, Germany and Italy, together with their satellite nations, came in on the side of Japan. All over the globe, the lines were now sharply drawn.

Japan's first blows were effective. At Pearl Harbor, the United States suffered heavy losses in damage to land and naval installations. One battleship, one target ship, three destroyers and one minelayer were lost, together with many aircraft. Guam fell, and a short time later Wake was occupied, after a gallant stand by a small defending garrison of 400 United States marines. On Christmas Day, 1941, Hongkong surrendered to the Japanese after relentless pressure for more than two weeks. Thailand capitulated almost immediately, and Japan used that country as a base of operations against Malaya. In Malaya, the Japanese moved swiftly. The British air base at Kota Bharu fell, and soon afterwards, Penang, the big naval base commanding the Straits of Malacca, on the west coast of Malaya. The Japanese then began a systematic advance down both sides of the Malayan peninsula. At the end of the year, Ipoh had been taken, and Kuantan and Kuala Lumpur were threatened. Sizeable landings had also been made on the Dutch island of Sumatra, and in British North Borneo and Sarawak.

Possibly the heaviest Japanese blows were struck in the Philippines. Landing some 200,000 troops at several beach-heads on the island of Luzon, the Japanese converged rapidly on Manila. The fall of that capital appeared imminent at the close of the year, although the small defending forces of United States and Filipino troops seemed capable of further resistance for some time. The occupation of the island of Mindanao was completed by the Japanese, against comparatively weak resistance.

As the year 1941 ended, the air and naval forces of the Netherlands East Indies and the United States had done appreciable damage to Japanese warships and transports, but on the whole, the Allies were still gathering strength for defensive and offensive action in the far east.

III. The War at Sea.—World War II up to Jan. 1, 1942 had seen conflict on the surface, under the surface and above the surface of nearly all the ocean highways travelled by the ships of all the nations of the world.

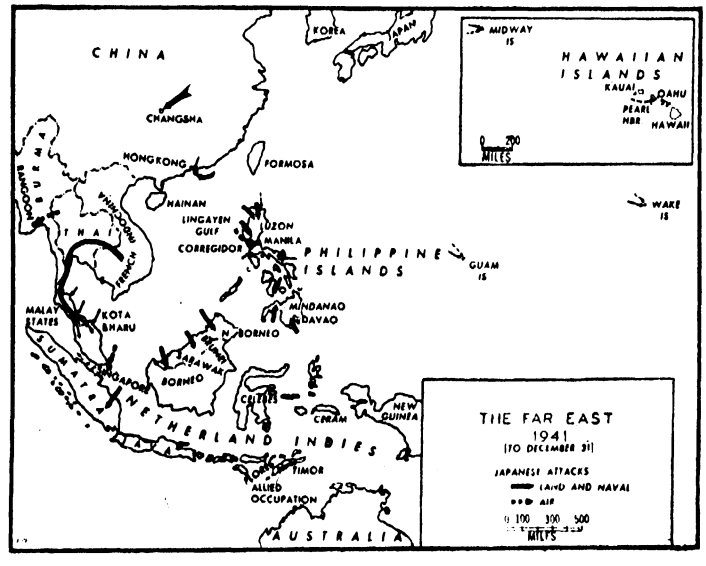
Sea power, the predominant force in determining so many of the great struggles in history, still remained a vital and unsolved problem during 1941. In the great world conflict between dictatorships and the democracies, the democracies controlled the seas, although they were subject to severe challenge in the Atlantic and in the far east at the close of the year. The British empire, with a powerful fleet, had strong naval forces based upon the British Isles, the Mediterranean sea—both in the east and in the west—and at Singapore in the far east. Other additional strong units were operating along West African shores covering routes to South Africa and to India, as well as additional forces operating along Red sea and Suez routes. The British had approximately 20,000,000 tons of merchant shipping when the war began in 1939. From various countries defeated by Germany she acquired additional tonnage available outside the European continent. Purchases from neutrals and her own ship-building program increased the grand total available for the prosecution of the war. Estimates place the grand total tonnage at around 26,000,000 tons. In these respects, naval strength and merchant tonnage, the British had a decided advantage in the conduct of the war at sea. (*See* also NAVIES OF THE WORLD.)

The British plan of operation included the protection first of the mainland of the home country, and with this, the protection of the merchant fleet bringing war supplies to the home front and to other fronts. It followed that the converse action for the British naval forces was the denial of free access to the merchant shipping lanes of the world to the opponents; and, whenever the opportunity arose, direct naval action against enemy naval forces, and the support of the empire land and air forces in operations against the enemy.

The circumstances of World War II contrast sharply with those of World War I insofar as the war at sea is concerned. In World War II, Italy was an axis partner and had to be dealt with in the Mediterranean sea and in the Red sea and Suez areas. Japan was an enemy and seriously threatened the security of the empire in the far east. While the Dutch East Indies were allies, the source of vital supplies in this area, and the security of the Commonwealth of Australia and of New Zealand, became new responsibilities of the British naval forces. In addition, British naval bases in the far east at Hongkong and at the formerly friendly ports controlled by the French were in Japanese hands. The area to be denied to the enemy by blockade was enormously increased. Germany controlled the western European coastline from Narvik to Spain. From a hundred land bases for planes, and dozens of excellent harbours for surface raiders and submarines, the enemy could launch strong and continuous attacks against the blockade forces and against the merchant shipping lanes. The Vichy French government was in a doubtful position insofar as the eventual control and use of the remainder of the defeated French fleet was concerned. To the naval craft and surface raider and the ever-present submarine had been added the powerful effect of the air arm. Geography, airpower, the loss of allies, increased demands for supplies . . . these appeared to be the principal characteristics of the conduct of the war at sea for the British in World War II.

The axis powers, increased late in the year by the addition of the Japanese, had considerable strength for the conduct of warfare at sea. If Germany was short on battleships, she had considerable strength in submarines and employed available new Atlantic bases to full capacity. Italy had a Mediterranean fleet which might not compare in excellence with the British, but which had to be defeated before the Mediterranean would be free for the movement of vital supplies of men and materials. In the far east, Japan had a powerful fleet not fully tested in modern warfare, but demanding the full attention of the British and United States forces engaged in that theatre. To all this axis naval strength, must be added the new and powerful air arm which appeared to be more useful to the axis than to the Allies so far as the developments until the close of the year indicated. With these forces opposed to each other, the conduct of operations in the war at sea for 1941 produced important results.

During 1941 the battle of the Atlantic, the battle of the Mediterranean, and the battle in the far east, were the leading events in naval warfare. In the battle of the Atlantic, Germany announced a war-zone area including the British Isles and Iceland and extending to the three-mile limit around Greenland and south to the French coast. From the western coastline of Europe, German attacks were launched against the British naval forces. The object of these attacks was to cut the vital lines of supply bringing war materials to the British. A secondary but included objective was to reduce the strength of the British naval forces whenever opportunity permitted. Surface raiders ranged throughout the North and South Atlantic waters attacking and sinking merchant ships, avoiding if possible any action with naval forces. Submarines in large numbers, frequently on individual missions, but often in packs of six or more, slipped through blockade lines to wait for their prey along the shipping routes to the British Isles. Overhead, the large seaplanes carried death and destruction to both ships and crews by bombing raids against supply ships, and by acting as scouts for the submarine packs waiting for the kill. Reports indicate that during 1940, British weekly losses were around 70,000 tons due to this type of



U.S. SOLDIERS at their post in a machine-gun nest during the Japanese attack on Oahu, Hawaii, Dec. 7, 1941

war at sea. In Jan. 1941 the British claimed a new low in shipping losses when they put the total for one seven-day period at 37,000 tons. Losses increased in February, and in March 1941 a new high was reached when figures released by the British admitted a total of tonnage lost for one week at 148,000. Shortly afterwards the British Admiralty announced that totals would not be published in the future, and it appeared that the Germans had begun to succeed in the war at sea in the Atlantic. (*See* also BLOCKADE; SUBMARINE WARFARE.)

The introduction of the convoy system, the acquisition by the United States of new bases in the North Atlantic, the improvement in anti-aircraft defense within the British Isles, the prompt destruction of German naval units seeking battle, and the wide extension of British air power in offensive action against German bases on the continent, resulted in the reduction of these shipping losses. In addition, both the British and the U.S. shipyards established new records for speed in turning out new units for the maintenance of vital supply lines. These factors helped during the period from April to Dec. 1941 when the entrance of Japan into the conflict introduced the possibility of serious change. All British and United States forces removed from the Atlantic to the far east would reduce the effectiveness of their joint resistance against Germany in the Atlantic area. At the close of the year, the war at sea in the far east had not developed sufficiently to warrant an analysis of these effects.

On May 27, 1941 the German battleship "Bismarck" was sunk in the North Atlantic after a spectacular naval engagement with units of the British fleet. Reports indicate that the German battleship left the Norwegian coast from a naval base at Bergen on May 22, crossed the North Atlantic to the vicinity of Greenland, and was sighted by British naval forces near Iceland on May 23. Apparently the objective of the "Bismarck" was to attack and destroy British naval units operating merchant-ship convoys in these waters. On May 24, British and German naval forces engaged in battle in this area. The scene of the first action was in the body of water known as the Denmark strait between Iceland and Greenland. The "Bismarck" was slightly damaged during this encounter. However, the British battle cruiser "Hood" was sunk and the "Prince of Wales" damaged. The "Bismarck" disengaged from this combat and the pursuit was undertaken by several units of the British home fleet. Air attacks were delivered by planes based on the aircraft carrier "Victorious" before all sight of the "Bismarck" was lost. On the morning of May 26 an American-built naval patrol plane with the British fleet sighted the "Bismarck" en route to the shelter of the French coast. Several large British units as well as other vessels closed in for battle. Torpedo bombers from the carrier "Ark Royal" severely damaged the "Bismarck" and the battleship was forced by this action to reduce its speed. Destroyer units launched attacks which rendered the enemy steering action useless, and the warships "Rodney" and "King George V" silenced the "Bismarck" guns. On the morning of the 27th, the British vessel "Dorsetshire" sank the "Bismarck" off the French coast by torpedo attack. This engagement in the war at sea indicated the two principal types of naval action in modern warfare. The first principle was the ship-versus-ship action during which the battle cruiser "Hood" was lost, and the "Bismarck" damaged. The second was the discovery, and the attack upon the "Bismarck" by patrol and torpedo planes. The first type of action is in the classical tradition of naval warfare. The second is comparatively new and while at that time not decisive, the air action contributed considerably to the final destruction of the opponent. The loss of the battle cruiser "Hood" was a severe blow to the British. However, the loss of the new battleship "Bismarck" to the German fleet represented a greater loss of strength in comparison between the relative strengths of the two navies. No decisive answer had been made to the erroneous but persistent question of the battleship *vs.* the aeroplane.

The balance of the war at sea in the Atlantic was concerned with the operations of convoys, the occasional excursion on raids against the European coast, and protection of the home front and coast lines against invasion.

In the Mediterranean sea the British were faced with a different but equally important task in the war at sea. The British control of Gibraltar and of the Suez was essential to the conduct of the war. These entrances into the Mediterranean had to be in British hands if the Italian naval forces were to be denied the use of the Atlantic, and if the British were to continue to use this area as a supply route for the home front. The narrow channel between Sicily and Tunisia, about 90 mi. in width, offered the Italians opportunities to launch attacks upon forces moving along the east-west routes between Gibraltar and the Suez. This geographical factor meant that the whole Mediterranean area was divided into two theatres of action. In the western theatre the fall of France meant the loss of Toulon, Corsica, Bizerte, Algiers and Oran, as naval bases for joint British and French use. It will be recalled that the existence of France and Italy as allies during World War I made all these circumstances aids to the British rather than danger zones. Far from controlling this area, the British faced a constant struggle to maintain themselves in the war in the Mediterranean sea.

In Jan. 1941 the British aircraft carrier "Illustrious" was crippled by air attacks while the cruiser "Southampton" was so badly damaged by an air attack it was beyond salvage value and was sunk. In this action at least one destroyer, the "Gallant," was seriously damaged. These attacks from the air were launched in the narrow channel between Sicily and Tunisia. The fact that they could be launched and could result in such extensive damage indicated the strong challenge to continued British use of the east-west route through the Mediterranean.

In February, the British fleet made raids along the eastern Adriatic coast line off the shores of Albania, and also attacked the naval base at Genoa. Earlier raids had already been made against the base at Taranto in 1940. These raids were combined with air attacks to reduce the possibilities of continued Italian naval action.

In March, the British fleet engaged a strong Italian force in the vicinity of Cape Matapan. These Italian forces moving east in two columns, approached the island of Crete from the west. The British forces moving west from Alexandria and Suda bay in Crete attacked the southern column of the Italian force. One Italian battleship the "Vittorio Veneto" was badly damaged, three heavy cruisers were lost, and two destroyers were also sunk. The British reports indicated no losses in this action. This engagement went far toward establishing the British control in the eastern Mediterranean.

During the Libyan campaigns and also during the campaigns in Greece and in Crete the various elements of the British fleet took part. These actions were not considered to be limited solely to naval forces and are described in the analysis of the military operations.

In the far east the war at sea was confined for the most part to occasional surface-raider attacks upon shipping, and to the limited action of the Japanese naval units against stray Chinese merchant vessels. These circumstances obtained until the entrance of Japan into the war in December. The Japanese war at sea was not confined alone to the operation of naval units. The attacks upon Pearl Harbor in the Hawaiian group, and upon Guam, Midway and Wake islands were combined naval and air actions. In addition the attacks upon the Philippines, upon the Malayan coast and the East Indies were the result of combined action. The most spectacular naval action was the result of the engagement between the British battle cruiser "Repulse" and the British battleship "Prince of Wales" with Japanese air forces. Without adequate air protection these British vessels were attacked and sunk by Japanese air forces. This action appeared to be the only outstanding plane versus ship operation during the year in the war at sea.

In considering the old question of the plane versus the battleship this action should prove at least one point, which is that the question in itself is irrelevant. Battleships without adequate air support are subject to attack and destruction. It follows that there must be unity of command wherever air and other units are employed in the same action. These forces are complementary in their effects and must be balanced and controlled as the separate instruments in an orchestra are harmonized and led by a single conductor.

IV. The War in the Air.—The war in the air during 1941 extended the action and supported the belief that air power is essential to the successful conclusion of major operations in modern warfare. During the principal military campaigns air power continued to play a decisive role in co-ordinated operations with ground and naval forces. Air warfare over Britain and the British air warfare over the axis-controlled areas of the continent did not produce decisive results. No major lesson can be drawn regarding the relative merits of one form of warfare employed alone in any action, as compared to any other form of warfare employed alone in any action. In Crete the transportation of all effective ground forces, and their support during the operations, were accomplished by air forces. In this action a landing was made on a hostile position defended by superior land and naval forces. Off the Malayan coast Japanese air forces attacked two British ships and destroyed them. In each of these instances the attacker had complete air superiority. The conclusion to be drawn appears to be that the surface forces, both ground and naval, cannot secure decisive results without securing equality, or temporary superiority, in the air. In Britain, and also on the continent, air forces alone had been unable to secure decisive results. This necessity for adequate air strength acting in concert with other forces in the conduct of operations, is further dependent upon the adoption of unity of command. These are not new lessons of warfare. The number of

operations in the war in the air, and the magnitude of the world conflict emphasize their importance.

Aside from the use of air forces in the separate campaigns discussed under military operations, the principal war in the air was concerned with the battle of Britain and the subsequent opening of the battle of Germany. Early in the year Lord Beaverbrook (*q.v.*), British minister for air, stated in effect that Britain had more aeroplanes of every type in operation than ever before in her history. During January the British made the first mass air raid on German bases on the continent. Since Dec. 29, 1940, when German air raids over London had been most severe, the axis planes appeared to have reduced the number and the intensity of their attacks. Britain meanwhile had adopted the offensive and was gradually extending the radius of distant attacks on Germany. The lull in German attacks continued in February and many estimates were made as to the dispositions and probable employment of the German air forces. Some British estimates placed the German air force combat-plane strength at 19,000 ships. A United States estimate suggested that Germany had about 18,000 first-line planes, with another 18,000 for replacement, available for an attack on England. No large-scale attack of this character developed during the year. The report of these estimates indicates the concern over the possibility of the use of air power, and suggests that this air power exerts effect both when used and when not used in actual attack.

It was apparent that the British plan for the conduct of the battle of Britain in 1940 had been changed for 1941. In 1940 the British had fought savagely to maintain air equality over the islands, and had attempted occasional air raids over the channel. Now the British extended offensive air action in attempts to destroy invasion bases and to reach far inland to destroy the German capacity to concentrate and support a large-scale invasion. In addition the British extended the use of the air arm to assist naval and ground forces in some of the operations in the Mediterranean. It was reported that British parachute troops had been dropped in southern Italy during February. In March the British claimed extensive air raids over the continent, as far to the east as Cracow. The loss of life due to air raids over Britain dropped to a new low of 1,500 per month compared with the tragic high figure of some 6,900 for the month of Sept. 1940. It appeared that the British air strength had increased to warrant full support of the new British plan for the conduct of the war in the air during the early months of 1941.

During April, furious German air raids began again over widespread areas in England. Despite heavy losses these raids continued during April and May. In mid-June, after a period of relative quiet, the British initiated the first of their large-scale daylight raids over the channel coast and the German bases. The opening of the German war against Russia, and the acquisition of the Iceland base by the United States combined to offer new opportunities to the British in the conduct of the war in the air. New supplies of ships and supplies could be expected from the United States. German air forces would be engaged in the Russian war.

Britain swiftly improved its air equipment, developed its air defense and air offensive tactics and launched repeated attacks against the continent. In July Germany launched no reprisal raids. Scattered German attacks were made over England during August and September. During September the German air forces appeared to be concentrating on shipping, both along the sea lanes and also against the ports of entry on the coast. British claims in October indicated that the Germans were dropping large land mines, which might have caused the extensive damage to Coventry and to other English towns in earlier raids. The intensity of the British raids over the continent continued during the balance of the year. Ports were bombed, industrial areas were destroyed, Berlin was under frequent attack and at times both the British and the Russian forces combined in launching raids over the German cities. The full extent of the British raids had to be reduced during a part of November due to poor weather and also because the German anti-aircraft defenses had been improved. This increased resistance resulted in heavy losses of pilots and planes for a short period during this month.

The year closed with the British definitely equal in strength and frequently superior in strength to the German air forces. Complete air superiority appears to be an impossibility. Temporary air superiority may be secured for a short period of time and as a result of large concentrations for operations frequently resulting in large losses of men and materials. Regardless of the excellence of the modern air defenses, some planes will get through to launch at least minor attacks which are not designed to bring about decisive results.

The war in the air developed within the German forces a system of close co-ordination with ground and naval forces. Unity of command appeared to be the rule. While a separate air force existed in Germany, complete co-ordination appeared to be secured at all times. The British developed a satisfactory type of plane detection for use during day and night, organized fighter commands and coastal commands of great strength and flexibility and, despite occasional heavy losses, adopted extensive offensive actions over the continent. British air co-operation with ground and naval forces was erratic but showed improvement. Considerable improvement could be expected as soon as the principle of unity of command in operations became the rule instead of the exception.

Harbor, Hawaii, after the Japanese raid of Dec. 7, 1941

Commanding Generals of Various Campaigns in World War II (1941)

The following list may be inaccurate. Commanding generals were not in all instances officially announced during 1941. The listing is based on unofficial reports. Up to Jan. 1, 1942, for example, it was not definitely known whether Milch or von Falkenhorst was the actual leader of the German attack on Crete nor who was the new chief of the Japanese imperial general staff. There was so much confusion attendant to the leadership in these campaigns, that the author of the article on World War II purposely omitted emphasis on names in the compilation of the material.

A. Balkan campaign
Yugoslavia: Dushan Simovitch*, commander in chief
Great Britain: Sir Henry Maitland Wilson and Sir Thomas Blamey
Greece: Alexander Papagos, commander in chief; Giorgios Tsolakoglou (Epirus)
Germany: Walther von Brauchitsch*, commander in chief of army

B. Crete
Great Britain: Bernard Cyril Freyberg
Germany: —

C. East Africa
Great Britain: Sir Alan Gordon Cunningham*
Italy: Duke of Aosta

D. North African campaign
1. First phase (Jan. 1–March 31)
Italy: Rodolfo Graziani
Great Britain: Sir Archibald Percival Wavell*
2. Second phase (March 30–April 30)
Italy: Italo Gariboldi
Germany: Erwin Rommel*
Great Britain: Sir Archibald Percival Wavell*
3. Third phase (Nov. 18–Dec. 31)
Italy: Italo Gariboldi
Germany: Erwin Rommel*
Great Britain: Sir Alan G. Cunningham*, succeeded by Neil Methuen Ritchie*

E. Near East
1. Iraq
Great Britain: Sir Archibald Percival Wavell*, commander of British middle eastern forces
2. Syria
Great Britain: Sir Henry Maitland Wilson
Free French: Georges Catroux
Vichy France: Henri Fernand Dentz*
3. Iran
Great Britain: Sir Archibald Percival Wavell*
U.S.S.R.: Vassili Novikox
Iran: —

F. Russian campaign
Germany: Walther von Brauchitsch*, commander in chief of army (removed Dec. 19) and Wilhelm Joseph Franz Ritter von Leeb* (north); Fedor von Bock* (centre); Karl Rudolf Gerd von Rundstedt* (south)
U.S.S.R.: Klimenti E. Voroshilov* (north); Simeon K. Timoshenko*, succeeded by Georgi K. Zhukov* (centre); Simeon M. Budenny*, succeeded by Timoshenko* (south)

G. Far East
Allied supreme commander: Sir Archibald P. Wavell*
United States: Douglas MacArthur* (Philippines); Thomas C. Hart*, commander in chief of Asiatic fleet
Great Britain: Sir Robert Brooke-Popham*, succeeded by Sir Henry R. Pownall* (Malaya); Sir Tom Phillips*, commander in chief of far eastern fleet (died Dec. 10)
China: Chiang Kai-shek*, commander in chief
Dutch East Indies: Hein ter Poorten*, commander in chief
Japan:—Masaharu Homma (Philippines); Tomoyuki Yamashita (Malaya)

Wren, Percival Christopher (1885–1941), British soldier and novelist, was born in Burroughs court, Devonshire, and was educated at Oxford. After leaving school, he roamed the world and was in turn a sailor, schoolmaster, college principal, peddler, boxer, journalist and explorer. He settled in India for 10 years as assistant director of education for the Bombay government and during World War I served in the Indian army in East Africa and the French foreign legion. His experiences as a legionnaire furnished the material for his most popular work, *Beau Geste* (1924), an immediate best-seller. He also wrote *Beau Sabreur* (1926), *Beau Ideal* (1928), *Good Gestes* (1929). His other works included: *Dew and Mildew* (1912), *The Wages of Virtue* (1916), *Stepsons of France* (1917), *The Disappearance of General Jason* and *Two Feet from Heaven* (1940). He died in Amberley, Gloucestershire, Nov. 23.

Wrestling. With professional wrestling on the down-hill for a half a decade, no recognition was given to new or old champions by state ruling bodies. Only in a few mid-western cities was any interest shown in the professionals, comprising old timers and others trying to impress the galleries. Amateur wrestling, on the other hand, was popular. The National Collegiate A.A. awarded top honours in 1941 to grapplers of Oklahoma A. and M., who took four titles. Two brothers from Michigan, Merle and Burl Jennings took the 121 and 128-lb. classes. In National A.A.U. competition, the N.Y. West Side "Y" captured the team title with one victory and several places. Princeton and Yale tied for the team title in the Eastern Collegiate championships, with Navy taking two of the titles.

(J. B. P.)

Wyoming. A Rocky mountain state, admitted to the union July 10, 1890, as the 44th state. Leadership in the extension of rights to women gave it the name "Equality state." Area, 97,914 sq.mi.; pop. (1940) 250,742. The rural population was 157,165; urban, 93,577; 229,818 native white, 950 Negro, 17,107 foreign born, 2,345 Indians, 390 Japanese and 43 Chinese. Capital, Cheyenne (22,474). Other principal cities are: Casper (17,964); Laramie (10,627); Sheridan (10,529).

History.—Elective state officials in 1941 were: governor, Nels H. Smith (R.); secretary of state, Lester C. Hunt (D.); auditor, William Jack (D.); treasurer, Mart T. Christensen (R.); superintendent of public instruction, Esther Anderson (R.).

The 26th state legislature enacted few laws in 1941. A teachers' retirement act was passed, but was vetoed. Communists were barred from primary and general election ballots. Defeated were attempts to replace the 2% sales tax with a gross receipts tax, to establish a drivers' licence law, to legalize gambling, to move the college of agriculture, and to remove regulations on trucking. Ninety per cent of the more than 300 bills introduced in both houses were designed to correct defects in existing laws.

Education.—In 1940 there were 944 rural schools with an enrolment of 9,531 and 943 teachers. There were 39,917 elementary-school pupils and 947 elementary-school teachers. There were 135 high schools with 16,825 pupils and 661 teachers. The University of Wyoming, the only institution of higher learning in the state, had 1,860 students and 165 teachers in 1941.

Public Welfare, Charities, Correction.—The total of federal, state and county public-welfare disbursements Oct. 1, 1938 through Sept. 30, 1940 was $3,928,952.96. Of this amount, $1,776,606 was for old-age assistance; $517,727 for aid to dependent children; $103,135 for aid to the blind; and $687,816.12 for general welfare. Wyoming had four correctional institutions in 1941—state penitentiary, penitentiary farm, industrial institute for boys, and girls' school. State expenditures for these institutions in the year ending Sept. 30, 1940 amounted to $205,182.80.

Communication.—There were, in 1941, 23,000 mi. of roads, of which 3,400 mi. were hard surfaced. The state highway department spent $5,416,260.48 during the year ending Sept. 30, 1940. There were 1,992.69 mi. of railroad in the state. In 1941 there were 48 airports and two major air lines.

Banking and Finance.—There were 32 state banks and 26 national banks in Wyoming on June 30, 1941. The state banks had deposits of $20,329,994 and resources of $23,264,333.83. The national banks had deposits of $52,849,991.58 and resources of $59,229,221.10. The state had nine insured savings and loan associations in 1941, with assets of $4,598,860. For the year ending Sept. 30, 1940, the total of state receipts was $15,467,985.93; total disbursements, $14,260,447.86. The state's bonded debt on Sept. 30, 1940 was $3,878,000.

Ranching and Agriculture.—Livestock and crop conditions were unusually good in 1941. Wyoming livestock products sold for $52,515,200, and its farm crops were valued at $30,556,350.

Table I.—*Leading Ranch and Farm Products of Wyoming, 1941 and 1940*

Product	Value 1941	Value 1940
Cattle	$26,295,750	$19,000,000
Sheep	13,338,000	11,000,000
Wool	11,881,450	10,000,000
Hogs	1,000,000	600,000
Alfalfa (707,000 tons)	5,161,000	4,164,400
Wheat (5,598,000 bu.)	4,742,320	2,557,700
Sugar beets (526,000 tons)	3,419,000	2,546,000
Dry beans (667,000 cwt.)	2,334,500	1,270,500
Corn (2,928,000 bu.)	2,168,720	1,215,900
Wild hay (320,000 tons)	2,080,000	1,688,100

Manufacturing.—The value of all manufactures, excluding oil refining and dairying, was estimated at $26,000,000 in 1941.

Table II.—*Principal Industries of Wyoming, 1939 and 1937*

Industry	Value of products	
	1939	1937
Petroleum refining	$24,671,993	$20,093,404
Bread and other bakery products	1,315,075	1,419,501
Butter	968,991	1,076,855

Mineral Production.—The total value of Wyoming's mineral production in 1941 was estimated at $190,950,000.* The greatest gain over 1940 was in petroleum production. There were 35 active oil fields.

Table III.—*Principal Mineral Products of Wyoming, 1941 and 1940*

Mineral	Value 1941	Value 1940
Petroleum (refined value)	$165,000,000*	$152,420,000*
Bituminous coal	18,750,000	16,000,000
Iron	3,500,000	3,000,000
Bentonite	1,500,000	1,500,000

*Estimates of state minerals supervisor; figures include oil refined in state, oil used on roads and oil piped outside state for refining.

(A. T. L.)

X-Ray. Advances in the diagnostic and therapeutic fields of medical radiology during 1941 were all in the nature of improvements in apparatus and refinement of methods rather than in any completely new discoveries.

A method of film reproduction which would undoubtedly have important applications not only in the organization and storage requirements of X-ray departments but in medical education, teaching and research was developed.

The filing and storage of roentgenograms have always been a real problem in hospitals and large clinics. Because of their value in studyihg the progress of disease in individual cases or as records in medico-legal cases or for teaching purposes, some institutions require that all roentgenograms must be preserved indefinitely. Others, because of lack of storage space, permit destruction of films after varying periods, three, five, eight or ten years.

A method was worked out by Sutherland for reproduction of roentgenograms which would largely solve the storage difficulties and at the same time would make vast numbers of roentgenograms available for study and teaching as they have never been before. The method consists in reproduction of the original roentgenogram of whatever size on a 35 mm. film; its preservation either in rolls or in individual mounts or both, and its examination in a specially devised illuminator with magnification, or by projec-

tion on a screen. This reproduction can be accomplished without essential loss in the detail of the original film.

The procedure recommended by Sutherland is as follows: A master film is made (the equivalent of the intermediate in the making of a lantern slide) and two copy rolls (facsimiles of the original roentgenogram). He suggests that the master film may be retained by the department concerned with the making of prints for publication, etc., while one copy roll may be used in the radiological department where it may be cut into individual films to be preserved in envelopes or placed in suitable mounts. These may replace the original films in the hospital file and can be used for lantern slides where desired. The second copy roll may be used for teaching purposes or as a reserve in case the master film or small mounts should be destroyed. The first and most obvious advantage in this method is the reduction in the volume of the file. Instead of requiring much shelf room for filing various-sized films, a small cabinet may be substituted. A unit occupying 20x20 in. floor space will accommodate 320,000 individual miniature reproductions in an orderly arrangement. The economic saving in the reduction of floor space necessary for filing films is impossible to estimate but it would be very great.

A second advantage of the method is the ready availability of the miniature films for study. If it is found desirable, an entire roll of 800 miniatures may be studied by use of a small projector and this can be done in any convenient place without transportation of large films.

A third advantage is the insurance against loss of valuable records which have not only scientific but clinical value. The entire film storage space in an institution may be destroyed by fire or other catastrophe. By having the duplicated miniatures stored in different places and easily transportable the liability that they would all be destroyed is greatly reduced.

The fourth advantage of the method is its contribution to teaching. Films can be made available in large numbers to the departments of anatomy and pathology in medical schools, and to the clinical departments which now use the X-ray to such a large extent and which may have on hand sets of films of every subject.

Sutherland suggests the desirability of establishing a great central depository of roentgenograms covering every medical and surgical subject in which the X-ray is of use, including those diseases which are not common in the United States. It is difficult to exaggerate the value of such a collection in the army medical library where it would be open to the entire nation. (*See* also HEART AND HEART DISEASES; PHOTOGRAPHY; TUBERCULOSIS.)

Yachting. In spite of the many influences both in the United States and elsewhere, which were far from beneficial, the yachting season of 1941 saw record and near-record numbers of boats in commission in the majority of yachting centres all over the U.S.A. Many of the larger craft were sold or given to the navy and the coast guard during the year; and, although this gave still further impetus to the trend to smaller boats, the net effect on the total number of yachts and yachtsmen was negligible.

The biennial transpacific race from San Pedro to Hawaii brought out a fleet of only seven for the 2,225-mi. slide down the trade winds to Diamond Head. They were all west coast craft and the finish was, as usual, very close, D. W. Elliott's "Escapade" winning by less than four hours after 14 days at sea.

The premier long-distance race on the Atlantic coast was sponsored jointly by the Storm Trysail club of New York and the Hampton Yacht club of Virginia with the start at New London, Conn. and the finish off the latter club's anchorage. Three of the U.S. naval academy's sailing yachts participated and performed notably but the winners were James H. Grove's cutter "Blitzen," in Class A and Harvey Conover's sloop "Revonoc" in Class B. The Chicago and Detroit-Mackinac races, premier events of the Great Lakes season, brought 50 and 27 starters, respectively, with honours going to Sumner Scott's ketch "Breeze" and John Timken's cutter "Kitty Hawk."

There was no racing in the large one-design and rule classes on Long Island sound and very little at Marblehead, Mass., the old strongholds of large yachts. At the Larchmont Yacht club's annual race week on the Sound the number of entries suffered another disheartening decline. At Marblehead the situation was not as bad, but year after year it had become more and more apparent that these old-established centres of yacht racing no longer held the pre-eminent position they once enjoyed. In contrast, Great South bay's race week, the various regattas on Chesapeake bay and leading events at Cleveland, Detroit, Chicago, and other Great Lakes cities and on the Pacific coast, all found as many or more boats than ever before competing for honours.

There was, of course, no international yacht racing in 1941, and in its absence national championships in the various classes took on added significance. George Fleitz sailed "Wench" to the championship of the Star class in a close, hard-weather series off his home port, San Pedro, Calif. Phil Somervill of Edgewater Park, N.J., retained his Comet class title by outsailing 34 others in another bit of breezy weather at Sandusky, O. The fast-growing Lightning class crowned John M. Stern of the Buffalo Canoe club its champion. The championship of the Snipe class, most numerous one-design class in the world, was won by Darby Metcalf of Los Angeles, Calif.

The Sears Bowl, emblematic of the national Junior title, was successfully defended by Robert Coulson's Eastern Yacht club crew of Marblehead, Mass., but with Cold Spring Harbor, N.Y. and Vineyard Haven, Mass. only one and two points behind. A Riverside (Conn.) Yacht club crew, headed by Miss Lois MacIntyre, took the women's national title with comparative ease.

(H. L. ST.)

Yale University. An institution of higher education at New Haven, Conn. The opening of the Yale medical library was an outstanding event of the academic year 1940–41. The building, provided by funds from the estate of John W. Sterling, '64, and designed by Grosvenor Atterbury, '91, houses the general medical library and the historical library. The historical library contains the great collection of medical and scientific history bequeathed by Dr. Harvey Cushing, '91, and the collections given by Dr. Arnold C. Klebs, Dr. John F. Fulton and many others.

During the year the curriculum of the school of music was reorganized for the advanced study of music. The Norfolk music school of Yale university at Norfolk, Conn., established by the bequest of Ellen Battell Stoeckel, opened its first summer session on June 23, 1941, under the direction of Dean Bruce Simonds.

The Art gallery received the early American miniatures collected by John Hill Morgan, '93, and the Lewis Fox Frissell collection of Sandwich glass.

Gifts and bequests received by the university during the year ending June 30, 1941, totalled $3,260,282; gross additions to funds were $1,994,019, including interest on certain funds; total endowment and reserves were $112,096,810, with a net after investment losses of $102,188,407. In addition the Sheffield Scientific school trustees had assets of a book value of $2,243,667.

(C. A. L.)

Yamamoto, Isoroku (1884–), Japanese naval officer, was born in April. He was graduated from the naval academy in 1904 and fought as an ensign in the Russo-Japanese war. He was naval attaché in the Japanese embassy in Washington, 1925. As Japanese delegate at the London naval conference in 1934–35, he successfully fought the Anglo-American proposal to extend the naval "holiday." The talks foundered on the issue of parity between the U.S. and Japan, and Yamamoto won rapid promotion for his work in London. Foremost Japanese advocate of combining air and sea power in naval attacks, he was promoted to commander-in-chief of the fleet in 1939. Referring to the Japanese surprise attack on Pearl Harbor, Domei (Japanese) news agency revealed in a dispatch on Dec. 17, 1941, that the strategy of surprise carried out by Adm. Yamamoto was planned by him earlier. Domei also quoted a letter written by the Japanese fleet commander to a friend almost a year before, in which Yamamoto assertedly declared: "Any time war breaks out between Japan and the U.S., I shall not be content merely to capture Guam and the Philippines and occupy Hawaii and San

Francisco. I am looking forward to dictating peace to the U.S. in the White House at Washington."

Yemen: *see* ARABIA.

Young Men's Christian Association.

In 1941 Frank A. Bayley was president; Eugene E. Barnett, general secretary. (Corporate title: The International Committee of Young Men's Christian associations.) The 1940 Y.M.C.A. Yearbook listed 1,292 local associations with 1,224,410 members in cities, high schools, colleges, rural areas, railroad and industrial centres, and near military establishments. The major emphases in 1941 included service to young men in military and related defense service as one of six agencies composing the United Service Organizations for National Defense, with responsibility for operating approximately 140 clubs and centres, in addition to extending regular facilities everywhere. Service among 4,000,000 prisoners of war was also expanded through the World's Alliance at Geneva, and continued its 50-year-old program of international co-operation in thirty countries. Important meetings were the Sixth North American Assembly of Y.M.C.A. Workers with Boys at Louisville, Ky.; the National Physical Education convention at Berea college; the International Conference on Basic Membership Policies at Detroit, Mich.; the 24th Conference on Industrial Relations at Silver Bay, Lake George, N.Y., and special institutes for foremen and transportation workers. Other emphases included citizenship and public affairs, national uniform membership and program reporting, and public relations. Plans were laid by the national council for the centennial celebration of the founding of the Y.M.C.A. in London in 1844. (O. E. P.)

Young Women's Christian Association.

During 1941 nearly 3,000,000 women and girls had some share in the regular service program of the Y.W.C.A. carried on in its 1,470 local centres in the United States. As one of the agencies in the United Service Organizations for National Defense, Inc., the Y.W.C.A. also assumed responsibility for helping to meet the needs and problems of the large numbers of women and girls in communities affected by camp concentrations and defense industries. The Y.W.C.A. in 1941 continued its work with refugees from abroad as well as the raising of special funds through the Y.W.C.A. world emergency fund to aid the Y.W.C.A.'s in China, Europe and Great Britain in meeting the many emergency demands created by the war. Outstanding events in 1941 included a luncheon in honour of Lady Halifax, former president of the British Y.W.C.A. War Time Appeal, with an attendance of 2,500; the 60th anniversary, in April, of the younger girl group in the Y.W.C.A.—called "Girl Reserves" —in observance of which a nation-wide broadcast was arranged from Washington, D.C.; and a meeting at the national board headquarters in New York City at which Dr. A. Maude Royden of London, England, spoke on the subject "The World Crisis and Religion." President: Lilace Reid Barnes. (M. S. Ss.)

Youth Administration, National: *see* NATIONAL YOUTH ADMINISTRATION.

Youth Movements.

Such movements are an organized effort at political, cultural and social self-expression of young people.

In totalitarian states youth movements are on a nation-wide and compulsory basis; they are strictly regimented and made completely subservient to the aims of the state. How far this indoctrination had succeeded by 1941 was most interestingly revealed in a publication, Gregor Ziemer's *Education for Death*, which brought the most up-to-date firsthand observations of the youth movement in Germany. The German pattern of youth movement had been imitated, more or less successfully, in all states which came under national socialist control—in Italy and Spain, and later in Rumania and France. At the end of Aug. 1941, youth leaders from a dozen countries under national socialist control met at Breslau in Germany and laid the foundations for a new continental youth organization. The occasion was an athletic meet of the Hitler Youth which was proclaimed to be the first international "junior Olympics." Preparations were made for some form of common tie for the regimented youth of the "new Europe" under German leadership. In Spain a "youth front" was set up to have jurisdiction over all children between 6 and 18 years of age, whether they were in school or not, and was placed under the direction of the Falangist university students syndicate.

In the democratic countries like Great Britain and the United States only a small part of the young people were organized in youth movements, of which many, like the Boy Scouts and different church groups, were entirely apolitical. On the other hand others tried to play a definite political role, among them the American Youth congress, which was established in the summer of 1934 and was the centre of much controversy. While in 1940 the American Youth congress had maintained an uncompromisingly hostile attitude to American foreign policy and to what they called American intervention in "foreign" or "imperialist" wars, and had sided with the extreme noninterventionists, it somewhat, though only slightly, modified its stand in its session in Washington on Feb. 9, 1941. It proclaimed its opposition to all dictatorships but denounced the war in Europe as an imperialist war in which the United States should have no part. The entrance of the soviet union into the war in June 1941 brought, however, a complete reversal of the stand taken by these American youth organizations. They now advocated full American aid, not only to the soviet union but also to Great Britain and to all peoples fighting against fascist aggression. The foreign policy of the United States and its defense program were now fully backed. Meanwhile other new youth organizations had been formed throughout the United States which from the beginning supported the foreign policy of their country and in some cases went even further in advocating the fullest co-operation of the United States with all peoples fighting for the preservation of their freedom. (*See* also CATHOLIC YOUTH ORGANIZATION.)

Yugoslavia.

A kingdom in southeastern Europe, divided up as a result of German aggression in 1941. Area 95,576 sq.mi.; pop. (est. Jan. 1, 1940) 15,703,000. Capital: Belgrade (266,849). Other chief cities: Zagreb (185,581); Subotica (100,058); Ljubljana (79,056); Sarajevo (78,173). Religion: 6,785,501 Greek Orthodox; 5,217,910 Roman Catholic; 1,561,166 Mohammedans; 231,169 Protestants; 68,405 Jews. King: Peter II (*q.v.*); prime minister, Gen. Richard Dushan Simovitch (*q.v.*).

History.—On Feb. 13, 1941 the Prime Minister Cvetkovitch and Foreign Minister Cincar-Markovitch went to see Chancellor Hitler. Long negotiations followed, and meanwhile Bulgaria's adherence to the axis pact put Yugoslavia into a very unfavourable strategic position. At the same time, the agitation of Croat extremists and the fascist-terrorist group of the Ustashi under the leadership of Dr. Ante Pavelitch, who directed the movement from Italy, caused concern to the Yugoslavs.

The Yugoslav government tried to arrive at a compromise with Germany, which had demanded not only signature of the axis pact but permission to send troops down the Morava and Vardar valleys to Greece, and additional military, political and economic concessions binding Yugoslavia firmly to the "new order." While the government deliberated, the democratic Serb parties who represented the vast majority of the population organized an opposition to Yugoslavia's surrender to Germany. The German minister to Yugoslavia, Viktor von Heeren, negotiated secretly with minority groups in Yugoslavia, promising "freedom" to the separatist groups in Croatia and Bosnia in exchange for their promise of neutrality in case of a Yugoslav-German conflict. The Yugoslav government tried to substitute a friendship and nonaggression pact with Germany for the demanded full membership in the axis. For several days Yugoslavia seemed to fluctuate between acceptance and resistance. Popular temper definitely changed in the latter direction. Undercover movements were organized to lead the resistance throughout the country in case of a German occupation. Finally on March 20 the Yugoslav cabinet accepted the German final terms for a settlement which would take into account the nonactive character of Yugoslav co-operation with the "new order." But the unrest of the people grew hourly. In the early morning hours of March 27, the 17-year-old King Peter II took over the government of the country, Prince Paul fled, and a new government under Gen. Dushan Simovitch, chief of the Yugoslav air force, was formed. In the new cabinet the Croat leader, Dr. Vlatko Matchek, was first vice-president.

The time left to the new government to prepare for the decisive struggle with Germany was much too short. On April 6 the invasion began, simultaneously through Hungary and Bulgaria and by April 16 the Yugoslav army had disintegrated. King Peter and his cabinet were forced to flee. (*See* WORLD WAR II.)

Large parts of the country were annexed outright by Bulgaria, Hungary, Germany and Italy. Southern Serbia (Macedonia) was annexed by Bulgaria; northeastern Yugoslavia, the fertile plains of the Banat, were annexed by Hungary, while Slovenia was divided between Germany, which annexed the northern part, and Italy, which annexed the southern part as an autonomous province of Ljubljana. Out of the remaining part of Yugoslavia, an "independent" new kingdom of Croatia was created, while in rump Serbia, under a German-instituted government of General Milan Neditch, the Serb population continued the struggle against the German invaders with an indomitable courage and an unparalleled heroism. Meanwhile the legal Yugoslav government continued to function in London,

PARTITION OF YUGOSLAVIA among Germany, Italy, Hungary, Rumania and Bulgaria after the axis conquest of April 1941

there it had found temporary refuge as one of the allied governments. (*See* also CROATIA; DALMATIA; MONTENEGRO.)

(H. Ko.)

Yukon Territory. The most westerly of the northern territories of Canada, was created a separate territory in June 1898, by act of parliament (the Yukon act). Area, 207,076 sq.mi.; pop. 4,230 (estimate of dominion bureau of statistics, 1941.) At the height of the gold-mining boom 1901) the population was 27,219. Seat of government: Dawson 828).

The government in 1941 was composed of a chief executive, who is the controller, and an elective legislative council of three members, with a three-year tenure of office. The controller administers the government of the territory under instructions from the dominion federal government. The territory was represented in the house of commons as of 1941, by one member.

Education.—In 1941 there were five public schools and one Roman Catholic school with 185 pupils.

Transportation.—Transportation is largely by air, with landing fields at Dawson, Mayo, Whitehorse and Carcross, and emergency fields at McQuesten, Selkirk and Carmacks. There were 58 miles of railway and 324 miles of wagon roads in 1941.

Finance.—Ordinary revenue in 1938 was $213,712; ordinary expenditure, $212,597.

Industry.—The chief industry is mining, followed by furs and fish. Mineral production in 1939 was as follows: gold, 87,745 fine oz., valued at 3,171,192; silver, 3,830,864 fine oz., valued at $1,551,040; lead, 7,544,-32 lb., valued at $239,089; the total value was $4,961,321. Furs (1939): elts, 77,475; value $267,721; fisheries (1939): value $4,867.

(J. T. C.)

Zahle, Herluf (1873–1941), Danish diplomat, was born March 14 in Denmark. He entered the diplomatic service in 1900 and subsequently became minister to weden and Germany. In 1911 Zahle was named chamberlain to he king of Denmark. He was president of the Danish delegation o the League of Nations at Geneva from 1920 to 1927 and was resident of the League assembly in 1928. In 1925 he presided ver the International Opium conference at Geneva and sat as udge in the Permanent Court of International Justice in 1932 nd 1933. He was minister to Berlin in June 1939 when German Foreign Minister Joachim von Ribbentrop signed a nonaggression pact with Denmark. The news of his death was reported from Berlin May 4.

Zanzibar and Pemba: *see* BRITISH EAST AFRICA.

Zhukov, Georgi Konstantinovich (? –), Russian army officer, joined the Russian imperial army as a private in 1915. After the revolution, he attended the Frunze military academy, where he received his military training under Gen. Boris Shaposhnikov (*q.v.*), crack soviet strategist. He was then appointed commander of the Kiev military district, and later led tank units in the brief border war against the Japanese in Mongolia, 1939. He was named chief of the Red army general staff and vice-commissar for defense, Feb. 1941. During the nazi drive on Moscow in the fall of 1941, Zhukov was given command of the capital's defense forces on Oct. 23, replacing Gen. Timoshenko (*q.v.*), who was sent to the southern front. The German offensive at one time reached a point some 20 miles from Moscow, but there Russian armies held fast. Zhukov's armies launched a series of counter-attacks; in December, German defenses cracked under the hammering Russian blows, and Hitler's armies, ill-equipped to cope with the rigours of winter fighting, had fallen back by Dec. 31 on nearly all sectors of the immense Moscow front, with Russian armies in hot pursuit.

Zinc. In the accompanying table of world production of zinc, all figures were estimates except for the United States, and were subject to revision. Fairly large increases in output in Australia, United States, Great Britain and Canada, were largely offset by decreases in Belgium, France and Norway, leaving the world total only 3% greater than in 1939.

World Production of Zinc
(In thousands of metric tons)

	1929	1937	1938	1939	1940
Australia	50.8	70.9	70.9	70.8	85.0
Belgium	197.9	225.6	210.4	185.7	65.0
Canada	78.1	143.9	155.7	161.8	180.0
France	91.6	60.4	62.2	60.3	35.0
Germany	102.0	163.3	192.5	212.3	225.0
Norway	6.4	41.3	46.5	45.0	20.0
Poland	169.0	109.3	110.8	117.9	120.0
U.S.S.R.	3.4	70.0	80.0	90.0	85.0
United States	573.0	534.9	414.6	488.3	583.7
United Kingdom	59.2	63.1	56.2	50.4	60.0
World Total	1,472.8	1,667.9	1,589.7	1,678.1	1,732.0
Ex. U.S.	899.8	1,133.0	1,175.1	1,189.8	1,148.0

Production in the United States in 1940 included 666,400 short tons in mine output, 675,275 tons of primary metal (589,988 tons from domestic ores and 85,287 tons from imported ores), and 205,921 tons of secondary metal, all being heavy increases over 1939. Imports were down to 10,146 tons, and exports up to 79,091 tons, or a net export of 68,945 tons, against a net import of 36,445 tons in 1939. Production was not able to keep up with demand, and stocks at the smelters declined 64,516 tons during 1941.

Casting a balance for 1941, total output plus depletion of stocks, less net exports, left 670,846 tons available for consumption, as compared with an estimated actual consumption of 719,000 tons. This left a difference of 48,154 tons to be made up from consumers' stocks. All told, then, stocks were robbed of a total of 114,670 tons during the year, while at the end of the year smelter stocks were 19,212 tons and consumers' stocks 78,194, a total of 97,406 tons.

During the first ten months of 1941, mine production in the United States was 608,457 tons, and the year's total was estimated at 732,000 tons; metal production from both domestic and foreign ores, to the end of November, was 784,974 tons, or an estimated 860,000 tons for the year. Smelter shipments to the same date were 779,374 tons, including 685,836 tons for domestic consumption and 93,538 tons for export, and an estimated total of 853,000 tons for the year. Ore imports totalled 140,339 tons during the first three quarters of the year, an average rate of 187,100 tons for the year. Metal imports were 31,971 tons and exports 60,976 tons in the same period, a net export of 29,005 tons, but indications point to an increased rate for exports during the last quarter. There had been improve-

ment in the stock situation; smelters' and consumers' stocks at the end of October were 79,387 tons, against 97,406 on Jan. 1, a reduction of only 18,019 tons, against 114,670 tons in 1940.

Prime Western zinc was quoted at 7.25 cents per lb. in St. Louis to Oct. 9, and 8.25 cents per lb. for the remainder of the year, while the official maximum price in London for the same grade was £26 10s. per long ton.

Mine production of zinc in Mexico in the first seven months of 1941 totalled 69,181 metric tons, against 64,249 tons in the same period of 1940. (G. A. Ro.)

Zirconium. One of the largest plants for the recovery of zirconium is that at Byron bay, on the north coast of New South Wales, Australia, where beach sands are treated for the recovery of zircon and a concentrate containing 63% rutile and 37% ilmenite. Other sources are Brazil and India. Imports of zirconium ores into the United States in 1940 jumped to almost double anything previously on record, to 16,845 short tons, about half of which was from Australia. (G. A. Ro.)

Zoological Gardens. In the U.S. the St. Louis, Mo., zoo acquired the first specimen of the Guatemalan quetzel from Wolfgang van Hagen. Once the sacred bird of the Incas and Mayas, and worth about $4,000, this bird is the size of a pigeon. Some of the animals on the zoo ship "West Kebar," from South Africa, were drowned in a storm, but the rest arrived safely at Boston, Mass., for American zoos. In Canada three chimpanzees were received at the Toronto zoo from London, in exchange for an elk or moose after the war.

Dr. Raymond L. Ditmars prepared a report on the venomous snakes found in Central and South American areas where air bases may be established. Later he sailed for Trinidad to collect animals for a vampire bat cave. Capt. Jean Delacour was appointed consultant for the future development of the New York zoo park. The New York city aquarium closed and the African plains were opened in the Bronx park zoo. Zoological park directors decided to form a national association.

Europe.—In Britain, zoological gardens kept going in spite of enemy action, food shortage, reduced revenue and the difficulty of importing animals. *Animal and Zoo Magazine* ceased publication in June. In Regent's Park zoo there were about 2,600 animals worth about £40,000 at the beginning of 1941. The adoption scheme continued; regiments adopted their crest animals and *Punch's* Round Table, a lion. New arrivals included a wattled crane, Impeyan pheasants and tragopans and a pair of Senegal touracos from J. Spedan Lewis of Leckford near Winchester, a silver cock-pheasant from Watford and a two-toed American sloth. Losses included the Chilean sea-eagle, a spiny Echidna and Jean, the tame Bengal tigress.

At Whipsnade attendance improved. A depleted staff grew oats, wheat and root crops. An anti-rat campaign followed, the dead rats forming food for other animals. The herd of Chinese water deer was reduced. New stock included ten wallabies and three llamas presented by the duke of Bedford, a Manchurian crane and pairs of Asiatic white cranes and hooded cranes from Mr. Lewis' collection. Black swans bred and two baby camels and wallabies were born.

At Chester animals were re-grouped to economize heat and labour. More air-raid shelters and breeding tanks were provided. A lioness, a black panther and a leopard from Bristol and two white Bahrein donkeys from Edinburgh were among the evacuees received. Chester city education committee was making the zoo a money grant to enable children to pay visits free.

Manchester zoo successfully bred a lion cub. Edinburgh lost six budgerigars and a wild rabbit from enemy action. In a lecture, M. C. Thomson, curator of the aquarium, stated that Germany tried to claim a world record for keeping herrings alive for 14 weeks; Edinburgh had kept them for two years. Dublin opened a children's corner in the spring. (V. R.)

Zoology. Zoology in 1941 continued along essentially the same pattern of the last several years. No distinctly new trends emerged. The American Society of Zoologists met in December in Dallas, Tex., for an active session. A volume entitled *A Symposium on Hydrobiology* summarized much of the status of current research on limnology (fresh-water biology). A symposium held at the University of Chicago in September called "Levels of Integration in Biological and Social Systems" attempted to re-examine the relationship between biological and social organization.

Moore reported one of the interesting studies of the year in the field of physiology of reproduction. This worker studied the pouch young of the opossum. These animals are born as very immature individuals and finish their development attached for 60 to 70 days to mammary glands in the pouch of the mother. Thus they are excellent objects for experimentation since, in effect, they are mammalian embryos that develop for a time outside the maternal uterus. Moore treated these pouch young of both sexes with synthetic male and female sex hormones applied either as a skin ointment or by injection. After such treatment the young opossums were examined and the effect of the hormones on their reproductive system noted. Mammals have in their embryology both male components (Wolffian ducts) and female components (Mullerian ducts). In an animal that is to become a female the Mullerian ducts will form the fallopian tubes, uterus and vagina. In males the Wolffian ducts form part of the epididymis, a tube that collects spermatozoa from the testis. The Wolffian ducts in the adult female and the Mullerian ducts in the adult male become functionally degenerate. In the opossum Moore demonstrated, among other things, that (1) Wolffian duct stimulation by male hormones is relatively greater in females than in males; (2) Mullerian ducts in males show comparatively little response to male hormones, whereas in females tremendous precocious stimulation results from treatment; (3) Wolffian ducts in males respond less markedly to female hormones than do those in females, and (4) Mullerian ducts are not retained in their normal relations in males, whereas in females precocious differentiation occurs. This study because of its originality should stimulate further research in zoology on the important relation between hormones and embryonic development.

An instructive report on abnormalities of metamorphosis in the flour beetle *Tribolium confusum* was published by Roth and Howland. These investigators showed that the beetles as adults give off a gas which can be collected in sizeable quantities both in solution and crystalline form. The gas is liberated through special pores that lie in the thorax and abdomen. It was shown that when this substance, possibly related to the quinones, was brought into contact with developing larvae curious abnormalities resulted. For example, if large larvae are exposed they give rise to adults that lack antennae; if crystals of the substance are applied to the legs of older larvae an adult emerges with duplicated to triplicated legs. Not much is known of the mechanisms involved but the investigation is pregnant with ideas and techniques for future research.

There has long been interest in zoological circles in the spawning and migratory behaviour of the salmon. The current state of knowledge was summarized by Powers as follows: (1) Salmon spawn on characteristic spawning grounds in fresh water. (2) At more-or-less definite ages the young migrate to the sea. (3) After feeding and reaching maturity they return to these grounds to spawn. (4) The Pacific salmon dies after spawning while the steelhead trout and the Atlantic salmon may return to the sea and make a second or a third trip back to the spawning grounds. (5) A large proportion return to the original spawning streams and quite likely to the grounds upon which they were spawned. (6) This is not completely fixed; there is a certain amount of straying. (7) The movements from the sea to the spawning streams are facilitated by the freshets emerging from the streams into the ocean. (8) When the fish reach the mouth of the stream they respond to the water currents existing there. In addition to these established points Powers presented experimental data to show "that response of the salmon to carbon dioxide tension of the water is a dominant factor in determining the migratory movements to the sea and the return to spawning grounds." (*See* also MARINE BIOLOGY.)

BIBLIOGRAPHY.—James G. Needham *et al.*, *A Symposium on Hydrobiology* (1941); Carl R. Moore, *Physiological Zoology*, 14 (1941); Louis M. Roth and Ruth B. Howland, *Annals, Entomological Society America*, 34 (1941); Edwin B. Powers, *Ecology*, 22 (1941). (T. Pk.)

INDEX

The black type entries are article headings and cross references. These black type article entries do not show page notations because they are to be found in their alphabetical position in the body of the book, but they show the dates of the issues of the *Book of the Year* in which the articles appear. For example, **"American Institute of Architects 42, 41, 39, 38"** indicates that the entry "American Institute of Architects" is to be found in the *1942 Book of the Year*, the *1941 Book of the Year*, the *1939 Book of the Year* and the *1938 Book of the Year*. The reference **"Adult Education: *see* Education 42. *See* Education, Adult 41, 40, 39. *See* Adult Education 38"** indicates that the entry "Adult Education" is to be found in the article "Education" in the *1942 Book of the Year*, and under the heading "Education, Adult" in the *1941 Book of the Year*, the *1940 Book of the Year* and the *1939 Book of the Year* and under the heading "Adult Education" in the *1938 Book of the Year*. **All black type entries without dates indicate that the same entries appear in all previous issues. Examples,** not **Advertising 42, 41, 40, 39, 38,** but **Advertising;** not **Academy of Arts and Letters, American: *see* American Academy of Arts and Letters 42, 41, 40, 39, 38,** but **Academy of Arts and Letters, American: *see* American Academy of Arts and Letters.**

The light type headings which are indented under black type article headings and cross references refer to articles elsewhere in the text (of this issue only) related to the entry listed in black type. The light type headings which are not indented refer to information in the text (of this issue only) not given a special article. All the light type headings show page references.

All headings whether consisting of a single word or more are treated for the purpose of alphabetization as single complete headings. Names beginning with "Mc" and "Mac" are alphabetized as "Mac"; "St." is treated as "Saint." All references below show the exact quarter of the page by means of the letters *a*, *b*, *c*, and *d*, signifying respectively the upper and lower halves of the first column and the upper and lower halves of the second column.
